Output Parameters

a	On exit, If *jobu* = 'O', *a* is overwritten with the first min(*m*,*n*) columns of *U* (the left singular vectors stored columnwise); If *jobvt* = 'O', *a* is overwritten with the first min(*m*, *n*) rows of *V'*/conjg(*V'*) (the right singular vectors stored rowwise); If *jobu*≠'O' and *jobvt*≠'O', the contents of *a* are destroyed.
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, min(*m*,*n*)). Contains the singular values of *A* sorted so that *s*(i) ≥ *s*(i+1).
u, *vt*	REAL for sgesvd DOUBLE PRECISION for dgesvd COMPLEX for cgesvd DOUBLE COMPLEX for zgesvd. Arrays: *u*(*ldu*,*); the second dimension of *u* must be at least max(1, *m*) if *jobu* = 'A', and at least max(1, min(*m*, *n*)) if *jobu* = 'S'. If *jobu* = 'A', *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*. If *jobu* = 'S', *u* contains the first min(*m*, *n*) columns of *U* (the left singular vectors, stored columnwise). If *jobu* = 'N' or 'O', *u* is not referenced. *vt*(*ldvt*,*); the second dimension of *vt* must be at least max(1, *n*). If *jobvt* = 'A', *vt* contains the *n*-by-*n* orthogonal/unitary matrix *V'*/conjg(*V'*). If *jobvt* = 'S', *vt* contains the first min(*m*, *n*) rows of *V'*/conjg(*V'*) (the right singular vectors, stored rowwise). If *jobvt* = 'N'or 'O', *vt* is not referenced.
work	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

For real flavors:
If *info* > 0, *work*(2:min(*m*,*n*)) contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A*=*u***B***vt*, so it has the same singular values as *A*, and singular vectors related by *u* and *vt*.

rwork — On exit (for complex flavors), if *info* > 0, *rwork*(1:min(*m*,*n*)-1) contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A* = *u***B***vt*, so it has the same singular values as *A*, and singular vectors related by *u* and *vt*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then if ?bdsqr did not converge, *i* specifies how many superdiagonals of the intermediate bidiagonal form *B* did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gesvd interface are the following:

a — Holds the matrix *A* of size (*m*, *n*).

s — Holds the vector of length min(*m*, *n*).

u — If present and is a square *m*-by-*m* matrix, on exit contains the *m*-by-*m* orthogonal/unitary matrix *U*.
Otherwise, if present, on exit contains the first min(*m*,*n*) columns of the matrix *U* (left singular vectors stored columnwise).

vt — If present and is a square *n*-by-*n* matrix, on exit contains the *n*-by-*n* orthogonal/unitary matrix *V*'/conjg(*V*').
Otherwise, if present, on exit contains the first min(*m*,*n*) rows of the matrix *V*'/conjg(*V*') (right singular vectors stored rowwise).

ww — Holds the vector of length min(*m*, *n*)-1. *ww* contains the unconverged superdiagonal elements of an upper bidiagonal matrix *B* whose diagonal is in *s* (not necessarily sorted). *B* satisfies *A* = *U***B***VT*, so it has the same singular values as *A*, and singular vectors related by *U* and *VT*.

job — Must be either 'N', or 'U', or 'V'. The default value is 'N'.
If *job* = 'U', and *u* is not present, then *u* is returned in the array *a*.
If *job* = 'V', and *vt* is not present, then *vt* is returned in the array *a*.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gesdd

Computes the singular value decomposition of a general rectangular matrix using a divide and conquer method.

Syntax

FORTRAN 77:

```
call sgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, iwork, info)
call dgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, iwork, info)
call cgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, iwork, info)
call zgesdd(jobz, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, iwork, info)
```

Fortran 95:

```
call gesdd(a, s [,u] [,vt] [,jobz] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the singular value decomposition (SVD) of a real/complex *m*-by-*n* matrix *A*, optionally computing the left and/or right singular vectors.

If singular vectors are desired, it uses a divide-and-conquer algorithm. The SVD is written

A = *U**Σ**V'* for real routines,

A = *U**Σ*conjg(*V'*) for complex routines,

where Σ is an *m*-by-*n* matrix which is zero except for its min(*m*,*n*) diagonal elements, *U* is an *m*-by-*m* orthogonal/unitary matrix, and *V* is an *n*-by-*n* orthogonal/unitary matrix. The diagonal elements of Σ are the singular values of *A*; they are real and non-negative, and are returned in descending order. The first min(*m*, *n*) columns of *U* and *V* are the left and right singular vectors of *A*.

Note that the routine returns *vt* = *V'* (for real flavors) or *vt* = conjg(*V'*) (for complex flavors), not *V*.

Input Parameters

jobz CHARACTER*1. Must be 'A', 'S', 'O', or 'N'.

Specifies options for computing all or part of the matrix *U*.
If *jobz* = 'A', all *m* columns of *U* and all *n* rows of *V'*/conjg(*V'*) are returned in the arrays *u* and *vt*;
if *jobz* = 'S', the first min(*m*, *n*) columns of *U* and the first min(*m*, *n*) rows of *V'*/conjg(*V'*) are returned in the arrays *u* and *vt*;
if *jobz* = 'O', then
if *m* ≥ *n*, the first *n* columns of *U* are overwritten in the array *a* and all rows of *V'*/conjg(*V'*) are returned in the array *vt*;
if *m* < *n*, all columns of *U* are returned in the array *u* and the first *m* rows of *V'*/conjg(*V'*) are overwritten in the array *a*;
if *jobz* = 'N', no columns of *U* or rows of *V'*/conjg(*V'*) are computed.

m

INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).

n

INTEGER. The number of columns in *A* (*n* ≥ 0).

a, *work*

REAL for sgesdd
DOUBLE PRECISION for dgesdd
COMPLEX for cgesdd
DOUBLE COMPLEX for zgesdd.
Arrays: *a*(*lda*,*) is an array containing the *m*-by-*n* matrix *A*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda

INTEGER. The first dimension of the array *a*. Must be at least max(1, *m*).

ldu, *ldvt*

INTEGER. The leading dimensions of the output arrays *u* and *vt*, respectively.
Constraints:
ldu ≥ 1; *ldvt* ≥ 1.
If *jobz* = 'S' or 'A', or *jobz* = 'O' and *m* < *n*,
then *ldu* ≥ *m*;
If *jobz* = 'A' or *jobz* = 'O' and *m* ≥ *n*,
then *ldvt* ≥ *n*;
If *jobz* = 'S', *ldvt* ≥ min(*m*, *n*).

lwork

INTEGER.
The dimension of the array *work*; *lwork* ≥ 1.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the *work*(1), and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

rwork

REAL for cgesdd
DOUBLE PRECISION for zgesdd
Workspace array, DIMENSION at least max(1, 5*min(*m*,*n*)) if *jobz* = 'N'.

Otherwise, the dimension of *rwork* must be at least max(1, $5*(\min(m,n))^2 + 7*\min(m,n)$). This array is used in complex flavors only.

iwork — INTEGER. Workspace array, DIMENSION at least max(1, 8 *min(*m*, *n*)).

Output Parameters

a — On exit:
If *jobz* = 'O', then if *m* ≥ *n*, *a* is overwritten with the first *n* columns of *U* (the left singular vectors, stored columnwise). If *m* < *n*, *a* is overwritten with the first *m* rows of V^T (the right singular vectors, stored rowwise);
If *jobz* ≠ 'O', the contents of *a* are destroyed.

s — REAL for single precision flavors DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, min(*m*,*n*)). Contains the singular values of *A* sorted so that *s*(i) ≥ *s*(i+1).

u, *vt* — REAL for sgesdd
DOUBLE PRECISION for dgesdd
COMPLEX for cgesdd
DOUBLE COMPLEX for zgesdd.
Arrays:
u(*ldu*,*); the second dimension of *u* must be at least max(1, *m*) if *jobz* = 'A' or *jobz* = 'O' and *m* < *n*.
If *jobz* = 'S', the second dimension of *u* must be at least max(1, min(*m*, *n*)).
If *jobz* = 'A'or *jobz* = 'O' and *m* < *n*, *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*.
If *jobz* = 'S', *u* contains the first min(*m*, *n*) columns of *U* (the left singular vectors, stored columnwise).
If *jobz* = 'O' and *m* ≥ *n*, or *jobz* = 'N', *u* is not referenced.
vt(*ldvt*,*); the second dimension of *vt* must be at least max(1, *n*).
If *jobz* = 'A'or *jobz* = 'O' and *m* ≥ *n*, *vt* contains the *n*-by-*n* orthogonal/unitary matrix V^T.
If *jobz* = 'S', *vt* contains the first min(*m*, *n*) rows of V^T (the right singular vectors, stored rowwise).
If *jobz* = 'O' and *m* < *n*, or *jobz* = 'N', *vt* is not referenced.

work(1) — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then ?bdsdc did not converge, updating process failed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gesdd interface are the following:

a Holds the matrix *A* of size (*m*, *n*).

s Holds the vector of length min(*m*, *n*).

u Holds the matrix *U* of size

- (*m*,*m*) if *jobz*='A' or *jobz*='O' and *m* < *n*
- (*m*,min(*m*, *n*)) if *jobz*='S'

u is not referenced if *jobz* is not supplied or if *jobz*='N' or *jobz*='O' and *m* ≥ *n*.

vt Holds the matrix *VT* of size

- (*n*,*n*) if *jobz*='A' or *jobz*='O' and *m* ≥ *n*
- (min(*m*, *n*), *n*) if *jobz*='S'

vt is not referenced if *jobz* is not supplied or if *jobz*='N' or *jobz*='O' and *m* < *n*.

job Must be 'N', 'A', 'S', or 'O'. The default value is 'N'.

Application Notes

For real flavors:

If *jobz* = 'N', *lwork* ≥ 3*min(*m*, *n*) + max (max(*m*,*n*), 6*min(*m*, *n*));

If *jobz* = 'O', *lwork* ≥ $3*(\min(m, n))^2$ + max (max(*m*, *n*), $5*(\min(m, n))^2$ + 4*min(*m*, *n*));

If *jobz* = 'S' or 'A', *lwork* ≥ $3*(\min(m, n))^2$ + max (max(*m*, *n*), $4*(\min(m, n))^2$ + 4*min(*m*, *n*))

For complex flavors:

If *jobz* = 'N', *lwork* ≥ 2*min(*m*, *n*) + max(*m*, *n*);

If *jobz* = 'O', *lwork* ≥ $2*(\min(m, n))^2$ + max(*m*, *n*) + 2*min(*m*, *n*);

If *jobz* = 'S' or 'A', *lwork* ≥ $(\min(m, n))^2$ + max(*m*, *n*) + 2*min(*m*, *n*);

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gejsv

Computes the singular value decomposition of a real matrix using a preconditioned Jacobi SVD method.

Syntax

FORTRAN 77:

call sgejsv(*joba*, *jobu*, *jobv*, *jobr*, *jobt*, *jobp*, *m*, *n*, *a*, *lda*, *sva*, *u*, *ldu*, *v*, *ldv*, *work*, *lwork*, *iwork*, *info*)

call dgejsv(*joba*, *jobu*, *jobv*, *jobr*, *jobt*, *jobp*, *m*, *n*, *a*, *lda*, *sva*, *u*, *ldu*, *v*, *ldv*, *work*, *lwork*, *iwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the singular value decomposition (SVD) of a real *m*-by-*n* matrix *A*, where $m \geq n$.

The SVD is written as

A = *U**Σ**V'*,

where Σ is an *m*-by-*n* matrix which is zero except for its *n* diagonal elements, *U* is an *m*-by-*n* (or *m*-by-*m*) orthonormal matrix, and *V* is an *n*-by-*n* orthogonal matrix. The diagonal elements of Σ are the singular values of *A*; the columns of *U* and *V* are the left and right singular vectors of *A*, respectively. The matrices *U* and *V* are computed and stored in the arrays *u* and *v*, respectively. The diagonal of Σ is computed and stored in the array *sva*.

The routine implements a preconditioned Jacobi SVD algorithm. It uses ?geqp3, ?geqrf, and ?gelqf as preprocessors and preconditioners. Optionally, an additional row pivoting can be used as a preprocessor, which in some cases results in much higher accuracy. An example is matrix *A* with the structure A = D1 * C * D2, where D1, D2 are arbitrarily ill-conditioned diagonal matrices and C is a well-conditioned matrix. In that case, complete pivoting in the first QR factorizations provides accuracy dependent on the condition number of C, and independent of D1, D2. Such higher accuracy is not completely understood theoretically, but it works well in practice.

If *A* can be written as A = B*D, with well-conditioned *B* and some diagonal *D*, then the high accuracy is guaranteed, both theoretically and in software independent of *D*. For more details see [Drmac08-1], [Drmac08-2].

The computational range for the singular values can be the full range (UNDERFLOW,OVERFLOW), provided that the machine arithmetic and the BLAS and LAPACK routines called by ?gejsv are implemented to work in that range. If that is not the case, the restriction for safe computation with the singular values in the range of normalized IEEE numbers is that the spectral condition number kappa(A)=sigma_max(A)/sigma_min(A) does

not overflow. This code (?gejsv) is best used in this restricted range, meaning that singular values of magnitude below ||A||_2 / slamch('O') (for single precision) or ||A||_2 / dlamch('O') (for double precision) are returned as zeros. See *jobr* for details on this.

This implementation is slower than the one described in [Drmac08-1], [Drmac08-2] due to replacement of some non-LAPACK components, and because the choice of some tuning parameters in the iterative part (?gesvj) is left to the implementer on a particular machine.

The rank revealing QR factorization (in this code: ?geqp3) should be implemented as in [Drmac08-3].

If *m* is much larger than *n*, it is obvious that the inital QRF with column pivoting can be preprocessed by the QRF without pivoting. That well known trick is not used in ?gejsv because in some cases heavy row weighting can be treated with complete pivoting. The overhead in cases *m* much larger than *n* is then only due to pivoting, but the benefits in accuracy have prevailed. You can incorporate this extra QRF step easily and also improve data movement (matrix transpose, matrix copy, matrix transposed copy) - this implementation of ?gejsv uses only the simplest, naive data movement.

Input Parameters

joba

CHARACTER*1. Must be 'C', 'E', 'F', 'G', 'A', or 'R'.
Specifies the level of accuracy:
If *joba* = 'C', high relative accuracy is achieved if *A* = *B*D* with well-conditioned *B* and arbitrary diagonal matrix *D*. The accuracy cannot be spoiled by column scaling. The accuracy of the computed output depends on the condition of *B*, and the procedure aims at the best theoretical accuracy. The relative error max_{i=1:N}|d sigma_i| / sigma_i is bounded by f(M,N)*epsilon* cond(B), independent of *D*. The input matrix is preprocessed with the QRF with column pivoting. This initial preprocessing and preconditioning by a rank revealing QR factorization is common for all values of *joba*. Additional actions are specified as follows:
If *joba* = 'E', computation as with 'C' with an additional estimate of the condition number of *B*. It provides a realistic error bound.
If *joba* = 'F', accuracy higher than in the 'C' option is achieved, if *A* = *D1*C*D2* with ill-conditioned diagonal scalings *D1*, *D2*, and a well-conditioned matrix *C*. This option is advisable, if the structure of the input matrix is not known and relative accuracy is desirable. The input matrix *A* is preprocessed with QR factorization with full (row and column) pivoting.
If *joba* = 'G', computation as with 'F' with an additional estimate of the condition number of *B*, where *A* = *B*D*. If *A* has heavily weighted rows, using this condition number gives too pessimistic error bound.
If *joba* = 'A', small singular values are the noise and the matrix is treated as numerically rank defficient. The error in the computed singular values is bounded by f(m,n)*epsilon*||A||. The computed SVD A = U*S*V**t restores *A* up to f(m,n)*epsilon*||A||. This enables the procedure to set all singular values below n*epsilon*||A|| to zero.

If *joba* = 'R', the procedure is similar to the 'A' option. Rank revealing property of the initial QR factorization is used to reveal (using triangular factor) a gap sigma_{r+1} < epsilon * sigma_r, in which case the numerical rank is declared to be *r*. The SVD is computed with absolute error bounds, but more accurately than with 'A'.

jobu CHARACTER*1. Must be 'U', 'F', 'W', or 'N'.
Specifies whether to compute the columns of the matrix *U*:
If *jobu* = 'U', *n* columns of *U* are returned in the array *u*
If *jobu* = 'F', a full set of *m* left singular vectors is returned in the array *u*.
If *jobu* = 'W', *u* may be used as workspace of length *m***n*. See the description of *u*.
If *jobu* = 'N', *u* is not computed.

jobv CHARACTER*1. Must be 'V', 'J', 'W', or 'N'.
Specifies whether to compute the matrix *V*:
If *jobv* = 'V', *n* columns of *V* are returned in the array *v*; Jacobi rotations are not explicitly accumulated.
If *jobv* = 'J', *n* columns of *V* are returned in the array *v* but they are computed as the product of Jacobi rotations. This option is allowed only if *jobu* ≠ *n*
If *jobv* = 'W', *v* may be used as workspace of length *n***n*. See the description of *v*.
If *jobv* = 'N', *v* is not computed.

jobr CHARACTER*1. Must be 'N' or 'R'.
Specifies the range for the singular values. If small positive singular values are outside the specified range, they may be set to zero. If *A* is scaled so that the largest singular value of the scaled matrix is around sqrt(big), big = ?lamch('O'), the function can remove columns of *A* whose norm in the scaled matrix is less than sqrt(?lamch('S')) (for *jobr* = 'R'), or less than small = ?lamch('S')/?lamch('E').
If *jobr* = 'N', the function does not remove small columns of the scaled matrix. This option assumes that BLAS and QR factorizations and triangular solvers are implemented to work in that range. If the condition of *A* if greater that big, use ?gesvj.
If *jobr* = 'R', restricted range for singular values of the scaled matrix *A* is [sqrt(?lamch('S'), sqrt(big)], roughly as described above. This option is recommended.
For computing the singular values in the full range [?lamch('S'),big], use ?gesvj.

jobt CHARACTER*1. Must be 'T' or 'N'.
If the matrix is square, the procedure may determine to use a transposed *A* if *A***t seems to be better with respect to convergence. If the matrix is not square, *jobt* is ignored. This is subject to changes in the future.
The decision is based on two values of entropy over the adjoint orbit of *A***t * *A*. See the descriptions of *work(6)* and *work(7)*.

	If *jobt* = 'T', the function perfomrs transpositon if the entropy test indicates possibly faster convergence of the Jacobi process, if *A* is taken as input. If *A* is replaced with *A***t, the row pivoting is included automatically. If *jobt* = 'N', the functions attempts no speculations. This option can be used to compute only the singular values, or the full SVD (*u*, *sigma*, and *v*). For only one set of singular vectors (*u* or *v*), the caller should provide both *u* and *v*, as one of the matrices is used as workspace if the matrix *A* is transposed. The implementer can easily remove this constraint and make the code more complicated. See the descriptions of *u* and *v*.
jobp	CHARACTER*1. Must be 'P' or 'N'. Enables structured perturbations of denormalized numbers. This option should be active if the denormals are poorly implemented, causing slow computation, especially in cases of fast convergence. For details, see [Drmac08-1], [Drmac08-2] . For simplicity, such perturbations are included only when the full SVD or only the singular values are requested. You can add the perturbation for the cases of computing one set of singular vectors. If *jobp* = 'P', the function introduces perturbation. If *jobp* = 'N', the function introduces no perturbation.
m	INTEGER. The number of rows of the input matrix *A*; *m* ≥ 0.
n	INTEGER. The number of columns in the input matrix *A*; *n* ≥ 0.
a, *work*, *sva*, *u*, *v*	REAL for sgejsv DOUBLE PRECISION for dgejsv. Array *a*(*lda*,*) is an array containing the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*). *sva* is a workspace array, its dimension is *n*. *u* is a workspace array, its dimension is (*ldu*,*); the second dimension of *u* must be at least max(1, *n*). *v* is a workspace array, its dimension is (*ldv*,*); the second dimension of *u* must be at least max(1, *n*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *m*).
ldu	INTEGER. The first dimension of the array *u*; *ldu* ≥ 1. *jobu* = 'U' or 'F' or 'W', *ldu* ≥ *m*.
ldv	INTEGER. The first dimension of the array *v*; *ldv* ≥ 1. *jobv* = 'V' or 'J' or 'W', *ldv* ≥ *n*.
lwork	INTEGER. Length of *work* to confirm proper allocation of work space. *lwork* depends on the task performed: If only *sigma* is needed (*jobu* = 'N', *jobv* = 'N') and

- ... no scaled condition estimate is required, then *lwork* ≥ max(2*m+n,4*n+1,7). This is the minimal requirement. For optimal performance (blocked code) the optimal value is *lwork* ≥ max(2*m+n,3*n+(n+1)*nb,7). Here *nb* is the optimal block size for ?geqp3/?geqrf.
- ... an estimate of the scaled condition number of *A* is required (*joba* = 'E', 'G'). In this case, *lwork* is the maximum of the above and *n*n+4*n*, that is, *lwork* ≥ max(2*m+n,n*n+4*n,7)

If *sigma* and the right singular vectors are needed (*jobv* = 'V',

- the minimal requirement is *lwork* ≥ max(2*n+m,7).
- for optimal performance, *lwork* ≥ max(2*n+m,2*n*n+n*nb,7), where *nb* is the optimal block size.

If *sigma* and the left singular vectors are needed

- the minimal requirement is *lwork* ≥ max(2*n+m,7).
- for optimal performance, *lwork* ≥ max(2*n+m,2*n*n+n*nb,7), where *nb* is the optimal block size.

If full SVD is needed (*jobu* = 'U' or 'F', *jobv* = 'V') and

- ... the singular vectors are computed without explicit accumulation of the Jacobi rotations, *lwork* ≥ 6*n+2*n*n.
- ... in the iterative part, the Jacobi rotations are explicitly accumulated (option, see the description of *jobv*), the minimal requirement is *lwork* ≥ max(*m*+3*n+n*n,7). For better performance, if *nb* is the optimal block size, *lwork* ≥ max(3*n+n*n+m, 3*n+n*n+n*nb,7).

iwork INTEGER. Workspace array, DIMENSION *m*+3*n*.

Output Parameters

sva On exit:
For *work(1)/work(2)* = one: the singular values of *A*. During the computation *sva* contains Euclidean column norms of the iterated matrices in the array *a*.
For *work(1)≠work(2)*: the singular values of *A* are (*work(1)/work(2)*) * *sva*(1:*n*). This factored form is used if *sigma_max(A)* overflows or if small singular values have been saved from underflow by scaling the input matrix *A*.

jobr = 'R', some of the singular values may be returned as exact zeros obtained by 'setting to zero' because they are below the numerical rank threshold or are denormalized numbers.

u On exit:
If *jobu* = 'U', contains the *m*-by-*n* matrix of the left singular vectors.
If *jobu* = 'F', contains the *m*-by-*m* matrix of the left singular vectors, including an orthonormal basis of the orthogonal complement of the range of *A*.
If *jobu* = 'W' and *jobv* = 'V', *jobt* = 'T', and *m* = *n*, then *u* is used as workspace if the procedure replaces *A* with *A**t*. In that case, *v* is computed in *u* as left singular vectors of *A**t* and copied back to the *v* array. This 'W' option is just a reminder to the caller that in this case *u* is reserved as workspace of length *n***n*.
If *jobu* = 'N', *u* is not referenced.

v On exit:
If *jobv* = 'V' or 'J', contains the *n*-by-*n* matrix of the right singular vectors.
If *jobv* = 'W' and *jobv* = 'U', *jobt* = 'T', and *m* = *n*, then *v* is used as workspace if the procedure replaces *A* with *A**t*. In that case, *u* is computed in *v* as right singular vectors of *A**t* and copied back to the *u* array. This 'W' option is just a reminder to the caller that in this case *v* is reserved as workspace of length *n***n*.
If *jobv* = 'N', *v* is not referenced.

work On exit,
work(1) = *scale* = *work(2)*/*work(1)* is the scaling factor such that *scale***sva*(1:*n*) are the computed singular values of *A*. See the description of *sva()*.
work(2) = see the description of *work(1)*.
work(3) = *sconda* is an estimate for the condition number of column equilibrated *A*. If *joba* = 'E' or 'G', *sconda* is an estimate of sqrt(||(R**t * R)**(-1)||_1). It is computed using ?pocon. It holds *n***(-1/4) * *sconda* ≤ ||R**(-1)||_2 ≤ *n***(1/4) * *sconda*, where R is the triangular factor from the QRF of *A*. However, if R is truncated and the numerical rank is determined to be strictly smaller than *n*, *sconda* is returned as -1, indicating that the smallest singular values might be lost.
If full SVD is needed, the following two condition numbers are useful for the analysis of the algorithm. They are provied for a user who is familiar with the details of the method.
work(4) = an estimate of the scaled condition number of the triangular factor in the first QR factorization.
work(5) = an estimate of the scaled condition number of the triangular factor in the second QR factorization.
The following two parameters are computed if *jobt* = 'T'. They are provided for a user who is familiar with the details of the method.

	work(6) = the entropy of *A***t**A* :: this is the Shannon entropy of diag(*A***t**A*) / Trace(*A***t**A*) taken as point in the probability simplex. *work(7)* = the entropy of *A***A***t.
iwork	INTEGER. On exit, *iwork(1)* = the numerical rank determined after the initial QR factorization with pivoting. See the descriptions of *joba* and *jobr*. *iwork(2)* = the number of the computed nonzero singular value. *iwork(3)* = if nonzero, a warning message. If *iwork(3)*=1, some of the column norms of *A* were denormalized floats. The requested high accuracy is not warranted by the data.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* > 0, the function did not converge in the maximal number of sweeps. The computed values may be inaccurate.

?gesvj

Computes the singular value decomposition of a real matrix using Jacobi plane rotations.

Syntax

FORTRAN 77:

```
call sgesvj(joba, jobu, jobv, m, n, a, lda, sva, mv, v, ldv, work, lwork, info)
call dgesvj(joba, jobu, jobv, m, n, a, lda, sva, mv, v, ldv, work, lwork, info)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the singular value decomposition (SVD) of a real *m*-by-*n* matrix *A*, where $m \geq n$.

The SVD of *A* is written as

$A = U*\Sigma*V'$,

where Σ is an *m*-by-*n* diagonal matrix, *U* is an *m*-by-*n* orthonormal matrix, and *V* is an *n*-by-*n* orthogonal matrix. The diagonal elements of Σ are the singular values of *A*; the columns of *U* and *V* are the left and right singular vectors of *A*, respectively. The matrices *U* and *V* are computed and stored in the arrays *u* and *v*, respectively. The diagonal of Σ is computed and stored in the array *sva*.

The *n*-by-*n* orthogonal matrix *V* is obtained as a product of Jacobi plane rotations. The rotations are implemented as fast scaled rotations of Anda and Park [AndaPark94]. In the case of underflow of the Jacobi angle, a modified Jacobi transformation of Drmac ([Drmac08-4]) is used. Pivot strategy uses column interchanges of de Rijk ([deRijk98]). The relative accuracy of the computed singular values and the accuracy of the computed singular vectors (in angle metric) is as guaranteed by the theory of Demmel and Veselic [Demmel92]. The condition number that determines the accuracy in the full rank case is essentially

$$(\min_i d_{ii}) \cdot \kappa(A \cdot D)$$

where κ(.) is the spectral condition number. The best performance of this Jacobi SVD procedure is achieved if used in an accelerated version of Drmac and Veselic [Drmac08-1], [Drmac08-2]. Some tunning parameters (marked with TP) are available for the implementer.

The computational range for the nonzero singular values is the machine number interval (UNDERFLOW,OVERFLOW). In extreme cases, even denormalized singular values can be computed with the corresponding gradual loss of accurate digit.

Input Parameters

joba — CHARACTER*1. Must be 'L', 'U' or 'G'.
Specifies the structure of *A*:
If *joba* = 'L', the input matrix *A* is lower triangular.
If *joba* = 'U', the input matrix *A* is upper triangular.
If *joba* = 'G', the input matrix *A* is a general *m*-by-*n*, $m \geq n$.

jobu — CHARACTER*1. Must be 'U', 'C' or 'N'.
Specifies whether to compute the left singular vectors (columns of *U*):
If *jobu* = 'U', the left singular vectors corresponding to the nonzero singular values are computed and returned in the leading columns of *A*. See more details in the description of *a*. The default numerical orthogonality threshold is set to approximately TOL=CTOL*EPS, CTOL=sqrt(*m*), EPS = ?lamch('E')
If *jobu* = 'C', analogous to *jobu* = 'U', except that you can control the level of numerical orthogonality of the computed left singular vectors. TOL can be set to TOL=CTOL*EPS, where CTOL is given on input in the array *work*. No CTOL smaller than ONE is allowed. CTOL greater than 1 / EPS is meaningless. The option 'C' can be used if *m**EPS is satisfactory orthogonality of the computed left singular vectors, so CTOL=*m* could save few sweeps of Jacobi rotations. See the descriptions of *a* and *work(1)*.
If *jobu* = 'N', *u* is not computed. However, see the description of *a*.

jobv — CHARACTER*1. Must be 'V', 'A' or 'N'.

	Specifies whether to compute the right singular vectors, that is, the matrix *V*: If *jobv* = 'V', the matrix *V* is computed and returned in the array *v*. If *jobv* = 'A', the Jacobi rotations are applied to the *mv*-by*n* array *v*. In other words, the right singular vector matrix *V* is not computed explicitly, instead it is applied to an *mv*-by*n* matrix initially stored in the first *mv* rows of *V*. If *jobv* = 'N', the matrix *V* is not computed and the array *v* is not referenced.
m	INTEGER. The number of rows of the input matrix *A*; $m \geq 0$.
n	INTEGER. The number of columns in the input matrix *A*; $n \geq 0$.
a, *work*, *sva*, *v*	REAL for sgesvj DOUBLE PRECISION for dgesvj. Array *a*(*lda*,*) is an array containing the *m*-by-*n* matrix *A*. The second dimension of *a* is max(1, *n*). *work* is a workspace array, its dimension max(4, *m*+*n*). If *jobu* = 'C', *work(1)*=CTOL, where CTOL defines the threshold for convergence. The process stops if all columns of *A* are mutually orthogonal up to CTOL*EPS, EPS=?lamch('E'). It is required that CTOL ≥ 1, that is, it is not allowed to force the routine to obtain orthogonality below ε. *sva* is a workspace array, its dimension is *n*. *u* is a workspace array, its dimension is (*ldu*,*); the second dimension of *u* must be at least max(1, *n*). *v* is a workspace array, its dimension is (*ldv*,*); the second dimension of *u* must be at least max(1, *n*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *m*).
mv	INTEGER. *jobv* = 'A', the product of Jacobi rotations in ?gesvj is applied to the first *mv* rows of *v*. See the description of *jobv*.
ldv	INTEGER. The first dimension of the array *v*; *ldv* ≥ 1. *jobv* = 'V', *ldv* ≥ max(1, *n*). *jobv* = 'A', *ldv* ≥ max(1, *mv*).
lwork	INTEGER. Length of *work*, *work* ≥ max(6,*m*+*n*).

Output Parameters

a	On exit: If *jobu* = 'U' or *jobu* = 'C':

- if *info* = 0, the leading columns of *A* contain left singular vectors corresponding to the computed singular values of *a* that are above the underflow threshold ?lamch('S'), that is, non-zero singular values. The number of the computed non-zero singular values is returned in *work(2)*. Also see the descriptions of *sva* and *work*. The computed columns of *u* are mutually numerically orthogonal up to approximately TOL=sqrt(*m*)*EPS (default); or TOL=CTOL*EPS *jobu* = 'C', see the description of *jobu*.
- if *info* > 0, the procedure ?gesvj did not converge in the given number of iterations (sweeps). In that case, the computed columns of *u* may not be orthogonal up to TOL. The output *u* (stored in *a*), *sigma* (given by the computed singular values in *sva*(1:n)) and *v* is still a decomposition of the input matrix *A* in the sense that the residual ||a-scale*u*sigma*v**t||_2 / ||a||_2 is small.

If *jobu* = 'N':

- if *info* = 0, note that the left singular vectors are 'for free' in the one-sided Jacobi SVD algorithm. However, if only the singular values are needed, the level of numerical orthogonality of *u* is not an issue and iterations are stopped when the columns of the iterated matrix are numerically orthogonal up to approximately *m**EPS. Thus, on exit, *a* contains the columns of *u* scaled with the corresponding singular values.
- if *info* > 0, the procedure ?gesvj did not converge in the given number of iterations (sweeps).

sva

On exit:
If *info* = 0, depending on the value *scale* = *work(1)*, where *scale* is the scaling factor:

- if *scale* = 1, *sva*(1:n) contains the computed singular values of *a*. During the computation, *sva* contains the Euclidean column norms of the iterated matrices in the array *a*.
- if *scale* ≠ 1, the singular values of *a* are *scale***sva*(1:n), and this factored representation is due to the fact that some of the singular values of *a* might underflow or overflow.

If *info* > 0, the procedure ?gesvj did not converge in the given number of iterations (sweeps) and *scale***sva*(1:n) may not be accurate.

v

On exit:
If *jobv* = 'V', contains the *n*-by-*n* matrix of the right singular vectors.
If *jobv* = 'A', then *v* contains the product of the computed right singular vector matrix and the initial matrix in the array *v*.
If *jobv* = 'N', *v* is not referenced.

work

On exit,

	work(1) = *scale* is the scaling factor such that *scale***sva*(1:*n*) are the computed singular values of *A*. See the description of *sva()*. *work(2)* is the number of the computed nonzero singular value. *work(3)* is the number of the computed singular values that are larger than the underflow threshold. *work(4)* is the number of sweeps of Jacobi rotations needed for numerical convergence. *work(5)* = max_{i.NE.j} |COS(A(:,i),A(:,j))| in the last sweep. This is useful information in cases when ?gesvj did not converge, as it can be used to estimate whether the output is still useful and for post festum analysis. *work(6)* is the largest absolute value over all sines of the Jacobi rotation angles in the last sweep. It can be useful in a post festum analysis.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* > 0, the function did not converge in the maximal number (30) of sweeps. The output may still be useful. See the description of *work*.

```

Fortran 95:

```
call ggsvd(a, b, alpha, beta [, k] [,l] [,u] [,v] [,q] [,iwork] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the generalized singular value decomposition (GSVD) of an *m*-by-*n* real/complex matrix *A* and *p*-by-*n* real/complex matrix *B*:

$U'*A*Q = D_1*(0\ R), V'*B*Q = D_2*(0\ R),$

where *U*, *V* and *Q* are orthogonal/unitary matrices and *U'*, *V'* mean transpose/conjugate transpose of *U* and *V* respectively.

Let $k+l$ = the effective numerical rank of the matrix $(A', B')'$, then *R* is a $(k+l)$-by-$(k+l)$ nonsingular upper triangular matrix, D_1 and D_2 are *m*-by-$(k+l)$ and *p*-by-$(k+l)$ "diagonal" matrices and of the following structures, respectively:

If $m-k-l \geq 0$,

$$D_1 = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} I & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{array}$$

$$(0\ \ R) = \begin{array}{c} \\ k \\ l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \end{array},$$

where

$C = \mathrm{diag}(alpha(K+1), \ldots, alpha(K+l))$

$S = \mathrm{diag}(beta(K+1), \ldots, beta(K+l))$

$C^2 + S^2 = I$

R is stored in $a(1{:}k+l, n-k-l+1{:}n)$ on exit.

If $m-k-l < 0$,

$$D_1 = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ m-k \\ k+l-m \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & S & 0 \\ & 0 & I \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

$$(0 \quad R) = \begin{array}{c} \\ k \\ m-k \\ k+l-m \end{array} \begin{array}{c} \begin{array}{cccc} n-k-l & k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix} \end{array}$$

where

C = diag($alpha(K+1)$,..., $alpha(m)$),

S = diag($beta(K+1)$,...,$beta(m)$),

$C_2 + S_2 = I$

On exit, $\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$ is stored in $a(1{:}m, n{-}k{-}l{+}1{:}n)$ and R_{33} is stored in $b(m{-}k{+}1{:}l, n{+}m{-}k{-}l{+}1{:}n)$.

The routine computes C, S, R, and optionally the orthogonal/unitary transformation matrices U, V and Q.

In particular, if B is an n-by-n nonsingular matrix, then the GSVD of A and B implicitly gives the SVD of $A*B^{-1}$:

$A*B^{-1} = U*(D_1*D_2^{-1})*V'$.

If (A', B')' has orthonormal columns, then the GSVD of A and B is also equal to the CS decomposition of A and B. Furthermore, the GSVD can be used to derive the solution of the eigenvalue problem:

$A'*A*X = \lambda*B'*B*X$.

Input Parameters

jobu	CHARACTER*1. Must be 'U' or 'N'. If *jobu* = 'U', orthogonal/unitary matrix U is computed. If *jobu* = 'N', U is not computed.
jobv	CHARACTER*1. Must be 'V' or 'N'.

	If *jobv* = 'V', orthogonal/unitary matrix *V* is computed. If *jobv* = 'N', *V* is not computed.
jobq	CHARACTER*1. Must be 'Q' or 'N'. If *jobq* = 'Q', orthogonal/unitary matrix *Q* is computed. If *jobq* = 'N', *Q* is not computed.
m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrices *A* and *B* (*n* ≥ 0).
p	INTEGER. The number of rows of the matrix *B* (*p* ≥ 0).
a, *b*, *work*	REAL for sggsvd DOUBLE PRECISION for dggsvd COMPLEX for cggsvd DOUBLE COMPLEX for zggsvd. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(3*n*, *m*, *p*)+*n*.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *p*).
ldu	INTEGER. The first dimension of the array *u* . *ldu* ≥ max(1, *m*) if *jobu* = 'U'; *ldu* ≥ 1 otherwise.
ldv	INTEGER. The first dimension of the array *v* . *ldv* ≥ max(1, *p*) if *jobv* = 'V'; *ldv* ≥ 1 otherwise.
ldq	INTEGER. The first dimension of the array *q* . *ldq* ≥ max(1, *n*) if *jobq* = 'Q'; *ldq* ≥ 1 otherwise.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cggsvd DOUBLE PRECISION for zggsvd. Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

k, *l*	INTEGER. On exit, *k* and *l* specify the dimension of the subblocks. The sum *k*+*l* is equal to the effective numerical rank of (*A'*, *B'*)'.
a	On exit, *a* contains the triangular matrix *R* or part of *R*.
b	On exit, *b* contains part of the triangular matrix R if *m*-*k*-*l* < 0.
alpha, *beta*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays, DIMENSION at least max(1, *n*) each.

	Contain the generalized singular value pairs of *A* and *B*: *alpha*(1:*k*) = 1, *beta*(1:*k*) = 0, and if *m*-*k*-*l* ≥ 0, *alpha*(*k*+1:*k*+*l*) = *C*, *beta*(*k*+1:*k*+*l*) = *S*, or if *m*-*k*-*l* < 0, *alpha*(*k*+1:*m*)= *C*, *alpha*(*m*+1:*k*+*l*)=0 *beta*(*k*+1:*m*) = *S*, *beta*(*m*+1:*k*+*l*) = 1 and *alpha*(*k*+*l*+1:*n*) = 0 *beta*(*k*+*l*+1:*n*) = 0.
u, *v*, *q*	REAL for sggsvd DOUBLE PRECISION for dggsvd COMPLEX for cggsvd DOUBLE COMPLEX for zggsvd. Arrays: *u*(*ldu*,*); the second dimension of *u* must be at least max(1, *m*). If *jobu* = 'U', *u* contains the *m*-by-*m* orthogonal/unitary matrix *U*. If *jobu* = 'N', *u* is not referenced. *v*(*ldv*,*); the second dimension of *v* must be at least max(1, *p*). If *jobv* = 'V', *v* contains the *p*-by-*p* orthogonal/unitary matrix *V*. If *jobv* = 'N', *v* is not referenced. *q*(*ldq*,*); the second dimension of *q* must be at least max(1, *n*). If *jobq* = 'Q', *q* contains the *n*-by-*n* orthogonal/unitary matrix *Q*. If *jobq* = 'N', *q* is not referenced.
iwork	On exit, *iwork* stores the sorting information.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the Jacobi-type procedure failed to converge. For further details, see subroutine ?tgsja.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggsvd interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
b	Holds the matrix *B* of size (*p*, *n*).
alpha	Holds the vector of length *n*.
beta	Holds the vector of length *n*.
u	Holds the matrix *U* of size (*m*, *m*).
v	Holds the matrix *V* of size (*p*, *p*).
q	Holds the matrix *Q* of size (*n*, *n*).

iwork	Holds the vector of length *n*.
jobu	Restored based on the presence of the argument *u* as follows: *jobu* = 'U', if *u* is present, *jobu* = 'N', if *u* is omitted.
jobv	Restored based on the presence of the argument *v* as follows: *jobz* = 'V', if *v* is present, *jobz* = 'N', if *v* is omitted.
jobq	Restored based on the presence of the argument *q* as follows: *jobz* = 'Q', if *q* is present, *jobz* = 'N', if *q* is omitted.

Generalized Symmetric Definite Eigenproblems

This section describes LAPACK driver routines used for solving generalized symmetric definite eigenproblems. See also computational routines that can be called to solve these problems. Table 4-13 lists all such driver routines for FORTRAN 77 interface. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-13 Driver Routines for Solving Generalized Symmetric Definite Eigenproblems

Routine Name	Operation performed
?sygv/?hegv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem.
?sygvd/?hegvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem. If eigenvectors are desired, it uses a divide and conquer method.
?sygvx/?hegvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem.
?spgv/?hpgv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with matrices in packed storage.
?spgvd/?hpgvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with matrices in packed storage. If eigenvectors are desired, it uses a divide and conquer method.
?spgvx/?hpgvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with matrices in packed storage.
?sbgv/?hbgv	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with banded matrices.
?sbgvd/?hbgvd	Computes all eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.
?sbgvx/?hbgvx	Computes selected eigenvalues and, optionally, eigenvectors of a real / complex generalized symmetric /Hermitian definite eigenproblem with banded matrices.

?sygv

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem.

Syntax

FORTRAN 77:

```
call ssygv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, info)
call dsygv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, info)
```

Fortran 95:

```
call sygv(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$A*x = \lambda*B*x$, $A*B*x = \lambda*x$, or $B*A*x = \lambda*x$.

Here A and B are assumed to be symmetric and B is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *work*	REAL for ssygv DOUBLE PRECISION for dsygv. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*.

The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb INTEGER. The first dimension of *b*; at least max(1, *n*).

lwork INTEGER.
The dimension of the array *work*;

lwork ≥ max(1, 3*n*-1).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, Z^T*B*Z = I;
if *itype* = 3, $Z^T*\text{inv}(B)*Z$ = I;
If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.

w REAL for ssygv
DOUBLE PRECISION for dsygv.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

work(1) On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, spotrf/dpotrf and ssyev/dsyev returned an error code:

If *info* = *i* ≤ *n*, ssyev/dsyev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sygv interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+2)**n*, where *nb* is the blocksize for ssytrd/dsytrd returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegv

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem.

Syntax

FORTRAN 77:

```
call chegv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, info)
call zhegv(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, info)
```

Fortran 95:

```
call hegv(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be Hermitian and *B* is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
a, *b*, *work*	COMPLEX for chegv DOUBLE COMPLEX for zhegv. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
lwork	INTEGER. The dimension of the array *work*; *lwork* ≥ max(1, 2*n*-1). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.
rwork	REAL for chegv DOUBLE PRECISION for zhegv. Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

a	On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
	if *itype* = 1 or 2, Z^H**B*Z* = I;
	if *itype* = 3, Z^H*inv(*B*)**Z* = I;

	If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.
b	On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$.
w	REAL for chegv DOUBLE PRECISION for zhegv. Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument has an illegal value. If *info* > 0, cpotrf/zpotrf and cheev/zheev return an error code: If *info* = *i* ≤ *n*, cheev/zheev fails to converge, and *i* off-diagonal elements of an intermediate tridiagonal do not converge to zero; If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* can not be completed and no eigenvalues or eigenvectors are computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hegv interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+1)**n*, where *nb* is the blocksize for chetrd/zhetrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sygvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

FORTRAN 77:

```
call ssygvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, iwork, liwork, info)
call dsygvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call sygvd(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be symmetric and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x* = *lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x* = *lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
a, *b*, *work*	REAL for ssygvd

DOUBLE PRECISION for dsygvd.
Arrays:
a(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*.
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

lwork — INTEGER.
The dimension of the array *work*.
Constraints:

If $n \leq 1$, $lwork \geq 1$;

If *jobz* = 'N' and *n*>1, $lwork < 2n+1$;

If *jobz* = 'V' and *n*>1, $lwork < 2n^2+6n+1$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER.
Workspace array, its dimension max(1, *lwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
Constraints:

If $n \leq 1$, $liwork \geq 1$;

If *jobz* = 'N' and *n*>1, $liwork \geq 1$;

If *jobz* = 'V' and *n*>1, $liwork \geq 5n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

a — On exit, if *jobz* = 'V', then if *info* = 0, *a* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^T*B*Z = I$;
if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then on exit the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is destroyed.

b	On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization *B* = U^T*U or *B* = *L*L^T.
w	REAL for ssygvd DOUBLE PRECISION for dsygvd. Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0= *i* ≤ *n*, and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero; if *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*,*n*+1); If *info* > 0= *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sygvd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegvd

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

FORTRAN 77:

```
call chegvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, lrwork, iwork, liwork, info)
call zhegvd(itype, jobz, uplo, n, a, lda, b, ldb, w, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hegvd(a, b, w [,itype] [,jobz] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be Hermitian and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype — INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:
if *itype* = 1, the problem type is *A*x* = *lambda*B*x*;
if *itype* = 2, the problem type is *A*B*x* = *lambda*x*;
if *itype* = 3, the problem type is *B*A*x* = *lambda*x*.

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then compute eigenvalues only.
If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;
If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n
INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, *b*, *work*
COMPLEX for chegvd
DOUBLE COMPLEX for zhegvd.
Arrays:
a(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*.
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb
INTEGER. The first dimension of *b*; at least max(1, *n*).

lwork
INTEGER.
The dimension of the array *work*.
Constraints:

If $n \leq 1$, $lwork \geq 1$;

If *jobz* = 'N' and $n>1$, $lwork \geq n+1$;

If *jobz* = 'V' and $n>1$, $lwork \geq n^2+2n$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork
REAL for chegvd
DOUBLE PRECISION for zhegvd.
Workspace array, DIMENSION max(1, *lrwork*).

lrwork
INTEGER.
The dimension of the array *rwork*.
Constraints:

If $n \leq 1$, $lrwork \geq 1$;

If *jobz* = 'N' and $n>1$, $lrwork \geq n$;

If *jobz* = 'V' and $n>1$, $lrwork \geq 2n^2+5n+1$.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork
INTEGER.
Workspace array, DIMENSION max(1, *liwork*).

liwork
INTEGER.
The dimension of the array *iwork*.
Constraints:

If $n \leq 1$, $liwork \geq 1$;

If $jobz$ = 'N' and n>1, $liwork \geq 1$;

If $jobz$ = 'V' and n>1, $liwork \geq 5n+3$.

If $liwork$ = -1, then a workspace query is assumed; the routine only calculates the optimal size of the $work$, $rwork$ and $iwork$ arrays, returns these values as the first entries of the $work$, $rwork$ and $iwork$ arrays, and no error message related to $lwork$ or $lrwork$ or $liwork$ is issued by xerbla. See *Application Notes* for details.

Output Parameters

a

On exit, if $jobz$ = 'V', then if $info$ = 0, a contains the matrix Z of eigenvectors. The eigenvectors are normalized as follows:
if $itype$ = 1 or 2, Z^H* B*Z = I;
if $itype$ = 3, Z^H*inv(B)*Z = I;
If $jobz$ = 'N', then on exit the upper triangle (if $uplo$ = 'U') or the lower triangle (if $uplo$ = 'L') of A, including the diagonal, is destroyed.

b

On exit, if $info \leq n$, the part of b containing the matrix is overwritten by the triangular factor U or L from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$.

w

REAL for chegvd
DOUBLE PRECISION for zhegvd.
Array, DIMENSION at least max(1, n).
If $info$ = 0, contains the eigenvalues in ascending order.

work(1)

On exit, if $info$ = 0, then $work$(1) returns the required minimal size of $lwork$.

rwork(1)

On exit, if $info$ = 0, then $rwork$(1) returns the required minimal size of $lrwork$.

iwork(1)

On exit, if $info$ = 0, then $iwork$(1) returns the required minimal size of $liwork$.

info

INTEGER.
If $info$ = 0, the execution is successful.
If $info$ = -i, the i-th argument had an illegal value.
If $info$ = i, and $jobz$ = 'N', then the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero;
if $info$ = i, and $jobz$ = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns $info$/(n+1) through mod($info$, n+1).

If $info$ = n + i, for $1 \leq i \leq n$, then the leading minor of order i of B is not positive-definite. The factorization of B could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hegvd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sygvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem.

Syntax

FORTRAN 77:

call ssygvx(*itype*, *jobz*, *range*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *iwork*, *ifail*, *info*)

call dsygvx(*itype*, *jobz*, *range*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *iwork*, *ifail*, *info*)

Fortran 95:

call sygvx(*a*, *b*, *w* [,*itype*] [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be symmetric and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(i) in the half-open interval: *vl*<*lambda*(i)≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
a, *b*, *work*	REAL for ssygvx DOUBLE PRECISION for dsygvx. Arrays: *a*(*lda*,*) contains the upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper or lower triangle of the symmetric positive definite matrix *B*, as specified by *uplo*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
vl, *vu*	REAL for ssygvx DOUBLE PRECISION for dsygvx.

If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for ssygvx
DOUBLE PRECISION for dsygvx. The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz — INTEGER. The leading dimension of the output array *z*. Constraints:
ldz ≥ 1; if *jobz* = 'V', *ldz* ≥ max(1, *n*).

lwork — INTEGER.
The dimension of the array *work*;
lwork < max(1, 8*n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

iwork — INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

a — On exit, the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is overwritten.

b — On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$.

m — INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z* — REAL for ssygvx
DOUBLE PRECISION for dsygvx.
Arrays:
w(*), DIMENSION at least max(1, *n*).
The first *m* elements of *w* contain the selected eigenvalues in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).

	If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:
	if *itype* = 1 or 2, Z^T*B*Z = I;
	if *itype* = 3, Z^T*inv(*B*)*Z* = I;
	If *jobz* = 'N', then *z* is not referenced.
	If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
	Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th argument had an illegal value. If *info* > 0, spotrf/dpotrf and ssyevx/dsyevx returned an error code: If *info* = *i* ≤ *n*, ssyevx/dsyevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*; If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sygvx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.

uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then $\varepsilon * ||T||_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, set *abstol* to 2*?lamch('S').

For optimum performance use *lwork* ≥ (*nb*+3)*n, where *nb* is the blocksize for ssytrd/dsytrd returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hegvx

Computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem.

Syntax

FORTRAN 77:

call chegvx(*itype*, *jobz*, *range*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *rwork*, *iwork*, *ifail*, *info*)

call zhegvx(*itype*, *jobz*, *range*, *uplo*, *n*, *a*, *lda*, *b*, *ldb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *rwork*, *iwork*, *ifail*, *info*)

Fortran 95:

call hegvx(*a*, *b*, *w* [,*itype*] [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be Hermitian and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype — INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved:
if *itype* = 1, the problem type is *A*x = lambda*B*x*;
if *itype* = 2, the problem type is *A*B*x = lambda*x*;
if *itype* = 3, the problem type is *B*A*x = lambda*x*.

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then compute eigenvalues only.
If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
vl<*lambda*(*i*)≤ *vu*.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *a* and *b* store the upper triangles of *A* and *B*;

If *uplo* = 'L', arrays *a* and *b* store the lower triangles of *A* and *B*.

n
INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, *b*, *work*
COMPLEX for chegvx
DOUBLE COMPLEX for zhegvx.
Arrays:
a(*lda*,*) contains the upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the upper or lower triangle of the Hermitian positive definite matrix *B*, as specified by *uplo*.
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb
INTEGER. The first dimension of *b*; at least max(1, *n*).

vl, *vu*
REAL for chegvx
DOUBLE PRECISION for zhegvx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: $1 \leq il \leq iu \leq n$, if $n > 0$; *il*=1 and *iu*=0 if $n = 0$.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for chegvx
DOUBLE PRECISION for zhegvx.
The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz
INTEGER. The leading dimension of the output array *z*. Constraints:
$ldz \geq 1$; if *jobz* = 'V', $ldz \geq \max(1, n)$.

lwork
INTEGER.
The dimension of the array *work*; $lwork \geq \max(1, 2n)$.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

rwork
REAL for chegvx
DOUBLE PRECISION for zhegvx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork
INTEGER.

Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

a — On exit, the upper triangle (if *uplo* = 'U') or the lower triangle (if *uplo* = 'L') of *A*, including the diagonal, is overwritten.

b — On exit, if *info* ≤ *n*, the part of *b* containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization *B* = U^H*U or *B* = *L*L^H.

m — INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w — REAL for chegvx
DOUBLE PRECISION for zhegvx.
Array, DIMENSION at least max(1, *n*).
The first *m* elements of *w* contain the selected eigenvalues in ascending order.

z — COMPLEX for chegvx
DOUBLE COMPLEX for zhegvx.
Array z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:
if *itype* = 1 or 2, Z^H*B*Z = I;
if *itype* = 3, Z^H*inv(*B*)*Z = I;
If *jobz* = 'N', then *z* is not referenced.
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

work(1) — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th argument had an illegal value.

If *info* > 0, cpotrf/zpotrf and cheevx/zheevx returned an error code:

If *info* = *i* ≤ *n*, cheevx/zheevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hegvx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length *n*.
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then $\varepsilon * ||T||_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

For optimum performance use *lwork* ≥ (*nb*+1)*n, where *nb* is the blocksize for chetrd/zhetrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?spgv

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage.

Syntax

FORTRAN 77:

```
call sspgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, info)
call dspgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, info)
```

Fortran 95:

```
call spgv(ap, bp, w [,itype] [,uplo] [,z] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be symmetric, stored in packed format, and *B* is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
ap, *bp*, *work*	REAL for sspgv DOUBLE PRECISION for dspgv. Arrays: *ap(*)* contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp(*)* contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*. The dimension of *bp* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, DIMENSION at least max(1, 3*n*).
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

Output Parameters

ap	On exit, the contents of *ap* are overwritten.
bp	On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.
w, *z*	REAL for sspgv DOUBLE PRECISION for dspgv. Arrays: *w*(*), DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows: if *itype* = 1 or 2, $Z^T*B*Z = I$; if *itype* = 3, $Z^T*\text{inv}(B)*Z = I$; If *jobz* = 'N', then *z* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, spptrf/dpptrf and sspev/dspev returned an error code:

If *info* = *i* ≤ *n*, sspev/dspev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spgv interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?hpgv

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with matrices in packed storage.

Syntax

FORTRAN 77:

```
call chpgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, rwork, info)
call zhpgv(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, rwork, info)
```

Fortran 95:

```
call hpgv(ap, bp, w [,itype] [,uplo] [,z] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

$A*x = \lambda*B*x$, $A*B*x = \lambda*x$, or $B*A*x = \lambda*x$.

Here A and B are assumed to be Hermitian, stored in packed format, and B is also positive definite.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ap, *bp*, *work*	COMPLEX for chpgv DOUBLE COMPLEX for zhpgv. Arrays: *ap(*)* contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp(*)* contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*. The dimension of *bp* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, DIMENSION at least max(1, 2*n*-1).
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).
rwork	REAL for chpgv DOUBLE PRECISION for zhpgv. Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

ap	On exit, the contents of *ap* are overwritten.
bp	On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.
w	REAL for chpgv DOUBLE PRECISION for zhpgv. Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
z	COMPLEX for chpgv DOUBLE COMPLEX for zhpgv. Array z(*ldz*,*).

	The second dimension of *z* must be at least max(1, *n*).
	If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
	if *itype* = 1 or 2, Z^H*B*Z = I;
	if *itype* = 3, Z^H*inv(*B*)*Z* = I;
	If *jobz* = 'N', then *z* is not referenced.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, cpptrf/zpptrf and chpev/zhpev returned an error code: If *info* = *i* ≤ *n*, chpev/zhpev failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpgv interface are the following:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
bp	Holds the array *B* of size (*n**(*n*+1)/2).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?spgvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

FORTRAN 77:

```
call sspgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, iwork, liwork, info)
call dspgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

`call spgvd(ap, bp, w [,itype] [,uplo] [,z] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$A*x = \lambda*B*x$, $A*B*x = \lambda*x$, or $B*A*x = \lambda*x$.

Here A and B are assumed to be symmetric, stored in packed format, and B is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
ap, *bp*, *work*	REAL for sspgvd DOUBLE PRECISION for dspgvd. Arrays: *ap(*)* contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp(*)* contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*. The dimension of *bp* must be at least max(1, *n**(*n*+1)/2). *work* is a workspace array, its dimension max(1, *lwork*).
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* $\geq$ 1. If *jobz* = 'V', *ldz* $\geq$ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraints: If *n* $\leq$ 1, *lwork* $\geq$ 1; If *jobz* = 'N' and *n*>1, *lwork* $\geq$ 2*n*;

If *jobz* = 'V' and *n*>1, *lwork* ≥ $2n^2+6n+1$.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER.
Workspace array, its dimension max(1, *lwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
Constraints:

If *n* ≤ 1, *liwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *liwork* ≥ 1;

If *jobz* = 'V' and *n*>1, *liwork* ≥ 5*n*+3.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ap — On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.

w, *z* — REAL for sspgv
DOUBLE PRECISION for dspgv.
Arrays:
w(*), DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^T*B*Z = I$;
if *itype* = 3, $Z^T*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then *z* is not referenced.

work(1) — On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

iwork(1) — On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.

If *info* > 0, spptrf/dpptrf and sspevd/dspevd returned an error code:

If *info* = *i* ≤ *n*, sspevd/dspevd failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spgvd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hpgvd

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with matrices in packed storage. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

FORTRAN 77:

`call chpgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

`call zhpgvd(itype, jobz, uplo, n, ap, bp, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

Fortran 95:

`call hpgvd(ap, bp, w [,itype] [,uplo] [,z] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be Hermitian, stored in packed format, and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ap, *bp*, *work*	COMPLEX for chpgvd DOUBLE COMPLEX for zhpgvd. Arrays:

ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
bp(*) contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*.
The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).
work is a workspace array, its dimension max(1, *lwork*).

ldz

INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

lwork

INTEGER.
The dimension of the array *work*.
Constraints:

If *n* ≤ 1, *lwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *lwork* ≥ *n*;

If *jobz* = 'V' and *n*>1, *lwork* ≥ 2*n*.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork

REAL for chpgvd
DOUBLE PRECISION for zhpgvd.
Workspace array, its dimension max(1, *lrwork*).

lrwork

INTEGER.
The dimension of the array *rwork*.
Constraints:

If *n* ≤ 1, *lrwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *lrwork* ≥ *n*;

If *jobz* = 'V' and *n*>1, *lrwork* ≥ $2n^2$+5*n*+1.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork

INTEGER.
Workspace array, its dimension max(1, *liwork*).

liwork

INTEGER.
The dimension of the array *iwork*.
Constraints:

If *n* ≤ 1, *liwork* ≥ 1;

If *jobz* = 'N' and *n*>1, *liwork* ≥ 1;

If *jobz* = 'V' and *n*>1, *liwork* ≥ 5*n*+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ap — On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

w — REAL for chpgvd
DOUBLE PRECISION for zhpgvd.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z — COMPLEX for chpgvd
DOUBLE COMPLEX for zhpgvd.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
if *itype* = 1 or 2, $Z^H*B*Z = I$;
if *itype* = 3, $Z^H*\mathrm{inv}(B)*Z = I$;
If *jobz* = 'N', then *z* is not referenced.

work(1) — On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1) — On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1) — On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, cpptrf/zpptrf and chpevd/zhpevd returned an error code:
If *info* = *i* ≤ *n*, chpevd/zhpevd failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;
If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpgvd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?spgvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with matrices in packed storage.

Syntax

FORTRAN 77:

call sspgvx(*itype*, *jobz*, *range*, *uplo*, *n*, *ap*, *bp*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

call dspgvx(*itype*, *jobz*, *range*, *uplo*, *n*, *ap*, *bp*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

Fortran 95:

call spgvx(*ap*, *bp*, *w* [,*itype*] [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*.

Here *A* and *B* are assumed to be symmetric, stored in packed format, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x = lambda*B*x*; if *itype* = 2, the problem type is *A*B*x = lambda*x*; if *itype* = 3, the problem type is *B*A*x = lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda(i)* in the half-open interval: *vl<lambda(i)≤ vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ap, *bp*, *work*	REAL for sspgvx DOUBLE PRECISION for dspgvx. Arrays: *ap(*)* contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp(*)* contains the packed upper or lower triangle of the symmetric matrix *B*, as specified by *uplo*. The dimension of *bp* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, DIMENSION at least max(1, 8*n*).
vl, *vu*	REAL for sspgvx DOUBLE PRECISION for dspgvx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl< vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: $1 \le il \le iu \le n$, if $n > 0$; il=1 and iu=0 if $n = 0$.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for sspgvx
DOUBLE PRECISION for dspgvx.
The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz — INTEGER. The leading dimension of the output array *z*. Constraints:

ldz ≥ 1; if *jobz* = 'V', *ldz* ≥ max(1, *n*).

iwork — INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap — On exit, the contents of *ap* are overwritten.

bp — On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^T*U$ or $B = L*L^T$, in the same storage format as *B*.

m — INTEGER. The total number of eigenvalues found,

$0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z* — REAL for sspgvx
DOUBLE PRECISION for dspgvx.
Arrays:
w(*), DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:
if *itype* = 1 or 2, Z^T*B*Z = I;
if *itype* = 3, Z^T*inv(*B*)*Z = I;
If *jobz* = 'N', then *z* is not referenced.
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).

	If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, spptrf/dpptrf and sspevx/dspevx returned an error code: If *info* = *i* ≤ *n*, sspevx/dspevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*; If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spgvx interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector with the number of elements *n*.
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used instead, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues are computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, set *abstol* to 2*?lamch('S').

?hpgvx

Computes selected eigenvalues and, optionally, eigenvectors of a generalized Hermitian definite eigenproblem with matrices in packed storage.

Syntax

FORTRAN 77:

call chpgvx(*itype*, *jobz*, *range*, *uplo*, *n*, *ap*, *bp*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

call zhpgvx(*itype*, *jobz*, *range*, *uplo*, *n*, *ap*, *bp*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

Fortran 95:

call hpgvx(*ap*, *bp*, *w* [,*itype*] [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

*A*x* = λ*B*x*, *A*B*x* = λ*x*, or *B*A*x* = λ*x*.

Here *A* and *B* are assumed to be Hermitian, stored in packed format, and *B* is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. Specifies the problem type to be solved: if *itype* = 1, the problem type is *A*x* = *lambda*B*x*; if *itype* = 2, the problem type is *A*B*x* = *lambda*x*; if *itype* = 3, the problem type is *B*A*x* = *lambda*x*.
jobz	CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then compute eigenvalues only.
If *jobz* = 'V', then compute eigenvalues and eigenvectors.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
vl< *lambda*(*i*) ≤ *vu*.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *ap* and *bp* store the upper triangles of *A* and *B*;
If *uplo* = 'L', arrays *ap* and *bp* store the lower triangles of *A* and *B*.

n — INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).

ap, *bp*, *work* — COMPLEX for chpgvx
DOUBLE COMPLEX for zhpgvx.
Arrays:
ap(*) contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*.
The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
bp(*) contains the packed upper or lower triangle of the Hermitian matrix *B*, as specified by *uplo*.
The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).
work(*) is a workspace array, DIMENSION at least max(1, 2*n*).

vl, *vu* — REAL for chpgvx
DOUBLE PRECISION for zhpgvx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for chpgvx
DOUBLE PRECISION for zhpgvx.
The absolute error tolerance for the eigenvalues.
See *Application Notes* for more information.

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

rwork — REAL for chpgvx
DOUBLE PRECISION for zhpgvx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap On exit, the contents of *ap* are overwritten.

bp On exit, contains the triangular factor *U* or *L* from the Cholesky factorization $B = U^H*U$ or $B = L*L^H$, in the same storage format as *B*.

m INTEGER. The total number of eigenvalues found,

$0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w REAL for chpgvx
DOUBLE PRECISION for zhpgvx.
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z COMPLEX for chpgvx
DOUBLE COMPLEX for zhpgvx.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized as follows:
if *itype* = 1 or 2, Z^H*B*Z = I;
if *itype* = 3, Z^H*inv(*B*)*Z = I;
If *jobz* = 'N', then *z* is not referenced.
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, cpptrf/zpptrf and chpevx/zhpevx returned an error code:

If *info* = *i* ≤ *n*, chpevx/zhpevx failed to converge, and *i* eigenvectors failed to converge. Their indices are stored in the array *ifail*;

If *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then the leading minor of order *i* of *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpgvx interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector with the number of elements *n*.
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?sbgv

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices.

Syntax

FORTRAN 77:

```
call ssbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, info)
call dsbgv(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, info)
```

Fortran 95:

```
call sbgv(ab, bb, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here A and B are assumed to be symmetric and banded, and B is also positive definite.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of A and B; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of A and B.
n	INTEGER. The order of the matrices A and B ($n \geq 0$).
ka	INTEGER. The number of super- or sub-diagonals in A ($ka \geq 0$).
kb	INTEGER. The number of super- or sub-diagonals in B ($kb \geq 0$).
ab, *bb*, *work*	REAL for ssbgv DOUBLE PRECISION for dsbgv Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix A (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb*(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix B (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, dimension at least max(1, 3*n*)

ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

Output Parameters

ab	On exit, the contents of *ab* are overwritten.
bb	On exit, contains the factor *S* from the split Cholesky factorization *B* = S^T*S, as returned by spbstf/dpbstf.
w, *z*	REAL for ssbgv DOUBLE PRECISION for dsbgv Arrays: *w*(*), DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that Z^T*B*Z = I. If *jobz* = 'N', then *z* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, and if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then spbstf/dpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbgv interface are the following:

ab	Holds the array *A* of size (*ka+1*, *n*).
bb	Holds the array *B* of size (*kb+1*, *n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present,

jobz = 'N', if *z* is omitted.

?hbgv

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with banded matrices.

Syntax

FORTRAN 77:

call chbgv(*jobz*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *w*, *z*, *ldz*, *work*, *rwork*, *info*)

call zhbgv(*jobz*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *w*, *z*, *ldz*, *work*, *rwork*, *info*)

Fortran 95:

call hbgv(*ab*, *bb*, *w* [,*uplo*] [,*z*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here A and B are Hermitian and banded matrices, and matrix B is also positive definite.

Input Parameters

jobz
CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then compute eigenvalues only.
If *jobz* = 'V', then compute eigenvalues and eigenvectors.

uplo
CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of A and B;
If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of A and B.

n
INTEGER. The order of the matrices A and B ($n \geq 0$).

ka
INTEGER. The number of super- or sub-diagonals in A ($ka \geq 0$).

kb
INTEGER. The number of super- or sub-diagonals in B ($kb \geq 0$).

ab, *bb*, *work*
COMPLEX for chbgv
DOUBLE COMPLEX for zhbgv
Arrays:
ab (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix A (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*).
bb(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix B (as specified by *uplo*) in band storage format.

	The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, DIMENSION at least max(1, *n*).
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).
rwork	REAL for chbgv DOUBLE PRECISION for zhbgv. Workspace array, DIMENSION at least max(1, 3*n*).

Output Parameters

ab	On exit, the contents of *ab* are overwritten.
bb	On exit, contains the factor *S* from the split Cholesky factorization *B* = S^H**S*, as returned by cpbstf/zpbstf.
w	REAL for chbgv DOUBLE PRECISION for zhbgv. Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order.
z	COMPLEX for chbgv DOUBLE COMPLEX for zhbgv Array z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that Z^H**B***Z* = I. If *jobz* = 'N', then *z* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, and if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then cpbstf/zpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbgv interface are the following:

ab	Holds the array *A* of size (*ka*+1, *n*).

bb	Holds the array *B* of size (*kb*+1, *n*).

jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?sbgvd

Computes all eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

FORTRAN 77:

```
call ssbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, iwork, liwork, info)
call dsbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call sbgvd(ab, bb, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here *A* and *B* are assumed to be symmetric and banded, and *B* is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
ka	INTEGER. The number of super- or sub-diagonals in *A*

	(*ka* ≥ 0).
kb	INTEGER. The number of super- or sub-diagonals in *B* (*kb* ≥ 0).
ab, *bb*, *work*	REAL for ssbgvd DOUBLE PRECISION for dsbgvd Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb*(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraints: If *n* ≤ 1, *lwork* ≥ 1; If *jobz* = 'N' and *n*>1, *lwork* ≥ 3*n*; If *jobz* = 'V' and *n*>1, *lwork* ≥ $2n^2$+5*n*+1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.
iwork	INTEGER. Workspace array, its dimension max(1, *liwork*).
liwork	INTEGER. The dimension of the array *iwork*. Constraints: If *n* ≤ 1, *liwork* ≥ 1; If *jobz* = 'N' and *n*>1, *liwork* ≥ 1; If *jobz* = 'V' and *n*>1, *liwork* ≥ 5*n*+3. If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ab	On exit, the contents of *ab* are overwritten.
bb	On exit, contains the factor *S* from the split Cholesky factorization *B* = S^T*S, as returned by spbstf/dpbstf.
w, *z*	REAL for ssbgvd DOUBLE PRECISION for dsbgvd Arrays: *w*(*), DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that Z^T*B*Z = I. If *jobz* = 'N', then *z* is not referenced.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0, and if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero; if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then spbstf/dpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbgvd interface are the following:

ab	Holds the array *A* of size (*ka*+1, *n*).
bb	Holds the array *B* of size (*kb*+1, *n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hbgvd

Computes all eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with banded matrices. If eigenvectors are desired, it uses a divide and conquer method.

Syntax

FORTRAN 77:

```
call chbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call zhbgvd(jobz, uplo, n, ka, kb, ab, ldab, bb, ldbb, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hbgvd(ab, bb, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here A and B are assumed to be Hermitian and banded, and B is also positive definite.

If eigenvectors are desired, it uses a divide and conquer algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
uplo	CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*;
If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.

n
INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

ka
INTEGER. The number of super- or sub-diagonals in *A* ($ka \geq 0$).

kb
INTEGER. The number of super- or sub-diagonals in *B* ($kb \geq 0$).

ab, *bb*, *work*
COMPLEX for chbgvd
DOUBLE COMPLEX for zhbgvd
Arrays:
ab (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*).
bb(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

ldab
INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.

ldbb
INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.

ldz
INTEGER. The leading dimension of the output array *z*; $ldz \geq 1$. If *jobz* = 'V', $ldz \geq \max(1, n)$.

lwork
INTEGER.
The dimension of the array *work*.
Constraints:
If $n \leq 1$, $lwork \geq 1$;
If *jobz* = 'N' and $n>1$, $lwork \geq n$;
If *jobz* = 'V' and $n>1$, $lwork \geq 2n^2$.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork
REAL for chbgvd
DOUBLE PRECISION for zhbgvd.
Workspace array, DIMENSION max(1, *lrwork*).

lrwork
INTEGER.
The dimension of the array *rwork*.
Constraints:
If $n \leq 1$, $lrwork \geq 1$;
If *jobz* = 'N' and $n>1$, $lrwork \geq n$;
If *jobz* = 'V' and $n>1$, $lrwork \geq 2n^2+5n+1$.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER.
Workspace array, DIMENSION max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*.
Constraints:

If $n \leq 1$, *lwork* ≥ 1;

If *jobz* = 'N' and $n>1$, *liwork* ≥ 1;

If *jobz* = 'V' and $n>1$, *liwork* $\geq 5n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

ab On exit, the contents of *ab* are overwritten.

bb On exit, contains the factor *S* from the split Cholesky factorization $B = S^H*S$, as returned by cpbstf/zpbstf.

w REAL for chbgvd
DOUBLE PRECISION for zhbgvd.
Array, DIMENSION at least max(1, *n*) .
If *info* = 0, contains the eigenvalues in ascending order.

z COMPLEX for chbgvd
DOUBLE COMPLEX for zhbgvd
Array z(*ldz*,*) .
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors , with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^H*B*Z = I$.
If *jobz* = 'N', then *z* is not referenced.

work(1) On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork(1) On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1) On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.

info INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, and

if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then cpbstf/zpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbgvd interface are the following:

ab	Holds the array *A* of size (*ka+1*, *n*).
bb	Holds the array *B* of size (*kb+1*, *n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sbgvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem with banded matrices.

Syntax

FORTRAN 77:

call ssbgvx(*jobz*, *range*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

call dsbgvx(*jobz*, *range*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

Fortran 95:

call sbgvx(*ab*, *bb*, *w* [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*q*] [,*abstol*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes selected eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here A and B are assumed to be symmetric and banded, and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either all eigenvalues, a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \le vu$. If *range* = 'I', the routine computes eigenvalues in range *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of A and B; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of A and B.
n	INTEGER. The order of the matrices A and B ($n \ge 0$).
ka	INTEGER. The number of super- or sub-diagonals in A ($ka \ge 0$).
kb	INTEGER. The number of super- or sub-diagonals in B ($kb \ge 0$).

ab, *bb*, *work*
REAL for ssbgvx
DOUBLE PRECISION for dsbgvx
Arrays:
ab (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*).
bb(*ldbb*,*) is an array containing either upper or lower triangular part of the symmetric matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*).
work(*) is a workspace array, DIMENSION (7**n*).

ldab
INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.

ldbb
INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.

vl, *vu*
REAL for ssbgvx
DOUBLE PRECISION for dsbgvx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for ssbgvx
DOUBLE PRECISION for dsbgvx.
The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz
INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

ldq
INTEGER. The leading dimension of the output array *q*; *ldq* < 1.
If *jobz* = 'V', *ldq* < max(1, *n*).

iwork
INTEGER.
Workspace array, DIMENSION (5**n*).

Output Parameters

ab
On exit, the contents of *ab* are overwritten.

bb
On exit, contains the factor *S* from the split Cholesky factorization *B* = S^T**S*, as returned by spbstf/dpbstf.

m
INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z*, *q*
REAL for ssbgvx

DOUBLE PRECISION for dsbgvx
Arrays:
w(*), DIMENSION at least max(1, *n*) .
If *info* = 0, contains the eigenvalues in ascending order.
z(*ldz*,*) .
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors , with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^T*B*Z = I$.
If *jobz* = 'N', then *z* is not referenced.
q(*ldq*,*) .
The second dimension of *q* must be at least max(1, *n*).
If *jobz* = 'V', then *q* contains the *n*-by-*n* matrix used in the reduction of *A*x* = *lambda*B*x* to standard form, that is, *C*x*= *lambda*x* and consequently *C* to tridiagonal form.
If *jobz* = 'N', then *q* is not referenced.

ifail — INTEGER.
Array, DIMENSION (*m*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, and

if *i* ≤ *n*, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for 1 ≤ *i* ≤ *n*, then spbstf/dpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbgvx interface are the following:

ab — Holds the array *A* of size (*ka+1*, *n*).

bb — Holds the array *B* of size (*kb+1*, *n*).

w — Holds the vector with the number of elements *n*.

z — Holds the matrix *Z* of size (*n*, *n*).

ifail — Holds the vector with the number of elements *n*.

q — Holds the matrix *Q* of size (*n*, *n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted. Note that there will be an error condition if *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hbgvx

Computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem with banded matrices.

Syntax

FORTRAN 77:

call chbgvx(*jobz*, *range*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

call zhbgvx(*jobz*, *range*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *q*, *ldq*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

Fortran 95:

call hbgvx(*ab*, *bb*, *w* [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*q*] [,*abstol*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes selected eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite banded eigenproblem, of the form $A*x = \lambda*B*x$. Here A and B are assumed to be Hermitian and banded, and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either all eigenvalues, a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then compute eigenvalues only. If *jobz* = 'V', then compute eigenvalues and eigenvectors.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \le vu$. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', arrays *ab* and *bb* store the upper triangles of *A* and *B*; If *uplo* = 'L', arrays *ab* and *bb* store the lower triangles of *A* and *B*.
n	INTEGER. The order of the matrices *A* and *B* ($n \ge 0$).
ka	INTEGER. The number of super- or sub-diagonals in *A* ($ka \ge 0$).
kb	INTEGER. The number of super- or sub-diagonals in *B* ($kb \ge 0$).
ab, *bb*, *work*	COMPLEX for chbgvx DOUBLE COMPLEX for zhbgvx Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb*(*ldbb*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, DIMENSION at least max(1, *n*).
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
vl, *vu*	REAL for chbgvx DOUBLE PRECISION for zhbgvx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for chbgvx
DOUBLE PRECISION for zhbgvx.
The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', *ldz* ≥ max(1, *n*).

ldq — INTEGER. The leading dimension of the output array *q*; *ldq* ≥ 1. If *jobz* = 'V', *ldq* ≥ max(1, *n*).

rwork — REAL for chbgvx
DOUBLE PRECISION for zhbgvx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork — INTEGER.
Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ab — On exit, the contents of *ab* are overwritten.

bb — On exit, contains the factor *S* from the split Cholesky factorization $B = S^H*S$, as returned by cpbstf/zpbstf.

m — INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w — REAL for chbgvx
DOUBLE PRECISION for zhbgvx.
Array *w*(*), DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z, *q* — COMPLEX for chbgvx
DOUBLE COMPLEX for zhbgvx
Arrays:
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the matrix *Z* of eigenvectors, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). The eigenvectors are normalized so that $Z^H*B*Z = I$.

If *jobz* = 'N', then *z* is not referenced.
q(*ldq*,*).
The second dimension of *q* must be at least max(1, *n*).
If *jobz* = 'V', then *q* contains the *n*-by-*n* matrix used in the reduction of $Ax = \lambda Bx$ to standard form, that is, $Cx = \lambda x$ and consequently *C* to tridiagonal form.
If *jobz* = 'N', then *q* is not referenced.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th argument had an illegal value.
If *info* > 0, and

if $i \le n$, the algorithm failed to converge, and *i* off-diagonal elements of an intermediate tridiagonal did not converge to zero;

if *info* = *n* + *i*, for $1 \le i \le n$, then cpbstf/zpbstf returned *info* = *i* and *B* is not positive-definite. The factorization of *B* could not be completed and no eigenvalues or eigenvectors were computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbgvx interface are the following:

ab — Holds the array *A* of size (*ka*+1, *n*).

bb — Holds the array *B* of size (*kb*+1, *n*).

w — Holds the vector with the number of elements *n*.

z — Holds the matrix *Z* of size (*n*, *n*).

ifail — Holds the vector with the number of elements *n*.

q — Holds the matrix *Q* of size (*n*, *n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

vl — Default value for this element is *vl* = -HUGE(*vl*).

vu — Default value for this element is *vu* = HUGE(*vl*).

il — Default value for this argument is *il* = 1.

iu — Default value for this argument is *iu* = *n*.

abstol — Default value for this element is *abstol* = 0.0_WP.

jobz — Restored based on the presence of the argument *z* as follows:
jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted.

Note that there will be an error condition if *ifail* or *q* is present and *z* is omitted.

range Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:
range = 'V', if one of or both *vl* and *vu* are present,
range = 'I', if one of or both *il* and *iu* are present,
range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,
Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

Generalized Nonsymmetric Eigenproblems

This section describes LAPACK driver routines used for solving generalized nonsymmetric eigenproblems. See also computational routines computational routines that can be called to solve these problems. Table 4-14 lists all such driver routines for FORTRAN 77 interface. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-14 Driver Routines for Solving Generalized Nonsymmetric Eigenproblems

Routine Name	Operation performed
?gges	Computes the generalized eigenvalues, Schur form, and the left and/or right Schur vectors for a pair of nonsymmetric matrices.
?ggesx	Computes the generalized eigenvalues, Schur form, and, optionally, the left and/or right matrices of Schur vectors.
?ggev	Computes the generalized eigenvalues, and the left and/or right generalized eigenvectors for a pair of nonsymmetric matrices.
?ggevx	Computes the generalized eigenvalues, and, optionally, the left and/or right generalized eigenvectors.

?gges

Computes the generalized eigenvalues, Schur form, and the left and/or right Schur vectors for a pair of nonsymmetric matrices.

Syntax

FORTRAN 77:

`call sgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info)`

`call dgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alphar, alphai, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, bwork, info)`

`call cgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info)`

`call zgges(jobvsl, jobvsr, sort, selctg, n, a, lda, b, ldb, sdim, alpha, beta, vsl, ldvsl, vsr, ldvsr, work, lwork, rwork, bwork, info)`

Fortran 95:

`call gges(a, b, alphar, alphai, beta [,vsl] [,vsr] [,select] [,sdim] [,info])`

`call gges(a, b, alpha, beta [, vsl] [,vsr] [,select] [,sdim] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*), the generalized eigenvalues, the generalized real/complex Schur form (*S*,*T*), optionally, the left and/or right matrices of Schur vectors (*vsl* and *vsr*). This gives the generalized Schur factorization

$(A,B) = (vsl*S*vsr^H, vsl*T*vsr^H)$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix *S* and the upper triangular matrix *T*. The leading columns of *vsl* and *vsr* then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

(If only the generalized eigenvalues are needed, use the driver ?ggev instead, which is faster.)

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar *w* or a ratio *alpha* / *beta* = *w*, such that *A* - *w***B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 or for both being zero. A pair of matrices (*S*,*T*) is in generalized real Schur form if *T* is upper triangular with non-negative diagonal and *S* is block upper triangular with 1-by-1 and 2-by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2-by-2 blocks of *S* will be "standardized" by making the corresponding elements of *T* have the form:

$$\begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}$$

and the pair of corresponding 2-by-2 blocks in *S* and *T* will have a complex conjugate pair of generalized eigenvalues. A pair of matrices (*S*,*T*) is in generalized complex Schur form if *S* and *T* are upper triangular and, in addition, the diagonal of *T* are non-negative real numbers.

Input Parameters

jobvsl	CHARACTER*1. Must be 'N' or 'V'. If *jobvsl* = 'N', then the left Schur vectors are not computed. If *jobvsl* = 'V', then the left Schur vectors are computed.
jobvsr	CHARACTER*1. Must be 'N' or 'V'. If *jobvsr* = 'N', then the right Schur vectors are not computed. If *jobvsr* = 'V', then the right Schur vectors are computed.
sort	CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form. If *sort* = 'N', then eigenvalues are not ordered. If *sort* = 'S', eigenvalues are ordered (see *selctg*).
selctg	LOGICAL FUNCTION of three REAL arguments for real flavors. LOGICAL FUNCTION of two COMPLEX arguments for complex flavors. *selctg* must be declared EXTERNAL in the calling subroutine. If *sort* = 'S', *selctg* is used to select eigenvalues to sort to the top left of the Schur form. If *sort* = 'N', *selctg* is not referenced. *For real flavors*: An eigenvalue (*alphar*(j) + *alphai*(j))/*beta*(j) is selected if *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected. Note that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) = .TRUE. after ordering. In this case *info* is set to *n*+2 . *For complex flavors*: An eigenvalue *alpha*(j) / *beta*(j) is selected if *selctg*(*alpha*(j), *beta*(j)) is true. Note that a selected complex eigenvalue may no longer satisfy *selctg*(*alpha*(j), *beta*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* is set to *n*+2 (see *info* below).
n	INTEGER. The order of the matrices *A*, *B*, *vsl*, and *vsr* (*n* ≥ 0).
a, *b*, *work*	REAL for sgges DOUBLE PRECISION for dgges COMPLEX for cgges DOUBLE COMPLEX for zgges. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).

	The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices). The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldb	INTEGER. The first dimension of the array *b*. Must be at least max(1, *n*).
ldvsl, *ldvsr*	INTEGER. The first dimensions of the output matrices *vsl* and *vsr*, respectively. Constraints: *ldvsl* ≥ 1. If *jobvsl* = 'V', *ldvsl* ≥ max(1, *n*). *ldvsr* ≥ 1. If *jobvsr* = 'V', *ldvsr* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ max(1, 8*n*+16) for real flavors; *lwork* ≥ max(1, 2*n*) for complex flavors. For good performance, *lwork* must generally be larger. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
rwork	REAL for cgges DOUBLE PRECISION for zgges Workspace array, DIMENSION at least max(1, 8*n*). This array is used in complex flavors only.
bwork	LOGICAL. Workspace array, DIMENSION at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a	On exit, this array has been overwritten by its generalized Schur form *S*.
b	On exit, this array has been overwritten by its generalized Schur form *T*.
sdim	INTEGER. If *sort* = 'N', *sdim*= 0. If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *selctg* is true. Note that for real flavors complex conjugate pairs for which *selctg* is true for either eigenvalue count as 2.
alphar, *alphai*	REAL for sgges; DOUBLE PRECISION for dgges.

Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha
COMPLEX for cgges;
DOUBLE COMPLEX for zgges.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta
REAL for sgges
DOUBLE PRECISION for dgges
COMPLEX for cgges
DOUBLE COMPLEX for zgges.
Array, DIMENSION at least max(1, *n*).
For real flavors:
On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.
alphar(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.
For complex flavors:
On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.
alpha(j), j=1,...,*n*, and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) output by cgges/zgges. The *beta*(j) will be non-negative real.
See also *Application Notes* below.

vsl, *vsr*
REAL for sgges
DOUBLE PRECISION for dgges
COMPLEX for cgges
DOUBLE COMPLEX for zgges.
Arrays:
vsl(*ldvsl*,*), the second dimension of *vsl* must be at least max(1, *n*).
If *jobvsl* = 'V', this array will contain the left Schur vectors.
If *jobvsl* = 'N', *vsl* is not referenced.
vsr(*ldvsr*,*), the second dimension of *vsr* must be at least max(1, *n*).
If *jobvsr* = 'V', this array will contain the right Schur vectors.
If *jobvsr* = 'N', *vsr* is not referenced.

work(1)
On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.

If *info* = *i*, and

i ≤ *n*:
the *QZ* iteration failed. (*A*, *B*) is not in Schur form, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1, ..., *n* should be correct.
i > *n*: errors that usually indicate LAPACK problems:
i = *n*+1: other than *QZ* iteration failed in ?hgeqz;
i = *n*+2: after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy *selctg* = .TRUE.. This could also be caused due to scaling;
i = *n*+3: reordering failed in ?tgsen.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gges interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
alphar	Holds the vector of length *n*. Used in real flavors only.
alphai	Holds the vector of length *n*. Used in real flavors only.
alpha	Holds the vector of length *n*. Used in complex flavors only.
beta	Holds the vector of length *n*.
vsl	Holds the matrix *VSL* of size (*n*, *n*).
vsr	Holds the matrix *VSR* of size (*n*, *n*).
jobvsl	Restored based on the presence of the argument *vsl* as follows: *jobvsl* = 'V', if *vsl* is present, *jobvsl* = 'N', if *vsl* is omitted.
jobvsr	Restored based on the presence of the argument *vsr* as follows: *jobvsr* = 'V', if *vsr* is present, *jobvsr* = 'N', if *vsr* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggesx

Computes the generalized eigenvalues, Schur form, and, optionally, the left and/or right matrices of Schur vectors.

Syntax

FORTRAN 77:

```
call sggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alphar, alphai,
beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)
```

```
call dggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alphar, alphai,
beta, vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)
```

```
call cggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alpha, beta,
vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, rwork, iwork, liwork, bwork, info)
```

```
call zggesx (jobvsl, jobvsr, sort, selctg, sense, n, a, lda, b, ldb, sdim, alpha, beta,
vsl, ldvsl, vsr, ldvsr, rconde, rcondv, work, lwork, rwork, iwork, liwork, bwork, info)
```

Fortran 95:

```
call ggesx(a, b, alphar, alphai, beta [,vsl] [,vsr] [,select] [,sdim] [,rconde] [, rcondv]
[,info])
```

```
call ggesx(a, b, alpha, beta [, vsl] [,vsr] [,select] [,sdim] [,rconde] [,rcondv] [, info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*), the generalized eigenvalues, the generalized real/complex Schur form (*S*,*T*), optionally, the left and/or right matrices of Schur vectors (*vsl* and *vsr*). This gives the generalized Schur factorization

$(A,B) = (vsl*S*vsr^H, vsl*T*vsr^H)$

Optionally, it also orders the eigenvalues so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the upper quasi-triangular matrix *S* and the upper triangular matrix *T*; computes a reciprocal condition number for the average of the selected eigenvalues (*rconde*); and computes a reciprocal condition number for

the right and left deflating subspaces corresponding to the selected eigenvalues (*rcondv*). The leading columns of *vsl* and *vsr* then form an orthonormal/unitary basis for the corresponding left and right eigenspaces (deflating subspaces).

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar *w* or a ratio *alpha / beta = w*, such that *A - w*B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 or for both being zero. A pair of matrices (*S*,*T*) is in generalized real Schur form if *T* is upper triangular with non-negative diagonal and *S* is block upper triangular with 1-by-1 and 2-by-2 blocks. 1-by-1 blocks correspond to real generalized eigenvalues, while 2-by-2 blocks of *S* will be "standardized" by making the corresponding elements of *T* have the form:

$$\begin{pmatrix} a & 0 \\ 0 & b \end{pmatrix}$$

and the pair of corresponding 2-by-2 blocks in *S* and *T* will have a complex conjugate pair of generalized eigenvalues. A pair of matrices (*S*,*T*) is in generalized complex Schur form if *S* and *T* are upper triangular and, in addition, the diagonal of *T* are non-negative real numbers.

Input Parameters

jobvsl
CHARACTER*1. Must be 'N' or 'V'.
If *jobvsl* = 'N', then the left Schur vectors are not computed.
If *jobvsl* = 'V', then the left Schur vectors are computed.

jobvsr
CHARACTER*1. Must be 'N' or 'V'.
If *jobvsr* = 'N', then the right Schur vectors are not computed.
If *jobvsr* = 'V', then the right Schur vectors are computed.

sort
CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.
If *sort* = 'N', then eigenvalues are not ordered.
If *sort* = 'S', eigenvalues are ordered (see *selctg*).

selctg
LOGICAL FUNCTION of three REAL arguments for real flavors.
LOGICAL FUNCTION of two COMPLEX arguments for complex flavors.
selctg must be declared EXTERNAL in the calling subroutine.
If *sort* = 'S', *selctg* is used to select eigenvalues to sort to the top left of the Schur form.
If *sort* = 'N', *selctg* is not referenced.
For real flavors:
An eigenvalue (*alphar*(j) + *alphai*(j))/*beta*(j) is selected if *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.
Note that in the ill-conditioned case, a selected complex eigenvalue may no longer satisfy *selctg*(*alphar*(j), *alphai*(j), *beta*(j)) = .TRUE. after ordering. In this case *info* is set to *n*+2.
For complex flavors:

An eigenvalue *alpha*(j) / *beta*(j) is selected if *selctg*(*alpha*(j), *beta*(j)) is true.
Note that a selected complex eigenvalue may no longer satisfy *selctg*(*alpha*(j), *beta*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* is set to *n*+2 (see *info* below).

sense — CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.
If *sense* = 'N', none are computed;
If *sense* = 'E', computed for average of selected eigenvalues only;
If *sense* = 'V', computed for selected deflating subspaces only;
If *sense* = 'B', computed for both.
If *sense* is 'E', 'V', or 'B', then *sort* must equal 'S'.

n — INTEGER. The order of the matrices *A*, *B*, *vsl*, and *vsr* (*n* ≥ 0).

a, *b*, *work* — REAL for sggesx
DOUBLE PRECISION for dggesx
COMPLEX for cggesx
DOUBLE COMPLEX for zggesx.
Arrays:
a(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices).
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices).
The second dimension of *b* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of the array *a*.
Must be at least max(1, *n*).

ldb — INTEGER. The first dimension of the array *b*.
Must be at least max(1, *n*).

ldvsl, *ldvsr* — INTEGER. The first dimensions of the output matrices *vsl* and *vsr*, respectively. Constraints:

ldvsl ≥ 1. If *jobvsl* = 'V', *ldvsl* ≥ max(1, *n*).

ldvsr ≥ 1. If *jobvsr* = 'V', *ldvsr* ≥ max(1, *n*).

lwork — INTEGER.
The dimension of the array *work*.
For real flavors:

If *n*=0 then *lwork*≥1.

If *n*>0 and *sense* = 'N', then *lwork* ≥ max(8*n, 6*n+16).

If *n*>0 and *sense* = 'E', 'V', or 'B', then *lwork* ≥ max(8*n, 6*n+16, 2*sdim*(n-sdim));
For complex flavors:

If n=0 then *lwork*≥1.

If n>0 and *sense* = 'N', then *lwork* ≥ max(1, 2*n);

If n>0 and *sense* = 'E', 'V', or 'B', then *lwork* ≥ max(1, 2*n, 2**sdim***(n-*sdim*)).

Note that 2**sdim***(n-*sdim*) ≤ n*n/2.

An error is only returned if *lwork* < max(8*n, 6*n+16)for real flavors, and *lwork* < max(1, 2*n) for complex flavors, but if *sense* = 'E', 'V', or 'B', this may not be large enough.

If *lwork*=-1, then a workspace query is assumed; the routine only calculates the bound on the optimal size of the *work* array and the minimum size of the *iwork* array, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla.

rwork

REAL for cggesx

DOUBLE PRECISION for zggesx

Workspace array, DIMENSION at least max(1, 8n).

This array is used in complex flavors only.

iwork

INTEGER.

Workspace array, DIMENSION max(1, *liwork*).

liwork

INTEGER.

The dimension of the array *iwork*.

If *sense* = 'N', or n=0, then *liwork*≥1,

otherwise *liwork* ≥ (n+6) for real flavors, and *liwork* ≥ (n+2) for complex flavors.

If *liwork*=-1, then a workspace query is assumed; the routine only calculates the bound on the optimal size of the *work* array and the minimum size of the *iwork* array, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla.

bwork

LOGICAL.

Workspace array, DIMENSION at least max(1, n).

Not referenced if *sort* = 'N'.

Output Parameters

a

On exit, this array has been overwritten by its generalized Schur form *S*.

b

On exit, this array has been overwritten by its generalized Schur form *T*.

sdim

INTEGER.

If *sort* = 'N', *sdim*= 0.

If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *selctg* is true.

Note that for real flavors complex conjugate pairs for which *selctg* is true for either eigenvalue count as 2.

alphar, *alphai*
REAL for sggesx;
DOUBLE PRECISION for dggesx.
Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha
COMPLEX for cggesx;
DOUBLE COMPLEX for zggesx.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta
REAL for sggesx
DOUBLE PRECISION for dggesx
COMPLEX for cggesx
DOUBLE COMPLEX for zggesx.
Array, DIMENSION at least max(1, *n*).
For real flavors:
On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n* will be the generalized eigenvalues.
alphar(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.
For complex flavors:
On exit, *alpha*(j)/*beta*(j), j=1,..., *n* will be the generalized eigenvalues.
alpha(j), j=1,..., *n*, and *beta*(j), j=1,...,*n* are the diagonals of the complex Schur form (*S*,*T*) output by cggesx/zggesx. The *beta*(j) will be non-negative real.
See also *Application Notes* below.

vsl, *vsr*
REAL for sggesx
DOUBLE PRECISION for dggesx
COMPLEX for cggesx
DOUBLE COMPLEX for zggesx.
Arrays:
vsl(*ldvsl*,*), the second dimension of *vsl* must be at least max(1, *n*).
If *jobvsl* = 'V', this array will contain the left Schur vectors.
If *jobvsl* = 'N', *vsl* is not referenced.
vsr(*ldvsr*,*), the second dimension of *vsr* must be at least max(1, *n*).
If *jobvsr* = 'V', this array will contain the right Schur vectors.
If *jobvsr* = 'N', *vsr* is not referenced.

rconde, *rcondv*
REAL for single precision flavors

	DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION (2) each If *sense* = 'E' or 'B', *rconde*(1) and *rconde*(2) contain the reciprocal condition numbers for the average of the selected eigenvalues. Not referenced if *sense* = 'N' or 'V'. If *sense* = 'V' or 'B', *rcondv*(1) and *rcondv*(2) contain the reciprocal condition numbers for the selected deflating subspaces. Not referenced if *sense* = 'N' or 'E'.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*: the *QZ* iteration failed. (*A*, *B*) is not in Schur form, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1, ..., *n* should be correct. *i* > *n*: errors that usually indicate LAPACK problems: *i* = *n*+1: other than *QZ* iteration failed in ?hgeqz; *i* = *n*+2: after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy *selctg* = .TRUE.. This could also be caused due to scaling; *i* = *n*+3: reordering failed in ?tgsen.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggesx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
alphar	Holds the vector of length *n*. Used in real flavors only.
alphai	Holds the vector of length *n*. Used in real flavors only.
alpha	Holds the vector of length *n*. Used in complex flavors only.
beta	Holds the vector of length *n*.
vsl	Holds the matrix *VSL* of size (*n*, *n*).
vsr	Holds the matrix *VSR* of size (*n*, *n*).
rconde	Holds the vector of length (2).
rcondv	Holds the vector of length (2).
jobvsl	Restored based on the presence of the argument *vsl* as follows:

	jobvsl = 'V', if *vsl* is present, *jobvsl* = 'N', if *vsl* is omitted.
jobvsr	Restored based on the presence of the argument *vsr* as follows: *jobvsr* = 'V', if *vsr* is present, *jobvsr* = 'N', if *vsr* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.
sense	Restored based on the presence of arguments *rconde* and rcondv as follows: *sense* = 'B', if both *rconde* and *rcondv* are present, *sense* = 'E', if *rconde* is present and *rcondv* omitted, *sense* = 'V', if *rconde* is omitted and *rcondv* present, *sense* = 'N', if both *rconde* and *rcondv* are omitted.

Note that there will be an error condition if *rconde* or *rcondv* are present and *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggev

Computes the generalized eigenvalues, and the left and/or right generalized eigenvectors for a pair of nonsymmetric matrices.

Syntax

FORTRAN 77:

```
call sggev(jobvl, jobvr, n, a, lda, b, ldb, alphar, alphai, beta, vl, ldvl, vr, ldvr,
work, lwork, info)
```

```
call dggev(jobvl, jobvr, n, a, lda, b, ldb, alphar, alphai, beta, vl, ldvl, vr, ldvr,
work, lwork, info)
```

call cggev(*jobvl*, *jobvr*, *n*, *a*, *lda*, *b*, *ldb*, *alpha*, *beta*, *vl*, *ldvl*, *vr*, *ldvr*, *work*, *lwork*, *rwork*, *info*)

call zggev(*jobvl*, *jobvr*, *n*, *a*, *lda*, *b*, *ldb*, *alpha*, *beta*, *vl*, *ldvl*, *vr*, *ldvr*, *work*, *lwork*, *rwork*, *info*)

Fortran 95:

call ggev(*a*, *b*, *alphar*, *alphai*, *beta* [,*vl*] [,*vr*] [,*info*])

call ggev(*a*, *b*, *alpha*, *beta* [, *vl*] [,*vr*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar λ or a ratio *alpha* / *beta* = λ, such that *A* - λ*B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta* =0 and even for both being zero.

The right generalized eigenvector *v*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

*A*v*(j) = λ(j)*B*v*(j).

The left generalized eigenvector *u*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

$u(j)^H * A = \lambda(j) * u(j)^H * B$

where $u(j)^H$ denotes the conjugate transpose of *u*(j).

Input Parameters

jobvl	CHARACTER*1. Must be 'N' or 'V'. If *jobvl* = 'N', the left generalized eigenvectors are not computed; If *jobvl* = 'V', the left generalized eigenvectors are computed.
jobvr	CHARACTER*1. Must be 'N' or 'V'. If *jobvr* = 'N', the right generalized eigenvectors are not computed; If *jobvr* = 'V', the right generalized eigenvectors are computed.
n	INTEGER. The order of the matrices *A*, *B*, *vl*, and *vr* (*n* ≥ 0).
a, *b*, *work*	REAL for sggev DOUBLE PRECISION for dggev COMPLEX for cggev DOUBLE COMPLEX for zggev. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices). The second dimension of *a* must be at least max(1, *n*).

	b(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices). The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldb	INTEGER. The first dimension of the array *b*. Must be at least max(1, *n*).
ldvl, *ldvr*	INTEGER. The first dimensions of the output matrices *vl* and *vr*, respectively. Constraints: *ldvl* ≥ 1. If *jobvl* = 'V', *ldvl* ≥ max(1, *n*). *ldvr* ≥ 1. If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ max(1, 8*n*+16) for real flavors; *lwork* ≥ max(1, 2*n*) for complex flavors. For good performance, *lwork* must generally be larger. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
rwork	REAL for cggev DOUBLE PRECISION for zggev Workspace array, DIMENSION at least max(1, 8*n*). This array is used in complex flavors only.

Output Parameters

a, *b*	On exit, these arrays have been overwritten.
alphar, *alphai*	REAL for sggev; DOUBLE PRECISION for dggev. Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors. See *beta*.
alpha	COMPLEX for cggev; DOUBLE COMPLEX for zggev. Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.
beta	REAL for sggev DOUBLE PRECISION for dggev COMPLEX for cggev DOUBLE COMPLEX for zggev. Array, DIMENSION at least max(1, *n*). *For real flavors*:

	On exit, (*alphar*(j)+ *alphai*(j)*i)/*beta*(j), j=1,..., *n*, are the generalized eigenvalues. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative. *For complex flavors:* On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, are the generalized eigenvalues. See also *Application Notes* below.
vl, *vr*	REAL for sggev DOUBLE PRECISION for dggev COMPLEX for cggev DOUBLE COMPLEX for zggev. Arrays: *vl*(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*). If *jobvl* = 'V', the left generalized eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues. Each eigenvector is scaled so the largest component has abs(Re) + abs(Im) = 1. If *jobvl* = 'N', *vl* is not referenced. *For real flavors*: If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*. If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i**vl*(:,j+1) and *u*(j+1) = *vl*(:,j) - *i**vl*(:,j+1), where *i* = sqrt(-1). *For complex flavors*: *u*(j) = *vl*(:,j), the j-th column of *vl*. *vr*(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*). If *jobvr* = 'V', the right generalized eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues. Each eigenvector is scaled so the largest component has abs(Re) + abs(Im) = 1. If *jobvr* = 'N', *vr* is not referenced. *For real flavors*: If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*. If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *v*(j) = *vr*(:,j) + *i**vr*(:,j+1) and *v*(j+1) = *vr*(:,j) - *i**vr*(:,j+1). *For complex flavors*: *v*(j) = *vr*(:,j), the j-th column of *vr*.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and

i ≤ *n*: the *QZ* iteration failed. No eigenvectors have been calculated, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1, . . . , *n* should be correct.
i > *n*: errors that usually indicate LAPACK problems:
i = *n*+1: other than *QZ* iteration failed in ?hgeqz;
i = *n*+2: error return from ?tgevc.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggev interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
alphar	Holds the vector of length *n*. Used in real flavors only.
alphai	Holds the vector of length *n*. Used in real flavors only.
alpha	Holds the vector of length *n*. Used in complex flavors only.
beta	Holds the vector of length *n*.
vl	Holds the matrix *VL* of size (*n*, *n*).
vr	Holds the matrix *VR* of size (*n*, *n*).
jobvl	Restored based on the presence of the argument *vl* as follows: *jobvl* = 'V', if *vl* is present, *jobvl* = 'N', if *vl* is omitted.
jobvr	Restored based on the presence of the argument *vr* as follows: *jobvr* = 'V', if *vr* is present, *jobvr* = 'N', if *vr* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* (for real flavors) or *alpha* (for complex flavors) will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

?ggevx

Computes the generalized eigenvalues, and, optionally, the left and/or right generalized eigenvectors.

Syntax

FORTRAN 77:

call sggevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *b*, *ldb*, *alphar*, *alphai*, *beta*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, *bbnrm*, *rconde*, *rcondv*, *work*, *lwork*, *iwork*, *bwork*, *info*)

call dggevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *b*, *ldb*, *alphar*, *alphai*, *beta*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, *bbnrm*, *rconde*, *rcondv*, *work*, *lwork*, *iwork*, *bwork*, *info*)

call cggevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *b*, *ldb*, *alpha*, *beta*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, *bbnrm*, *rconde*, *rcondv*, *work*, *lwork*, *rwork*, *iwork*, *bwork*, *info*)

call zggevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *b*, *ldb*, *alpha*, *beta*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, *bbnrm*, *rconde*, *rcondv*, *work*, *lwork*, *rwork*, *iwork*, *bwork*, *info*)

Fortran 95:

call ggevx(*a*, *b*, *alphar*, *alphai*, *beta* [,*vl*] [,*vr*] [,*balanc*] [,*ilo*] [,*ihi*] [, *lscale*] [,*rscale*] [,*abnrm*] [,*bbnrm*] [,*rconde*] [,*rcondv*] [,*info*])

call ggevx(*a*, *b*, *alpha*, *beta* [, *vl*] [,*vr*] [,*balanc*] [,*ilo*] [,*ihi*] [,*lscale*] [, *rscale*] [,*abnrm*] [,*bbnrm*] [,*rconde*] [,*rcondv*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for a pair of *n*-by-*n* real/complex nonsymmetric matrices (*A*,*B*), the generalized eigenvalues, and optionally, the left and/or right generalized eigenvectors.

Optionally also, it computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors (*ilo*, *ihi*, *lscale*, *rscale*, *abnrm*, and *bbnrm*), reciprocal condition numbers for the eigenvalues (*rconde*), and reciprocal condition numbers for the right eigenvectors (*rcondv*).

A generalized eigenvalue for a pair of matrices (*A*,*B*) is a scalar λ or a ratio *alpha* / *beta* = λ, such that *A* - λ**B* is singular. It is usually represented as the pair (*alpha*, *beta*), as there is a reasonable interpretation for *beta*=0 and even for both being zero. The right generalized eigenvector *v*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

*A***v*(j) = λ(j)**B***v*(j).

The left generalized eigenvector *u*(j) corresponding to the generalized eigenvalue λ(j) of (*A*,*B*) satisfies

$u(j)^H*A = \lambda(j)*u(j)^H*B$

where $u(j)^H$ denotes the conjugate transpose of $u(j)$.

Input Parameters

balanc	CHARACTER*1. Must be 'N', 'P', 'S', or 'B'. Specifies the balance option to be performed. If *balanc* = 'N', do not diagonally scale or permute; If *balanc* = 'P', permute only; If *balanc* = 'S', scale only; If *balanc* = 'B', both permute and scale. Computed reciprocal condition numbers will be for the matrices after balancing and/or permuting. Permuting does not change condition numbers (in exact arithmetic), but balancing does.
jobvl	CHARACTER*1. Must be 'N' or 'V'. If *jobvl* = 'N', the left generalized eigenvectors are not computed; If *jobvl* = 'V', the left generalized eigenvectors are computed.
jobvr	CHARACTER*1. Must be 'N' or 'V'. If *jobvr* = 'N', the right generalized eigenvectors are not computed; If *jobvr* = 'V', the right generalized eigenvectors are computed.
sense	CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed. If *sense* = 'N', none are computed; If *sense* = 'E', computed for eigenvalues only; If *sense* = 'V', computed for eigenvectors only; If *sense* = 'B', computed for eigenvalues and eigenvectors.
n	INTEGER. The order of the matrices *A*, *B*, *vl*, and *vr* ($n \geq 0$).
a, *b*, *work*	REAL for sggevx DOUBLE PRECISION for dggevx COMPLEX for cggevx DOUBLE COMPLEX for zggevx. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A* (first of the pair of matrices). The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) is an array containing the *n*-by-*n* matrix *B* (second of the pair of matrices). The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldb	INTEGER. The first dimension of the array *b*. Must be at least max(1, *n*).
ldvl, *ldvr*	INTEGER. The first dimensions of the output matrices *vl* and *vr*, respectively.

Constraints:

ldvl ≥ 1. If *jobvl* = 'V', *ldvl* ≥ max(1, *n*).

ldvr ≥ 1. If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).

lwork — INTEGER.

The dimension of the array *work*. *lwork* ≥ max(1, 2**n*);

For real flavors:

If *balanc* = 'S', or 'B', or *jobvl* = 'V', or *jobvr* = 'V', then *lwork* ≥ max(1, 6**n*);

if *sense* = 'E', or 'B', then *lwork* ≥ max(1, 10**n*);

if *sense* = 'V', or 'B', *lwork* ≥ ($2n^2$+ 8**n*+16).

For complex flavors:

if *sense* = 'E', *lwork* ≥ max(1, 4**n*);

if *sense* = 'V', or 'B', *lwork* ≥max(1, $2*n^2$+ 2**n*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork — REAL for cggevx
DOUBLE PRECISION for zggevx
Workspace array, DIMENSION at least max(1, 6**n*) if *balanc* = 'S', or 'B', and at least max(1, 2**n*) otherwise.
This array is used in complex flavors only.

iwork — INTEGER.
Workspace array, DIMENSION at least (*n*+6) for real flavors and at least (*n*+2) for complex flavors.
Not referenced if *sense* = 'E'.

bwork — LOGICAL. Workspace array, DIMENSION at least max(1, *n*).
Not referenced if *sense* = 'N'.

Output Parameters

a, *b* — On exit, these arrays have been overwritten.
If *jobvl* = 'V' or *jobvr* = 'V' or both, then *a* contains the first part of the real Schur form of the "balanced" versions of the input *A* and *B*, and *b* contains its second part.

alphar, *alphai* — REAL for sggevx;
DOUBLE PRECISION for dggevx.
Arrays, DIMENSION at least max(1, *n*) each. Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha — COMPLEX for cggevx;
DOUBLE COMPLEX for zggevx.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors. See *beta*.

beta

REAL for sggevx
DOUBLE PRECISION for dggevx
COMPLEX for cggevx
DOUBLE COMPLEX for zggevx.
Array, DIMENSION at least max(1, *n*).
For real flavors:
On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.
If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative.
For complex flavors:
On exit, *alpha*(j)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues.
See also *Application Notes* below.

vl, *vr*

REAL for sggevx
DOUBLE PRECISION for dggevx
COMPLEX for cggevx
DOUBLE COMPLEX for zggevx.
Arrays:
vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).
If *jobvl* = 'V', the left generalized eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest component have abs(Re) + abs(Im) = 1.
If *jobvl* = 'N', *vl* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i**vl*(:,j+1) and *u*(j+1) = *vl*(:,j) - *i**vl*(:,j+1), where *i* = sqrt(-1).
For complex flavors:
u(j) = *vl*(:,j), the j-th column of *vl*.
vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).
If *jobvr* = 'V', the right generalized eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues. Each eigenvector will be scaled so the largest component have abs(Re) + abs(Im) = 1.
If *jobvr* = 'N', *vr* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *v*(j) = *vr*(:,j) + *i**vr*(:,j+1) and *v*(j+1) = *vr*(:,j) - *i**vr*(:,j+1).
For complex flavors:
v(j) = *vr*(:,j), the j-th column of *vr*.

ilo, *ihi*
INTEGER. *ilo* and *ihi* are integer values such that on exit *A*(i,j) = 0 and *B*(i,j) = 0 if i > j and j = 1,..., *ilo*-1 or i = *ihi*+1,..., *n*.
If *balanc* = 'N' or 'S', *ilo* = 1 and *ihi* = *n*.

lscale, *rscale*
REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Arrays, DIMENSION at least max(1, *n*) each.
lscale contains details of the permutations and scaling factors applied to the left side of *A* and *B*.
If *PL*(j) is the index of the row interchanged with row j, and *DL*(j) is the scaling factor applied to row j, then
lscale(j) = *PL*(j), for j = 1,..., *ilo*-1
= *DL*(j), for j = *ilo*,...,*ihi*
= *PL*(j) for j = *ihi*+1,..., *n*.
The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
rscale contains details of the permutations and scaling factors applied to the right side of *A* and *B*.
If *PR*(j) is the index of the column interchanged with column j, and *DR*(j) is the scaling factor applied to column j, then
rscale(j) = *PR*(j), for j = 1,..., *ilo*-1
= *DR*(j), for j = *ilo*,...,*ihi*
= *PR*(j) for j = *ihi*+1,..., *n*.
The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.

abnrm, *bbnrm*
REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
The one-norms of the balanced matrices *A* and *B*, respectively.

rconde, *rcondv*
REAL for single precision flavors DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *n*) each.
If *sense* = 'E', or 'B', *rconde* contains the reciprocal condition numbers of the eigenvalues, stored in consecutive elements of the array. For a complex conjugate pair of eigenvalues two consecutive elements of *rconde* are set to the same value. Thus *rconde*(j), *rcondv*(j), and the j-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the j-th eigenpair, unless all eigenpairs are selected).
If *sense* = 'N', or 'V', *rconde* is not referenced.
If *sense* = 'V', or 'B', *rcondv* contains the estimated reciprocal condition numbers of the eigenvectors, stored in consecutive elements of the array. For a complex eigenvector two consecutive elements of *rcondv* are set to the same value.
If the eigenvalues cannot be reordered to compute *rcondv*(j), *rcondv*(j) is set to 0; this can only occur when the true value would be very small anyway.
If *sense* = 'N', or 'E', *rcondv* is not referenced.

work(1) On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, and

i ≤ *n*:
the *QZ* iteration failed. No eigenvectors have been calculated, but *alphar*(j), *alphai*(j) (for real flavors), or *alpha*(j) (for complex flavors), and *beta*(j), j=*info*+1, ..., *n* should be correct.
i > *n*: errors that usually indicate LAPACK problems:
i = *n*+1: other than *QZ* iteration failed in ?hgeqz;
i = *n*+2: error return from ?tgevc.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggevx interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

b Holds the matrix *B* of size (*n*, *n*).

alphar Holds the vector of length *n*. Used in real flavors only.

alphai Holds the vector of length *n*. Used in real flavors only.

alpha Holds the vector of length *n*. Used in complex flavors only.

beta Holds the vector of length *n*.

vl Holds the matrix *VL* of size (*n*, *n*).

vr Holds the matrix *VR* of size (*n*, *n*).

lscale Holds the vector of length *n*.

rscale Holds the vector of length *n*.

rconde Holds the vector of length *n*.

rcondv Holds the vector of length *n*.

balanc Must be 'N', 'B', or 'P'. The default value is 'N'.

jobvl Restored based on the presence of the argument *vl* as follows:
jobvl = 'V', if *vl* is present,
jobvl = 'N', if *vl* is omitted.

jobvr Restored based on the presence of the argument *vr* as follows:
jobvr = 'V', if *vr* is present,
jobvr = 'N', if *vr* is omitted.

sense Restored based on the presence of arguments *rconde* and rcondv as follows:
sense = 'B', if both *rconde* and *rcondv* are present,
sense = 'E', if *rconde* is present and *rcondv* omitted,
sense = 'V', if *rconde* is omitted and *rcondv* present,
sense = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The quotients *alphar*(j)/*beta*(j) and *alphai*(j)/*beta*(j) may easily over- or underflow, and *beta*(j) may even be zero. Thus, you should avoid simply computing the ratio. However, *alphar* and *alphai* (for real flavors) or *alpha* (for complex flavors) will be always less than and usually comparable with norm(*A*) in magnitude, and *beta* always less than and usually comparable with norm(*B*).

LAPACK Auxiliary and Utility Routines

5

This chapter describes the Intel® Math Kernel Library implementation of LAPACK auxiliary and utility routines. The library includes auxiliary routines for both real and complex data.

Auxiliary Routines

Routine naming conventions, mathematical notation, and matrix storage schemes used for LAPACK auxiliary routines are the same as for the driver and computational routines described in previous chapters.

The table below summarizes information about the available LAPACK auxiliary routines.

Table 5-1 LAPACK Auxiliary Routines

Routine Name	Data Types	Description
?lacgv	c, z	Conjugates a complex vector.
?lacrm	c, z	Multiplies a complex matrix by a square real matrix.
?lacrt	c, z	Performs a linear transformation of a pair of complex vectors.
?laesy	c, z	Computes the eigenvalues and eigenvectors of a 2-by-2 complex symmetric matrix.
?rot	c, z	Applies a plane rotation with real cosine and complex sine to a pair of complex vectors.
?spmv	c, z	Computes a matrix-vector product for complex vectors using a complex symmetric packed matrix
?spr	c, z	Performs the symmetrical rank-1 update of a complex symmetric packed matrix.
?symv	c, z	Computes a matrix-vector product for a complex symmetric matrix.
?syr	c, z	Performs the symmetric rank-1 update of a complex symmetric matrix.
i?max1	c, z	Finds the index of the vector element whose real part has maximum absolute value.
?sum1	sc, dz	Forms the 1-norm of the complex vector using the true absolute value.

Routine Name	Data Types	Description
?gbtf2	s, d, c, z	Computes the LU factorization of a general band matrix using the unblocked version of the algorithm.
?gebd2	s, d, c, z	Reduces a general matrix to bidiagonal form using an unblocked algorithm.
?gehd2	s, d, c, z	Reduces a general square matrix to upper Hessenberg form using an unblocked algorithm.
?gelq2	s, d, c, z	Computes the LQ factorization of a general rectangular matrix using an unblocked algorithm.
?geql2	s, d, c, z	Computes the QL factorization of a general rectangular matrix using an unblocked algorithm.
?geqr2	s, d, c, z	Computes the QR factorization of a general rectangular matrix using an unblocked algorithm.
?geqr2p	s, d, c, z	Computes the QR factorization of a general rectangular matrix with non-negative diagonal elements using an unblocked algorithm.
?gerq2	s, d, c, z	Computes the RQ factorization of a general rectangular matrix using an unblocked algorithm.
?gesc2	s, d, c, z	Solves a system of linear equations using the LU factorization with complete pivoting computed by ?getc2.
?getc2	s, d, c, z	Computes the LU factorization with complete pivoting of the general n-by-n matrix.
?getf2	s, d, c, z	Computes the LU factorization of a general *m*-by-*n* matrix using partial pivoting with row interchanges (unblocked algorithm).
?gtts2	s, d, c, z	Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.
?isnan	s, d,	Tests input for NaN.
?laisnan	s, d,	Tests input for NaN by comparing itwo arguments for inequality.
?labrd	s, d, c, z	Reduces the first *nb* rows and columns of a general matrix to a bidiagonal form.
?lacn2	s, d, c, z	Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.
?lacon	s, d, c, z	Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.
?lacpy	s, d, c, z	Copies all or part of one two-dimensional array to another.

Routine Name	Data Types	Description
?ladiv	s, d, c, z	Performs complex division in real arithmetic, avoiding unnecessary overflow.
?lae2	s, d	Computes the eigenvalues of a 2-by-2 symmetric matrix.
?laebz	s, d	Computes the number of eigenvalues of a real symmetric tridiagonal matrix which are less than or equal to a given value, and performs other tasks required by the routine ?stebz.
?laed0	s, d, c, z	Used by ?stedc. Computes all eigenvalues and corresponding eigenvectors of an unreduced symmetric tridiagonal matrix using the divide and conquer method.
?laed1	s, d	Used by sstedc/dstedc. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is tridiagonal.
?laed2	s, d	Used by sstedc/dstedc. Merges eigenvalues and deflates secular equation. Used when the original matrix is tridiagonal.
?laed3	s, d	Used by sstedc/dstedc. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is tridiagonal.
?laed4	s, d	Used by sstedc/dstedc. Finds a single root of the secular equation.
?laed5	s, d	Used by sstedc/dstedc. Solves the 2-by-2 secular equation.
?laed6	s, d	Used by sstedc/dstedc. Computes one Newton step in solution of the secular equation.
?laed7	s, d, c, z	Used by ?stedc. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is dense.
?laed8	s, d, c, z	Used by ?stedc. Merges eigenvalues and deflates secular equation. Used when the original matrix is dense.
?laed9	s, d	Used by sstedc/dstedc. Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is dense.
?laeda	s, d	Used by ?stedc. Computes the *Z* vector determining the rank-one modification of the diagonal matrix. Used when the original matrix is dense.
?laein	s, d, c, z	Computes a specified right or left eigenvector of an upper Hessenberg matrix by inverse iteration.
?laev2	s, d, c, z	Computes the eigenvalues and eigenvectors of a 2-by-2 symmetric/Hermitian matrix.
?laexc	s, d	Swaps adjacent diagonal blocks of a real upper quasi-triangular matrix in Schur canonical form, by an orthogonal similarity transformation.

Routine Name	Data Types	Description
?lag2	s, d	Computes the eigenvalues of a 2-by-2 generalized eigenvalue problem, with scaling as necessary to avoid over-/underflow.
?lags2	s, d	Computes 2-by-2 orthogonal matrices *U*, *V*, and *Q*, and applies them to matrices *A* and *B* such that the rows of the transformed *A* and *B* are parallel.
?lagtf	s, d	Computes an LU factorization of a matrix $T-\lambda I$, where *T* is a general tridiagonal matrix, and λ a scalar, using partial pivoting with row interchanges.
?lagtm	s, d, c, z	Performs a matrix-matrix product of the form $C = \alpha Ab+\beta C$, where *A* is a tridiagonal matrix, *B* and *C* are rectangular matrices, and α and β are scalars, which may be 0, 1, or -1.
?lagts	s, d	Solves the system of equations $(T-\lambda I)x = y$ or $(T-\lambda I)^T x = y$,where *T* is a general tridiagonal matrix and λ a scalar, using the LU factorization computed by ?lagtf.
?lagv2	s, d	Computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (*A*,*B*) where *B* is upper triangular.
?lahqr	s, d, c, z	Computes the eigenvalues and Schur factorization of an upper Hessenberg matrix, using the double-shift/single-shift QR algorithm.
?lahrd	s, d, c, z	Reduces the first *nb* columns of a general rectangular matrix *A* so that elements below the *k*-th subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of *A*.
?lahr2	s, d, c, z	Reduces the specified number of first columns of a general rectangular matrix *A* so that elements below thespecified subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of *A*.
?laic1	s, d, c, z	Applies one step of incremental condition estimation.
?laln2	s, d	Solves a 1-by-1 or 2-by-2 linear system of equations of the specified form.
?lals0	s, d, c, z	Applies back multiplying factors in solving the least squares problem using divide and conquer SVD approach. Used by ?gelsd.
?lalsa	s, d, c, z	Computes the SVD of the coefficient matrix in compact form. Used by ?gelsd.
?lalsd	s, d, c, z	Uses the singular value decomposition of *A* to solve the least squares problem.

Routine Name	Data Types	Description
?lamrg	s, d	Creates a permutation list to merge the entries of two independently sorted sets into a single set sorted in ascending order.
?laneg	s, d	Computes the Sturm count.
?langb	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of general band matrix.
?lange	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general rectangular matrix.
?langt	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general tridiagonal matrix.
?lanhs	s, d, c, z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of an upper Hessenberg matrix.
?lansb	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric band matrix.
?lanhb	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian band matrix.
?lansp	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix supplied in packed form.
?lanhp	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix supplied in packed form.
?lanst/?lanht	s, d/c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or complex Hermitian tridiagonal matrix.
?lansy	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix.
?lanhe	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix.
?lantb	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular band matrix.
?lantp	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix supplied in packed form.

Routine Name	Data Types	Description
?lantr	s, d, c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix.
?lanv2	s, d	Computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form.
?lapll	s, d, c, z	Measures the linear dependence of two vectors.
?lapmt	s, d, c, z	Performs a forward or backward permutation of the columns of a matrix.
?lapy2	s, d	Returns sqrt(x^2+y^2).
?lapy3	s, d	Returns sqrt($x^2+y^2+z^2$).
?laqgb	s, d, c, z	Scales a general band matrix, using row and column scaling factors computed by ?gbequ.
?laqge	s, d, c, z	Scales a general rectangular matrix, using row and column scaling factors computed by ?geequ.
?laqhb	c, z	Scales a Hermetian band matrix, using scaling factors computed by ?pbequ.
?laqp2	s, d, c, z	Computes a QR factorization with column pivoting of the matrix block.
?laqps	s, d, c, z	Computes a step of QR factorization with column pivoting of a real m-by-n matrix *A* by using BLAS level 3.
?laqr0	s, d, c, z	Computes the eigenvalues of a Hessenberg matrix, and optionally the matrices from the Schur decomposition.
?laqr1	s, d, c, z	Sets a scalar multiple of the first column of the product of 2-by-2 or 3-by-3 matrix *H* and specified shifts.
?laqr2	s, d, c, z	Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).
?laqr3	s, d, c, z	Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).
?laqr4	s, d, c, z	Computes the eigenvalues of a Hessenberg matrix, and optionally the matrices from the Schur decomposition.
?laqr5	s, d, c, z	Performs a single small-bulge multi-shift QR sweep.
?laqsb	s, d, c, z	Scales a symmetric/Hermitian band matrix, using scaling factors computed by ?pbequ.

Routine Name	Data Types	Description
?laqsp	s, d, c, z	Scales a symmetric/Hermitian matrix in packed storage, using scaling factors computed by ?ppequ.
?laqsy	s, d, c, z	Scales a symmetric/Hermitian matrix, using scaling factors computed by ?poequ.
?laqtr	s, d	Solves a real quasi-triangular system of equations, or a complex quasi-triangular system of special form, in real arithmetic.
?lar1v	s, d, c, z	Computes the (scaled) r-th column of the inverse of the submatrix in rows $b1$ through bn of the tridiagonal matrix $LDL^T - \sigma I$.
?lar2v	s, d, c, z	Applies a vector of plane rotations with real cosines and real/complex sines from both sides to a sequence of 2-by-2 symmetric/Hermitian matrices.
?larf	s, d, c, z	Applies an elementary reflector to a general rectangular matrix.
?larfb	s, d, c, z	Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.
?larfg	s, d, c, z	Generates an elementary reflector (Householder matrix).
?larfgp	s, d, c, z	Generates an elementary reflector (Householder matrix) with the non-negative beta.
?larft	s, d, c, z	Forms the triangular factor T of a block reflector $H = I - vtv^H$
?larfx	s, d, c, z	Applies an elementary reflector to a general rectangular matrix, with loop unrolling when the reflector has order ≤ 10.
?largv	s, d, c, z	Generates a vector of plane rotations with real cosines and real/complex sines.
?larnv	s, d, c, z	Returns a vector of random numbers from a uniform or normal distribution.
?larra	s, d	Computes the splitting points with the specified threshold.
?larrb	s, d	Provides limited bisection to locate eigenvalues for more accuracy.
?larrc	s, d	Computes the number of eigenvalues of the symmetric tridiagonal matrix.
?larrd	s, d	Computes the eigenvalues of a symmetric tridiagonal matrix to suitable accuracy.
?larre	s, d	Given the tridiagonal matrix T, sets small off-diagonal elements to zero and for each unreduced block T_i, finds base representations and eigenvalues.
?larrf	s, d	Finds a new relatively robust representation such that at least one of the eigenvalues is relatively isolated.

Routine Name	Data Types	Description
?larrj	s, d	Performs refinement of the initial estimates of the eigenvalues of the matrix T.
?larrk	s, d	Computes one eigenvalue of a symmetric tridiagonal matrix T to suitable accuracy.
?larrr	s, d	Performs tests to decide whether the symmetric tridiagonal matrix T warrants expensive computations which guarantee high relative accuracy in the eigenvalues.
?larrv	s, d, c, z	Computes the eigenvectors of the tridiagonal matrix $T = L\ D\ L^T$ given L, D and the eigenvalues of $L\ D\ L^T$.
?lartg	s, d, c, z	Generates a plane rotation with real cosine and real/complex sine.
?lartv	s, d, c, z	Applies a vector of plane rotations with real cosines and real/complex sines to the elements of a pair of vectors.
?laruv	s, d	Returns a vector of n random real numbers from a uniform distribution.
?larz	s, d, c, z	Applies an elementary reflector (as returned by ?tzrzf) to a general matrix.
?larzb	s, d, c, z	Applies a block reflector or its transpose/conjugate-transpose to a general matrix.
?larzt	s, d, c, z	Forms the triangular factor T of a block reflector $H = I - vtv^H$.
?las2	s, d	Computes singular values of a 2-by-2 triangular matrix.
?lascl	s, d, c, z	Multiplies a general rectangular matrix by a real scalar defined as c_{to}/c_{from}.
?lasd0	s, d	Computes the singular values of a real upper bidiagonal n-by-m matrix B with diagonal d and off-diagonal e. Used by ?bdsdc.
?lasd1	s, d	Computes the SVD of an upper bidiagonal matrix B of the specified size. Used by ?bdsdc.
?lasd2	s, d	Merges the two sets of singular values together into a single sorted set. Used by ?bdsdc.
?lasd3	s, d	Finds all square roots of the roots of the secular equation, as defined by the values in D and Z, and then updates the singular vectors by matrix multiplication. Used by ?bdsdc.
?lasd4	s, d	Computes the square root of the i-th updated eigenvalue of a positive symmetric rank-one modification to a positive diagonal matrix. Used by ?bdsdc.
?lasd5	s, d	Computes the square root of the i-th eigenvalue of a positive symmetric rank-one modification of a 2-by-2 diagonal matrix.Used by ?bdsdc.

Routine Name	Data Types	Description
?lasd6	s, d	Computes the SVD of an updated upper bidiagonal matrix obtained by merging two smaller ones by appending a row. Used by ?bdsdc.
?lasd7	s, d	Merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. Used by ?bdsdc.
?lasd8	s, d	Finds the square roots of the roots of the secular equation, and stores, for each element in D, the distance to its two nearest poles. Used by ?bdsdc.
?lasd9	s, d	Finds the square roots of the roots of the secular equation, and stores, for each element in D, the distance to its two nearest poles. Used by ?bdsdc.
?lasda	s, d	Computes the singular value decomposition (SVD) of a real upper bidiagonal matrix with diagonal *d* and off-diagonal *e*. Used by ?bdsdc.
?lasdq	s, d	Computes the SVD of a real bidiagonal matrix with diagonal *d* and off-diagonal *e*. Used by ?bdsdc.
?lasdt	s, d	Creates a tree of subproblems for bidiagonal divide and conquer. Used by ?bdsdc.
?laset	s, d, c, z	Initializes the off-diagonal elements and the diagonal elements of a matrix to given values.
?lasq1	s, d	Computes the singular values of a real square bidiagonal matrix. Used by ?bdsqr.
?lasq2	s, d	Computes all the eigenvalues of the symmetric positive definite tridiagonal matrix associated with the *qd* Array *Z* to high relative accuracy. Used by ?bdsqr and ?stegr.
?lasq3	s, d	Checks for deflation, computes a shift and calls *dqds*. Used by ?bdsqr.
?lasq4	s, d	Computes an approximation to the smallest eigenvalue using values of *d* from the previous transform. Used by ?bdsqr.
?lasq5	s, d	Computes one *dqds* transform in ping-pong form. Used by ?bdsqr and ?stegr.
?lasq6	s, d	Computes one *dqd* transform in ping-pong form. Used by ?bdsqr and ?stegr.
?lasr	s, d, c, z	Applies a sequence of plane rotations to a general rectangular matrix.
?lasrt	s, d	Sorts numbers in increasing or decreasing order.
?lassq	s, d, c, z	Updates a sum of squares represented in scaled form.
?lasv2	s, d	Computes the singular value decomposition of a 2-by-2 triangular matrix.

Routine Name	Data Types	Description
?laswp	s, d, c, z	Performs a series of row interchanges on a general rectangular matrix.
?lasy2	s, d	Solves the Sylvester matrix equation where the matrices are of order 1 or 2.
?lasyf	s, d, c, z	Computes a partial factorization of a real/complex symmetric matrix, using the diagonal pivoting method.
?lahef	c, z	Computes a partial factorization of a complex Hermitian indefinite matrix, using the diagonal pivoting method.
?latbs	s, d, c, z	Solves a triangular banded system of equations.
?latdf	s, d, c, z	Uses the LU factorization of the n-by-n matrix computed by ?getc2 and computes a contribution to the reciprocal Dif-estimate.
?latps	s, d, c, z	Solves a triangular system of equations with the matrix held in packed storage.
?latrd	s, d, c, z	Reduces the first *nb* rows and columns of a symmetric/Hermitian matrix *A* to real tridiagonal form by an orthogonal/unitary similarity transformation.
?latrs	s, d, c, z	Solves a triangular system of equations with the scale factor set to prevent overflow.
?latrz	s, d, c, z	Factors an upper trapezoidal matrix by means of orthogonal/unitary transformations.
?lauu2	s, d, c, z	Computes the product UU^H or L^HL, where U and L are upper or lower triangular matrices (unblocked algorithm).
?lauum	s, d, c, z	Computes the product UU^H or L^HL, where U and L are upper or lower triangular matrices (blocked algorithm).
?org2l/?ung2l	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from a QL factorization determined by ?geqlf (unblocked algorithm).
?org2r/?ung2r	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from a QR factorization determined by ?geqrf (unblocked algorithm).
?orgl2/?ungl2	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from an LQ factorization determined by ?gelqf (unblocked algorithm).
?orgr2/?ungr2	s, d/c, z	Generates all or part of the orthogonal/unitary matrix Q from an RQ factorization determined by ?gerqf (unblocked algorithm).
?orm2l/?unm2l	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a QL factorization determined by ?geqlf (unblocked algorithm).
?orm2r/?unm2r	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a QR factorization determined by ?geqrf (unblocked algorithm).

Routine Name	Data Types	Description
?orml2/?unml2	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a LQ factorization determined by ?gelqf (unblocked algorithm).
?ormr2/?unmr2	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a RQ factorization determined by ?gerqf (unblocked algorithm).
?ormr3/?unmr3	s, d/c, z	Multiplies a general matrix by the orthogonal/unitary matrix from a RZ factorization determined by ?tzrzf (unblocked algorithm).
?pbtf2	s, d, c, z	Computes the Cholesky factorization of a symmetric/ Hermitian positive definite band matrix (unblocked algorithm).
?potf2	s, d, c, z	Computes the Cholesky factorization of a symmetric/Hermitian positive definite matrix (unblocked algorithm).
?ptts2	s, d, c, z	Solves a tridiagonal system of the form $AX=B$ using the $L\ D\ L^H$ factorization computed by ?pttrf.
?rscl	s, d, cs, zd	Multiplies a vector by the reciprocal of a real scalar.
?sygs2/?hegs2	s, d/c, z	Reduces a symmetric/Hermitian definite generalized eigenproblem to standard form, using the factorization results obtained from ?potrf (unblocked algorithm).
?sytd2/?hetd2	s, d/c, z	Reduces a symmetric/Hermitian matrix to real symmetric tridiagonal form by an orthogonal/unitary similarity transformation (unblocked algorithm).
?sytf2	s, d, c, z	Computes the factorization of a real/complex symmetric indefinite matrix, using the diagonal pivoting method (unblocked algorithm).
?hetf2	c, z	Computes the factorization of a complex Hermitian matrix, using the diagonal pivoting method (unblocked algorithm).
?tgex2	s, d, c, z	Swaps adjacent diagonal blocks in an upper (quasi) triangular matrix pair by an orthogonal/unitary equivalence transformation.
?tgsy2	s, d, c, z	Solves the generalized Sylvester equation (unblocked algorithm).
?trti2	s, d, c, z	Computes the inverse of a triangular matrix (unblocked algorithm).
clag2z	c $\rightarrow$ z	Converts a complex single precision matrix to a complex double precision matrix.
dlag2s	d $\rightarrow$ s	Converts a double precision matrix to a single precision matrix.
slag2d	s $\rightarrow$ d	Converts a single precision matrix to a double precision matrix.
zlag2c	z $\rightarrow$ c	Converts a complex double precision matrix to a complex single precision matrix.

Routine Name	Data Types	Description
?larfp	s, d, c, z	Generates a real or complex elementary reflector.
ila?lc	s, d, c, z	Scans a matrix for its last non-zero column.
ila?lr	s, d, c, z	Scans a matrix for its last non-zero row.
?gsvj0	s, d	Pre-processor for the routine ?gesvj.
?gsvj1	s, d	Pre-processor for the routine ?gesvj, applies Jacobi rotations targeting only particular pivots.
?sfrk	s, d	Performs a symmetric rank-k operation for matrix in RFP format.
?hfrk	c, z	Performs a Hermitian rank-k operation for matrix in RFP format.
?tfsm	s, d, c, z	Solves a matrix equation (one operand is a triangular matrix in RFP format).
?lansf	s, d	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix in RFP format.
?lanhf	c, z	Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian matrix in RFP format.
?tfttp	s, d, c, z	Copies a triangular matrix from the rectangular full packed format (TF) to the standard packed format (TP).
?tfttr	s, d, c, z	Copies a triangular matrix from the rectangular full packed format (TF) to the standard full format (TR).
?tpttf	s, d, c, z	Copies a triangular matrix from the standard packed format (TP) to the rectangular full packed format (TF).
?tpttr	s, d, c, z	Copies a triangular matrix from the standard packed format (TP) to the standard full format (TR).
?trttf	s, d, c, z	Copies a triangular matrix from the standard full format (TR) to the rectangular full packed format (TF).
?trttp	s, d, c, z	Copies a triangular matrix from the standard full format (TR) to the standard packed format (TP).
?pstf2	s, d, c, z	Computes the Cholesky factorization with complete pivoting of a real symmetric or complex Hermitian positive semi-definite matrix.
dlat2s	d $\rightarrow$ s	Converts a double-precision triangular matrix to a single-precision triangular matrix.
zlat2c	z $\rightarrow$ c	Converts a double complex triangular matrix to a complex triangular matrix.

?lacgv

Conjugates a complex vector.

Syntax

```
call clacgv( n, x, incx )
call zlacgv( n, x, incx )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine conjugates a complex vector *x* of length *n* and increment *incx* (see "Vector Arguments in BLAS" in Appendix B).

Input Parameters

n	INTEGER. The length of the vector *x* (*n* ≥ 0).
x	COMPLEX for clacgv COMPLEX*16 for zlacgv. Array, dimension (1+(*n*-1)* |*incx*|). Contains the vector of length *n* to be conjugated.
incx	INTEGER. The spacing between successive elements of *x*.

Output Parameters

x	On exit, overwritten with conjg(*x*).

?lacrm

Multiplies a complex matrix by a square real matrix.

Syntax

```
call clacrm( m, n, a, lda, b, ldb, c, ldc, rwork )
call zlacrm( m, n, a, lda, b, ldb, c, ldc, rwork )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine performs a simple matrix-matrix multiplication of the form

*C = A*B*,

where *A* is *m*-by-*n* and complex, *B* is *n*-by-*n* and real, *C* is *m*-by-*n* and complex.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* and of the matrix *C* (*m* ≥ 0).

n	INTEGER. The number of columns and rows of the matrix *B* and the number of columns of the matrix *C* (*n* ≥ 0).
a	COMPLEX for clacrm COMPLEX*16 for zlacrm Array, DIMENSION (*lda*, *n*). Contains the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*, *lda* ≥ max(1, *m*).
b	REAL for clacrm DOUBLE PRECISION for zlacrm Array, DIMENSION (*ldb*, *n*). Contains the *n*-by-*n* matrix *B*.
ldb	INTEGER. The leading dimension of the array *b*, *ldb* ≥ max(1, *n*).
ldc	INTEGER. The leading dimension of the output array *c*, *ldc* ≥ max(1, *n*).
rwork	REAL for clacrm DOUBLE PRECISION for zlacrm Workspace array, DIMENSION (2**m***n*).

Output Parameters

c	COMPLEX for clacrm COMPLEX*16 for zlacrm Array, DIMENSION (*ldc*, *n*). Contains the *m*-by-*n* matrix *C*.

?lacrt

Performs a linear transformation of a pair of complex vectors.

Syntax

```
call clacrt( n, cx, incx, cy, incy, c, s )
call zlacrt( n, cx, incx, cy, incy, c, s )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine performs the following transformation

$$\begin{pmatrix} c & s \\ -s & c \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} \Rightarrow \begin{pmatrix} x \\ y \end{pmatrix},$$

where *c*, *s* are complex scalars and *x*, *y* are complex vectors.

Input Parameters

n	INTEGER. The number of elements in the vectors *cx* and *cy* ($n \geq 0$).
cx, *cy*	COMPLEX for clacrt COMPLEX*16 for zlacrt Arrays, dimension (*n*). Contain input vectors *x* and *y*, respectively.
incx	INTEGER. The increment between successive elements of *cx*.
incy	INTEGER. The increment between successive elements of *cy*.
c, *s*	COMPLEX for clacrt COMPLEX*16 for zlacrt Complex scalars that define the transform matrix

$$\begin{bmatrix} c & s \\ -s & c \end{bmatrix}$$

Output Parameters

cx	On exit, overwritten with *c*x + s*y* .
cy	On exit, overwritten with *-s*x + c*y* .

?laesy

Computes the eigenvalues and eigenvectors of a 2-by-2 complex symmetric matrix, and checks that the norm of the matrix of eigenvectors is larger than a threshold value.

Syntax

```
call claesy( a, b, c, rt1, rt2, evscal, cs1, sn1 )
call zlaesy( a, b, c, rt1, rt2, evscal, cs1, sn1 )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine performs the eigendecomposition of a 2-by-2 symmetric matrix

$$\begin{bmatrix} a & b \\ b & c \end{bmatrix},$$

provided the norm of the matrix of eigenvectors is larger than some threshold value.

rt1 is the eigenvalue of larger absolute value, and *rt2* of smaller absolute value. If the eigenvectors are computed, then on return (*cs1*, *sn1*) is the unit eigenvector for *rt1*, hence

$$\begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ b & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & -sn1 \\ sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

Input Parameters

a, *b*, *c*	COMPLEX for claesy COMPLEX*16 for zlaesy Elements of the input matrix.

Output Parameters

rt1, *rt2*	COMPLEX for claesy COMPLEX*16 for zlaesy Eigenvalues of larger and smaller modulus, respectively.
evscal	COMPLEX for claesy COMPLEX*16 for zlaesy The complex value by which the eigenvector matrix was scaled to make it orthonormal. If *evscal* is zero, the eigenvectors were not computed. This means one of two things: the 2-by-2 matrix could not be diagonalized, or the norm of the matrix of eigenvectors before scaling was larger than the threshold value thresh (set to 0.1E0).
cs1, *sn1*	COMPLEX for claesy COMPLEX*16 for zlaesy If *evscal* is not zero, then (*cs1*, *sn1*) is the unit right eigenvector for *rt1*.

?rot

Applies a plane rotation with real cosine and complex sine to a pair of complex vectors.

Syntax

```
call crot( n, cx, incx, cy, incy, c, s )
call zrot( n, cx, incx, cy, incy, c, s )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine applies a plane rotation, where the cosine (*c*) is real and the sine (*s*) is complex, and the vectors *cx* and *cy* are complex. This routine has its real equivalents in BLAS (see ?rot in Chapter 2).

Input Parameters

n	INTEGER. The number of elements in the vectors *cx* and *cy*.
cx, *cy*	COMPLEX for crot COMPLEX*16 for zrot Arrays of dimension (*n*), contain input vectors *x* and *y*, respectively.
incx	INTEGER. The increment between successive elements of *cx*.
incy	INTEGER. The increment between successive elements of *cy*.
c	REAL for crot DOUBLE PRECISION for zrot
s	COMPLEX for crot COMPLEX*16 for zrot Values that define a rotation

$$\begin{bmatrix} c & s \\ -\text{conjg}(s) & c \end{bmatrix}$$

where *c*c + s*conjg(s) = 1.0.

Output Parameters

cx	On exit, overwritten with *c*x + s*y*.
cy	On exit, overwritten with -conjg(*s*)*x + *c*y*.

?spmv

Computes a matrix-vector product for complex vectors using a complex symmetric packed matrix.

Syntax

call cspmv(*uplo*, *n*, *alpha*, *ap*, *x*, *incx*, *beta*, *y*, *incy*)

call zspmv(*uplo*, *n*, *alpha*, *ap*, *x*, *incx*, *beta*, *y*, *incy*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The ?spmv routines perform a matrix-vector operation defined as

y := *alpha*a*x* + *beta*y*,

where:

alpha and *beta* are complex scalars,

x and *y* are *n*-element complex vectors

a is an *n*-by-*n* complex symmetric matrix, supplied in packed form.

These routines have their real equivalents in BLAS (see ?spmv in Chapter 2).

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *a* is supplied in the packed array *ap*. If *uplo* = 'U' or 'u', the upper triangular part of the matrix *a* is supplied in the array *ap*. If *uplo* = 'L' or 'l', the lower triangular part of the matrix *a* is supplied in the array *ap* .
n	INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.
alpha, *beta*	COMPLEX for cspmv COMPLEX*16 for zspmv Specify complex scalars *alpha* and *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
ap	COMPLEX for cspmv COMPLEX*16 for zspmv Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry, with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *A*(1, 1), *ap*(2) and *ap*(3) contain *A*(1, 2) and *A*(2, 2) respectively, and so on. Before entry, with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on.
x	COMPLEX for cspmv COMPLEX*16 for zspmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array x must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for cspmv COMPLEX*16 for zspmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

?spr

Performs the symmetrical rank-1 update of a complex symmetric packed matrix.

Syntax

```
call cspr( uplo, n, alpha, x, incx, ap )
call zspr( uplo, n, alpha, x, incx, ap )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The `?spr` routines perform a matrix-vector operation defined as

`a := alpha*x*conjg(x') + a`,

where:

alpha is a complex scalar

x is an *n*-element complex vector

a is an *n*-by-*n* complex symmetric matrix, supplied in packed form.

These routines have their real equivalents in BLAS (see `?spr` in Chapter 2).

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the matrix *a* is supplied in the packed array *ap*, as follows: If *uplo* = `'U'` or `'u'`, the upper triangular part of the matrix *a* is supplied in the array *ap*. If *uplo* = `'L'` or `'l'`, the lower triangular part of the matrix *a* is supplied in the array *ap* .
n	`INTEGER`. Specifies the order of the matrix *a*. The value of *n* must be at least zero.

alpha	`COMPLEX` for `cspr`
	`COMPLEX*16` for `zspr`
	Specifies the scalar *alpha*.

x	`COMPLEX` for `cspr`
	`COMPLEX*16` for `zspr`
	Array, `DIMENSION` at least `(1 + (n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
ap	`COMPLEX` for `cspr` `COMPLEX*16` for `zspr`

Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry, with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *A*(1,1), *ap*(2) and *ap*(3) contain *A*(1, 2) and *A*(2,2) respectively, and so on.
Before entry, with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.
Note that the imaginary parts of the diagonal elements need not be set, they are assumed to be zero, and on exit they are set to zero.

Output Parameters

ap — With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

?symv

Computes a matrix-vector product for a complex symmetric matrix.

Syntax

```
call csymv( uplo, n, alpha, a, lda, x, incx, beta, y, incy )
call zsymv( uplo, n, alpha, a, lda, x, incx, beta, y, incy )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine performs the matrix-vector operation defined as

y := *alpha***a***x* + *beta***y*,

where:

alpha and *beta* are complex scalars

x and *y* are *n*-element complex vectors

a is an *n*-by-*n* symmetric complex matrix.

These routines have their real equivalents in BLAS (see ?symv in Chapter 2).

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used:
If *uplo* = 'U' or 'u', then the upper triangular part of the array *a* is used.

	If *uplo* = 'L' or 'l', then the lower triangular part of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.
alpha, *beta*	COMPLEX for csymv COMPLEX*16 for zsymv Specify the scalars *alpha* and *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
a	COMPLEX for csymv COMPLEX*16 for zsymv Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. Specifies the first dimension of *A* as declared in the calling (sub)program. The value of *lda* must be at least max(1,*n*).
x	COMPLEX for csymv COMPLEX*16 for zsymv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for csymv COMPLEX*16 for zsymv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

?syr

Performs the symmetric rank-1 update of a complex symmetric matrix.

Syntax

```
call csyr( uplo, n, alpha, x, incx, a, lda )
call zsyr( uplo, n, alpha, x, incx, a, lda )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine performs the symmetric rank 1 operation defined as

`a := alpha*x*x' + a`,

where:

alpha is a complex scalar

x is an *n*-element complex vector

a is an *n*-by-*n* complex symmetric matrix.

These routines have their real equivalents in BLAS (see `?syr` in Chapter 2).

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the array *a* is used: If *uplo* = `'U'` or `'u'`, then the upper triangular part of the array *a* is used. If *uplo* = `'L'` or `'l'`, then the lower triangular part of the array *a* is used.
n	`INTEGER`. Specifies the order of the matrix *a*. The value of *n* must be at least zero.

alpha	`COMPLEX` for `csyr`
	`COMPLEX*16` for `zsyr`
	Specifies the scalar *alpha*.

x	`COMPLEX` for `csyr`
	`COMPLEX*16` for `zsyr`
	Array, `DIMENSION` at least `(1 + (n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector x.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

a	`COMPLEX` for `csyr`
	`COMPLEX*16` for `zsyr`
	Array, `DIMENSION (lda, n)`. Before entry with *uplo* = `'U'` or `'u'`, the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced.
	Before entry with *uplo* = `'L'` or `'l'`, the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.

lda	`INTEGER`. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1,n)`.

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

i?max1

Finds the index of the vector element whose real part has maximum absolute value.

Syntax

index = icmax1(*n*, *cx*, *incx*)

index = izmax1(*n*, *cx*, *incx*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

Given a complex vector *cx*, the i?max1 functions return the index of the vector element whose real part has maximum absolute value. These functions are based on the BLAS functions icamax/izamax, but using the absolute value of the real part. They are designed for use with clacon/zlacon.

Input Parameters

n	INTEGER. Specifies the number of elements in the vector *cx*.
cx	COMPLEX for icmax1 COMPLEX*16 for izmax1 Array, DIMENSION at least (1+(*n*-1)*abs(*incx*)). Contains the input vector.
incx	INTEGER. Specifies the spacing between successive elements of *cx*.

Output Parameters

index	INTEGER. Contains the index of the vector element whose real part has maximum absolute value.

?sum1

Forms the 1-norm of the complex vector using the true absolute value.

Syntax

res = scsum1(*n*, *cx*, *incx*)

res = dzsum1(*n*, *cx*, *incx*)

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

Given a complex vector *cx*, `scsum1`/`dzsum1` functions take the sum of the absolute values of vector elements and return a single/`DOUBLE PRECISION` result, respectively. These functions are based on `scasum`/`dzasum` from Level 1 BLAS, but use the true absolute value and were designed for use with `clacon`/`zlacon`.

Input Parameters

n	`INTEGER`. Specifies the number of elements in the vector *cx*.
cx	`COMPLEX` for `scsum1` `COMPLEX*16` for dzsum1 Array, `DIMENSION` at least `(1+(`*n*`-1)*abs(`*incx*`))`. Contains the input vector whose elements will be summed.
incx	`INTEGER`. Specifies the spacing between successive elements of *cx* (*incx* > 0).

Output Parameters

res	`REAL` for `scsum1`
	`DOUBLE PRECISION` for `dzsum1`
	Contains the sum of absolute values.

?gbtf2

Computes the LU factorization of a general band matrix using the unblocked version of the algorithm.

Syntax

```
call sgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call dgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call cgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
call zgbtf2( m, n, kl, ku, ab, ldab, ipiv, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine forms the *LU* factorization of a general real/complex *m*-by-*n* band matrix *A* with *kl* sub-diagonals and *ku* super-diagonals. The routine uses partial pivoting with row interchanges and implements the unblocked version of the algorithm, calling Level 2 BLAS. See also `?gbtrf`.

Input Parameters

m	`INTEGER`. The number of rows of the matrix *A* (*m* ≥ 0).
n	`INTEGER`. The number of columns in *A* (*n* ≥ 0).

kl	INTEGER. The number of sub-diagonals within the band of *A* (*kl* ≥ 0).
ku	INTEGER. The number of super-diagonals within the band of *A* (*ku* ≥ 0).
ab	REAL for sgbtf2 DOUBLE PRECISION for dgbtf2 COMPLEX for cgbtf2 COMPLEX*16 for zgbtf2. Array, DIMENSION (*ldab*,*). The array *ab* contains the matrix *A* in band storage (see Matrix Arguments). The second dimension of *ab* must be at least max(1, *n*).
ldab	INTEGER. The first dimension of the array *ab*. (*ldab* ≥ 2*kl* + *ku* +1)

Output Parameters

ab	Overwritten by details of the factorization. The diagonal and *kl* + *ku* super-diagonals of *U* are stored in the first 1 + *kl* + *ku* rows of *ab*. The multipliers used during the factorization are stored in the next *kl* rows.
ipiv	INTEGER. Array, DIMENSION at least max(1,min(*m*,*n*)). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info* =0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

?gebd2

Reduces a general matrix to bidiagonal form using an unblocked algorithm.

Syntax

```
call sgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call dgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call cgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
call zgebd2( m, n, a, lda, d, e, tauq, taup, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine reduces a general *m*-by-*n* matrix *A* to upper or lower bidiagonal form *B* by an orthogonal (unitary) transformation: *Q'*A*P = B*

If $m \geq n$, B is upper bidiagonal; if $m < n$, B is lower bidiagonal.

The routine does not form the matrices Q and P explicitly, but represents them as products of elementary reflectors.

if $m \geq n$,

$Q = H(1)*H(2)*...*H(n)$, and $P = G(1)*G(2)*...*G(n-1)$

if $m < n$,

$Q = H(1)*H(2)*...*H(m-1)$, and $P = G(1)*G(2)*...*G(m)$

Each $H(i)$ and $G(i)$ has the form

$H(i) = I - tauq*v*v'$ and $G(i) = I - taup*u*u'$

where *tauq* and *taup* are scalars (real for sgebd2/dgebd2, complex for cgebd2/zgebd2), and *v* and *u* are vectors (real for sgebd2/dgebd2, complex for cgebd2/zgebd2).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
a, *work*	REAL for sgebd2 DOUBLE PRECISION for dgebd2 COMPLEX for cgebd2 COMPLEX*16 for zgebd2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* general matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*). *work*(*) is a workspace array, the dimension of *work* must be at least max(1, *m*, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	if $m \geq n$, the diagonal and first super-diagonal of *a* are overwritten with the upper bidiagonal matrix *B*. Elements below the diagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements above the first superdiagonal, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors. if $m < n$, the diagonal and first sub-diagonal of *a* are overwritten by the lower bidiagonal matrix *B*. Elements below the first subdiagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements above the diagonal, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.
d	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*)).

	Contains the diagonal elements of the bidiagonal matrix *B*: *d*(i) = *a*(i, i).
e	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*) - 1). Contains the off-diagonal elements of the bidiagonal matrix *B*: if *m* ≥ *n*, *e*(i) = *a*(i, i+1) for i = 1,2,..., *n*-1; if *m* < *n*, *e*(i) = *a*(i+1, i) for i = 1,2,..., *m*-1.
tauq, *taup*	REAL for sgebd2 DOUBLE PRECISION for dgebd2 COMPLEX for cgebd2 COMPLEX*16 for zgebd2. Arrays, DIMENSION at least max (1, min(*m*, *n*)). Contain scalar factors of the elementary reflectors which represent orthogonal/unitary matrices *Q* and *p*, respectively.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

?gehd2

Reduces a general square matrix to upper Hessenberg form using an unblocked algorithm.

Syntax

```
call sgehd2( n, ilo, ihi, a, lda, tau, work, info )
call dgehd2( n, ilo, ihi, a, lda, tau, work, info )
call cgehd2( n, ilo, ihi, a, lda, tau, work, info )
call zgehd2( n, ilo, ihi, a, lda, tau, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine reduces a real/complex general matrix *A* to upper Hessenberg form *H* by an orthogonal or unitary similarity transformation *Q'*A*Q* = *H*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of *elementary reflectors*.

Input Parameters

n	INTEGER The order of the matrix *A* (*n* ≥ 0).
ilo, *ihi*	INTEGER. It is assumed that *A* is already upper triangular in rows and columns 1:*ilo* -1 and *ihi*+1:*n*. If *A* has been output by ?gebal, then

	ilo and *ihi* must contain the values returned by that routine. Otherwise they should be set to *ilo* = 1 and *ihi* = *n*. Constraint: 1 ≤ *ilo* ≤ *ihi* ≤ max(1, *n*).
a, *work*	REAL for sgehd2 DOUBLE PRECISION for dgehd2 COMPLEX for cgehd2 COMPLEX*16 for zgehd2. Arrays: *a* (*lda*,*) contains the *n*-by-*n* matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*). *work* (*n*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).

Output Parameters

a	On exit, the upper triangle and the first subdiagonal of *A* are overwritten with the upper Hessenberg matrix *H* and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors. See *Application Notes* below.
tau	REAL for sgehd2 DOUBLE PRECISION for dgehd2 COMPLEX for cgehd2 COMPLEX*16 for zgehd2. Array, DIMENSION at least max (1, *n*-1). Contains the scalar factors of elementary reflectors. See *Application Notes* below.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

The matrix *Q* is represented as a product of (*ihi* - *ilo*) elementary reflectors

Q = *H*(*ilo*)**H*(*ilo* +1)*...**H*(*ihi* -1)

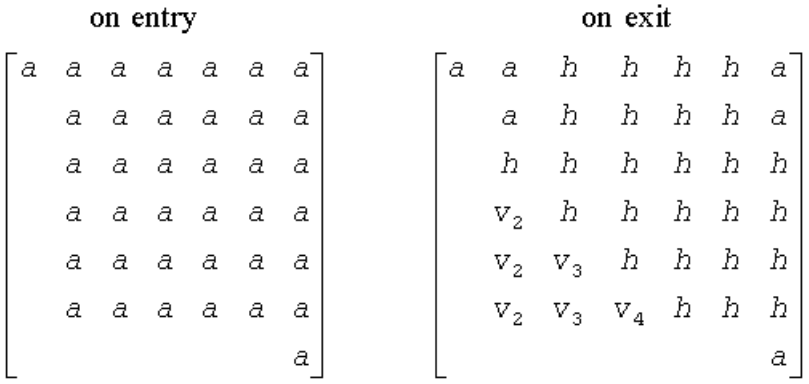
Each *H*(i) has the form

H(i) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:i) = 0, *v*(i+1) = 1 and *v*(*ihi*+1:*n*) = 0.

On exit, *v*(i+2:*ihi*) is stored in *a*(i+2:*ihi*, i) and *tau* in *tau*(i).

The contents of *a* are illustrated by the following example, with *n* = 7, *ilo* = 2 and *ihi* = 6:



where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

?gelq2

Computes the LQ factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgelq2( m, n, a, lda, tau, work, info )
call dgelq2( m, n, a, lda, tau, work, info )
call cgelq2( m, n, a, lda, tau, work, info )
call zgelq2( m, n, a, lda, tau, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes an *LQ* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *L***Q*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

Q = *H*(k) ... *H*(2) *H*(1) (or *Q* = *H*(k)' ... *H*(2)' *H*(1)' for complex flavors), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(1:i-1) = 0 and *v*(i) = 1.

On exit, *v*(i+1:*n*) (for real functions) and conjg*v*(i+1:*n*) (for complex functions) are stored in *a*(i, i+1:*n*).

Input Parameters

m INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).

n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgelq2 DOUBLE PRECISION for dgelq2 COMPLEX for cgelq2 COMPLEX*16 for zgelq2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*m*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, the elements on and below the diagonal of the array *a* contain the *m*-by-min(*n*,*m*) lower trapezoidal matrix *L* (*L* is lower triangular if *n* ≥ *m*); the elements above the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors.
tau	REAL for sgelq2 DOUBLE PRECISION for dgelq2 COMPLEX for cgelq2 COMPLEX*16 for zgelq2. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?geql2

Computes the QL factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgeql2( m, n, a, lda, tau, work, info )
call dgeql2( m, n, a, lda, tau, work, info )
call cgeql2( m, n, a, lda, tau, work, info )
call zgeql2( m, n, a, lda, tau, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes a *QL* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *Q***L*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

Q = *H*(k)* ... *H*(2)*H(1), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau*v*v'

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(*m*-k+i+1:*m*) = 0 and *v*(*m*-k+i) = 1.

On exit, *v*(1:*m*-k+i-1) is stored in *a*(1:*m*-k+i-1, *n*-k+i).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeql2 DOUBLE PRECISION for dgeql2 COMPLEX for cgeql2 COMPLEX*16 for zgeql2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*m*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, if *m* ≥ *n*, the lower triangle of the subarray *a*(*m*-*n*+1:*m*, 1:*n*) contains the *n*-by-*n* lower triangular matrix *L*; if *m* < *n*, the elements on and below the (*n*-*m*)th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgeql2 DOUBLE PRECISION for dgeql2 COMPLEX for cgeql2 COMPLEX*16 for zgeql2. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?geqr2

Computes the QR factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgeqr2( m, n, a, lda, tau, work, info )
call dgeqr2( m, n, a, lda, tau, work, info )
call cgeqr2( m, n, a, lda, tau, work, info )
call zgeqr2( m, n, a, lda, tau, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes a *QR* factorization of a real/complex *m*-by-*n* matrix *A* as *A = Q*R*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

Q = H(1)**H*(2)* ... **H*(k), where *k = min*(*m*, *n*)

Each *H*(i) has the form

H(i) = *I - tau*v*v'*

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(1:i-1) = 0 and *v*(i) = 1.

On exit, *v*(i+1:*m*) is stored in *a*(i+1:*m*, i).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeqr2 DOUBLE PRECISION for dgeqr2 COMPLEX for cgeqr2 COMPLEX*16 for zgeqr2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*n*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows:

	on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m* ≥ *n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgeqr2 DOUBLE PRECISION for dgeqr2 COMPLEX for cgeqr2 COMPLEX*16 for zgeqr2. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?geqr2p

Computes the QR factorization of a general rectangular matrix with non-negative diagonal elements using an unblocked algorithm.

Syntax

```
call sgeqr2p( m, n, a, lda, tau, work, info )
call dgeqr2p( m, n, a, lda, tau, work, info )
call cgeqr2p( m, n, a, lda, tau, work, info )
call zgeqr2p( m, n, a, lda, tau, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes a *QR* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *Q***R*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

Q = *H*(1)**H*(2)* ... **H*(k), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(1:i-1) = 0 and *v*(i) = 1.

On exit, *v*(i+1:*m*) is stored in *a*(i+1:*m*, i).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).

n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeqr2p DOUBLE PRECISION for dgeqr2p COMPLEX for cgeqr2p COMPLEX*16 for zgeqr2p. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*n*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m* ≥ *n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors. The diagonal elements of the matrix *R* are non-negative.
tau	REAL for sgeqr2p DOUBLE PRECISION for dgeqr2p COMPLEX for cgeqr2p COMPLEX*16 for zgeqr2p. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?gerq2

Computes the RQ factorization of a general rectangular matrix using an unblocked algorithm.

Syntax

```
call sgerq2( m, n, a, lda, tau, work, info )
call dgerq2( m, n, a, lda, tau, work, info )
call cgerq2( m, n, a, lda, tau, work, info )
call zgerq2( m, n, a, lda, tau, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes a *RQ* factorization of a real/complex *m*-by-*n* matrix *A* as *A* = *R***Q*.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors* :

Q = *H*(1)**H*(2)* ... **H*(k), where *k* = min(*m*, *n*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar stored in *tau*(i), and *v* is a real/complex vector with *v*(*n*-k+i+1:*n*) = 0 and *v*(*n*-k+i) = 1.

On exit, *v*(1:*n*-k+i-1) is stored in *a*(*m*-k+i, 1:*n*-k+i-1).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgerq2 DOUBLE PRECISION for dgerq2 COMPLEX for cgerq2 COMPLEX*16 for zgerq2. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work*(*m*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by the factorization data as follows: on exit, if *m* ≤ *n*, the upper triangle of the subarray *a*(1:*m*, *n*-*m*+1:*n*) contains the *m*-by-*m* upper triangular matrix *R*; if *m* > *n*, the elements on and above the (*m*-*n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgerq2 DOUBLE PRECISION for dgerq2 COMPLEX for cgerq2 COMPLEX*16 for zgerq2. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?gesc2

Solves a system of linear equations using the LU factorization with complete pivoting computed by ?getc2.

Syntax

```
call sgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call dgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call cgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
call zgesc2( n, a, lda, rhs, ipiv, jpiv, scale )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine solves a system of linear equations

*A*X = scale*RHS*

with a general *n*-by-*n* matrix *A* using the *LU* factorization with complete pivoting computed by ?getc2.

Input Parameters

n	INTEGER. The order of the matrix *A*.
a, *rhs*	REAL for sgesc2 DOUBLE PRECISION for dgesc2 COMPLEX for cgesc2 COMPLEX*16 for zgesc2. Arrays: *a*(*lda*, *) contains the *LU* part of the factorization of the *n*-by-*n* matrix *A* computed by ?getc2: *A = P*L*U*Q*. The second dimension of *a* must be at least max(1, *n*); *rhs*(*n*) contains on entry the right hand side vector for the system of equations.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for 1 ≤ i ≤ *n*, row i of the matrix has been interchanged with row *ipiv*(i).
jpiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for 1 ≤ j ≤ *n*, column j of the matrix has been interchanged with column *jpiv*(j).

Output Parameters

rhs	On exit, overwritten with the solution vector *X*.
scale	REAL for sgesc2/cgesc2 DOUBLE PRECISION for dgesc2/zgesc2 Contains the scale factor. *scale* is chosen in the range $0 \le scale \le 1$ to prevent overflow in the solution.

?getc2

Computes the LU factorization with complete pivoting of the general n-by-n matrix.

Syntax

```
call sgetc2( n, a, lda, ipiv, jpiv, info )
call dgetc2( n, a, lda, ipiv, jpiv, info )
call cgetc2( n, a, lda, ipiv, jpiv, info )
call zgetc2( n, a, lda, ipiv, jpiv, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes an *LU* factorization with complete pivoting of the *n*-by-*n* matrix *A*. The factorization has the form *A = P*L*U*Q*, where *P* and *Q* are permutation matrices, *L* is lower triangular with unit diagonal elements and *U* is upper triangular.

The LU factorization computed by this routine is used by `?latdf` to compute a contribution to the reciprocal Dif-estimate.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \ge 0$).
a	REAL for sgetc2 DOUBLE PRECISION for dgetc2 COMPLEX for cgetc2 COMPLEX*16 for zgetc2. Array *a*(*lda*, *) contains the *n*-by-*n* matrix *A* to be factored. The second dimension of *a* must be at least max(1, *n*);
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).

Output Parameters

a	On exit, the factors *L* and *U* from the factorization *A = P*L*U*Q*; the unit diagonal elements of *L* are not stored. If *U*(*k*, *k*) appears to be less than smin, *U*(*k*, *k*) is given the value of smin, that is giving a nonsingular perturbed system.

ipiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for $1 \le i \le n$, row i of the matrix has been interchanged with row *ipiv*(i).
jpiv	INTEGER. Array, DIMENSION at least max(1,*n*). The pivot indices: for $1 \le j \le n$, column j of the matrix has been interchanged with column *jpiv*(j).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *k* >0, *U*(*k*, *k*) is likely to produce overflow if we try to solve for *x* in *A*x* = *b*. So *U* is perturbed to avoid the overflow.

?getf2

Computes the LU factorization of a general m-by-n matrix using partial pivoting with row interchanges (unblocked algorithm).

Syntax

```
call sgetf2( m, n, a, lda, ipiv, info )
call dgetf2( m, n, a, lda, ipiv, info )
call cgetf2( m, n, a, lda, ipiv, info )
call zgetf2( m, n, a, lda, ipiv, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the *LU* factorization of a general *m*-by-*n* matrix *A* using partial pivoting with row interchanges. The factorization has the form

A = *P*L*U*

where *p* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m* > *n*) and *U* is upper triangular (upper trapezoidal if *m* < *n*).

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a	REAL for sgetf2 DOUBLE PRECISION for dgetf2 COMPLEX for cgetf2 COMPLEX*16 for zgetf2.

	Array, DIMENSION (*lda*,*). Contains the matrix *A* to be factored. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).

Output Parameters

a	Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.
ipiv	INTEGER. Array, DIMENSION at least max(1,min(*m*,*n*)). The pivot indices: for 1 ≤ i ≤ *n* , row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* >0, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

?gtts2

Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.

Syntax

```
call sgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call dgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call cgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
call zgtts2( itrans, n, nrhs, dl, d, du, du2, ipiv, b, ldb )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine solves for *X* one of the following systems of linear equations with multiple right hand sides:

*A*X = B*, $A^T*X = B$, or $A^H*X = B$ (for complex matrices only), with a tridiagonal matrix A using the *LU* factorization computed by ?gttrf.

Input Parameters

itrans	INTEGER. Must be 0, 1, or 2. Indicates the form of the equations to be solved: If *itrans* = 0, then *A*X = B* (no transpose). If *itrans* = 1, then $A^T*X = B$ (transpose). If *itrans* = 2, then $A^H*X = B$ (conjugate transpose).
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).

nrhs	INTEGER. The number of right-hand sides, i.e., the number of columns in *B* (*nrhs* ≥ 0).
dl,*d*,*du*,*du2*,*b*	REAL for sgtts2 DOUBLE PRECISION for dgtts2 COMPLEX for cgtts2 COMPLEX*16 for zgtts2. Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1), *du2*(*n* - 2), *b*(*ldb*,*nrhs*). The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A*. The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. The array *du* contains the (*n* - 1) elements of the first super-diagonal of *U*. The array *du2* contains the (*n* - 2) elements of the second super-diagonal of *U*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The leading dimension of *b*; must be *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION (*n*). The pivot indices array, as returned by ?gttrf.

Output Parameters

b	Overwritten by the solution matrix *X*.

?isnan

Tests input for NaN.

Syntax

val = sisnan(*sin*)

val = disnan(*din*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

This logical routine returns .TRUE. if its argument is NaN, and .FALSE. otherwise.

Input Parameters

sin	REAL for sisnan Input to test for NaN.
din	DOUBLE PRECISION for disnan Input to test for NaN.

Output Parameters

val	Logical. Result of the test.

?laisnan

Tests input for NaN.

Syntax

val = slaisnan(*sin1*, *sin2*)

val = dlaisnan(*din1*, *din2*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

This logical routine checks for NaNs (NaN stands for 'Not A Number') by comparing its two arguments for inequality. NaN is the only floating-point value where NaN ≠ NaN returns .TRUE. To check for NaNs, pass the same variable as both arguments.

This routine is not for general use. It exists solely to avoid over-optimization in ?isnan.

Input Parameters

sin1, *sin2*	REAL for sisnan Two numbers to compare for inequality.
din2, *din2*	DOUBLE PRECISION for disnan Two numbers to compare for inequality.

Output Parameters

val	Logical. Result of the comparison.

?labrd

Reduces the first nb rows and columns of a general matrix to a bidiagonal form.

Syntax

call slabrd(*m*, *n*, *nb*, *a*, *lda*, *d*, *e*, *tauq*, *taup*, *x*, *ldx*, *y*, *ldy*)

call dlabrd(*m*, *n*, *nb*, *a*, *lda*, *d*, *e*, *tauq*, *taup*, *x*, *ldx*, *y*, *ldy*)

call clabrd(*m*, *n*, *nb*, *a*, *lda*, *d*, *e*, *tauq*, *taup*, *x*, *ldx*, *y*, *ldy*)

call zlabrd(*m*, *n*, *nb*, *a*, *lda*, *d*, *e*, *tauq*, *taup*, *x*, *ldx*, *y*, *ldy*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine reduces the first *nb* rows and columns of a general *m*-by-*n* matrix *A* to upper or lower bidiagonal form by an orthogonal/unitary transformation *Q'*A*P*, and returns the matrices *X* and *Y* which are needed to apply the transformation to the unreduced part of *A*.

if *m* ≥ *n*, *A* is reduced to upper bidiagonal form; if *m* < *n*, to lower bidiagonal form.

The matrices *Q* and *P* are represented as products of elementary reflectors: *Q = H*(1)*(2)* ...**H*(*nb*), and *P = G*(1)**G*(2)* ...**G*(*nb*)

Each *H*(i) and *G*(i) has the form

H(i) = *I - tauq*v*v'* and *G*(i) = *I - taup*u*u'*

where *tauq* and *taup* are scalars, and *v* and *u* are vectors.

The elements of the vectors *v* and *u* together form the *m*-by-*nb* matrix *V* and the *nb*-by-*n* matrix *U'* which are needed, with *X* and *Y*, to apply the transformation to the unreduced part of the matrix, using a block update of the form: *A := A - V*Y' - X*U'*.

This is an auxiliary routine called by ?gebrd.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
nb	INTEGER. The number of leading rows and columns of *A* to be reduced.
a	REAL for slabrd DOUBLE PRECISION for dlabrd COMPLEX for clabrd COMPLEX*16 for zlabrd. Array *a*(*lda*,*) contains the matrix *A* to be reduced. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldx	INTEGER. The first dimension of the output array *x*; must beat least max(1, *m*).
ldy	INTEGER. The first dimension of the output array *y*; must beat least max(1, *n*).

Output Parameters

a	On exit, the first *nb* rows and columns of the matrix are overwritten; the rest of the array is unchanged. if *m* ≥ *n*, elements on and below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors; and elements above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.

	if *m* < *n*, elements below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements on and above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *p* as a product of elementary reflectors.
d, *e*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays, DIMENSION (*nb*) each. The array *d* contains the diagonal elements of the first *nb* rows and columns of the reduced matrix: *d*(i) = *a*(i,i). The array *e* contains the off-diagonal elements of the first *nb* rows and columns of the reduced matrix.
tauq, *taup*	REAL for slabrd DOUBLE PRECISION for dlabrd COMPLEX for clabrd COMPLEX*16 for zlabrd. Arrays, DIMENSION (*nb*) each. Contain scalar factors of the elementary reflectors which represent the orthogonal/unitary matrices *Q* and *P*, respectively.
x, *y*	REAL for slabrd DOUBLE PRECISION for dlabrd COMPLEX for clabrd COMPLEX*16 for zlabrd. Arrays, dimension *x*(*ldx*, *nb*), *y*(*ldy*, *nb*). The array *x* contains the *m*-by-*nb* matrix *X* required to update the unreduced part of *A*. The array *y* contains the *n*-by-*nb* matrix *Y* required to update the unreduced part of *A*.

Application Notes

if *m* ≥ *n*, then for the elementary reflectors *H*(i) and *G*(i),

v(1:i-1) = 0, *v*(i) = 1, and *v*(i:*m*) is stored on exit in *a*(i:*m*, i); *u*(1:i) = 0, *u*(i+1) = 1, and *u*(i+1:*n*) is stored on exit in *a*(i, i+1:*n*);

tauq is stored in *tauq*(i) and *taup* in *taup*(i).

if *m* < *n*,

v(1:i) = 0, *v*(i+1) = 1, and *v*(i+1:*m*) is stored on exit in *a*(i+2:*m*, i) ; *u*(1:i-1) = 0, *u*(i) = 1, and *u*(i:*n*) is stored on exit in *a*(i, i+1:*n*); *tauq* is stored in *tauq*(i) and *taup* in *taup*(i).

The contents of *a* on exit are illustrated by the following examples with *nb* = 2:

$m = 6,\ n = 5\ (m > n)$

$$\begin{bmatrix} 1 & 1 & u_1 & u_1 & u_1 \\ v_1 & 1 & 1 & u_2 & u_2 \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

$m = 5,\ n = 6\ (m < n)$

$$\begin{bmatrix} 1 & u_1 & u_1 & u_1 & u_1 & u_1 \\ 1 & 1 & u_2 & u_2 & u_2 & u_2 \\ v_1 & 1 & a & a & a & a \\ v_1 & v_2 & a & a & a & a \\ v_1 & v_2 & a & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix which is unchanged, v_i denotes an element of the vector defining *H*(i), and u_i an element of the vector defining *G*(i).

?lacn2

Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.

Syntax

```
call slacn2( n, v, x, isgn, est, kase, isave )
call dlacn2( n, v, x, isgn, est, kase, isave )
call clacn2( n, v, x, est, kase, isave )
call zlacn2( n, v, x, est, kase, isave )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine estimates the 1-norm of a square, real or complex matrix *A*. Reverse communication is used for evaluating matrix-vector products.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 1$).
v, *x*	REAL for slacn2 DOUBLE PRECISION for dlacn2 COMPLEX for clacn2 COMPLEX*16 for zlacn2. Arrays, DIMENSION (*n*) each. *v* is a workspace array. *x* is used as input after an intermediate return.
isgn	INTEGER. Workspace array, DIMENSION (*n*), used with real flavors only.
est	REAL for slacn2/clacn2 DOUBLE PRECISION for dlacn2/zlacn2

	On entry with *kase* set to 1 or 2, and *isave*(1) = 1, *est* must be unchanged from the previous call to the routine.
kase	INTEGER. On the initial call to the routine, *kase* must be set to 0.
isave	INTEGER. Array, DIMENSION (*3*). Contains variables from the previous call to the routine.

Output Parameters

est	An estimate (a lower bound) for norm(*A*).
kase	On an intermediate return, *kase* is set to 1 or 2, indicating whether *x* is overwritten by *A***x* or *A'***x*. On the final return, *kase* is set to 0.
v	On the final return, *v* = *A***w*, where *est* = norm(*v*)/norm(*w*) (*w* is not returned).
x	On an intermediate return, *x* is overwritten by *A***x* , if *kase* = 1, *A'***x* , if *kase* = 2, (*A'* is the conjugate transpose of *A*), and the routine must be re-called with all the other parameters unchanged.
isave	This parameter is used to save variables between calls to the routine.

?lacon

Estimates the 1-norm of a square matrix, using reverse communication for evaluating matrix-vector products.

Syntax

```
call slacon( n, v, x, isgn, est, kase )
call dlacon( n, v, x, isgn, est, kase )
call clacon( n, v, x, est, kase )
call zlacon( n, v, x, est, kase )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine estimates the 1-norm of a square, real/complex matrix *A*. Reverse communication is used for evaluating matrix-vector products.

WARNING. The ?lacon routine is not thread-safe. It is deprecated and retained for the backward compatibility only. Use the thread-safe ?lacn2 routine instead.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 1$).
v, *x*	REAL for slacon DOUBLE PRECISION for dlacon COMPLEX for clacon COMPLEX*16 for zlacon. Arrays, DIMENSION (*n*) each. *v* is a workspace array. *x* is used as input after an intermediate return.
isgn	INTEGER. Workspace array, DIMENSION (*n*), used with real flavors only.
est	REAL for slacon/clacon DOUBLE PRECISION for dlacon/zlacon An estimate that with *kase*=1 or 2 should be unchanged from the previous call to ?lacon.
kase	INTEGER. On the initial call to ?lacon, *kase* should be 0.

Output Parameters

est	REAL for slacon/clacon DOUBLE PRECISION for dlacon/zlacon An estimate (a lower bound) for norm(*A*).
kase	On an intermediate return, *kase* will be 1 or 2, indicating whether *x* should be overwritten by *A***x* or *A'***x*. On the final return from ?lacon, *kase* will again be 0.
v	On the final return, *v* = *A***w*, where *est* = norm(*v*)/norm(*w*) (*w* is not returned).
x	On an intermediate return, *x* should be overwritten by *A***x* , if *kase* = 1, *A'***x* , if *kase* = 2, (where for complex flavors *A'* is the conjugate transpose of *A*), and ?lacon must be re-called with all the other parameters unchanged.

?lacpy

Copies all or part of one two-dimensional array to another.

Syntax

```
call slacpy( uplo, m, n, a, lda, b, ldb )
call dlacpy( uplo, m, n, a, lda, b, ldb )
call clacpy( uplo, m, n, a, lda, b, ldb )
```

```
call zlacpy( uplo, m, n, a, lda, b, ldb )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine copies all or part of a two-dimensional matrix *A* to another matrix *B*.

Input Parameters

uplo	CHARACTER*1. Specifies the part of the matrix *A* to be copied to *B*. If *uplo* = 'U', the upper triangular part of ; if *uplo* = 'L', the lower triangular part of *A*. Otherwise, all of the matrix *A* is copied.
m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a	REAL for slacpy DOUBLE PRECISION for dlacpy COMPLEX for clacpy COMPLEX*16 for zlacpy. Array *a*(*lda*,*), contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1,*n*). If *uplo* = 'U', only the upper triangle or trapezoid is accessed; if *uplo* = 'L', only the lower triangle or trapezoid is accessed.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *m*).
ldb	INTEGER. The first dimension of the output array *b*; *ldb* ≥ max(1, *m*).

Output Parameters

b	REAL for slacpy DOUBLE PRECISION for dlacpy COMPLEX for clacpy COMPLEX*16 for zlacpy. Array *b*(*ldb*,*), contains the *m*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1,*n*). On exit, *B* = *A* in the locations specified by *uplo*.

?ladiv

Performs complex division in real arithmetic, avoiding unnecessary overflow.

Syntax

```
call sladiv( a, b, c, d, p, q )
```

```
call dladiv( a, b, c, d, p, q )
res = cladiv( x, y )
res = zladiv( x, y )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routines `sladiv/dladiv` perform complex division in real arithmetic as

$$p + iq = \frac{a + ib}{c + id}$$

Complex functions `cladiv/zladiv` compute the result as

res = *x*/*y*,

where *x* and *y* are complex. The computation of *x* / *y* will not overflow on an intermediary step unless the results overflows.

Input Parameters

a, *b*, *c*, *d*	`REAL` for `sladiv`
	`DOUBLE PRECISION` for `dladiv`
	The scalars *a*, *b*, *c*, and *d* in the above expression (for real flavors only).

x, *y*	`COMPLEX` for `cladiv`
	`COMPLEX*16` for `zladiv`
	The complex scalars *x* and *y* (for complex flavors only).

Output Parameters

p, *q*	`REAL` for `sladiv`
	`DOUBLE PRECISION` for `dladiv`
	The scalars *p* and *q* in the above expression (for real flavors only).

res	`COMPLEX` for `cladiv`
	`DOUBLE COMPLEX` for `zladiv`
	Contains the result of division *x* / *y*.

?lae2

Computes the eigenvalues of a 2-by-2 symmetric matrix.

Syntax

```
call slae2( a, b, c, rt1, rt2 )
call dlae2( a, b, c, rt1, rt2 )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routines `sla2/dlae2` compute the eigenvalues of a 2-by-2 symmetric matrix

$$\begin{bmatrix} a & b \\ b & c \end{bmatrix}$$

On return, *rt1* is the eigenvalue of larger absolute value, and *rt1* is the eigenvalue of smaller absolute value.

Input Parameters

a, *b*, *c*	REAL for `slae2` DOUBLE PRECISION for `dlae2` The elements *a*, *b*, and *c* of the 2-by-2 matrix above.

Output Parameters

rt1, *rt2*	REAL for `slae2` DOUBLE PRECISION for `dlae2` The computed eigenvalues of larger and smaller absolute value, respectively.

Application Notes

rt1 is accurate to a few ulps barring over/underflow. *rt2* may be inaccurate if there is massive cancellation in the determinant *a*c-b*b*; higher precision or correctly rounded or correctly truncated arithmetic would be needed to compute *rt2* accurately in all cases.

Overflow is possible only if *rt1* is within a factor of 5 of overflow. Underflow is harmless if the input data is 0 or exceeds

underflow_threshold / `macheps`.

?laebz

Computes the number of eigenvalues of a real symmetric tridiagonal matrix which are less than or equal to a given value, and performs other tasks required by the routine `?stebz`.

Syntax

`call slaebz(` *ijob, nitmax, n, mmax, minp, nbmin, abstol, reltol, pivmin, d, e, e2, nval, ab, c, mout, nab, work, iwork, info* `)`

`call dlaebz(` *ijob, nitmax, n, mmax, minp, nbmin, abstol, reltol, pivmin, d, e, e2, nval, ab, c, mout, nab, work, iwork, info* `)`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?laebz` contains the iteration loops which compute and use the function *n*(*w*), which is the count of eigenvalues of a symmetric tridiagonal matrix *T* less than or equal to its argument *w*. It performs a choice of two types of loops:

ijob	=1, followed by
ijob	=2: It takes as input a list of intervals and returns a list of sufficiently small intervals whose union contains the same eigenvalues as the union of the original intervals. The input intervals are (*ab*(j,1),*ab*(j,2)], j=1,...,*minp*. The output interval (*ab*(j,1),*ab*(j,2)] will contain eigenvalues *nab*(j,1)+1,...,*nab*(j,2), where 1 ≤ j ≤ *mout*.
ijob	=3: It performs a binary search in each input interval (*ab*(j,1),*ab*(j,2)] for a point *w*(*j*) such that *n*(*w*(*j*))=*nval*(*j*), and uses *c*(*j*) as the starting point of the search. If such a *w*(*j*) is found, then on output *ab*(j,1)=*ab*(j,2)=*w*. If no such *w*(*j*) is found, then on output (*ab*(j,1),*ab*(j,2)] will be a small interval containing the point where *n*(*w*) jumps through *nval*(*j*), unless that point lies outside the initial interval.

Note that the intervals are in all cases half-open intervals, that is, of the form (*a*,*b*], which includes *b* but not *a* .

To avoid underflow, the matrix should be scaled so that its largest element is no greater than $overflow^{1/2} * overflow^{1/4}$ in absolute value. To assure the most accurate computation of small eigenvalues, the matrix should be scaled to be not much smaller than that, either.

NOTE. In general, the arguments are not checked for unreasonable values.

Input Parameters

ijob	INTEGER. Specifies what is to be done: = 1: Compute *nab* for the initial intervals. = 2: Perform bisection iteration to find eigenvalues of *T*. = 3: Perform bisection iteration to invert *n*(*w*), i.e., to find a point which has a specified number of eigenvalues of *T* to its left. Other values will cause `?laebz` to return with *info*=-1.
nitmax	INTEGER. The maximum number of "levels" of bisection to be performed, i.e., an interval of width *W* will not be made smaller than $2^{-nitmax} * W$. If not all intervals have converged after *nitmax* iterations, then *info* is set to the number of non-converged intervals.
n	INTEGER. The dimension *n* of the tridiagonal matrix *T*. It must be at least 1.
mmax	INTEGER. The maximum number of intervals. If more than *mmax* intervals are generated, then `?laebz` will quit with *info*=*mmax*+1.

minp INTEGER. The initial number of intervals. It may not be greater than *mmax*.

nbmin INTEGER. The smallest number of intervals that should be processed using a vector loop. If zero, then only the scalar loop will be used.

abstol REAL for slaebz
DOUBLE PRECISION for dlaebz.
The minimum (absolute) width of an interval. When an interval is narrower than *abstol*, or than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, i.e., converged. This must be at least zero.

reltol REAL for slaebz
DOUBLE PRECISION for dlaebz.
The minimum relative width of an interval. When an interval is narrower than *abstol*, or than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, i.e., converged. Note: this should always be at least *radix*machine epsilon*.

pivmin REAL for slaebz
DOUBLE PRECISION for dlaebz.
The minimum absolute value of a "pivot" in the Sturm sequence loop. This value **must** be at least (max |e(j)**2|**safe_min*) and at least *safe_min*, where *safe_min* is at least the smallest number that can divide one without overflow.

d, *e*, *e2* REAL for slaebz
DOUBLE PRECISION for dlaebz.
Arrays, dimension (*n*) each. The array *d* contains the diagonal elements of the tridiagonal matrix *T*.
The array *e* contains the off-diagonal elements of the tridiagonal matrix *T* in positions 1 through *n*-1. *e*(*n*)vis arbitrary.
The array *e2* contains the squares of the off-diagonal elements of the tridiagonal matrix *T*. *e2*(*n*) is ignored.

nval INTEGER.
Array, dimension (*minp*).
If *ijob*=1 or 2, not referenced.
If *ijob*=3, the desired values of *n*(*w*).

ab REAL for slaebz
DOUBLE PRECISION for dlaebz.
Array, dimension (*mmax*,2) The endpoints of the intervals. *ab*(j,1) is *a*(*j*), the left endpoint of the *j*-th interval, and *ab*(j,2) is *b*(*j*), the right endpoint of the *j*-th interval.

c REAL for slaebz
DOUBLE PRECISION for dlaebz.
Array, dimension (*mmax*)
If *ijob*=1, ignored.
If *ijob*=2, workspace.
If *ijob*=3, then on input *c*(*j*) should be initialized to the first search point in the binary search.

nab INTEGER.
Array, dimension (*mmax*,2)
If *ijob*=2, then on input, *nab*(i,j) should be set. It must satisfy the condition:
n(*ab*(i,1)) ≤ *nab*(i,1) ≤ *nab*(i,2) ≤ *n*(*ab*(i,2)), which means that in interval i only eigenvalues *nab*(i,1)+1, . . . , *nab*(i,2) are considered. Usually, *nab*(i,j)=*n*(*ab*(i,j)), from a previous call to ?laebz with *ijob*=1.
If *ijob*=3, normally, *nab* should be set to some distinctive value(s) before ?laebz is called.

work REAL for slaebz
DOUBLE PRECISION for dlaebz.
Workspace array, dimension (*mmax*).

iwork INTEGER.
Workspace array, dimension (*mmax*).

Output Parameters

nval The elements of *nval* will be reordered to correspond with the intervals in *ab*. Thus, *nval*(*j*) on output will not, in general be the same as *nval*(*j*) on input, but it will correspond with the interval (*ab*(j,1),*ab*(j,2)] on output.

ab The input intervals will, in general, be modified, split, and reordered by the calculation.

mout INTEGER.
If *ijob*=1, the number of eigenvalues in the intervals.
If *ijob*=2 or 3, the number of intervals output.
If *ijob*=3, *mout* will equal *minp*.

nab If *ijob*=1, then on output *nab*(i,j) will be set to *N*(*ab*(i,j)).
If *ijob*=2, then on output, *nab*(i,j) will contain max(*na*(*k*, min(*nb*(*k*), *N*(*ab*(i,j)))), where *k* is the index of the input interval that the output interval (*ab*(j,1),*ab*(j,2)] came from, and *na*(*k*) and *nb*(*k*) are the input values of *nab*(*k*,1) and *nab*(*k*,2).
If *ijob*=3, then on output, *nab*(i,j) contains *N*(*ab*(i,j)), unless *N*(*w*) > *nval*(i) for all search points *w*, in which case *nab*(i,1) will not be modified, i.e., the output value will be the same as the input value (modulo reorderings, see *nval* and *ab*), or unless *N*(*w*) < *nval*(i) for all search points *w*, in which case *nab*(i,2) will not be modified.

info INTEGER.
If *info* = 0 - all intervals converged
If *info* = 1--*mmax* - the last *info* interval did not converge.
If info = mmax+1 - more than *mmax* intervals were generated

Application Notes

This routine is intended to be called only by other LAPACK routines, thus the interface is less user-friendly. It is intended for two purposes:

(a) finding eigenvalues. In this case, ?laebz should have one or more initial intervals set up in *ab*, and ?laebz should be called with *ijob*=1. This sets up *nab*, and also counts the eigenvalues. Intervals with no eigenvalues would usually be thrown out at this point. Also, if not all the eigenvalues in an interval i are desired, *nab*(i,1) can be increased or *nab*(i,2) decreased. For example, set *nab*(i,1)=*nab*(i,2)-1 to get the largest eigenvalue. ?laebz is then called with *ijob*=2 and *mmax* no smaller than the value of *mout* returned by the call with *ijob*=1. After this (*ijob*=2) call, eigenvalues *nab*(i,1)+1 through *nab*(i,2) are approximately *ab*(i,1) (or *ab*(i,2)) to the tolerance specified by *abstol* and *reltol*.

(b) finding an interval (*a*',*b*'] containing eigenvalues *w*(f),...,*w*(l). In this case, start with a Gershgorin interval (*a*,*b*). Set up *ab* to contain 2 search intervals, both initially (*a*,*b*). One *nval* element should contain f-1 and the other should contain l, while *c* should contain *a* and *b*, respectively. *nab*(i,1) should be -1 and *nab*(i,2) should be *n*+1, to flag an error if the desired interval does not lie in (*a*,*b*). ?laebz is then called with *ijob*=3. On exit, if *w*(f-1) < *w*(f), then one of the intervals -- j -- will have *ab*(j,1)=*ab*(j,2) and *nab*(j,1)=*nab*(j,2)=f-1, while if, to the specified tolerance, *w*(f-k)=...=*w*(f+r), k > 0 and r ≥ 0, then the interval will have *n*(*ab*(j,1))=*nab*(j,1)=f-k and *n*(*ab*(j,2))=*nab*(j,2)=f+r. The cases *w*(l) < *w*(l+1) and *w*(l-r)=...=*w*(l+k) are handled similarly.

?laed0

Used by ?stedc*. Computes all eigenvalues and corresponding eigenvectors of an unreduced symmetric tridiagonal matrix using the divide and conquer method.*

Syntax

```
call slaed0( icompq, qsiz, n, d, e, q, ldq, qstore, ldqs, work, iwork, info )
call dlaed0( icompq, qsiz, n, d, e, q, ldq, qstore, ldqs, work, iwork, info )
call claed0( qsiz, n, d, e, q, ldq, qstore, ldqs, rwork, iwork, info )
call zlaed0( qsiz, n, d, e, q, ldq, qstore, ldqs, rwork, iwork, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

Real flavors of this routine compute all eigenvalues and (optionally) corresponding eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.

Complex flavors claed0/zlaed0 compute all eigenvalues of a symmetric tridiagonal matrix which is one diagonal block of those from reducing a dense or band Hermitian matrix and corresponding eigenvectors of the dense or band matrix.

Input Parameters

icompq — INTEGER. Used with real flavors only.
If *icompq* = 0, compute eigenvalues only.
If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also.
On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.

	If *icompq* = 2, compute eigenvalues and eigenvectors of the tridiagonal matrix.
qsiz	INTEGER. The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; *qsiz* ≥ *n* (for real flavors, *qsiz* ≥ *n* if *icompq* = 1).
n	INTEGER. The dimension of the symmetric tridiagonal matrix (*n* ≥ 0).
d, *e*, *rwork*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d*(*) contains the main diagonal of the tridiagonal matrix. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of the tridiagonal matrix. The dimension of *e* must be at least max(1, *n*-1). *rwork*(*) is a workspace array used in complex flavors only. The dimension of *rwork* must be at least (1 +3*n*+2*n*lg(*n*)+3n^2), where lg(*n*) = smallest integer *k* such that $2^k \geq n$.
q, *qstore*	REAL for slaed0 DOUBLE PRECISION for dlaed0 COMPLEX for claed0 COMPLEX*16 for zlaed0. Arrays: *q*(*ldq*, *), *qstore*(*ldqs*, *). The second dimension of these arrays must be at least max(1, *n*). *For real flavors:* If *icompq* = 0, array *q* is not referenced. If *icompq* = 1, on entry, *q* is a subset of the columns of the orthogonal matrix used to reduce the full matrix to tridiagonal form corresponding to the subset of the full matrix which is being decomposed at this time. If *icompq* = 2, on entry, *q* will be the identity matrix. The array *qstore* is a workspace array referenced only when *icompq* = 1. Used to store parts of the eigenvector matrix when the updating matrix multiplies take place. For complex flavors: On entry, *q* must contain an *qsiz*-by-*n* matrix whose columns are unitarily orthonormal. It is a part of the unitary matrix that reduces the full dense Hermitian matrix to a (reducible) symmetric tridiagonal matrix. The array *qstore* is a workspace array used to store parts of the eigenvector matrix when the updating matrix multiplies take place.
ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
ldqs	INTEGER. The first dimension of the array *qstore*; *ldqs* ≥ max(1, *n*).
work	REAL for slaed0 DOUBLE PRECISION for dlaed0. Workspace array, used in real flavors only.

If *icompq* = 0 or 1, the dimension of *work* must be at least (1 +3*n*+2*n*lg(*n*)+2n^2), where lg(*n*) = smallest integer *k* such that $2^k \geq n$.
If *icompq* = 2, the dimension of *work* must be at least (4*n*+n^2).

iwork INTEGER.
Workspace array.
For real flavors, if *icompq* = 0 or 1, and for complex flavors, the dimension of *iwork* must be at least (6+6*n*+5*n*lg(*n*)).
For real flavors, if *icompq* = 2, the dimension of *iwork* must be at least (3+5*n*).

Output Parameters

d On exit, contains eigenvalues in ascending order.

e On exit, the array is destroyed.

q If *icompq* = 2, on exit, *q* contains the eigenvectors of the tridiagonal matrix.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i* >0, the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *i*/(*n*+1) through mod(*i*, *n*+1).

?laed1

Used by sstedc/dstedc. *Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed1( n, d, q, ldq, indxq, rho, cutpnt, work, iwork, info )
call dlaed1( n, d, q, ldq, indxq, rho, cutpnt, work, iwork, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?laed1 computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. This routine is used only for the eigenproblem which requires all eigenvalues and eigenvectors of a tridiagonal matrix. ?laed7 handles the case in which eigenvalues only or eigenvalues and eigenvectors of a full symmetric matrix (which was reduced to tridiagonal form) are desired.

T = *Q*(in)*(*D*(in)+ *rho***Z***Z*')**Q*'(in) = *Q*(out)**D*(out)**Q*'(out)

where $Z = Q'u$, u is a vector of length n with ones in the $cutpnt$ and ($cutpnt$+1) -th elements and zeros elsewhere. The eigenvectors of the original matrix are stored in Q, and the eigenvalues are in D. The algorithm consists of three stages:

The first stage consists of deflating the size of the problem when there are multiple eigenvalues or if there is a zero in the z vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine ?laed2.

The second stage consists of calculating the updated eigenvalues. This is done by finding the roots of the secular equation via the routine ?laed4 (as called by ?laed3). This routine also calculates the eigenvectors of the current problem.

The final stage consists of computing the updated eigenvectors directly using the updated eigenvalues. The eigenvectors for the current problem are multiplied with the eigenvectors from the overall problem.

Input Parameters

n	INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).
d, q, $work$	REAL for slaed1 DOUBLE PRECISION for dlaed1. Arrays: $d(*)$ contains the eigenvalues of the rank-1-perturbed matrix. The dimension of d must be at least max(1, n). $q(ldq, *)$ contains the eigenvectors of the rank-1-perturbed matrix. The second dimension of q must be at least max(1, n). $work(*)$ is a workspace array, dimension at least ($4n+n^2$).
ldq	INTEGER. The first dimension of the array q; $ldq \geq$ max(1, n).
$indxq$	INTEGER. Array, dimension (n). On entry, the permutation which separately sorts the two subproblems in d into ascending order.
rho	REAL for slaed1 DOUBLE PRECISION for dlaed1. The subdiagonal entry used to create the rank-1 modification. This parameter can be modified by ?laed2, where it is input/output.
$cutpnt$	INTEGER. The location of the last eigenvalue in the leading sub-matrix. min(1,n) $\leq cutpnt \leq n/2$.
$iwork$	INTEGER. Workspace array, dimension ($4n$).

Output Parameters

d	On exit, contains the eigenvalues of the repaired matrix.
q	On exit, q contains the eigenvectors of the repaired tridiagonal matrix.
$indxq$	On exit, contains the permutation which will reintegrate the subproblems back into sorted order, that is, $d(indxq(i = 1, n))$ will be in ascending order.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, an eigenvalue did not converge.

?laed2

Used by sstedc/dstedc. *Merges eigenvalues and deflates secular equation. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed2( k, n, n1, d, q, ldq, indxq, rho, z, dlamda, w, q2, indx, indxc, indxp, coltyp, info )
```

```
call dlaed2( k, n, n1, d, q, ldq, indxq, rho, z, dlamda, w, q2, indx, indxc, indxp, coltyp, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?laed2 merges the two sets of eigenvalues together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more eigenvalues are close together or if there is a tiny entry in the *z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

Input Parameters

k	INTEGER. The number of non-deflated eigenvalues, and the order of the related secular equation ($0 \le k \le n$).
n	INTEGER. The dimension of the symmetric tridiagonal matrix ($n \ge 0$).
n1	INTEGER. The location of the last eigenvalue in the leading sub-matrix; $\min(1,n) \le n1 \le n/2$.
d, *q*, *z*	REAL for slaed2 DOUBLE PRECISION for dlaed2. Arrays: *d*(*) contains the eigenvalues of the two submatrices to be combined. The dimension of *d* must be at least max(1, *n*). *q*(*ldq*, *) contains the eigenvectors of the two submatrices in the two square blocks with corners at (1,1), (*n1*,*n1*) and (*n1*+1,*n1*+1), (*n*,*n*). The second dimension of *q* must be at least max(1, *n*). *z*(*) contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix).
ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
indxq	INTEGER. Array, dimension (*n*).

	On entry, the permutation which separately sorts the two subproblems in *d* into ascending order. Note that elements in the second half of this permutation must first have *n1* added to their values.
rho	REAL for slaed2 DOUBLE PRECISION for dlaed2. On entry, the off-diagonal element associated with the rank-1 cut which originally split the two submatrices which are now being recombined.
indx, *indxp*	INTEGER. Workspace arrays, dimension (*n*) each. Array *indx* contains the permutation used to sort the contents of *dlamda* into ascending order. Array *indxp* contains the permutation used to place deflated values of *d* at the end of the array. *indxp*(1:*k*) points to the nondeflated *d*-values and *indxp*(*k*+1:*n*) points to the deflated eigenvalues.
coltyp	INTEGER. Workspace array, dimension (*n*). During execution, a label which will indicate which of the following types a column in the *q2* matrix is: 1 : non-zero in the upper half only; 2 : dense; 3 : non-zero in the lower half only; 4 : deflated.

Output Parameters

d	On exit, *d* contains the trailing (*n*-*k*) updated eigenvalues (those which were deflated) sorted into increasing order.
q	On exit, *q* contains the trailing (*n*-*k*) updated eigenvectors (those which were deflated) in its last *n*-*k* columns.
z	On exit, *z* content is destroyed by the updating process.
indxq	Destroyed on exit.
rho	On exit, *rho* has been modified to the value required by ?laed3.
dlamda, *w*, *q2*	REAL for slaed2 DOUBLE PRECISION for dlaed2. Arrays: *dlamda*(*n*), *w*(*n*), *q2*($n1^2+(n-n1)^2$). The array *dlamda* contains a copy of the first *k* eigenvalues which is used by ?laed3 to form the secular equation. The array *w* contains the first *k* values of the final deflation-altered *z*-vector which is passed to ?laed3. The array *q2* contains a copy of the first *k* eigenvectors which is used by ?laed3 in a matrix multiply (sgemm/dgemm) to solve for the new eigenvectors.
indxc	INTEGER. Array, dimension (*n*).

	The permutation used to arrange the columns of the deflated *q* matrix into three groups: the first group contains non-zero elements only at and above *n1*, the second contains non-zero elements only below *n1*, and the third is dense.
coltyp	On exit, *coltyp*(i) is the number of columns of type i, for i=1 to 4 only (see the definition of types in the description of *coltyp* in *Input Parameters*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?laed3

Used by sstedc/dstedc. *Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is tridiagonal.*

Syntax

```
call slaed3( k, n, n1, d, q, ldq, rho, dlamda, q2, indx, ctot, w, s, info )
call dlaed3( k, n, n1, d, q, ldq, rho, dlamda, q2, indx, ctot, w, s, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?laed3 finds the roots of the secular equation, as defined by the values in *d*, *w*, and *rho*, between 1 and *k*.

It makes the appropriate calls to ?laed4 and then updates the eigenvectors by multiplying the matrix of eigenvectors of the pair of eigensystems being combined by the matrix of eigenvectors of the *k*-by-*k* system which is solved here.

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray X-MP, Cray Y-MP, Cray C-90, or Cray-2. It could conceivably fail on hexadecimal or decimal machines without guard digits, but none are known.

Input Parameters

k	INTEGER. The number of terms in the rational function to be solved by ?laed4 ($k \geq 0$).
n	INTEGER. The number of rows and columns in the *q* matrix. $n \geq k$ (deflation may result in $n > k$).
n1	INTEGER. The location of the last eigenvalue in the leading sub-matrix; $\min(1,n) \leq n1 \leq n/2$.
q	REAL for slaed3 DOUBLE PRECISION for dlaed3.

	Array *q*(*ldq*, ***). The second dimension of *q* must be at least max(1, *n*). Initially, the first *k* columns of this array are used as workspace.
ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
rho	REAL for slaed3 DOUBLE PRECISION for dlaed3. The value of the parameter in the rank one update equation. *rho* ≥ 0 required.
dlamda, *q2*, *w*	REAL for slaed3 DOUBLE PRECISION for dlaed3. Arrays: *dlamda*(*k*), *q2*(*ldq2*, ***), *w*(*k*). The first *k* elements of the array *dlamda* contain the old roots of the deflated updating problem. These are the poles of the secular equation. The first *k* columns of the array *q2* contain the non-deflated eigenvectors for the split problem. The second dimension of *q2* must be at least max(1, *n*). The first *k* elements of the array *w* contain the components of the deflation-adjusted updating vector.
indx	INTEGER. Array, dimension (*n*). The permutation used to arrange the columns of the deflated *q* matrix into three groups (see ?laed2). The rows of the eigenvectors found by ?laed4 must be likewise permuted before the matrix multiply can take place.
ctot	INTEGER. Array, dimension (4). A count of the total number of the various types of columns in *q*, as described in *indx*. The fourth column type is any column which has been deflated.
s	REAL for slaed3 DOUBLE PRECISION for dlaed3. Workspace array, dimension (*n1*+1)**k* . Will contain the eigenvectors of the repaired matrix which will be multiplied by the previously accumulated eigenvectors to update the system.

Output Parameters

d	REAL for slaed3 DOUBLE PRECISION for dlaed3. Array, dimension at least max(1, *n*). *d*(i) contains the updated eigenvalues for 1 ≤ i ≤ *k*.
q	On exit, the columns 1 to *k* of *q* contain the updated eigenvectors.
dlamda	May be changed on output by having lowest order bit set to zero on Cray X-MP, Cray Y-MP, Cray-2, or Cray C-90, as described above.
w	Destroyed on exit.
info	INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = 1, an eigenvalue did not converge.

?laed4

Used by sstedc/dstedc. *Finds a single root of the secular equation.*

Syntax

```
call slaed4( n, i, d, z, delta, rho, dlam, info )
call dlaed4( n, i, d, z, delta, rho, dlam, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

This routine computes the *i*-th updated eigenvalue of a symmetric rank-one modification to a diagonal matrix whose elements are given in the array *d*, and that

D(i) < *D*(*j*) for *i* < *j*

and that *rho* > 0. This is arranged by the calling routine, and is no loss in generality. The rank-one modified system is thus

diag(*D*) + *rho***Z* * transpose(*Z*).

where we assume the Euclidean norm of *Z* is 1.

The method consists of approximating the rational functions in the secular equation by simpler interpolating rational functions.

Input Parameters

n	INTEGER. The length of all arrays.
i	INTEGER. The index of the eigenvalue to be computed; 1 ≤ i ≤ *n*.
d, *z*	REAL for slaed4 DOUBLE PRECISION for dlaed4 Arrays, dimension (*n*) each. The array *d* contains the original eigenvalues. It is assumed that they are in order, *d*(i) < *d*(*j*) for *i* < *j*. The array *z* contains the components of the updating vector *Z*.
rho	REAL for slaed4 DOUBLE PRECISION for dlaed4 The scalar in the symmetric updating formula.

Output Parameters

delta	REAL for slaed4 DOUBLE PRECISION for dlaed4 Array, dimension (*n*).

	If $n \neq 1$, *delta* contains (*d*(*j*) - *lambda_i*) in its *j*-th component. If $n = 1$, then *delta*(1) = 1. The vector *delta* contains the information necessary to construct the eigenvectors.
dlam	REAL for slaed4 DOUBLE PRECISION for dlaed4 The computed *lambda_i*, the *i*-th updated eigenvalue.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, the updating process failed.

?laed5

Used by sstedc/dstedc. *Solves the 2-by-2 secular equation.*

Syntax

```
call slaed5( i, d, z, delta, rho, dlam )
call dlaed5( i, d, z, delta, rho, dlam )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the *i*-th eigenvalue of a symmetric rank-one modification of a 2-by-2 diagonal matrix

diag(*D*) + *rho***Z* * transpose(*Z*).

The diagonal elements in the array *D* are assumed to satisfy

D(i) < *D*(*j*) for *i* < *j* .

We also assume *rho* > 0 and that the Euclidean norm of the vector *Z* is one.

Input Parameters

i	INTEGER. The index of the eigenvalue to be computed; $1 \leq i \leq 2$.
d, *z*	REAL for slaed5 DOUBLE PRECISION for dlaed5 Arrays, dimension (2) each. The array *d* contains the original eigenvalues. It is assumed that *d*(1) < *d*(2). The array *z* contains the components of the updating vector.
rho	REAL for slaed5 DOUBLE PRECISION for dlaed5 The scalar in the symmetric updating formula.

Output Parameters

delta	REAL for slaed5

DOUBLE PRECISION for dlaed5
Array, dimension (2).
The vector *delta* contains the information necessary to construct the eigenvectors.

dlam — REAL for slaed5
DOUBLE PRECISION for dlaed5
The computed *lambda_i*, the *i*-th updated eigenvalue.

?laed6

Used by sstedc/dstedc. *Computes one Newton step in solution of the secular equation.*

Syntax

```
call slaed6( kniter, orgati, rho, d, z, finit, tau, info )
call dlaed6( kniter, orgati, rho, d, z, finit, tau, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the positive or negative root (closest to the origin) of

$$f(x) = rho + \frac{z(1)}{d(1) - x} + \frac{z(2)}{d(2) - x} + \frac{z(3)}{d(3) - x}$$

It is assumed that if *orgati* = .TRUE. the root is between *d*(2) and *d*(3);otherwise it is between *d*(1) and *d*(2) This routine is called by ?laed4 when necessary. In most cases, the root sought is the smallest in magnitude, though it might not be in some extremely rare situations.

Input Parameters

kniter — INTEGER.
Refer to ?laed4 for its significance.

orgati — LOGICAL.
If *orgati* = .TRUE., the needed root is between *d*(2) and *d*(3); otherwise it is between *d*(1) and *d*(2). See ?laed4 for further details.

rho — REAL for slaed6
DOUBLE PRECISION for dlaed6
Refer to the equation for *f*(*x*) above.

d, *z* — REAL for slaed6
DOUBLE PRECISION for dlaed6
Arrays, dimension (3) each.
The array *d* satisfies *d*(1) < *d*(2) < *d*(3).
Each of the elements in the array *z* must be positive.

finit	REAL for slaed6 DOUBLE PRECISION for dlaed6 The value of $f(x)$ at 0. It is more accurate than the one evaluated inside this routine (if someone wants to do so).

Output Parameters

tau	REAL for slaed6 DOUBLE PRECISION for dlaed6 The root of the equation for $f(x)$.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, failure to converge.

?laed7

Used by ?stedc*. Computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. Used when the original matrix is dense.*

Syntax

call slaed7(*icompq*, *n*, *qsiz*, *tlvls*, *curlvl*, *curpbm*, *d*, *q*, *ldq*, *indxq*, *rho*, *cutpnt*, *qstore*, *qptr*, *prmptr*, *perm*, *givptr*, *givcol*, *givnum*, *work*, *iwork*, *info*)

call dlaed7(*icompq*, *n*, *qsiz*, *tlvls*, *curlvl*, *curpbm*, *d*, *q*, *ldq*, *indxq*, *rho*, *cutpnt*, *qstore*, *qptr*, *prmptr*, *perm*, *givptr*, *givcol*, *givnum*, *work*, *iwork*, *info*)

call claed7(*n*, *cutpnt*, *qsiz*, *tlvls*, *curlvl*, *curpbm*, *d*, *q*, *ldq*, *rho*, *indxq*, *qstore*, *qptr*, *prmptr*, *perm*, *givptr*, *givcol*, *givnum*, *work*, *rwork*, *iwork*, *info*)

call zlaed7(*n*, *cutpnt*, *qsiz*, *tlvls*, *curlvl*, *curpbm*, *d*, *q*, *ldq*, *rho*, *indxq*, *qstore*, *qptr*, *prmptr*, *perm*, *givptr*, *givcol*, *givnum*, *work*, *rwork*, *iwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?laed7 computes the updated eigensystem of a diagonal matrix after modification by a rank-one symmetric matrix. This routine is used only for the eigenproblem which requires all eigenvalues and optionally eigenvectors of a dense symmetric/Hermitian matrix that has been reduced to tridiagonal form. For real flavors, slaed1/dlaed1 handles the case in which all eigenvalues and eigenvectors of a symmetric tridiagonal matrix are desired.

$T = Q(\text{in})*(D(\text{in})+rho*Z*Z')*Q'(\text{in}) = Q(\text{out})*D(\text{out})*Q'(\text{out})$

where $Z = Q'*u$, u is a vector of length n with ones in the *cutpnt* and (*cutpnt* + 1) -th elements and zeros elsewhere. The eigenvectors of the original matrix are stored in Q, and the eigenvalues are in D. The algorithm consists of three stages:

The first stage consists of deflating the size of the problem when there are multiple eigenvalues or if there is a zero in the *z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine `slaed8/dlaed8` (for real flavors) or by the routine `slaed2/dlaed2` (for complex flavors).

The second stage consists of calculating the updated eigenvalues. This is done by finding the roots of the secular equation via the routine `?laed4` (as called by `?laed9` or `?laed3`). This routine also calculates the eigenvectors of the current problem.

The final stage consists of computing the updated eigenvectors directly using the updated eigenvalues. The eigenvectors for the current problem are multiplied with the eigenvectors from the overall problem.

Input Parameters

icompq — INTEGER. Used with real flavors only.
If *icompq* = 0, compute eigenvalues only.
If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also. On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.

n — INTEGER. The dimension of the symmetric tridiagonal matrix (*n* ≥ 0).

cutpnt — INTEGER. The location of the last eigenvalue in the leading sub-matrix.
min(1,*n*) ≤ *cutpnt* ≤ *n* .

qsiz — INTEGER.
The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; *qsiz* ≥ *n* (for real flavors, *qsiz* ≥ *n* if *icompq* = 1).

tlvls — INTEGER. The total number of merging levels in the overall divide and conquer tree.

curlvl — INTEGER. The current level in the overall merge routine, 0 ≤ *curlvl* ≤ *tlvls* .

curpbm — INTEGER. The current problem in the current level in the overall merge routine (counting from upper left to lower right).

d — REAL for `slaed7/claed7`
DOUBLE PRECISION for `dlaed7/zlaed7`.
Array, dimension at least max(1, *n*).
Array *d*(*) contains the eigenvalues of the rank-1-perturbed matrix.

q, *work* — REAL for `slaed7`
DOUBLE PRECISION for `dlaed7`
COMPLEX for `claed7`
COMPLEX*16 for `zlaed7`.
Arrays:
q(*ldq*, *) contains the eigenvectors of the rank-1-perturbed matrix.
The second dimension of *q* must be at least max(1, *n*).
work(*) is a workspace array, dimension at least (3*n*+*qsiz***n*) for real flavors and at least (*qsiz***n*) for complex flavors.

ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
indxq	INTEGER. Array, dimension (*n*). Contains the permutation that separately sorts the two sub-problems in *d* into ascending order.
rho	REAL for slaed7 /claed7 DOUBLE PRECISION for dlaed7/zlaed7. The subdiagonal element used to create the rank-1 modification.
qstore	REAL for slaed7/claed7 DOUBLE PRECISION for dlaed7/zlaed7. Array, dimension (n^2+1). Serves also as output parameter. Stores eigenvectors of submatrices encountered during divide and conquer, packed together. *qptr* points to beginning of the submatrices.
qptr	INTEGER. Array, dimension (*n*+2). Serves also as output parameter. List of indices pointing to beginning of submatrices stored in *qstore*. The submatrices are numbered starting at the bottom left of the divide and conquer tree, from left to right and bottom to top.
prmptr, *perm*, *givptr*	INTEGER. Arrays, dimension (*n* lg*n*) each. The array *prmptr*(*) contains a list of pointers which indicate where in *perm* a level's permutation is stored. *prmptr*(i+1) - *prmptr*(i) indicates the size of the permutation and also the size of the full, non-deflated problem. The array *perm*(*) contains the permutations (from deflation and sorting) to be applied to each eigenblock. This parameter can be modified by ?laed8, where it is output. The array *givptr*(*) contains a list of pointers which indicate where in *givcol* a level's Givens rotations are stored. *givptr*(i+1) - *givptr*(i) indicates the number of Givens rotations.
givcol	INTEGER. Array, dimension (2, *n* lg*n*). Each pair of numbers indicates a pair of columns to take place in a Givens rotation.
givnum	REAL for slaed7/claed7 DOUBLE PRECISION for dlaed7/zlaed7. Array, dimension (2, *n* lg*n*). Each number indicates the *S* value to be used in the corresponding Givens rotation.
iwork	INTEGER. Workspace array, dimension (4*n*).
rwork	REAL for claed7 DOUBLE PRECISION for zlaed7. Workspace array, dimension (3*n*+2*qsiz***n*). Used in complex flavors only.

Output Parameters

d	On exit, contains the eigenvalues of the repaired matrix.

q	On exit, *q* contains the eigenvectors of the repaired tridiagonal matrix.
indxq	INTEGER. Array, dimension (*n*). Contains the permutation that reintegrates the subproblems back into a sorted order, that is, *d*(*indxq*(i = 1, *n*)) will be in the ascending order.
rho	This parameter can be modified by ?laed8, where it is input/output.
prmptr, *perm*, *givptr*	INTEGER. Arrays, dimension (*n* lg*n*) each. The array *prmptr* contains an updated list of pointers. The array *perm* contains an updated permutation. The array *givptr* contains an updated list of pointers.
givcol	This parameter can be modified by ?laed8, where it is output.
givnum	This parameter can be modified by ?laed8, where it is output.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, an eigenvalue did not converge.

?laed8

Used by ?stedc. *Merges eigenvalues and deflates secular equation. Used when the original matrix is dense.*

Syntax

call slaed8(*icompq*, *k*, *n*, *qsiz*, *d*, *q*, *ldq*, *indxq*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *perm*, *givptr*, *givcol*, *givnum*, *indxp*, *indx*, *info*)

call dlaed8(*icompq*, *k*, *n*, *qsiz*, *d*, *q*, *ldq*, *indxq*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *perm*, *givptr*, *givcol*, *givnum*, *indxp*, *indx*, *info*)

call claed8(*k*, *n*, *qsiz*, *q*, *ldq*, *d*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *indxp*, *indx*, *indxq*, *perm*, *givptr*, *givcol*, *givnum*, *info*)

call zlaed8(*k*, *n*, *qsiz*, *q*, *ldq*, *d*, *rho*, *cutpnt*, *z*, *dlamda*, *q2*, *ldq2*, *w*, *indxp*, *indx*, *indxq*, *perm*, *givptr*, *givcol*, *givnum*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine merges the two sets of eigenvalues together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more eigenvalues are close together or if there is a tiny element in the *z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

Input Parameters

icompq	INTEGER. Used with real flavors only. If *icompq* = 0, compute eigenvalues only.

	If *icompq* = 1, compute eigenvectors of original dense symmetric matrix also. On entry, the array *q* must contain the orthogonal matrix used to reduce the original matrix to tridiagonal form.
n	INTEGER. The dimension of the symmetric tridiagonal matrix (*n* ≥ 0).
cutpnt	INTEGER. The location of the last eigenvalue in the leading sub-matrix. min(1,*n*) ≤ *cutpnt* ≤ *n* .
qsiz	INTEGER. The dimension of the orthogonal/unitary matrix used to reduce the full matrix to tridiagonal form; *qsiz* ≥ *n* (for real flavors, *qsiz* ≥ *n* if *icompq* = 1).
d, *z*	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8. Arrays, dimension at least max(1, *n*) each. The array *d*(*) contains the eigenvalues of the two submatrices to be combined. On entry, *z*(*) contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix). The contents of *z* are destroyed by the updating process.
q	REAL for slaed8 DOUBLE PRECISION for dlaed8 COMPLEX for claed8 COMPLEX*16 for zlaed8. Array *q*(*ldq*, *). The second dimension of *q* must be at least max(1, *n*). On entry, *q* contains the eigenvectors of the partially solved system which has been previously updated in matrix multiplies with other partially solved eigensystems. For real flavors, If *icompq* = 0, *q* is not referenced.
ldq	INTEGER. The first dimension of the array *q*; *ldq* ≥ max(1, *n*).
ldq2	INTEGER. The first dimension of the output array *q2*; *ldq2* ≥ max(1, *n*).
indxq	INTEGER. Array, dimension (*n*). The permutation that separately sorts the two sub-problems in *d* into ascending order. Note that elements in the second half of this permutation must first have *cutpnt* added to their values in order to be accurate.
rho	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8. On entry, the off-diagonal element associated with the rank-1 cut which originally split the two submatrices which are now being recombined.

Output Parameters

k	INTEGER. The number of non-deflated eigenvalues, and the order of the related secular equation.
d	On exit, contains the trailing (*n*-*k*) updated eigenvalues (those which were deflated) sorted into increasing order.
z	On exit, the updating process destroys the contents of *z*.
q	On exit, *q* contains the trailing (*n*-*k*) updated eigenvectors (those which were deflated) in its last (*n*-*k*) columns.
indxq	INTEGER. Array, dimension (*n*). The permutation of merged eigenvalues set.
rho	On exit, *rho* has been modified to the value required by ?laed3.
dlamda, *w*	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8. Arrays, dimension (*n*) each. The array *dlamda*(*) contains a copy of the first *k* eigenvalues which will be used by ?laed3 to form the secular equation. The array *w*(*) will hold the first *k* values of the final deflation-altered *z*-vector and will be passed to ?laed3.
q2	REAL for slaed8 DOUBLE PRECISION for dlaed8 COMPLEX for claed8 COMPLEX*16 for zlaed8. Array *q2*(*ldq2*, *). The second dimension of *q2* must be at least max(1, *n*). Contains a copy of the first *k* eigenvectors which will be used by slaed7/dlaed7 in a matrix multiply (sgemm/dgemm) to update the new eigenvectors. For real flavors, If *icompq* = 0, *q2* is not referenced.
indxp, *indx*	INTEGER. Workspace arrays, dimension (*n*) each. The array *indxp*(*) will contain the permutation used to place deflated values of *d* at the end of the array. On output, *indxp*(1:*k*) points to the nondeflated *d*-values and *indxp*(*k*+1:*n*) points to the deflated eigenvalues. The array *indx*(*) will contain the permutation used to sort the contents of *d* into ascending order.
perm	INTEGER. Array, dimension (*n*). Contains the permutations (from deflation and sorting) to be applied to each eigenblock.
givptr	INTEGER. Contains the number of Givens rotations which took place in this subproblem.
givcol	INTEGER. Array, dimension (2, *n*). Each pair of numbers indicates a pair of columns to take place in a Givens rotation.
givnum	REAL for slaed8/claed8 DOUBLE PRECISION for dlaed8/zlaed8.

	Array, dimension (2, *n*). Each number indicates the *S* value to be used in the corresponding Givens rotation.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?laed9

Used by sstedc/dstedc. *Finds the roots of the secular equation and updates the eigenvectors. Used when the original matrix is dense.*

Syntax

```
call slaed9( k, kstart, kstop, n, d, q, ldq, rho, dlamda, w, s, lds, info )
call dlaed9( k, kstart, kstop, n, d, q, ldq, rho, dlamda, w, s, lds, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine finds the roots of the secular equation, as defined by the values in *d*, *z*, and *rho*, between *kstart* and *kstop*. It makes the appropriate calls to slaed4/dlaed4 and then stores the new matrix of eigenvectors for use in calculating the next level of *z* vectors.

Input Parameters

k	INTEGER. The number of terms in the rational function to be solved by slaed4/dlaed4 ($k \geq 0$).
kstart, *kstop*	INTEGER. The updated eigenvalues *lambda*(i), $kstart \leq i \leq kstop$ are to be computed. $1 \leq kstart \leq kstop \leq k$.
n	INTEGER. The number of rows and columns in the *Q* matrix. $n \geq k$ (deflation may result in $n > k$).
q	REAL for slaed9 DOUBLE PRECISION for dlaed9. Workspace array, dimension (*ldq*, *). The second dimension of *q* must be at least max(1, *n*).
ldq	INTEGER. The first dimension of the array *q*; $ldq \geq \max(1, n)$.
rho	REAL for slaed9 DOUBLE PRECISION for dlaed9 The value of the parameter in the rank one update equation. $rho \geq 0$ required.
dlamda, *w*	REAL for slaed9 DOUBLE PRECISION for dlaed9

Arrays, dimension (*k*) each. The first *k* elements of the array *dlamda*(*) contain the old roots of the deflated updating problem. These are the poles of the secular equation.
The first *k* elements of the array *w*(*) contain the components of the deflation-adjusted updating vector.

lds — INTEGER. The first dimension of the output array *s*; *lds* ≥ max(1, *k*).

Output Parameters

d — REAL for slaed9
DOUBLE PRECISION for dlaed9
Array, dimension (*n*). Elements in *d(i)* are not referenced for 1 ≤ *i* < *kstart* or *kstop* < *i* ≤ *n*.

s — REAL for slaed9
DOUBLE PRECISION for dlaed9.
Array, dimension (*lds*, *) .
The second dimension of *s* must be at least max(1, *k*). Will contain the eigenvectors of the repaired matrix which will be stored for subsequent *z* vector calculation and multiplied by the previously accumulated eigenvectors to update the system.

dlamda — On exit, the value is modified to make sure all *dlamda*(*i*) - *dlamda*(*j*) can be computed with high relative accuracy, barring overflow and underflow.

w — Destroyed on exit.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the eigenvalue did not converge.

?laeda

Used by ?stedc*. Computes the Z vector determining the rank-one modification of the diagonal matrix. Used when the original matrix is dense.*

Syntax

```
call slaeda( n, tlvls, curlvl, curpbm, prmptr, perm, givptr, givcol, givnum, q, qptr, z, ztemp, info )
```

```
call dlaeda( n, tlvls, curlvl, curpbm, prmptr, perm, givptr, givcol, givnum, q, qptr, z, ztemp, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?laeda computes the *Z* vector corresponding to the merge step in the *curlvl*-th step of the merge process with *tlvls* steps for the *curpbm*-th problem.

Input Parameters

n	INTEGER. The dimension of the symmetric tridiagonal matrix ($n \geq 0$).
tlvls	INTEGER. The total number of merging levels in the overall divide and conquer tree.
curlvl	INTEGER. The current level in the overall merge routine, $0 \leq curlvl \leq tlvls$.
curpbm	INTEGER. The current problem in the current level in the overall merge routine (counting from upper left to lower right).
prmptr, *perm*, *givptr*	INTEGER. Arrays, dimension ($n \lg n$) each. The array *prmptr*(*) contains a list of pointers which indicate where in *perm* a level's permutation is stored. *prmptr*(i+1) - *prmptr*(i) indicates the size of the permutation and also the size of the full, non-deflated problem. The array *perm*(*) contains the permutations (from deflation and sorting) to be applied to each eigenblock. The array *givptr*(*) contains a list of pointers which indicate where in *givcol* a level's Givens rotations are stored. *givptr*(i+1) - *givptr*(i) indicates the number of Givens rotations.
givcol	INTEGER. Array, dimension (2, $n \lg n$). Each pair of numbers indicates a pair of columns to take place in a Givens rotation.
givnum	REAL for slaeda DOUBLE PRECISION for dlaeda. Array, dimension (2, $n \lg n$). Each number indicates the *S* value to be used in the corresponding Givens rotation.
q	REAL for slaeda DOUBLE PRECISION for dlaeda. Array, dimension (n^2). Contains the square eigenblocks from previous levels, the starting positions for blocks are given by *qptr*.
qptr	INTEGER. Array, dimension (n+2). Contains a list of pointers which indicate where in *q* an eigenblock is stored. sqrt(*qptr*(i+1) - *qptr*(i)) indicates the size of the block.
ztemp	REAL for slaeda DOUBLE PRECISION for dlaeda. Workspace array, dimension (n).

Output Parameters

z	REAL for slaeda DOUBLE PRECISION for dlaeda.

	Array, dimension (*n*). Contains the updating vector (the last row of the first sub-eigenvector matrix and the first row of the second sub-eigenvector matrix).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?laein

Computes a specified right or left eigenvector of an upper Hessenberg matrix by inverse iteration.

Syntax

```
call slaein( rightv, noinit, n, h, ldh, wr, wi, vr, vi, b, ldb, work, eps3, smlnum, bignum, info )
call dlaein( rightv, noinit, n, h, ldh, wr, wi, vr, vi, b, ldb, work, eps3, smlnum, bignum, info )
call claein( rightv, noinit, n, h, ldh, w, v, b, ldb, rwork, eps3, smlnum, info )
call zlaein( rightv, noinit, n, h, ldh, w, v, b, ldb, rwork, eps3, smlnum, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?laein` uses inverse iteration to find a right or left eigenvector corresponding to the eigenvalue (*wr*,*wi*) of a real upper Hessenberg matrix *H* (for real flavors `slaein`/`dlaein`) or to the eigenvalue *w* of a complex upper Hessenberg matrix *H* (for complex flavors `claein`/`zlaein`).

Input Parameters

rightv	LOGICAL. If *rightv* = .TRUE., compute right eigenvector; if *rightv* = .FALSE., compute left eigenvector.
noinit	LOGICAL. If *noinit* = .TRUE., no initial vector is supplied in (*vr*,*vi*) or in *v* (for complex flavors); if *noinit* = .FALSE., initial vector is supplied in (*vr*,*vi*) or in *v* (for complex flavors).
n	INTEGER. The order of the matrix *H* (*n* ≥ 0).
h	REAL for `slaein` DOUBLE PRECISION for `dlaein` COMPLEX for `claein` COMPLEX*16 for `zlaein`. Array *h*(*ldh*, *). The second dimension of *h* must be at least max(1, *n*). Contains the upper Hessenberg matrix *H*.

ldh	INTEGER. The first dimension of the array *h*; *ldh* ≥ max(1, *n*).
wr, *wi*	REAL for slaein DOUBLE PRECISION for dlaein. The real and imaginary parts of the eigenvalue of *H* whose corresponding right or left eigenvector is to be computed (for real flavors of the routine).
w	COMPLEX for claein COMPLEX*16 for zlaein. The eigenvalue of *H* whose corresponding right or left eigenvector is to be computed (for complex flavors of the routine).
vr, *vi*	REAL for slaein DOUBLE PRECISION for dlaein. Arrays, dimension (*n*) each. Used for real flavors only. On entry, if *noinit* = .FALSE. and *wi* = 0.0, *vr* must contain a real starting vector for inverse iteration using the real eigenvalue *wr*; if *noinit* = .FALSE. and *wi* ≠ 0.0, *vr* and *vi* must contain the real and imaginary parts of a complex starting vector for inverse iteration using the complex eigenvalue (*wr*,*wi*);otherwise *vr* and *vi* need not be set.
v	COMPLEX for claein COMPLEX*16 for zlaein. Array, dimension (*n*). Used for complex flavors only. On entry, if *noinit* = .FALSE., *v* must contain a starting vector for inverse iteration; otherwise *v* need not be set.
b	REAL for slaein DOUBLE PRECISION for dlaein COMPLEX for claein COMPLEX*16 for zlaein. Workspace array *b*(*ldb*, *). The second dimension of *b* must be at least max(1, *n*).
ldb	INTEGER. The first dimension of the array *b*; *ldb* ≥ *n*+1 for real flavors; *ldb* ≥ max(1, *n*) for complex flavors.
work	REAL for slaein DOUBLE PRECISION for dlaein. Workspace array, dimension (*n*). Used for real flavors only.
rwork	REAL for claein DOUBLE PRECISION for zlaein. Workspace array, dimension (*n*). Used for complex flavors only.
eps3, *smlnum*	REAL for slaein/claein DOUBLE PRECISION for dlaein/zlaein.

eps3 is a small machine-dependent value which is used to perturb close eigenvalues, and to replace zero pivots.
smlnum is a machine-dependent value close to underflow threshold.

bignum — REAL for slaein
DOUBLE PRECISION for dlaein.
bignum is a machine-dependent value close to overflow threshold. Used for real flavors only.

Output Parameters

vr, *vi* — On exit, if *wi* = 0.0 (real eigenvalue), *vr* contains the computed real eigenvector; if *wi* ≠ 0.0 (complex eigenvalue), *vr* and *vi* contain the real and imaginary parts of the computed complex eigenvector. The eigenvector is normalized so that the component of largest magnitude has magnitude 1; here the magnitude of a complex number (*x*,*y*) is taken to be |*x*| + |*y*|.
vi is not referenced if *wi* = 0.0.

v — On exit, *v* contains the computed eigenvector, normalized so that the component of largest magnitude has magnitude 1; here the magnitude of a complex number (*x*,*y*) is taken to be |*x*| + |*y*|.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = 1, inverse iteration did not converge. For real flavors, *vr* is set to the last iterate, and so is *vi*, if *wi* ≠ 0.0. For complex flavors, *v* is set to the last iterate.

?laev2

Computes the eigenvalues and eigenvectors of a 2-by-2 symmetric/Hermitian matrix.

Syntax

```
call slaev2( a, b, c, rt1, rt2, cs1, sn1 )
call dlaev2( a, b, c, rt1, rt2, cs1, sn1 )
call claev2( a, b, c, rt1, rt2, cs1, sn1 )
call zlaev2( a, b, c, rt1, rt2, cs1, sn1 )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine performs the eigendecomposition of a 2-by-2 symmetric matrix

$$\begin{bmatrix} a & b \\ b & c \end{bmatrix}$$ (for *slaev2*/*dlaev2*) or Hermitian matrix $$\begin{bmatrix} a & b \\ \text{conjg}(b) & c \end{bmatrix}$$

(for claev2/zlaev2).

On return, *rt1* is the eigenvalue of larger absolute value, *rt2* of smaller absolute value, and (*cs1*, *sn1*) is the unit right eigenvector for *rt1*, giving the decomposition

$$\begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ b & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

(for slaev2/dlaev2),

or

$$\begin{bmatrix} cs1 & conjg(sn1) \\ -sn1 & cs1 \end{bmatrix} \cdot \begin{bmatrix} a & b \\ conjg(b) & c \end{bmatrix} \cdot \begin{bmatrix} cs1 & -conjg(sn1) \\ sn1 & cs1 \end{bmatrix} = \begin{bmatrix} rt1 & 0 \\ 0 & rt2 \end{bmatrix}$$

(for claev2/zlaev2).

Input Parameters

a, *b*, *c*	REAL for slaev2 DOUBLE PRECISION for dlaev2 COMPLEX for claev2 COMPLEX*16 for zlaev2. Elements of the input matrix.

Output Parameters

rt1, *rt2*	REAL for slaev2/claev2 DOUBLE PRECISION for dlaev2/zlaev2. Eigenvalues of larger and smaller absolute value, respectively.
cs1	REAL for slaev2/claev2 DOUBLE PRECISION for dlaev2/zlaev2.
sn1	REAL for slaev2 DOUBLE PRECISION for dlaev2 COMPLEX for claev2 COMPLEX*16 for zlaev2. The vector (*cs1*, *sn1*) is the unit right eigenvector for rt1.

Application Notes

rt1 is accurate to a few ulps barring over/underflow. *rt2* may be inaccurate if there is massive cancellation in the determinant *a*c-b*b*; higher precision or correctly rounded or correctly truncated arithmetic would be needed to compute *rt2* accurately in all cases. *cs1* and *sn1* are accurate to a few ulps barring over/underflow. Overflow is possible only if *rt1* is within a factor of 5 of overflow. Underflow is harmless if the input data is 0 or exceeds *underflow_threshold* / macheps.

?laexc

Swaps adjacent diagonal blocks of a real upper quasi-triangular matrix in Schur canonical form, by an orthogonal similarity transformation.

Syntax

```
call slaexc( wantq, n, t, ldt, q, ldq, j1, n1, n2, work, info )
call dlaexc( wantq, n, t, ldt, q, ldq, j1, n1, n2, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine swaps adjacent diagonal blocks T_{11} and T_{22} of order 1 or 2 in an upper quasi-triangular matrix T by an orthogonal similarity transformation.

T must be in Schur canonical form, that is, block upper triangular with 1-by-1 and 2-by-2 diagonal blocks; each 2-by-2 diagonal block has its diagonal elements equal and its off-diagonal elements of opposite sign.

Input Parameters

wantq	LOGICAL. If *wantq* = .TRUE., accumulate the transformation in the matrix *Q*; If *wantq* = .FALSE., do not accumulate the transformation.
n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
t, *q*	REAL for slaexc DOUBLE PRECISION for dlaexc Arrays: *t*(*ldt*,*) contains on entry the upper quasi-triangular matrix *T*, in Schur canonical form. The second dimension of *t* must be at least max(1, *n*). *q*(*ldq*,*) contains on entry, if *wantq* = .TRUE., the orthogonal matrix *Q*. If *wantq* = .FALSE., *q* is not referenced. The second dimension of *q* must be at least max(1, *n*).
ldt	INTEGER. The first dimension of *t*; at least max(1, *n*).
ldq	INTEGER. The first dimension of *q*; If *wantq* = .FALSE., then *ldq* ≥ 1. If *wantq* = .TRUE., then *ldq* ≥ max(1,*n*).
j1	INTEGER. The index of the first row of the first block T_{11}.
n1	INTEGER. The order of the first block T_{11} (*n1* = 0, 1, or 2).
n2	INTEGER. The order of the second block T_{22} (*n2* = 0, 1, or 2).
work	REAL for slaexc; DOUBLE PRECISION for dlaexc.

Workspace array, DIMENSION (*n*).

Output Parameters

t	On exit, the updated matrix *T*, again in Schur canonical form.
q	On exit, if *wantq* = .TRUE., the updated matrix *Q*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, the transformed matrix *T* would be too far from Schur form; the blocks are not swapped and *T* and *Q* are unchanged.

?lag2

Computes the eigenvalues of a 2-by-2 generalized eigenvalue problem, with scaling as necessary to avoid over-/underflow.

Syntax

```
call slag2( a, lda, b, ldb, safmin, scale1, scale2, wr1, wr2, wi )
call dlag2( a, lda, b, ldb, safmin, scale1, scale2, wr1, wr2, wi )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the eigenvalues of a 2 x 2 generalized eigenvalue problem *A* - *w* **B*, with scaling as necessary to avoid over-/underflow. The scaling factor, *s*, results in a modified eigenvalue equation

*s*A - w*B* ,

where *s* is a non-negative scaling factor chosen so that *w*, *w*B*, and *s*A* do not overflow and, if possible, do not underflow, either.

Input Parameters

a, *b*	REAL for slag2 DOUBLE PRECISION for dlag2 Arrays: *a*(*lda*,2) contains, on entry, the 2 x 2 matrix *A*. It is assumed that its 1-norm is less than 1/*safmin*. Entries less than sqrt(*safmin*)*norm(*A*) are subject to being treated as zero. *b*(*ldb*,2) contains, on entry, the 2 x 2 upper triangular matrix *B*. It is assumed that the one-norm of *B* is less than 1/*safmin*. The diagonals should be at least sqrt(*safmin*) times the largest element of *B* (in absolute value); if a diagonal is smaller than that, then +/- sqrt(*safmin*) will be used instead of that diagonal.
lda	INTEGER. The first dimension of *a*; *lda* ≥ 2.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ 2.

safmin — REAL for slag2;
DOUBLE PRECISION for dlag2.
The smallest positive number such that 1/*safmin* does not overflow. (This should always be ?lamch('S') - it is an argument in order to avoid having to call ?lamch frequently.)

Output Parameters

scale1 — REAL for slag2;
DOUBLE PRECISION for dlag2.
A scaling factor used to avoid over-/underflow in the eigenvalue equation which defines the first eigenvalue. If the eigenvalues are complex, then the eigenvalues are (*wr1* +/- *wii*)/*scale1* (which may lie outside the exponent range of the machine), *scale1*=*scale2*, and *scale1* will always be positive.
If the eigenvalues are real, then the first (real) eigenvalue is *wr1*/*scale1*, but this may overflow or underflow, and in fact, *scale1* may be zero or less than the underflow threshhold if the exact eigenvalue is sufficiently large.

scale2 — REAL for slag2;
DOUBLE PRECISION for dlag2.
A scaling factor used to avoid over-/underflow in the eigenvalue equation which defines the second eigenvalue. If the eigenvalues are complex, then *scale2*=*scale1*. If the eigenvalues are real, then the second (real) eigenvalue is *wr2*/*scale2*, but this may overflow or underflow, and in fact, *scale2* may be zero or less than the underflow threshold if the exact eigenvalue is sufficiently large.

wr1 — REAL for slag2;
DOUBLE PRECISION for dlag2.
If the eigenvalue is real, then *wr1* is *scale1* times the eigenvalue closest to the (2,2) element of *A**inv(*B*).
If the eigenvalue is complex, then *wr1*=*wr2* is *scale1* times the real part of the eigenvalues.

wr2 — REAL for slag2;
DOUBLE PRECISION for dlag2.
If the eigenvalue is real, then *wr2* is *scale2* times the other eigenvalue. If the eigenvalue is complex, then *wr1*=*wr2* is *scale1* times the real part of the eigenvalues.

wi — REAL for slag2;
DOUBLE PRECISION for dlag2.
If the eigenvalue is real, then *wi* is zero. If the eigenvalue is complex, then *wi* is *scale1* times the imaginary part of the eigenvalues. *wi* will always be non-negative.

?lags2

Computes 2-by-2 orthogonal matrices U, V, and Q, and applies them to matrices A and B such that the rows of the transformed A and B are parallel.

Syntax

`call slags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq)`

`call dlags2( upper, a1, a2, a3, b1, b2, b3, csu, snu, csv, snv, csq, snq)`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes 2-by-2 orthogonal matrices *U*, *V* and *Q*, such that if *upper* = .TRUE., then

$$U'*A*Q = U'*\begin{bmatrix} A_1 & A_2 \\ 0 & A_3 \end{bmatrix}*Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

and

$$V'*B*Q = U'*\begin{bmatrix} B_1 & B_2 \\ 0 & B_3 \end{bmatrix}*Q = \begin{bmatrix} x & 0 \\ x & x \end{bmatrix}$$

or if *upper* = .FALSE., then

$$U'*A*Q = U'*\begin{bmatrix} A_1 & 0 \\ A_2 & A_3 \end{bmatrix}*Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

and

$$V'*B*Q = U'*\begin{bmatrix} B_1 & 0 \\ B_2 & B_3 \end{bmatrix}*Q = \begin{bmatrix} x & x \\ 0 & x \end{bmatrix}$$

The rows of the transformed *A* and *B* are parallel, where

$$U=\begin{bmatrix} csu & snu \\ -snu & csu \end{bmatrix}, V = \begin{bmatrix} csv & snv \\ -snv & csv \end{bmatrix}, Q = \begin{bmatrix} csq & snq \\ -snq & csq \end{bmatrix}$$

Here Z' denotes the transpose of Z.

Input Parameters

upper	LOGICAL. If *upper* = .TRUE., the input matrices *A* and *B* are upper triangular; If *upper* = .FALSE., the input matrices *A* and *B* are lower triangular.
a1, *a2*, *a3*	REAL for slags2 DOUBLE PRECISION for dlags2 On entry, *a1*, *a2* and *a3* are elements of the input 2-by-2 upper (lower) triangular matrix *A*.
b1, *b2*, *b3*	REAL for slags2 DOUBLE PRECISION for dlags2 On entry, *b1*, *b2* and *b3* are elements of the input 2-by-2 upper (lower) triangular matrix *B*.

Output Parameters

csu, *snu*	REAL for slags2 DOUBLE PRECISION for dlags2 The desired orthogonal matrix *U*.
csv, *snv*	REAL for slags2 DOUBLE PRECISION for dlags2 The desired orthogonal matrix *V*.
csq, *snq*	REAL for slags2 DOUBLE PRECISION for dlags2 The desired orthogonal matrix *Q*.

?lagtf

*Computes an LU factorization of a matrix T-≤*I, where T is a general tridiagonal matrix, and ≤ is a scalar, using partial pivoting with row interchanges.*

Syntax

```
call slagtf( n, a, lambda, b, c, tol, d, in, info )
call dlagtf( n, a, lambda, b, c, tol, d, in, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine factorizes the matrix (*T - lambda*I*), where *T* is an *n*-by-*n* tridiagonal matrix and *lambda* is a scalar, as

*T - lambda*I = P*L*U*,

where *P* is a permutation matrix, *L* is a unit lower tridiagonal matrix with at most one non-zero sub-diagonal elements per column and *U* is an upper triangular matrix with at most two non-zero super-diagonal elements per column. The factorization is obtained by Gaussian elimination with partial pivoting and implicit row scaling. The parameter *lambda* is included in the routine so that ?lagtf may be used, in conjunction with ?lagts, to obtain eigenvectors of *T* by inverse iteration.

Input Parameters

n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
a, *b*, *c*	REAL for slagtf DOUBLE PRECISION for dlagtf Arrays, dimension *a*(*n*), *b*(*n*-1), *c*(*n*-1): On entry, *a*(*) must contain the diagonal elements of the matrix *T*. On entry, *b*(*) must contain the (*n*-1) super-diagonal elements of *T*. On entry, *c*(*) must contain the (*n*-1) sub-diagonal elements of *T*.
tol	REAL for slagtf DOUBLE PRECISION for dlagtf On entry, a relative tolerance used to indicate whether or not the matrix (*T* - *lambda***I*) is nearly singular. *tol* should normally be chose as approximately the largest relative error in the elements of *T*. For example, if the elements of *T* are correct to about 4 significant figures, then *tol* should be set to about $5*10^{-4}$. If *tol* is supplied as less than eps, where eps is the relative machine precision, then the value eps is used in place of *tol*.

Output Parameters

a	On exit, *a* is overwritten by the *n* diagonal elements of the upper triangular matrix *U* of the factorization of *T*.
b	On exit, *b* is overwritten by the *n*-1 super-diagonal elements of the matrix *U* of the factorization of *T*.
c	On exit, *c* is overwritten by the *n*-1 sub-diagonal elements of the matrix *L* of the factorization of *T*.
d	REAL for slagtf DOUBLE PRECISION for dlagtf Array, dimension (*n*-2). On exit, *d* is overwritten by the *n*-2 second super-diagonal elements of the matrix *U* of the factorization of *T*.
in	INTEGER. Array, dimension (*n*). On exit, *in* contains details of the permutation matrix *p*. If an interchange occurred at the k-th step of the elimination, then *in*(k) = 1, otherwise *in*(k) = 0. The element *in*(*n*) returns the smallest positive integer j such that abs(*u*(j,j)) ≤ norm((*T* - *lambda***I*)(j))**tol*,

where norm(*A*(j)) denotes the sum of the absolute values of the j-th row of the matrix *A*.
If no such j exists then *in*(*n*) is returned as zero. If *in*(*n*) is returned as positive, then a diagonal element of *U* is small, indicating that (*T - lambda*I*) is singular or nearly singular.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*k*, the *k*-th parameter had an illegal value.

?lagtm

*Performs a matrix-matrix product of the form C = alpha*A*B+beta*C, where A is a tridiagonal matrix, B and C are rectangular matrices, and alpha and beta are scalars, which may be 0, 1, or -1.*

Syntax

```
call slagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call dlagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call clagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
call zlagtm( trans, n, nrhs, alpha, dl, d, du, x, ldx, beta, b, ldb )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine performs a matrix-vector product of the form:

*B := alpha*A*X + beta*B*

where *A* is a tridiagonal matrix of order *n*, *B* and *X* are *n*-by-*nrhs* matrices, and *alpha* and *beta* are real scalars, each of which may be 0., 1., or -1.

Input Parameters

trans — CHARACTER*1. Must be 'N' or 'T' or 'C'.
Indicates the form of the equations:
If *trans* = 'N', then *B* := *alpha*A*X* + *beta*B* (no transpose);
If *trans* = 'T', then *B* := *alpha*A*^{T}**X* + *beta*B* (transpose);
If *trans* = 'C', then *B* := *alpha*A*^{H}**X* + *beta*B* (conjugate transpose)

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

nrhs — INTEGER. The number of right-hand sides, i.e., the number of columns in *X* and *B* (*nrhs* ≥ 0).

alpha, *beta* — REAL for slagtm/clagtm
DOUBLE PRECISION for dlagtm/zlagtm

	Specify the scalars *alpha* and *beta* respectively. *alpha* must be 0., 1., or -1.; otherwise, it is assumed to be 0. *beta* must be 0., 1., or -1.; otherwise, it is assumed to be 1.
dl, *d*, *du*	REAL for slagtm DOUBLE PRECISION for dlagtm COMPLEX for clagtm COMPLEX*16 for zlagtm. Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1). The array *dl* contains the (*n* - 1) sub-diagonal elements of *T*. The array *d* contains the *n* diagonal elements of *T*. The array *du* contains the (*n* - 1) super-diagonal elements of *T*.
x, *b*	REAL for slagtm DOUBLE PRECISION for dlagtm COMPLEX for clagtm COMPLEX*16 for zlagtm. Arrays: *x*(*ldx*,*) contains the *n*-by-*nrhs* matrix *X*. The second dimension of *x* must be at least max(1, *nrhs*). *b*(*ldb*,*) contains the *n*-by-*nrhs* matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*).
ldx	INTEGER. The leading dimension of the array *x*; *ldx* ≥ max(1, *n*).
ldb	INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the matrix expression *B* := *alpha*A*X* + *beta*B*

?lagts

*Solves the system of equations (T - lambda*I)*x = y or (T - lambda*I)^T*x = y ,where T is a general tridiagonal matrix and lambda is a scalar, using the LU factorization computed by* ?lagtf.

Syntax

```
call slagts( job, n, a, b, c, d, in, y, tol, info )
call dlagts( job, n, a, b, c, d, in, y, tol, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine may be used to solve for *x* one of the systems of equations:

(*T - lambda*I*)*x = y* or (*T - lambda*I*)'*x = y*,

where *T* is an *n*-by-*n* tridiagonal matrix, following the factorization of (*T - lambda*I*) as

*T - lambda*I = P*L*U*,

computed by the routine ?lagtf.

The choice of equation to be solved is controlled by the argument *job*, and in each case there is an option to perturb zero or very small diagonal elements of *U*, this option being intended for use in applications such as inverse iteration.

Input Parameters

job — INTEGER. Specifies the job to be performed by ?lagts as follows:
= 1: The equations (*T* - *lambda*I*)*x* = *y* are to be solved, but diagonal elements of *U* are not to be perturbed.
= -1: The equations (*T* - *lambda*I*)*x* = *y* are to be solved and, if overflow would otherwise occur, the diagonal elements of *U* are to be perturbed. See argument *tol* below.
= 2: The equations (*T* - *lambda*I*)'*x* = *y* are to be solved, but diagonal elements of *U* are not to be perturbed.
= -2: The equations (*T* - *lambda*I*)'*x* = *y* are to be solved and, if overflow would otherwise occur, the diagonal elements of *U* are to be perturbed. See argument *tol* below.

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

a, *b*, *c*, *d* — REAL for slagts
DOUBLE PRECISION for dlagts
Arrays, dimension *a*(*n*), *b*(*n*-1), *c*(*n*-1), *d*(*n*-2):
On entry, *a*(*) must contain the diagonal elements of *U* as returned from ?lagtf.
On entry, *b*(*) must contain the first super-diagonal elements of *U* as returned from ?lagtf.
On entry, *c*(*) must contain the sub-diagonal elements of *L* as returned from ?lagtf.
On entry, *d*(*) must contain the second super-diagonal elements of *U* as returned from ?lagtf.

in — INTEGER.
Array, dimension (*n*).
On entry, *in*(*) must contain details of the matrix *p* as returned from ?lagtf.

y — REAL for slagts
DOUBLE PRECISION for dlagts
Array, dimension (*n*). On entry, the right hand side vector *y*.

tol — REAL for slagtf
DOUBLE PRECISION for dlagtf.
On entry, with *job* < 0, *tol* should be the minimum perturbation to be made to very small diagonal elements of *U*. *tol* should normally be chosen as about *eps**norm(*U*), where *eps* is the relative machine precision, but if *tol* is supplied as non-positive, then it is reset to *eps**max(abs(u(i,j))). If *job* > 0 then *tol* is not referenced.

Output Parameters

y	On exit, *y* is overwritten by the solution vector *x*.
tol	On exit, *tol* is changed as described in *Input Parameters* section above, only if *tol* is non-positive on entry. Otherwise *tol* is unchanged.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* >0, overflow would occur when computing the *i*th element of the solution vector *x*. This can only occur when *job* is supplied as positive and either means that a diagonal element of *U* is very small, or that the elements of the right-hand side vector *y* are very large.

?lagv2

Computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (A,B) where B is upper triangular.

Syntax

```
call slagv2( a, lda, b, ldb, alphar, alphai, beta, csl, snl, csr, snr )
call dlagv2( a, lda, b, ldb, alphar, alphai, beta, csl, snl, csr, snr )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the Generalized Schur factorization of a real 2-by-2 matrix pencil (*A*,*B*) where *B* is upper triangular. The routine computes orthogonal (rotation) matrices given by *csl*, *snl* and *csr*, *snr* such that:

1) if the pencil (*A*,*B*) has two real eigenvalues (include 0/0 or 1/0 types), then

$$\begin{bmatrix} a_{11} & a_{11} \\ 0 & a_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

$$\begin{bmatrix} b_{11} & b_{11} \\ 0 & b_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} \\ 0 & b_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

2) if the pencil (*A*,*B*) has a pair of complex conjugate eigenvalues, then

$$\begin{bmatrix} a_{11} & a_{11} \\ a_{21} & a_{22} \end{bmatrix} = \begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

$$\begin{bmatrix} b_{11} & 0 \\ 0 & b_{22} \end{bmatrix} = \begin{bmatrix} cs1 & sn1 \\ -sn1 & cs1 \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} \\ 0 & b_{22} \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix}$$

where $b_{11} \geq b_{22} > 0$.

Input Parameters

a, *b*	REAL for slagv2 DOUBLE PRECISION for dlagv2 Arrays: *a*(*lda*,2) contains the 2-by-2 matrix *A*; *b*(*ldb*,2) contains the upper triangular 2-by-2 matrix *B*.
lda	INTEGER. The leading dimension of the array *a*; *lda* ≥ 2.
ldb	INTEGER. The leading dimension of the array *b*; *ldb* ≥ 2.

Output Parameters

a	On exit, *a* is overwritten by the "*A*-part" of the generalized Schur form.
b	On exit, *b* is overwritten by the "*B*-part" of the generalized Schur form.
alphar, *alphai*, *beta*	REAL for slagv2 DOUBLE PRECISION for dlagv2. Arrays, dimension (2) each. (*alphar*(k) + *i***alphai*(k))/*beta*(k) are the eigenvalues of the pencil (*A*,*B*), k=1,2 and *i* = sqrt(-1). Note that *beta*(k) may be zero.
csl, *snl*	REAL for slagv2 DOUBLE PRECISION for dlagv2 The cosine and sine of the left rotation matrix, respectively.
csr, *snr*	REAL for slagv2 DOUBLE PRECISION for dlagv2 The cosine and sine of the right rotation matrix, respectively.

?lahqr

Computes the eigenvalues and Schur factorization of an upper Hessenberg matrix, using the double-shift/single-shift QR algorithm.

Syntax

```
call slahqr( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, info )
call dlahqr( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, info )
```

```
call clahqr( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, info )
call zlahqr( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine is an auxiliary routine called by `?hseqr` to update the eigenvalues and Schur decomposition already computed by `?hseqr`, by dealing with the Hessenberg submatrix in rows and columns *ilo* to *ihi*.

Input Parameters

wantt	LOGICAL. If *wantt* = .TRUE., the full Schur form *T* is required; If *wantt* = .FALSE., eigenvalues only are required.
wantz	LOGICAL. If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required; If *wantz* = .FALSE., Schur vectors are not required.
n	INTEGER. The order of the matrix *H* ($n \geq 0$).
ilo, *ihi*	INTEGER. It is assumed that *h* is already upper quasi-triangular in rows and columns *ihi*+1:*n*, and that *h*(*ilo*,*ilo*-1) = 0 (unless *ilo* = 1). The routine ?lahqr works primarily with the Hessenberg submatrix in rows and columns *ilo* to *ihi*, but applies transformations to all of *h* if *wantt* = .TRUE.. Constraints: $1 \leq ilo \leq \max(1,ihi)$; $ihi \leq n$.
h, *z*	REAL for slahqr DOUBLE PRECISION for dlahqr COMPLEX for clahqr COMPLEX*16 for zlahqr. Arrays: *h*(*ldh*,*) contains the upper Hessenberg matrix *h*. The second dimension of *h* must be at least max(1, *n*). *z*(*ldz*,*) If *wantz* = .TRUE., then, on entry, *z* must contain the current matrix *z* of transformations accumulated by ?hseqr. If *wantz* = .FALSE., then *z* is not referenced. The second dimension of *z* must be at least max(1, *n*).
ldh	INTEGER. The first dimension of *h*; at least max(1, *n*).
ldz	INTEGER. The first dimension of *z*; at least max(1, *n*).
iloz, *ihiz*	INTEGER. Specify the rows of *z* to which transformations must be applied if *wantz* = .TRUE.. $1 \leq iloz \leq ilo$; $ihi \leq ihiz \leq n$.

Output Parameters

h — On exit, if *info* = 0 and *wantt* = .TRUE., then,

- for slahqr/dlahqr, *h* is upper quasi-triangular in rows and columns *ilo*:*ihi* with any 2-by-2 diagonal blocks in standard form.
- for clahqr/zlahqr, *h* is upper triangular in rows and columns *ilo*:*ihi*.

If *info* = 0 and *wantt* = .FALSE., the contents of *h* are unspecified on exit. If *info* is positive, see description of *info* for the output state of *h*.

wr, *wi* — REAL for slahqr
DOUBLE PRECISION for dlahqr
Arrays, DIMENSION at least max(1, *n*) each. Used with real flavors only. The real and imaginary parts, respectively, of the computed eigenvalues *ilo* to *ihi* are stored in the corresponding elements of *wr* and *wi*. If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the i-th and (i+1)-th, with *wi*(i)> 0 and *wi*(i+1) < 0.
If *wantt* = .TRUE., the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and, if *h*(i:i+1, i:i+1) is a 2-by-2 diagonal block, *wi*(i) = sqrt(*h*(i+1,i)***h*(i,i+1)) and *wi*(i+1) = -*wi*(i).

w — COMPLEX for clahqr
COMPLEX*16 for zlahqr.
Array, DIMENSION at least max(1, *n*). Used with complex flavors only. The computed eigenvalues *ilo* to *ihi* are stored in the corresponding elements of *w*.
If *wantt* = .TRUE., the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).

z — If *wantz* = .TRUE., then, on exit *z* has been updated; transformations are applied only to the submatrix *z*(*iloz*:*ihiz*, *ilo*:*ihi*).

info — INTEGER.
If *info* = 0, the execution is successful.
With *info* > 0,

- if *info* = *i*, ?lahqr failed to compute all the eigenvalues *ilo* to *ihi* in a total of 30 iterations per eigenvalue; elements i+1:*ihi* of *wr* and *wi* (for slahqr/dlahqr) or *w* (for clahqr/zlahqr) contain those eigenvalues which have been successfully computed.
- if *wantt* is .FALSE., then on exit the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.
- if *wantt* is .TRUE., then on exit
(initial value of *h*)**u* = *u**(final value of *h*), (*)

where *u* is an orthognal matrix. The final value of *h* is upper Hessenberg and triangular in rows and columns *info*+1 through *ihi*.

- if *wantz* is .TRUE., then on exit
(final value of *z*) = (initial value of *z*)* *u*,
where *u* is an orthognal matrix in (*) regardless of the value of *wantt*.

?lahrd

Reduces the first nb columns of a general rectangular matrix A so that elements below the k-th subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A.

Syntax

```
call slahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call dlahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call clahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call zlahrd( n, k, nb, a, lda, tau, t, ldt, y, ldy )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine reduces the first *nb* columns of a real/complex general *n*-by-(*n*-*k*+1) matrix *A* so that elements below the *k*-th subdiagonal are zero. The reduction is performed by an orthogonal/unitary similarity transformation *Q'*A*Q*. The routine returns the matrices *V* and *T* which determine *Q* as a block reflector *I* - *V*T*V'*, and also the matrix *Y* = *A*V*T*.

The matrix *Q* is represented as products of *nb* elementary reflectors:

Q = *H*(1)*H*(2)*... *H*(*nb*)

Each *H*(i) has the form

H(i) = *I* - *tau*v*v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector.

This is an obsolete auxiliary routine. Please use the new routine ?lahr2 instead.

Input Parameters

n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
k	INTEGER. The offset for the reduction. Elements below the *k*-th subdiagonal in the first *nb* columns are reduced to zero.
nb	INTEGER. The number of columns to be reduced.
a	REAL for slahrd

DOUBLE PRECISION for dlahrd
COMPLEX for clahrd
COMPLEX*16 for zlahrd.
Array *a*(*lda*, *n*-*k*+1) contains the *n*-by-(*n*-*k*+1) general matrix *A* to be reduced.

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldt — INTEGER. The first dimension of the output array *t*; must be at least max(1, *nb*).

ldy — INTEGER. The first dimension of the output array *y*; must be at least max(1, *n*).

Output Parameters

a — On exit, the elements on and above the *k*-th subdiagonal in the first *nb* columns are overwritten with the corresponding elements of the reduced matrix; the elements below the *k*-th subdiagonal, with the array *tau*, represent the matrix *Q* as a product of elementary reflectors. The other columns of *a* are unchanged. See *Application Notes* below.

tau — REAL for slahrd
DOUBLE PRECISION for dlahrd
COMPLEX for clahrd
COMPLEX*16 for zlahrd.
Array, DIMENSION (*nb*).
Contains scalar factors of the elementary reflectors.

t, *y* — REAL for slahrd
DOUBLE PRECISION for dlahrd
COMPLEX for clahrd
COMPLEX*16 for zlahrd.
Arrays, dimension *t*(*ldt*, *nb*), *y*(*ldy*, *nb*).
The array *t* contains upper triangular matrix *T*.
The array *y* contains the *n*-by-*nb* matrix *Y* .

Application Notes

For the elementary reflector *H*(i),

v(1:i+*k*-1) = 0, *v*(i+*k*) = 1; *v*(i+*k*+1:*n*) is stored on exit in *a*(i+*k*+1:*n*, i) and *tau* is stored in *tau*(i).

The elements of the vectors *v* together form the (*n*-*k*+1)-by-*nb* matrix *V* which is needed, with *T* and *Y*, to apply the transformation to the unreduced part of the matrix, using an update of the form:

A := (*I* - *V***T***V'*) * (*A* - *Y***V'*).

The contents of *A* on exit are illustrated by the following example with *n* = 7, *k* = 3 and *nb* = 2:

$$\begin{bmatrix} a & h & a & a & a \\ a & h & a & a & a \\ a & h & a & a & a \\ h & h & a & a & a \\ v_1 & h & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

See Also

- ?lahr2

?lahr2

Reduces the specified number of first columns of a general rectangular matrix A so that elements below the specified subdiagonal are zero, and returns auxiliary matrices which are needed to apply the transformation to the unreduced part of A.

Syntax

```
call slahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call dlahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call clahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
call zlahr2( n, k, nb, a, lda, tau, t, ldt, y, ldy )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine reduces the first *nb* columns of a real/complex general *n*-by-(*n*-*k*+1) matrix *A* so that elements below the *k*-th subdiagonal are zero. The reduction is performed by an orthogonal/unitary similarity transformation *Q'*A*Q*. The routine returns the matrices *V* and *T* which determine *Q* as a block reflector *I* - *V*T*V'*, and also the matrix *Y* = *A*V*T*.

The matrix *Q* is represented as products of *nb* elementary reflectors:

Q = *H*(1)**H*(2)*... **H*(*nb*)

Each *H*(i) has the form

H(i) = *I* - *tau*v*v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector.

This is an auxiliary routine called by ?gehrd.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 0$).
k	INTEGER. The offset for the reduction. Elements below the *k*-th subdiagonal in the first *nb* columns are reduced to zero ($k < n$).
nb	INTEGER. The number of columns to be reduced.
a	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 COMPLEX*16 for zlahr2. Array, DIMENSION (*lda*, *n*-*k*+1) contains the *n*-by-(*n*-*k*+1) general matrix *A* to be reduced.
lda	INTEGER. The first dimension of the array *a*; $lda \geq \max(1, n)$.
ldt	INTEGER. The first dimension of the output array *t*; $ldt \geq nb$.
ldy	INTEGER. The first dimension of the output array *y*; $ldy \geq n$.

Output Parameters

a	On exit, the elements on and above the *k*-th subdiagonal in the first *nb* columns are overwritten with the corresponding elements of the reduced matrix; the elements below the *k*-th subdiagonal, with the array *tau*, represent the matrix *Q* as a product of elementary reflectors. The other columns of *a* are unchanged. See *Application Notes* below.
tau	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 COMPLEX*16 for zlahr2. Array, DIMENSION (*nb*). Contains scalar factors of the elementary reflectors.
t, *y*	REAL for slahr2 DOUBLE PRECISION for dlahr2 COMPLEX for clahr2 COMPLEX*16 for zlahr2. Arrays, dimension *t*(*ldt*, *nb*), *y*(*ldy*, *nb*). The array *t* contains upper triangular matrix *T*. The array *y* contains the *n*-by-*nb* matrix *Y* .

Application Notes

For the elementary reflector *H*(i),

v(1:i+*k*-1) = 0, *v*(i+*k*) = 1; *v*(i+*k*+1:*n*) is stored on exit in *a*(i+*k*+1:*n*, i) and *tau* is stored in *tau*(i).

The elements of the vectors *v* together form the (*n*-*k*+1)-by-*nb* matrix *V* which is needed, with *T* and *Y*, to apply the transformation to the unreduced part of the matrix, using an update of the form:

A := (*I* - *V***T***V'*) * (*A* - *Y***V'*).

The contents of *A* on exit are illustrated by the following example with *n* = 7, *k* = 3 and *nb* = 2:

$$\begin{bmatrix} a & a & a & a & a \\ a & a & a & a & a \\ a & a & a & a & a \\ h & h & a & a & a \\ v_1 & h & a & a & a \\ v_1 & v_2 & a & a & a \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix *A*, *h* denotes a modified element of the upper Hessenberg matrix *H*, and v_i denotes an element of the vector defining *H*(i).

?laic1

Applies one step of incremental condition estimation.

Syntax

call slaic1(*job*, *j*, *x*, *sest*, *w*, *gamma*, *sestpr*, *s*, *c*)

call dlaic1(*job*, *j*, *x*, *sest*, *w*, *gamma*, *sestpr*, *s*, *c*)

call claic1(*job*, *j*, *x*, *sest*, *w*, *gamma*, *sestpr*, *s*, *c*)

call zlaic1(*job*, *j*, *x*, *sest*, *w*, *gamma*, *sestpr*, *s*, *c*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?laic1 applies one step of incremental condition estimation in its simplest version.

Let *x*, $||x||_2 = 1$ (where $||a||_2$ denotes the 2-norm of *a*), be an approximate singular vector of an *j*-by-*j* lower triangular matrix *L*, such that

$||L*x||_2 = sest$

Then ?laic1 computes *sestpr*, *s*, *c* such that the vector

$$xhat = \begin{bmatrix} s*x \\ c \end{bmatrix}$$

is an approximate singular vector of

$$Lhat = \begin{bmatrix} L & 0 \\ w' & gamma \end{bmatrix}$$

in the sense that

$||Lhat*xhat||_2 = sestpr$.

Depending on *job*, an estimate for the largest or smallest singular value is computed.

Note that `[s c]'` and $sestpr^2$ is an eigenpair of the system (for `slaic1/claic`)

$$\text{diag}(sest*sest, 0) + [alpha\ gamma] * \begin{bmatrix} alpha \\ gamma \end{bmatrix}$$

where *alpha* = *x'*w* ;

or of the system (for `claic1/zlaic`)

$$\text{diag}(sest*sest, 0) + [alpha\ gamma] * \begin{bmatrix} \text{conjg}(alpha) \\ \text{conjg}(gamma) \end{bmatrix}$$

where *alpha* = `conjg(`*x*`)'*`*w*.

Input Parameters

job	INTEGER. If *job* =1, an estimate for the largest singular value is computed; If *job* =2, an estimate for the smallest singular value is computed;
j	INTEGER. Length of *x* and *w*.
x, *w*	REAL for `slaic1` DOUBLE PRECISION for `dlaic1` COMPLEX for `claic1` COMPLEX*16 for `zlaic1`. Arrays, dimension (*j*) each. Contain vectors *x* and *w*, respectively.
sest	REAL for `slaic1/claic1`; DOUBLE PRECISION for `dlaic1/zlaic1`. Estimated singular value of *j*-by-*j* matrix *L*.
gamma	REAL for `slaic1` DOUBLE PRECISION for `dlaic1` COMPLEX for `claic1` COMPLEX*16 for `zlaic1`. The diagonal element *gamma*.

Output Parameters

sestpr	REAL for slaic1/claic1; DOUBLE PRECISION for dlaic1/zlaic1. Estimated singular value of (*j*+1)-by-(*j*+1) matrix *Lhat*.
s, *c*	REAL for slaic1 DOUBLE PRECISION for dlaic1 COMPLEX for claic1 COMPLEX*16 for zlaic1. Sine and cosine needed in forming *xhat*.

?laln2

Solves a 1-by-1 or 2-by-2 linear system of equations of the specified form.

Syntax

```
call slaln2( ltrans, na, nw, smin, ca, a, lda, d1, d2, b, ldb, wr, wi, x, ldx, scale, xnorm, info )
```

```
call dlaln2( ltrans, na, nw, smin, ca, a, lda, d1, d2, b, ldb, wr, wi, x, ldx, scale, xnorm, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine solves a system of the form

(*ca*A - w*D*)*X = s*B*, or (*ca*A' - w*D*)*X = s*B*

with possible scaling (*s*) and perturbation of *A* (*A'* means *A*-transpose.)

A is an *na*-by-*na* real matrix, *ca* is a real scalar, *D* is an *na*-by-*na* real diagonal matrix, *w* is a real or complex value, and *X* and *B* are *na*-by-1 matrices: real if *w* is real, complex if *w* is complex. The parameter *na* may be 1 or 2.

If *w* is complex, *X* and *B* are represented as *na*-by-2 matrices, the first column of each being the real part and the second being the imaginary part.

The routine computes the scaling factor *s* (≤ 1) so chosen that *X* can be computed without overflow. *X* is further scaled if necessary to assure that norm(*ca*A - w*D*)*norm(*X*) is less than overflow.

If both singular values of (*ca*&*A - w*D*) are less than *smin*, *smin*I* (where *I* stands for identity) will be used instead of (*ca*A - w*D*). If only one singular value is less than *smin*, one element of (*ca*A - w*D*) will be perturbed enough to make the smallest singular value roughly *smin*.

If both singular values are at least *smin*, (*ca*A - w*D*) will not be perturbed. In any case, the perturbation will be at most some small multiple of max(*smin*, *ulp*norm(*ca*A - w*D*)).

The singular values are computed by infinity-norm approximations, and thus will only be correct to a factor of 2 or so.

NOTE. All input quantities are assumed to be smaller than overflow by a reasonable factor (see *bignum*).

Input Parameters

trans	LOGICAL. If *trans* = .TRUE., *A*- transpose will be used. If *trans* = .FALSE., *A* will be used (not transposed.)
na	INTEGER. The size of the matrix *A*, possible values 1 or 2.
nw	INTEGER. This parameter must be 1 if *w* is real, and 2 if *w* is complex. Possible values 1 or 2.
smin	REAL for slaln2 DOUBLE PRECISION for dlaln2. The desired lower bound on the singular values of *A*. This should be a safe distance away from underflow or overflow, for example, between (*underflow/machine_precision*) and (*machine_precision* * *overflow*). (See *bignum* and *ulp*).
ca	REAL for slaln2 DOUBLE PRECISION for dlaln2. The coefficient by which *A* is multiplied.
a	REAL for slaln2 DOUBLE PRECISION for dlaln2. Array, DIMENSION (*lda*,*na*). The *na*-by-*na* matrix *A*.
lda	INTEGER. The leading dimension of *a*. Must be at least *na*.
d1, *d2*	REAL for slaln2 DOUBLE PRECISION for dlaln2. The (1,1) and (2,2) elements in the diagonal matrix *D*, respectively. *d2* is not used if *nw* = 1.
b	REAL for slaln2 DOUBLE PRECISION for dlaln2. Array, DIMENSION (*ldb*,*nw*). The *na*-by-*nw* matrix *B* (right-hand side). If *nw* =2 (*w* is complex), column 1 contains the real part of *B* and column 2 contains the imaginary part.
ldb	INTEGER. The leading dimension of *b*. Must be at least *na*.
wr, *wi*	REAL for slaln2 DOUBLE PRECISION for dlaln2. The real and imaginary part of the scalar *w*, respectively. *wi* is not used if *nw* = 1.
ldx	INTEGER. The leading dimension of the output array *x*. Must be at least *na*.

Output Parameters

x	REAL for slaln2 DOUBLE PRECISION for dlaln2. Array, DIMENSION (*ldx*,*nw*). The *na*-by-*nw* matrix *X* (unknowns), as computed by the routine. If *nw* = 2 (*w* is complex), on exit, column 1 will contain the real part of *X* and column 2 will contain the imaginary part.
scale	REAL for slaln2 DOUBLE PRECISION for dlaln2. The scale factor that *B* must be multiplied by to insure that overflow does not occur when computing *X*. Thus (*ca*A - w*D*) *X* will be *scale*B*, not *B* (ignoring perturbations of *A*.) It will be at most 1.
xnorm	REAL for slaln2 DOUBLE PRECISION for dlaln2. The infinity-norm of *X*, when *X* is regarded as an *na*-by-*nw* real matrix.
info	INTEGER. An error flag. It will be zero if no error occurs, a negative number if an argument is in error, or a positive number if (*ca*A - w*D*) had to be perturbed. The possible values are: If *info* = 0: no error occurred, and (*ca*A - w*D*) did not have to be perturbed. If *info* = 1: (*ca*A - w*D*) had to be perturbed to make its smallest (or only) singular value greater than *smin*.

NOTE. For higher speed, this routine does not check the inputs for errors.

?lals0

Applies back multiplying factors in solving the least squares problem using divide and conquer SVD approach. Used by ?gelsd.

Syntax

call slals0(*icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, info*)

call dlals0(*icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, work, info*)

call clals0(*icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, rwork, info*)

call zlals0(*icompq, nl, nr, sqre, nrhs, b, ldb, bx, ldbx, perm, givptr, givcol, ldgcol, givnum, ldgnum, poles, difl, difr, z, k, c, s, rwork, info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine applies back the multiplying factors of either the left or right singular vector matrix of a diagonal matrix appended by a row to the right hand side matrix *B* in solving the least squares problem using the divide-and-conquer SVD approach.

For the left singular vector matrix, three types of orthogonal matrices are involved:

(1L) Givens rotations: the number of such rotations is *givptr*;the pairs of columns/rows they were applied to are stored in *givcol*;and the *c*- and *s*-values of these rotations are stored in *givnum*.

(2L) Permutation. The (*nl*+1)-st row of *B* is to be moved to the first row, and for j=2:*n*, *perm*(*j*)-th row of *B* is to be moved to the *j*-th row.

(3L) The left singular vector matrix of the remaining matrix.

For the right singular vector matrix, four types of orthogonal matrices are involved:

(1R) The right singular vector matrix of the remaining matrix.

(2R) If *sqre* = 1, one extra Givens rotation to generate the right null space.

(3R) The inverse transformation of (2L).

(4R) The inverse transformation of (1L).

Input Parameters

icompq
INTEGER. Specifies whether singular vectors are to be computed in factored form:
If *icompq* = 0: Left singular vector matrix.
If *icompq* = 1: Right singular vector matrix.

nl
INTEGER. The row dimension of the upper block.
nl ≥ 1.

nr
INTEGER. The row dimension of the lower block.
nr ≥ 1.

sqre
INTEGER.
If *sqre* = 0: the lower block is an *nr*-by-*nr* square matrix.
If *sqre* = 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix.
The bidiagonal matrix has row dimension *n* = *nl* + *nr* + 1, and column dimension *m* = *n* + *sqre*.

nrhs
INTEGER. The number of columns of *B* and *bx*.
Must be at least 1.

b
REAL for slals0
DOUBLE PRECISION for dlals0
COMPLEX for clals0
COMPLEX*16 for zlals0.
Array, DIMENSION (*ldb*, *nrhs*).
Contains the right hand sides of the least squares problem in rows 1 through *m*.

ldb	INTEGER. The leading dimension of *b*. Must be at least max(1,max(*m*, *n*)).
bx	REAL for slals0 DOUBLE PRECISION for dlals0 COMPLEX for clals0 COMPLEX*16 for zlals0. Workspace array, DIMENSION (*ldbx*, *nrhs*).
ldbx	INTEGER. The leading dimension of *bx*.
perm	INTEGER. Array, DIMENSION (*n*). The permutations (from deflation and sorting) applied to the two blocks.
givptr	INTEGER. The number of Givens rotations which took place in this subproblem.
givcol	INTEGER. Array, DIMENSION (*ldgcol*, 2). Each pair of numbers indicates a pair of rows/columns involved in a Givens rotation.
ldgcol	INTEGER. The leading dimension of *givcol*, must be at least *n*.
givnum	REAL for slals0/clals0 DOUBLE PRECISION for dlals0/zlals0 Array, DIMENSION (*ldgnum*, 2). Each number indicates the c or *s* value used in the corresponding Givens rotation.
ldgnum	INTEGER. The leading dimension of arrays *difr*, *poles* and *givnum*, must be at least *k*.
poles	REAL for slals0/clals0 DOUBLE PRECISION for dlals0/zlals0 Array, DIMENSION (*ldgnum*, 2). On entry, *poles*(1:*k*, 1) contains the new singular values obtained from solving the secular equation, and *poles*(1:*k*, 2) is an array containing the poles in the secular equation.
difl	REAL for slals0/clals0 DOUBLE PRECISION for dlals0/zlals0 Array, DIMENSION (*k*). On entry, *difl*(*i*) is the distance between *i*-th updated (undeflated) singular value and the *i*-th (undeflated) old singular value.
difr	REAL for slals0/clals0 DOUBLE PRECISION for dlals0/zlals0 Array, DIMENSION (*ldgnum*, 2). On entry, *difr*(*i*, 1) contains the distances between *i*-th updated (undeflated) singular value and the *i+1*-th (undeflated) old singular value. And *difr*(*i*, 2) is the normalizing factor for the *i*-th right singular vector.
z	REAL for slals0/clals0 DOUBLE PRECISION for dlals0/zlals0 Array, DIMENSION (*k*). Contains the components of the deflation-adjusted updating row vector.
K	INTEGER. Contains the dimension of the non-deflated matrix. This is the order of the related secular equation. $1 \le k \le n$.
c	REAL for slals0/clals0

DOUBLE PRECISION for dlals0/zlals0
Contains garbage if *sqre* =0 and the *c* value of a Givens rotation related to the right null space if *sqre* = 1.

s — REAL for slals0/clals0
DOUBLE PRECISION for dlals0/zlals0
Contains garbage if *sqre* =0 and the *s* value of a Givens rotation related to the right null space if *sqre* = 1.

work — REAL for slals0
DOUBLE PRECISION for dlals0
Workspace array, DIMENSION (*k*). Used with real flavors only.

rwork — REAL for clals0
DOUBLE PRECISION for zlals0
Workspace array, DIMENSION (*k**(1+*nrhs*) + 2**nrhs*). Used with complex flavors only.

Output Parameters

b — On exit, contains the solution *X* in rows 1 through *n*.

info — INTEGER.
If *info* = 0: successful exit.
If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lalsa

Computes the SVD of the coefficient matrix in compact form. Used by ?gelsd.

Syntax

```
call slalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, work, iwork, info )
call dlalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, work, iwork, info )
call clalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, rwork, iwork, info )
call zlalsa( icompq, smlsiz, n, nrhs, b, ldb, bx, ldbx, u, ldu, vt, k, difl, difr, z,
poles, givptr, givcol, ldgcol, perm, givnum, c, s, rwork, iwork, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine is an intermediate step in solving the least squares problem by computing the SVD of the coefficient matrix in compact form. The singular vectors are computed as products of simple orthogonal matrices.

If *icompq* = 0, ?lalsa applies the inverse of the left singular vector matrix of an upper bidiagonal matrix to the right hand side; and if *icompq* = 1, the routine applies the right singular vector matrix to the right hand side. The singular vector matrices were generated in the compact form by ?lalsa.

Input Parameters

icompq	INTEGER. Specifies whether the left or the right singular vector matrix is involved. If *icompq* = 0: left singular vector matrix is used If *icompq* = 1: right singular vector matrix is used.
smlsiz	INTEGER. The maximum size of the subproblems at the bottom of the computation tree.
n	INTEGER. The row and column dimensions of the upper bidiagonal matrix.
nrhs	INTEGER. The number of columns of *b* and *bx*. Must be at least 1.
b	REAL for slalsa DOUBLE PRECISION for dlalsa COMPLEX for clalsa COMPLEX*16 for zlalsa Array, DIMENSION (*ldb*, *nrhs*). Contains the right hand sides of the least squares problem in rows 1 through *m*.
ldb	INTEGER. The leading dimension of *b* in the calling subprogram. Must be at least max(1,max(*m*, *n*)).
ldbx	INTEGER. The leading dimension of the output array *bx*.
u	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, *smlsiz*). On entry, *u* contains the left singular vector matrices of all subproblems at the bottom level.
ldu	INTEGER, *ldu* ≥ *n*. The leading dimension of arrays *u*, *vt*, *difl*, *difr*, *poles*, *givnum*, and *z*.
vt	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, *smlsiz* +1). On entry, contains the right singular vector matrices of all subproblems at the bottom level.
k	INTEGER array, DIMENSION (*n*).
difl	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, *nlvl*), where *nlvl* = int($\log_2$(*n* /(*smlsiz*+1))) + 1.
difr	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, 2**nlvl*). On entry, *difl*(*, *i*) and *difr*(*, 2*i* -1) record distances between singular values on the *i*-th level and singular values on the (*i* -1)-th level, and *difr*(*, 2*i*) record the normalizing factors of the right singular vectors matrices of subproblems on *i*-th level.
z	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa

	Array, DIMENSION (*ldu*, *nlvl* . On entry, *z*(1, *i*) contains the components of the deflation- adjusted updating the row vector for subproblems on the *i*-th level.
poles	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, 2**nlvl*). On entry, *poles*(*, 2*i*-1: 2*i*) contains the new and old singular values involved in the secular equations on the *i*-th level.
givptr	INTEGER. Array, DIMENSION (*n*). On entry, *givptr*(*i*) records the number of Givens rotations performed on the *i*-th problem on the computation tree.
givcol	INTEGER. Array, DIMENSION (*ldgcol*, 2**nlvl*). On entry, for each *i*, *givcol*(*, 2*i*-1: 2*i*) records the locations of Givens rotations performed on the *i*-th level on the computation tree.
ldgcol	INTEGER, *ldgcol* ≥ *n*. The leading dimension of arrays *givcol* and *perm*.
perm	INTEGER. Array, DIMENSION (*ldgcol*, *nlvl*). On entry, *perm*(*, *i*) records permutations done on the *i*-th level of the computation tree.
givnum	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*ldu*, 2**nlvl*). On entry, *givnum*(*, 2*i*-1 : 2*i*) records the *c* and *s* values of Givens rotations performed on the *i*-th level on the computation tree.
c	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*n*). On entry, if the *i*-th subproblem is not square, *c*(*i*) contains the *c* value of a Givens rotation related to the right null space of the *i*-th subproblem.
s	REAL for slalsa/clalsa DOUBLE PRECISION for dlalsa/zlalsa Array, DIMENSION (*n*). On entry, if the *i*-th subproblem is not square, *s*(*i*) contains the *s*-value of a Givens rotation related to the right null space of the *i*-th subproblem.
work	REAL for slalsa DOUBLE PRECISION for dlalsa Workspace array, DIMENSION at least (*n*). Used with real flavors only.
rwork	REAL for clalsa DOUBLE PRECISION for zlalsa Workspace array, DIMENSION at least max(*n*, (*smlsz*+1)**nrhs**3). Used with complex flavors only.
iwork	INTEGER. Workspace array, DIMENSION at least (3*n*).

Output Parameters

b	On exit, contains the solution *X* in rows 1 through *n*.
bx	REAL for slalsa DOUBLE PRECISION for dlalsa COMPLEX for clalsa COMPLEX*16 for zlalsa Array, DIMENSION (*ldbx*, *nrhs*). On exit, the result of applying the left or right singular vector matrix to *b*.
info	INTEGER. If *info* = 0: successful exit If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lalsd

Uses the singular value decomposition of A to solve the least squares problem.

Syntax

```
call slalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, iwork, info )
call dlalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, iwork, info )
call clalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, rwork, iwork, info )
call zlalsd( uplo, smlsiz, n, nrhs, d, e, b, ldb, rcond, rank, work, rwork, iwork, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine uses the singular value decomposition of *A* to solve the least squares problem of finding *X* to minimize the Euclidean norm of each column of *A***X*-*B*, where *A* is *n*-by-*n* upper bidiagonal, and *X* and *B* are *n*-by-*nrhs*. The solution *X* overwrites *B*.

The singular values of *A* smaller than *rcond* times the largest singular value are treated as zero in solving the least squares problem; in this case a minimum norm solution is returned. The actual singular values are returned in *d* in ascending order.

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray XMP, Cray YMP, Cray C 90, or Cray 2.

It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

Input Parameters

uplo	CHARACTER*1. If *uplo* = 'U', *d* and *e* define an upper bidiagonal matrix. If *uplo* = 'L', *d* and *e* define a lower bidiagonal matrix.

smlsiz INTEGER. The maximum size of the subproblems at the bottom of the computation tree.

n INTEGER. The dimension of the bidiagonal matrix.

$n \geq 0$.

nrhs INTEGER. The number of columns of *B*. Must be at least 1.

d REAL for slalsd/clalsd
DOUBLE PRECISION for dlalsd/zlalsd
Array, DIMENSION (*n*). On entry, *d* contains the main diagonal of the bidiagonal matrix.

e REAL for slalsd/clalsd
DOUBLE PRECISION for dlalsd/zlalsd
Array, DIMENSION (*n*-1). Contains the super-diagonal entries of the bidiagonal matrix. On exit, *e* is destroyed.

b REAL for slalsd
DOUBLE PRECISION for dlalsd
COMPLEX for clalsd
COMPLEX*16 for zlalsd
Array, DIMENSION (*ldb*,*nrhs*).
On input, *b* contains the right hand sides of the least squares problem. On output, *b* contains the solution X.

ldb INTEGER. The leading dimension of *b* in the calling subprogram. Must be at least max(1,*n*).

rcond REAL for slalsd/clalsd
DOUBLE PRECISION for dlalsd/zlalsd
The singular values of *A* less than or equal to *rcond* times the largest singular value are treated as zero in solving the least squares problem. If *rcond* is negative, machine precision is used instead. For example, for the least squares problem diag(*S*)**X*=*B*, where diag(*S*) is a diagonal matrix of singular values, the solution is *X*(*i*)=*B*(*i*)/*S*(*i*) if *S*(*i*) is greater than *rcond* *max(*S*), and *X*(*i*)=0 if *S*(*i*) is less than or equal to *rcond* *max(*S*).

rank INTEGER. The number of singular values of *A* greater than *rcond* times the largest singular value.

work REAL for slalsd
DOUBLE PRECISION for dlalsd
COMPLEX for clalsd
COMPLEX*16 for zlalsd
Workspace array.
DIMENSION for real flavors at least
$(9n+2n*smlsiz+8n*nlvl+n*nrhs+(smlsiz+1)^2)$,
where
$nlvl = \max(0, \text{int}(\log_2(n/(smlsiz+1))) + 1)$.
DIMENSION for complex flavors is (*n***nrhs*).

rwork REAL for clalsd
DOUBLE PRECISION for zlalsd

	Workspace array, used with complex flavors only. DIMENSION at least (9*n* + 2*n***smlsiz* + 8*n***nlvl* + 3**mlsiz***nrhs* + (*smlsiz*+1)^2), where *nlvl* = max(0, int(log$_2$(min(*m*,*n*)/(*smlsiz*+1))) + 1).
iwork	INTEGER. Workspace array of DIMENSION (3*n***nlvl* + 11*n*).

Output Parameters

d	On exit, if *info* = 0, *d* contains singular values of the bidiagonal matrix.
e	On exit, destroyed.
b	On exit, *b* contains the solution *X*.
info	INTEGER. If *info* = 0: successful exit. If *info* = -*i* < 0, the *i*-th argument had an illegal value. If *info* > 0: The algorithm failed to compute a singular value while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*,*n*+1).

?lamrg

Creates a permutation list to merge the entries of two independently sorted sets into a single set sorted in acsending order.

Syntax

```
call slamrg( n1, n2, a, strd1, strd2, index )
call dlamrg( n1, n2, a, strd1, strd2, index )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine creates a permutation list which will merge the elements of *a* (which is composed of two independently sorted sets) into a single set which is sorted in ascending order.

Input Parameters

n1, *n2*	INTEGER. These arguments contain the respective lengths of the two sorted lists to be merged.
a	REAL for slamrg DOUBLE PRECISION for dlamrg. Array, DIMENSION (*n1*+*n2*). The first *n1* elements of *a* contain a list of numbers which are sorted in either ascending or descending order. Likewise for the final *n2* elements.

strd1, *strd2* — INTEGER.
These are the strides to be taken through the array *a*. Allowable strides are 1 and -1. They indicate whether a subset of *a* is sorted in ascending (*strdx* = 1) or descending (*strdx* = -1) order.

Output Parameters

index — INTEGER. Array, DIMENSION (*n1*+*n2*).
On exit, this array will contain a permutation such that if *b*(*i*) = *a*(*index*(*i*)) for *i*=1, *n1*+*n2*, then *b* will be sorted in ascending order.

?laneg

*Computes the Sturm count, the number of negative pivots encountered while factoring tridiagonal T-sigma*I = L*D*L^T.*

Syntax

value = slaneg(*n*, *d*, *lld*, *sigma*, *pivmin*, *r*)

value = dlaneg(*n*, *d*, *lld*, *sigma*, *pivmin*, *r*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the Sturm count, the number of negative pivots encountered while factoring tridiagonal *T-sigma*I = L*D*L^T*. This implementation works directly on the factors without forming the tridiagonal matrix *T*. The Sturm count is also the number of eigenvalues of *T* less than *sigma*. This routine is called from ?larb. The current routine does not use the *pivmin* parameter but rather requires IEEE-754 propagation of infinities and NaNs (NaN stands for 'Not A Number'). This routine also has no input range restrictions but does require default exception handling such that *x*/0 produces Inf when *x* is non-zero, and Inf/Inf produces NaN. (For more information see [Marques06]).

Input Parameters

n — INTEGER. The order of the matrix.

d — REAL for slaneg
DOUBLE PRECISION for dlaneg
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the matrix *D*.

lld — REAL for slaneg
DOUBLE PRECISION for dlaneg
Array, DIMENSION (*n*-1).
Contains (*n*-1) elements *L*(i)*L*(i)*D*(i).

sigma — REAL for slaneg
DOUBLE PRECISION for dlaneg
Shift amount in *T-sigma*I = L*D*L**T*.

pivmin — REAL for slaneg

DOUBLE PRECISION for dlaneg
The minimum pivot in the Sturm sequence. May be used when zero pivots are encountered on non-IEEE-754 architectures.

r — INTEGER.
The twist index for the twisted factorization that is used for the negcount.

Output Parameters

value — INTEGER. The number of negative pivots encountered while factoring.

?langb

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of general band matrix.

Syntax

```
val = slangb( norm, n, kl, ku, ab, ldab, work )
val = dlangb( norm, n, kl, ku, ab, ldab, work )
val = clangb( norm, n, kl, ku, ab, ldab, work )
val = zlangb( norm, n, kl, ku, ab, ldab, work )
```

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* band matrix *A*, with *kl* sub-diagonals and *ku* super-diagonals.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?langb is set to zero.

kl — INTEGER. The number of sub-diagonals of the matrix *A*. $kl \geq 0$.

ku — INTEGER. The number of super-diagonals of the matrix *A*. $ku \geq 0$.

ab — REAL for slangb

DOUBLE PRECISION for dlangb
COMPLEX for clangb
COMPLEX*16 for zlangb
Array, DIMENSION (*ldab*,*n*).
The band matrix *A*, stored in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
ab(*ku*+1+*i*-*j*,*j*) = *a*(*i*,*j*)
for max(1,*j*-*ku*) ≤ *i* ≤ min(*n*,*j*+*kl*).

ldab — INTEGER. The leading dimension of the array *ab*.
ldab ≥ *kl*+*ku*+1.

work — REAL for slangb/clangb
DOUBLE PRECISION for dlangb/zlangb
Workspace array, DIMENSION (max(1, *lwork*)), where
lwork ≥ *n* when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slangb/clangb
DOUBLE PRECISION for dlangb/zlangb
Value returned by the function.

?lange

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general rectangular matrix.

Syntax

val = slange(*norm*, *m*, *n*, *a*, *lda*, *work*)

val = dlange(*norm*, *m*, *n*, *a*, *lda*, *work*)

val = clange(*norm*, *m*, *n*, *a*, *lda*, *work*)

val = zlange(*norm*, *m*, *n*, *a*, *lda*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lange returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex matrix *A*.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.

	= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum), = 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum), = 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).
m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0. When *m* = 0, ?lange is set to zero.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0. When *n* = 0, ?lange is set to zero.
a	REAL for slange DOUBLE PRECISION for dlange COMPLEX for clange COMPLEX*16 for zlange Array, DIMENSION (*lda*,*n*). The *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*m*,1).
work	REAL for slange and clange. DOUBLE PRECISION for dlange and zlange. Workspace array, DIMENSION max(1, *lwork*), where *lwork* ≥ *m* when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slange/clange DOUBLE PRECISION for dlange/zlange Value returned by the function.

?langt

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a general tridiagonal matrix.

Syntax

```
val = slangt( norm, n, dl, d, du )
val = dlangt( norm, n, dl, d, du )
val = clangt( norm, n, dl, d, du )
val = zlangt( norm, n, dl, d, du )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex tridiagonal matrix *A*.

Input Parameters

norm	CHARACTER*1. Specifies the value to be returned by the routine: = 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*. = '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum), = 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum), = 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).
n	INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?langt is set to zero.
dl, *d*, *du*	REAL for slangt DOUBLE PRECISION for dlangt COMPLEX for clangt COMPLEX*16 for zlangt Arrays: *dl* (*n*-1), *d* (*n*), *du* (*n*-1). The array *dl* contains the (*n*-1) sub-diagonal elements of *A*. The array *d* contains the diagonal elements of *A*. The array *du* contains the (*n*-1) super-diagonal elements of *A*.

Output Parameters

val	REAL for slangt/clangt DOUBLE PRECISION for dlangt/zlangt Value returned by the function.

?lanhs

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of an upper Hessenberg matrix.

Syntax

val = slanhs(*norm*, *n*, *a*, *lda*, *work*)

val = dlanhs(*norm*, *n*, *a*, *lda*, *work*)

val = clanhs(*norm*, *n*, *a*, *lda*, *work*)

val = zlanhs(*norm*, *n*, *a*, *lda*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lanhs returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hessenberg matrix *A*.

The value *val* returned by the function is:

val = max(abs(A_{ij})), if *norm* = 'M' or 'm'

= norm1(*A*), if *norm* = '1' or 'O' or 'o'

= normI(*A*), if *norm* = 'I' or 'i'

= normF(*A*), if *norm* = 'F', 'f', 'E' or 'e'

where norm1 denotes the 1-norm of a matrix (maximum column sum), normI denotes the infinity norm of a matrix (maximum row sum) and normF denotes the Frobenius norm of a matrix (square root of sum of squares). Note that max(abs(A_{ij})) is not a consistent matrix norm.

Input Parameters

norm	CHARACTER*1. Specifies the value to be returned by the routine as described above.
n	INTEGER. The order of the matrix *A*. *n* ≥ 0. When *n* = 0, ?lanhs is set to zero.
a	REAL for slanhs DOUBLE PRECISION for dlanhs COMPLEX for clanhs COMPLEX*16 for zlanhs Array, DIMENSION (*lda*,*n*). The *n*-by-*n* upper Hessenberg matrix *A*; the part of *A* below the first sub-diagonal is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*n*,1).
work	REAL for slanhs and clanhs. DOUBLE PRECISION for dlange and zlange. Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *n* when *norm* = 'I'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slanhs/clanhs DOUBLE PRECISION for dlanhs/zlanhs Value returned by the function.

?lansb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric band matrix.

Syntax

val = slansb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

val = dlansb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

val = clansb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

val = zlansb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lansb returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* real/complex symmetric band matrix *A*, with *k* super-diagonals.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the band matrix *A* is supplied. If *uplo* = 'U': upper triangular part is supplied; If *uplo* = 'L': lower triangular part is supplied.

n — INTEGER. The order of the matrix *A*. $n \geq 0$.
When *n* = 0, ?lansb is set to zero.

k — INTEGER. The number of super-diagonals or sub-diagonals of the band matrix *A*. $k \geq 0$.

ab — REAL for slansb
DOUBLE PRECISION for dlansb
COMPLEX for clansb
COMPLEX*16 for zlansb
Array, DIMENSION (*ldab*,*n*).
The upper or lower triangle of the symmetric band matrix *A*, stored in the first *k*+1 rows of *ab*. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*k*+1+*i*-*j*,*j*) = *a*(*i*,*j*)
for max(1,*j*-*k*) ≤ *i* ≤ *j*;
if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = *a*(*i*,*j*) for $j \leq i \leq \min(n, j+k)$.

ldab — INTEGER. The leading dimension of the array *ab*.
ldab ≥ *k*+1.

work — REAL for slansb and clansb.
DOUBLE PRECISION for dlansb and zlansb.

Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slansb/clansb
DOUBLE PRECISION for dlansb/zlansb
Value returned by the function.

?lanhb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian band matrix.

Syntax

val = clanhb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

val = zlanhb(*norm*, *uplo*, *n*, *k*, *ab*, *ldab*, *work*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* Hermitian band matrix *A*, with *k* super-diagonals.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the band matrix *A* is supplied.
If *uplo* = 'U': upper triangular part is supplied;
If *uplo* = 'L': lower triangular part is supplied.

n — INTEGER. The order of the matrix *A*. *n* ≥ 0. When *n* = 0, ?lanhb is set to zero.

k — INTEGER. The number of super-diagonals or sub-diagonals of the band matrix *A*.

	$k \geq 0$.
ab	COMPLEX for clanhb. COMPLEX*16 for zlanhb. Array, DIMENSION (*ldaB*,*n*). The upper or lower triangle of the Hermitian band matrix *A*, stored in the first $k+1$ rows of *ab*. The j-th column of *A* is stored in the j-th column of the array *ab* as follows: if *uplo* = 'U', $ab(k+1+i-j,j) = a(i,j)$ for $\max(1,j-k) \leq i \leq j$; if *uplo* = 'L', $ab(1+i-j,j) = a(i,j)$ for $j \leq i \leq \min(n,j+k)$. Note that the imaginary parts of the diagonal elements need not be set and are assumed to be zero.
ldab	INTEGER. The leading dimension of the array *ab*. $ldab \geq k+1$.
work	REAL for clanhb. DOUBLE PRECISION for zlanhb. Workspace array, DIMENSION $\max(1, lwork)$, where $lwork \geq n$ when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slanhb/clanhb DOUBLE PRECISION for dlanhb/zlanhb Value returned by the function.

?lansp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix supplied in packed form.

Syntax

val = slansp(*norm*, *uplo*, *n*, *ap*, *work*)

val = dlansp(*norm*, *uplo*, *n*, *ap*, *work*)

val = clansp(*norm*, *uplo*, *n*, *ap*, *work*)

val = zlansp(*norm*, *uplo*, *n*, *ap*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lansp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix *A*, supplied in packed form.

Input Parameters

norm	CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric matrix *A* is supplied.
If *uplo* = 'U': Upper triangular part of *A* is supplied
If *uplo* = 'L': Lower triangular part of *A* is supplied.

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lansp is set to zero.

ap — REAL for slansp
DOUBLE PRECISION for dlansp
COMPLEX for clansp
COMPLEX*16 for zlansp
Array, DIMENSION ($n(n+1)/2$).
The upper or lower triangle of the symmetric matrix *A*, packed columnwise in a linear array. The j-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;

if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

work — REAL for slansp and clansp.
DOUBLE PRECISION for dlansp and zlansp.
Workspace array, DIMENSION (max(1, *lwork*)), where
lwork $\geq n$ when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slansp/clansp
DOUBLE PRECISION for dlansp/zlansp
Value returned by the function.

?lanhp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix supplied in packed form.

Syntax

val = clanhp(*norm*, *uplo*, *n*, *ap*, *work*)

val = zlanhp(*norm*, *uplo*, *n*, *ap*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lanhp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix *A*, supplied in packed form.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is supplied.
If *uplo* = 'U': Upper triangular part of *A* is supplied
If *uplo* = 'L': Lower triangular part of *A* is supplied.

n — INTEGER. The order of the matrix *A*.

$n \geq 0$. When $n = 0$, ?lanhp is set to zero.

ap — COMPLEX for clanhp.
COMPLEX*16 for zlanhp.
Array, DIMENSION ($n(n+1)/2$). The upper or lower triangle of the Hermitian matrix *A*, packed columnwise in a linear array. The j-th column of *A* is stored in the array *ap* as follows:

if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;

if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

work — REAL for clanhp.
DOUBLE PRECISION for zlanhp.
Workspace array, DIMENSION (max(1, *lwork*)), where

lwork ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for clanhp.
DOUBLE PRECISION for zlanhp.
Value returned by the function.

?lanst/?lanht

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or complex Hermitian tridiagonal matrix.

Syntax

```
val = slanst( norm, n, d, e )
val = dlanst( norm, n, d, e )
val = clanht( norm, n, d, e )
val = zlanht( norm, n, d, e )
```

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The functions ?lanst/?lanht return the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real symmetric or a complex Hermitian tridiagonal matrix *A*.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

n — INTEGER. The order of the matrix *A*.
n ≥ 0. When *n* = 0, ?lanst/?lanht is set to zero.

d — REAL for slanst/clanht
DOUBLE PRECISION for dlanst/zlanht
Array, DIMENSION (*n*). The diagonal elements of *A*.

e — REAL for slanst
DOUBLE PRECISION for dlanst

COMPLEX for clanht
COMPLEX*16 for zlanht
Array, DIMENSION (*n*-1).
The (*n*-1) sub-diagonal or super-diagonal elements of *A*.

Output Parameters

val — REAL for slanst/clanht
DOUBLE PRECISION for dlanst/zlanht
Value returned by the function.

?lansy

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix.

Syntax

```
val = slansy( norm, uplo, n, a, lda, work )
val = dlansy( norm, uplo, n, a, lda, work )
val = clansy( norm, uplo, n, a, lda, work )
val = zlansy( norm, uplo, n, a, lda, work )
```

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lansy returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a real/complex symmetric matrix *A*.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric matrix *A* is to be referenced.
= 'U': Upper triangular part of *A* is referenced.
= 'L': Lower triangular part of *A* is referenced

n	INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lansy is set to zero.
a	REAL for slansy DOUBLE PRECISION for dlansy COMPLEX for clansy COMPLEX*16 for zlansy Array, DIMENSION (*lda*,*n*). The symmetric matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*n*,1).
work	REAL for slansy and clansy. DOUBLE PRECISION for dlansy and zlansy. Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slansy/clansy DOUBLE PRECISION for dlansy/zlansy Value returned by the function.

?lanhe

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix.

Syntax

val = clanhe(*norm*, *uplo*, *n*, *a*, *lda*, *work*)

val = zlanhe(*norm*, *uplo*, *n*, *a*, *lda*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lanhe returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a complex Hermitian matrix *A*.

Input Parameters

norm	CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is to be referenced.
= 'U': Upper triangular part of *A* is referenced.
= 'L': Lower triangular part of *A* is referenced

n — INTEGER. The order of the matrix *A*. $n \geq 0$. When $n = 0$, ?lanhe is set to zero.

a — COMPLEX for clanhe.
COMPLEX*16 for zlanhe.
Array, DIMENSION (*lda*,*n*). The Hermitian matrix *A*.
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*.
lda ≥ max(*n*,1).

work — REAL for clanhe.
DOUBLE PRECISION for zlanhe.
Workspace array, DIMENSION (max(1, *lwork*)) , where
lwork ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — REAL for clanhe.
DOUBLE PRECISION for zlanhe.
Value returned by the function.

?lantb

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular band matrix.

Syntax

```
val = slantb( norm, uplo, diag, n, k, ab, ldab, work )
val = dlantb( norm, uplo, diag, n, k, ab, ldab, work )
val = clantb( norm, uplo, diag, n, k, ab, ldab, work )
val = zlantb( norm, uplo, diag, n, k, ab, ldab, work )
```

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `?lantb` returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* triangular band matrix *A*, with (*k* + 1) diagonals.

Input Parameters

norm
CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo
CHARACTER*1.
Specifies whether the matrix *A* is upper or lower triangular.
= 'U': Upper triangular
= 'L': Lower triangular.

diag
CHARACTER*1.
Specifies whether or not the matrix *A* is unit triangular.
= 'N': Non-unit triangular
= 'U': Unit triangular.

n
INTEGER. The order of the matrix *A*. *n* ≥ 0. When *n* = 0, `?lantb` is set to zero.

k
INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals of the matrix *A* if *uplo* = 'L'. *k* ≥ 0.

ab
REAL for `slantb`
DOUBLE PRECISION for `dlantb`
COMPLEX for `clantb`

COMPLEX*16 for zlantb
Array, DIMENSION (*ldab*,*n*). The upper or lower triangular band matrix *A*, stored in the first *k*+1 rows of *ab*.
The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*k*+1+*i*-*j*,*j*) = *a*(*i*,*j*) for max(1,*j*-*k*) ≤ i ≤ j;
if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = *a*(*i*,*j*) for *j*≤ *i*≤ min(*n*,*j*+*k*).
Note that when *diag* = 'U', the elements of the array *ab* corresponding to the diagonal elements of the matrix *A* are not referenced, but are assumed to be one.

ldab — INTEGER. The leading dimension of the array *ab*.
ldab ≥ *k*+1.

work — REAL for slantb and clantb.
DOUBLE PRECISION for dlantb and zlantb.
Workspace array, DIMENSION (max(1, *lwork*)), where
lwork ≥ *n* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slantb/clantb.
DOUBLE PRECISION for dlantb/zlantb.
Value returned by the function.

?lantp

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix supplied in packed form.

Syntax

val = slantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

val = dlantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

val = clantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

val = zlantp(*norm*, *uplo*, *diag*, *n*, *ap*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lantp returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a triangular matrix *A*, supplied in packed form.

Input Parameters

norm — CHARACTER*1. Specifies the value to be returned by the routine:

= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo — CHARACTER*1.
Specifies whether the matrix *A* is upper or lower triangular.
= 'U': Upper triangular
= 'L': Lower triangular.

diag — CHARACTER*1.
Specifies whether or not the matrix *A* is unit triangular.
= 'N': Non-unit triangular
= 'U': Unit triangular.

n — INTEGER. The order of the matrix *A*.
n ≥ 0. When *n* = 0, ?lantp is set to zero.

ap — REAL for slantp
DOUBLE PRECISION for dlantp
COMPLEX for clantp
COMPLEX*16 for zlantp
Array, DIMENSION (*n*(*n*+1)/2).
The upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:
if *uplo* = 'U', AP(i + (*j*-1)*j*/2) = *a*(*i*,*j*) for 1≤ *i*≤ *j*;
if *uplo* = 'L', *ap*(*i* + (*j*-1)(2*n*-*j*)/2) = *a*(*i*,*j*) for *j*≤ *i*≤ *n*.
Note that when *diag* = 'U', the elements of the array *ap* corresponding to the diagonal elements of the matrix *A* are not referenced, but are assumed to be one.

work — REAL for slantp and clantp.
DOUBLE PRECISION for dlantp and zlantp.
Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *n* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val — REAL for slantp/clantp.
DOUBLE PRECISION for dlantp/zlantp.
Value returned by the function.

?lantr

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix.

Syntax

```
val = slantr( norm, uplo, diag, m, n, a, lda, work )
val = dlantr( norm, uplo, diag, m, n, a, lda, work )
val = clantr( norm, uplo, diag, m, n, a, lda, work )
val = zlantr( norm, uplo, diag, m, n, a, lda, work )
```

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `?lantr` returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular matrix *A*.

Input Parameters

norm
CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo
CHARACTER*1.
Specifies whether the matrix *A* is upper or lower trapezoidal.
= 'U': Upper trapezoidal
= 'L': Lower trapezoidal.
Note that *A* is triangular instead of trapezoidal if *m* = *n*.

diag
CHARACTER*1.
Specifies whether or not the matrix *A* has unit diagonal.
= 'N': Non-unit diagonal
= 'U': Unit diagonal.

m
INTEGER. The number of rows of the matrix *A*. *m* ≥ 0, and if *uplo* = 'U', *m* ≤ *n*.
When *m* = 0, ?lantr is set to zero.

n
INTEGER. The number of columns of the matrix *A*. *n* ≥ 0, and if *uplo* = 'L', *n* ≤ *m*.
When *n* = 0, ?lantr is set to zero.

a	REAL for slantr DOUBLE PRECISION for dlantr COMPLEX for clantr COMPLEX*16 for zlantr Array, DIMENSION (*lda*,*n*). The trapezoidal matrix *A* (*A* is triangular if *m* = *n*). If *uplo* = 'U', the leading *m*-by-*n* upper trapezoidal part of the array *a* contains the upper trapezoidal matrix, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *m*-by-*n* lower trapezoidal part of the array *a* contains the lower trapezoidal matrix, and the strictly upper triangular part of *A* is not referenced. Note that when *diag* = 'U', the diagonal elements of *A* are not referenced and are assumed to be one.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*m*,1).
work	REAL for slantr/clantrp. DOUBLE PRECISION for dlantr/zlantr. Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *m* when *norm* = 'I' ; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slantr/clantrp. DOUBLE PRECISION for dlantr/zlantr. Value returned by the function.

?lanv2

Computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form.

Syntax

```
call slanv2( a, b, c, d, rt1r, rt1i, rt2r, rt2i, cs, sn )
call dlanv2( a, b, c, d, rt1r, rt1i, rt2r, rt2i, cs, sn )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the Schur factorization of a real 2-by-2 nonsymmetric matrix in standard form:

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} cs & -sn \\ sn & cs \end{bmatrix} \begin{bmatrix} aa & bb \\ cc & dd \end{bmatrix} \begin{bmatrix} cs & sn \\ -sn & cs \end{bmatrix}$$

where either

1. *cc* = 0 so that *aa* and *dd* are real eigenvalues of the matrix, or

2. *aa* = *dd* and *bb***cc* < 0, so that *aa* ± sqrt(*bb***cc*) are complex conjugate eigenvalues.

The routine was adjusted to reduce the risk of cancellation errors, when computing real eigenvalues, and to ensure, if possible, that abs(*rt1r*) ≥ abs(*rt2r*).

Input Parameters

a, *b*, *c*, *d*	REAL for slanv2 DOUBLE PRECISION for dlanv2. On entry, elements of the input matrix.

Output Parameters

a, *b*, *c*, *d*	On exit, overwritten by the elements of the standardized Schur form.
rt1r, *rt1i*, *rt2r*, *rt2i*	REAL for slanv2 DOUBLE PRECISION for dlanv2. The real and imaginary parts of the eigenvalues. If the eigenvalues are a complex conjugate pair, *rt1i* > 0.
cs, *sn*	REAL for slanv2 DOUBLE PRECISION for dlanv2. Parameters of the rotation matrix.

?lapll

Measures the linear dependence of two vectors.

Syntax

```
call slapll( n, x, incx, Y, incy, ssmin )
call dlapll( n, x, incx, Y, incy, ssmin )
call clapll( n, x, incx, Y, incy, ssmin )
call zlapll( n, x, incx, Y, incy, ssmin )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

Given two column vectors *x* and *y* of length *n*, let

A = (*x* *y*) be the *n*-by-2 matrix.

The routine ?lapll first computes the *QR* factorization of *A* as *A* = *Q***R* and then computes the SVD of the 2-by-2 upper triangular matrix *R*. The smaller singular value of *R* is returned in *ssmin*, which is used as the measurement of the linear dependency of the vectors *x* and *y*.

Input Parameters

n	INTEGER. The length of the vectors *x* and *y*.
x	REAL for slapll

	DOUBLE PRECISION for dlapll COMPLEX for clapll COMPLEX*16 for zlapll Array, DIMENSION (1+(*n*-1)*incx*). On entry, *x* contains the *n*-vector x.
y	REAL for slapll DOUBLE PRECISION for dlapll COMPLEX for clapll COMPLEX*16 for zlapll Array, DIMENSION (1+(*n*-1)*incy*). On entry, *y* contains the *n*-vector y.
incx	INTEGER. The increment between successive elements of x; *incx* > 0.
incy	INTEGER. The increment between successive elements of y; *incy* > 0.

Output Parameters

x	On exit, *x* is overwritten.
y	On exit, *y* is overwritten.
ssmin	REAL for slapll/clapll DOUBLE PRECISION for dlapll/zlapll The smallest singular value of the *n*-by-2 matrix *A* = (*x y*).

?lapmt

Performs a forward or backward permutation of the columns of a matrix.

Syntax

```
call slapmt( forwrd, m, n, x, ldx, k )
call dlapmt( forwrd, m, n, x, ldx, k )
call clapmt( forwrd, m, n, x, ldx, k )
call zlapmt( forwrd, m, n, x, ldx, k )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lapmt rearranges the columns of the *m*-by-*n* matrix *X* as specified by the permutation *k*(1),*k*(2),...,*k*(*n*) of the integers 1,...,*n*.

If *forwrd* = .TRUE., forward permutation:

X(*,*k*(*j*)) is moved to *X*(*,*j*) for *j*=1,2,...,*n*.

If *forwrd* = .FALSE., backward permutation:

X(*,*j*) is moved to *X*(*,*k*(*j*)) for *j* = 1,2,...,*n*.

Input Parameters

forwrd	LOGICAL. If *forwrd* = .TRUE., forward permutation If *forwrd* = .FALSE., backward permutation
m	INTEGER. The number of rows of the matrix *X*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *X*. *n* ≥ 0.
x	REAL for slapmt DOUBLE PRECISION for dlapmt COMPLEX for clapmt COMPLEX*16 for zlapmt Array, DIMENSION (*ldx*,*n*). On entry, the *m*-by-*n* matrix *X*.
ldx	INTEGER. The leading dimension of the array *X*, *ldx* ≥ max(1,*m*).
k	INTEGER. Array, DIMENSION (*n*). On entry, *k* contains the permutation vector and is used as internal workspace.

Output Parameters

x	On exit, *x* contains the permuted matrix *X*.
k	On exit, *k* is reset to its original value.

?lapy2

Returns sqrt(x^2+y^2).

Syntax

val = slapy2(*x*, *y*)

val = dlapy2(*x*, *y*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lapy2 returns sqrt(x^2+y^2), avoiding unnecessary overflow or harmful underflow.

Input Parameters

x, *y*	REAL for slapy2 DOUBLE PRECISION for dlapy2 Specify the input values *x* and *y*.

Output Parameters

val	REAL for slapy2 DOUBLE PRECISION for dlapy2. Value returned by the function.

?lapy3

Returns sqrt(x^2+y^2+z^2).

Syntax

```
val = slapy3( x, y, z )
val = dlapy3( x, y, z )
```

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `?lapy3` returns `sqrt`(x^2+y^2+z^2), avoiding unnecessary overflow or harmful underflow.

Input Parameters

x, *y*, *z*	REAL for `slapy3` DOUBLE PRECISION for `dlapy3` Specify the input values *x*, *y* and *z*.

Output Parameters

val	REAL for `slapy3` DOUBLE PRECISION for `dlapy3`. Value returned by the function.

?laqgb

Scales a general band matrix, using row and column scaling factors computed by ?gbequ.

Syntax

```
call slaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call dlaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call claqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
call zlaqgb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, equed )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine equilibrates a general *m*-by-*n* band matrix *A* with *kl* subdiagonals and *ku* superdiagonals using the row and column scaling factors in the vectors *r* and *c*.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. $m \geq 0$.
n	INTEGER. The number of columns of the matrix *A*. $n \geq 0$.

kl INTEGER. The number of subdiagonals within the band of *A*. *kl* ≥ 0.

ku INTEGER. The number of superdiagonals within the band of *A*. *ku* ≥ 0.

ab REAL for slaqgb
DOUBLE PRECISION for dlaqgb
COMPLEX for claqgb
COMPLEX*16 for zlaqgb
Array, DIMENSION (*ldab*,*n*). On entry, the matrix *A* in band storage, in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows: *ab*(*ku*+1+*i*-*j*,*j*) = *A*(*i*,*j*) for max(1,*j*-*ku*) ≤ i ≤ min(*m*,*j*+*kl*).

ldab INTEGER. The leading dimension of the array *ab*.
lda ≥ *kl*+*ku*+1.

amax REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Absolute value of largest matrix entry.

r, *c* REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Arrays *r* (*m*), *c* (*n*). Contain the row and column scale factors for *A*, respectively.

rowcnd REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Ratio of the smallest *r*(*i*) to the largest *r*(*i*).

colcnd REAL for slaqgb/claqgb
DOUBLE PRECISION for dlaqgb/zlaqgb
Ratio of the smallest *c*(*i*) to the largest *c*(*i*).

Output Parameters

ab On exit, the equilibrated matrix, in the same storage format as *A*. See *equed* for the form of the equilibrated matrix.

equed CHARACTER*1.
Specifies the form of equilibration that was done.
If *equed* = 'N': No equilibration
If *equed* = 'R': Row equilibration, that is, *A* has been premultiplied by diag(*r*).
If *equed* = 'C': Column equilibration, that is, *A* has been postmultiplied by diag(*c*).
If *equed* = 'B': Both row and column equilibration, that is, *A* has been replaced by diag(*r*)*A*diag(*c*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if row or column scaling should be done based on the ratio of the row or column scaling factors. If *rowcnd* < *thresh*, row scaling is done, and if *colcnd* < *thresh*, column scaling is done. *large* and *small* are threshold values used to decide if row scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, row scaling is done.

?laqge

Scales a general rectangular matrix, using row and column scaling factors computed by ?geequ.

Syntax

```
call slaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call dlaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call claqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
call zlaqge( m, n, a, lda, r, c, rowcnd, colcnd, amax, equed )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine equilibrates a general *m*-by-*n* matrix *A* using the row and column scaling factors in the vectors *r* and *c*.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
a	REAL for slaqge DOUBLE PRECISION for dlaqge COMPLEX for claqge COMPLEX*16 for zlaqge Array, DIMENSION (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*m*,1).
r	REAL for slanqge/claqge DOUBLE PRECISION for dlaqge/zlaqge Array, DIMENSION (*m*). The row scale factors for A.
c	REAL for slanqge/claqge DOUBLE PRECISION for dlaqge/zlaqge Array, DIMENSION (*n*). The column scale factors for A.

rowcnd	REAL for slanqge/claqge DOUBLE PRECISION for dlaqge/zlaqge Ratio of the smallest *r*(*i*) to the largest *r*(*i*).
colcnd	REAL for slanqge/claqge DOUBLE PRECISION for dlaqge/zlaqge Ratio of the smallest *c*(*i*) to the largest *c*(*i*).
amax	REAL for slanqge/claqge DOUBLE PRECISION for dlaqge/zlaqge Absolute value of largest matrix entry.

Output Parameters

a	On exit, the equilibrated matrix. See *equed* for the form of the equilibrated matrix.
equed	CHARACTER*1. Specifies the form of equilibration that was done. If *equed* = 'N': No equilibration If *equed* = 'R': Row equilibration, that is, *A* has been premultiplied by diag(*r*). If *equed* = 'C': Column equilibration, that is, *A* has been postmultiplied by diag(*c*). If *equed* = 'B': Both row and column equilibration, that is, *A* has been replaced by diag(*r*)*A*diag(*c*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if row or column scaling should be done based on the ratio of the row or column scaling factors. If *rowcnd* < *thresh*, row scaling is done, and if *colcnd* < *thresh*, column scaling is done. *large* and *small* are threshold values used to decide if row scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, row scaling is done.

?laqhb

Scales a Hermetian band matrix, using scaling factors computed by ?pbequ.

Syntax

```
call claqhb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call zlaqhb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine equilibrates a Hermetian band matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the band matrix *A* is stored.
If *uplo* = 'U': upper triangular.
If *uplo* = 'L': lower triangular.

n — INTEGER. The order of the matrix *A*.
n ≥ 0.

kd — INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals if *uplo* = 'L'.
kd ≥ 0.

ab — COMPLEX for claqhb
COMPLEX*16 for zlaqhb
Array, DIMENSION (*ldab*,*n*). On entry, the upper or lower triangle of the band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*kd*+1+*i*-*j*,*j*) = A(*i*,*j*) for max(1,*j*-*kd*) ≤ *i* ≤ *j*;
if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = A(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*kd*).

ldab — INTEGER. The leading dimension of the array *ab*.
ldab ≥ *kd*+1.

scond — REAL for claqsb
DOUBLE PRECISION for zlaqsb
Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax — REAL for claqsb
DOUBLE PRECISION for zlaqsb
Absolute value of largest matrix entry.

Output Parameters

ab — On exit, if *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization *A* = *U*'**U* or *A* = *L***L*' of the band matrix *A*, in the same storage format as *A*.

s — REAL for claqsb
DOUBLE PRECISION for zlaqsb
Array, DIMENSION (*n*). The scale factors for A.

equed — CHARACTER*1.
Specifies whether or not equilibration was done.
If *equed* = 'N': No equilibration.
If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)**A***diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done.

The values *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqp2

Computes a QR factorization with column pivoting of the matrix block.

Syntax

```
call slaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call dlaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call claqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
call zlaqp2( m, n, offset, a, lda, jpvt, tau, vn1, vn2, work )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes a *QR* factorization with column pivoting of the block *A*(*offset*+1:*m*,1:*n*). The block *A*(1:*offset*,1:*n*) is accordingly pivoted, but not factorized.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
offset	INTEGER. The number of rows of the matrix *A* that must be pivoted but no factorized. *offset* ≥ 0.
a	REAL for slaqp2 DOUBLE PRECISION for dlaqp2 COMPLEX for claqp2 COMPLEX*16 for zlaqp2 Array, DIMENSION (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*m*).
jpvt	INTEGER. Array, DIMENSION (*n*). On entry, if *jpvt*(*i*) ≠ 0, the *i*-th column of *A* is permuted to the front of *A***P* (a leading column); if *jpvt*(*i*) = 0, the *i*-th column of *A* is a free column.
vn1, *vn2*	REAL for slaqp2/claqp2

DOUBLE PRECISION for dlaqp2/zlaqp2
Arrays, DIMENSION (*n*) each. Contain the vectors with the partial and exact column norms, respectively.

work — REAL for slaqp2
DOUBLE PRECISION for dlaqp2
COMPLEX for claqp2
COMPLEX*16 for zlaqp2 Workspace array, DIMENSION (*n*).

Output Parameters

a — On exit, the upper triangle of block *A*(*offset*+1:*m*,1:*n*) is the triangular factor obtained; the elements in block *A*(*offset*+1:*m*,1:*n*) below the diagonal, together with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors. Block *A*(1:*offset*,1:*n*) has been accordingly pivoted, but not factorized.

jpvt — On exit, if *jpvt*(*i*) = *k*, then the *i*-th column of *A***P* was the *k*-th column of *A*.

tau — REAL for slaqp2
DOUBLE PRECISION for dlaqp2
COMPLEX for claqp2
COMPLEX*16 for zlaqp2
Array, DIMENSION (min(*m*,*n*)).
The scalar factors of the elementary reflectors.

vn1, *vn2* — Contain the vectors with the partial and exact column norms, respectively.

?laqps

Computes a step of QR factorization with column pivoting of a real m-by-n matrix A by using BLAS level 3.

Syntax

```
call slaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call dlaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call claqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
call zlaqps( m, n, offset, nb, kb, a, lda, jpvt, tau, vn1, vn2, auxv, f, ldf )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes a step of *QR* factorization with column pivoting of a real *m*-by-*n* matrix *A* by using BLAS level 3. The routine tries to factorize *NB* columns from *A* starting from the row *offset*+1, and updates all of the matrix with BLAS level 3 routine ?gemm.

In some cases, due to catastrophic cancellations, ?laqps cannot factorize *NB* columns. Hence, the actual number of factorized columns is returned in *kb*.

Block $A(1:offset,1:n)$ is accordingly pivoted, but not factorized.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*. $m \geq 0$.
n	INTEGER. The number of columns of the matrix *A*. $n \geq 0$.
offset	INTEGER. The number of rows of *A* that have been factorized in previous steps.
nb	INTEGER. The number of columns to factorize.
a	REAL for slaqps DOUBLE PRECISION for dlaqps COMPLEX for claqps COMPLEX*16 for zlaqps Array, DIMENSION (*lda*,*n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. $lda \geq \max(1,m)$.
jpvt	INTEGER. Array, DIMENSION (*n*). If $jpvt(I) = k$ then column *k* of the full matrix *A* has been permuted into position *i* in AP.
vn1, *vn2*	REAL for slaqps/claqps DOUBLE PRECISION for dlaqps/zlaqps Arrays, DIMENSION (*n*) each. Contain the vectors with the partial and exact column norms, respectively.
auxv	REAL for slaqps DOUBLE PRECISION for dlaqps COMPLEX for claqps COMPLEX*16 for zlaqps Array, DIMENSION (*nb*). Auxiliary vector.
f	REAL for slaqps DOUBLE PRECISION for dlaqps COMPLEX for claqps COMPLEX*16 for zlaqps Array, DIMENSION (*ldf*,*nb*). Matrix $F' = L*Y'*A$.
ldf	INTEGER. The leading dimension of the array *f*. $ldf \geq \max(1,n)$.

Output Parameters

kb	INTEGER. The number of columns actually factorized.
a	On exit, block $A(offset+1:m,1:kb)$ is the triangular factor obtained and block $A(1:offset,1:n)$ has been accordingly pivoted, but no factorized. The rest of the matrix, block $A(offset+1:m,kb+1:n)$ has been updated.

jpvt	INTEGER array, DIMENSION (*n*). If *jpvt*(*I*) = *k* then column *k* of the full matrix *A* has been permuted into position *i* in AP.
tau	REAL for slaqps DOUBLE PRECISION for dlaqps COMPLEX for claqps COMPLEX*16 for zlaqps Array, DIMENSION (*kb*). The scalar factors of the elementary reflectors.
vn1, *vn2*	The vectors with the partial and exact column norms, respectively.
auxv	Auxiliary vector.
f	Matrix *F' = L*Y'*A*.

?laqr0

Computes the eigenvalues of a Hessenberg matrix, and optionally the marixes from the Schur decomposition.

Syntax

```
call slaqr0( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call dlaqr0( wantt, wantz, n, ilo, ihi, h, ldh, wr, wi, iloz, ihiz, z, ldz, work, lwork, info )
call claqr0( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
call zlaqr0( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the eigenvalues of a Hessenberg matrix *H*, and, optionally, the matrices *T* and *Z* from the Schur decomposition $H=Z*T*Z^H$, where *T* is an upper quasi-triangular/triangular matrix (the Schur form), and *Z* is the orthogonal/unitary matrix of Schur vectors.

Optionally *Z* may be postmultiplied into an input orthogonal/unitary matrix *Q* so that this routine can give the Schur factorization of a matrix *A* which has been reduced to the Hessenberg form *H* by the orthogonal/unitary matrix *Q*: $A = Q*H*Q^H = (QZ)*H*(QZ)^H$.

Input Parameters

wantt	LOGICAL. If *wantt* = .TRUE., the full Schur form T is required; If *wantt* = .FALSE., only eigenvalues are required.
wantz	LOGICAL. If *wantz* = .TRUE., the matrix of Schur vectors *Z* is required; If *wantz* = .FALSE., Schur vectors are not required.

n — INTEGER. The order of the Hessenberg matrix *H*. (*n* ≥ 0).

ilo, *ihi* — INTEGER.
It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*, and if *ilo* > 1 then *H*(*ilo*, *ilo*-1) = 0. *ilo* and *ihi* are normally set by a previous call to cgebal, and then passed to cgehrd when the matrix output by cgebal is reduced to Hessenberg form. Otherwise, *ilo* and *ihi* should be set to 1 and *n*, respectively.
If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*.
If *n*=0, then *ilo*=1 and *ihi*=0

h — REAL for slaqr0
DOUBLE PRECISION for dlaqr0
COMPLEX for claqr0
COMPLEX*16 for zlaqr0.
Array, DIMENSION (*ldh*, *n*), contains the upper Hessenberg matrix *H*.

ldh — INTEGER. The leading dimension of the array *h*. *ldh* ≥ max(1, *n*).

iloz, *ihiz* — INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE., 1 ≤ *iloz* ≤ *ilo*; *ihi* ≤ *ihiz* ≤ *n*.

z — REAL for slaqr0
DOUBLE PRECISION for dlaqr0
COMPLEX for claqr0
COMPLEX*16 for zlaqr0.
Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE..
If *wantz* is .FALSE., *z* is not referenced.

ldz — INTEGER. The leading dimension of the array *z*.
If *wantz* is .TRUE., then *ldz* ≥ max(1, *ihiz*). Otherwise, *ldz* ≥ 1.

work — REAL for slaqr0
DOUBLE PRECISION for dlaqr0
COMPLEX for claqr0
COMPLEX*16 for zlaqr0.
Workspace array with dimension *lwork*.

lwork — INTEGER. The dimension of the array *work*.
lwork ≥ max(1,*n*) is sufficient, but for the optimal performance a greater workspace may be required, typically as large as 6**n*.
It is recommended to use the workspace query to determine the optimal workspace size. If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *ilo*, and *ihi*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h	If *info*=0 , and *wantt* is .TRUE., then *h* contains the upper quasi-triangular/triangular matrix *T* from the Schur decomposition (the Schur form). If *info*=0 , and *wantt* is .FALSE., then the contents of *h* are unspecified on exit. (The output values of *h* when *info* > 0 are given under the description of the *info* parameter below.) The routine may explicitly set *h*(i,j) for i>j and j=1,2,...*ilo*-1 or j=*ihi*+1, *ihi*+2,...*n*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
w	COMPLEX for claqr0 COMPLEX*16 for zlaqr0. Arrays, DIMENSION(*n*). The computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *w*(*ilo*:*ihi*). If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).
wr, *wi*	REAL for slaqr0 DOUBLE PRECISION for dlaqr0 Arrays, DIMENSION(*ihi*) each. The real and imaginary parts, respectively, of the computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *wr*(*ilo*:*ihi*) and *wi*(*ilo*:*ihi*). If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the *i*-th and (*i*+1)-th, with *wi*(*i*)> 0 and *wi*(*i*+1) < 0. If *wantt* is .TRUE. , then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and if *h*(i:i+1,i:i+1)is a 2-by-2 diagonal block, then *wi*(i)=sqrt(-*h*(i+1,i)*h(i,i+1)).
z	If *wantz* is .TRUE., then *z(ilo:ihi, iloz:ihiz)* is replaced by *z(ilo:ihi, iloz:ihiz)*U*, where *U* is the orthogonal/unitary Schur factor of *h(ilo:ihi, ilo:ihi)*. If *wantz* is .FALSE., *z* is not referenced. (The output values of *z* when *info* > 0 are given under the description of the *info* parameter below.)
info	INTEGER. = 0: the execution is successful. > 0: if *info* = *i*, then the routine failed to compute all the eigenvalues. Elements 1:*ilo*-1 and i+1:*n* of *wr* and *wi* contain those eigenvalues which have been successfully computed. > 0: if *wantt* is .FALSE., then the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.

> 0: if *wantt* is .TRUE., then (initial value of *h*)**U* = *U**(final value of *h*, where *U* is an orthogonal/unitary matrix. The final value of *h* is upper Hessenberg and quasi-triangular/triangular in rows and columns *info*+1 through *ihi*.
> 0: if *wantz* is .TRUE., then (final value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*))=(initial value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*)***U*, where *U* is the orthogonal/unitary matrix in the previous expression (regardless of the value of *wantt*).
> 0: if *wantz* is .FALSE., then *z* is not accessed.

?laqr1

Sets a scalar multiple of the first column of the product of 2-by-2 or 3-by-3 matrix H and specified shifts.

Syntax

```
call slaqr1( n, h, ldh, sr1, si1, sr2, si2, v )
call dlaqr1( n, h, ldh, sr1, si1, sr2, si2, v )
call claqr1( n, h, ldh, s1, s2, v )
call zlaqr1( n, h, ldh, s1, s2, v )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

Given a 2-by-2 or 3-by-3 matrix *H*, this routine sets *v* to a scalar multiple of the first column of the product

K = (*H* - *s1***I*)*(*H* - *s2***I*), or *K* = (*H* - (*sr1* + i**si1*)**I*)*(*H* - (*sr2* + i**si2*)**I*)

scaling to avoid overflows and most underflows.

It is assumed that either 1) *sr1* = *sr2* and *si1* = -*si2*, or 2) *si1* = *si2* = 0.

This is useful for starting double implicit shift bulges in the QR algorithm.

Input Parameters

n	INTEGER. The order of the matrix *H*. *n* must be equal to 2 or 3.
sr1, *si2*, *sr2*, *si2*	REAL for slaqr1 DOUBLE PRECISION for dlaqr1 Shift values that define *K* in the formula above.
s1, *s2*	COMPLEX for claqr1 COMPLEX*16 for zlaqr1. Shift values that define *K* in the formula above.
h	REAL for slaqr1 DOUBLE PRECISION for dlaqr1 COMPLEX for claqr1 COMPLEX*16 for zlaqr1.

	Array, DIMENSION (*ldh*, *n*), contains 2-by-2 or 3-by-3 matrix *H* in the formula above.
ldh	INTEGER. The leading dimension of the array *h* just as declared in the calling routine. *ldh* ≥ *n*.

Output Parameters

v	REAL for slaqr1 DOUBLE PRECISION for dlaqr1 COMPLEX for claqr1 COMPLEX*16 for zlaqr1. Array with dimension (*n*). A scalar multiple of the first column of the matrix *K* in the formula above.

?laqr2

Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).

Syntax

call slaqr2(*wantt*, *wantz*, *n*, *ktop*, *kbot*, *nw*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, *ns*, *nd*, *sr*, *si*, *v*, *ldv*, *nh*, *t*, *ldt*, *nv*, *wv*, *ldwv*, *work*, *lwork*)

call dlaqr2(*wantt*, *wantz*, *n*, *ktop*, *kbot*, *nw*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, *ns*, *nd*, *sr*, *si*, *v*, *ldv*, *nh*, *t*, *ldt*, *nv*, *wv*, *ldwv*, *work*, *lwork*)

call claqr2(*wantt*, *wantz*, *n*, *ktop*, *kbot*, *nw*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, *ns*, *nd*, *sh*, *v*, *ldv*, *nh*, *t*, *ldt*, *nv*, *wv*, *ldwv*, *work*, *lwork*)

call zlaqr2(*wantt*, *wantz*, *n*, *ktop*, *kbot*, *nw*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, *ns*, *nd*, *sh*, *v*, *ldv*, *nh*, *t*, *ldt*, *nv*, *wv*, *ldwv*, *work*, *lwork*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine accepts as input an upper Hessenberg matrix *H* and performs an orthogonal/unitary similarity transformation designed to detect and deflate fully converged eigenvalues from a trailing principal submatrix. On output *H* has been overwritten by a new Hessenberg matrix that is a perturbation of an orthogonal/unitary similarity transformation of *H*. It is to be hoped that the final version of *H* has many zero subdiagonal entries.

This subroutine is identical to ?laqr3 except that it avoids recursion by calling ?lahqr instead of ?laqr4.

Input Parameters

wantt	LOGICAL.

	If *wantt* = .TRUE., then the Hessenberg matrix *H* is fully updated so that the quasi-triangular/triangular Schur factor may be computed (in cooperation with the calling subroutine). If *wantt* = .FALSE., then only enough of *H* is updated to preserve the eigenvalues.
wantz	LOGICAL. If *wantz* = .TRUE., then the orthogonal/unitary matrix *Z* is updated so that the orthogonal/unitary Schur factor may be computed (in cooperation with the calling subroutine). If *wantz* = .FALSE., then *Z* is not referenced.
n	INTEGER. The order of the Hessenberg matrix *H* and (if *wantz* = .TRUE.) the order of the orthogonal/unitary matrix *Z*.
ktop	INTEGER. It is assumed that either *ktop*=1 or *h*(*ktop*,*ktop-1*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.
kbot	INTEGER. It is assumed without a check that either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0. *ktop* and *kbot* together determine an isolated block along the diagonal of the Hessenberg matrix.
nw	INTEGER. Size of the deflation window. 1 ≤ *nw* ≤ (*kbot*-*ktop*+1).
h	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Array, DIMENSION (*ldh*, *n*), on input the initial *n*-by-*n* section of *h* stores the Hessenberg matrix *H* undergoing aggressive early deflation.
ldh	INTEGER. The leading dimension of the array *h* just as declared in the calling subroutine. *ldh*≥*n*.
iloz, *ihiz*	INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. 1 ≤ *iloz* ≤ *ihiz* ≤ *n*.
z	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Array, DIMENSION (*ldz*, *n*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.
ldz	INTEGER. The leading dimension of the array *z* just as declared in the calling subroutine. *ldz* ≥ 1.
v	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2.

	Workspace array with dimension (*ldv*, *nw*). An *nw*-by-*nw* work array.
ldv	INTEGER. The leading dimension of the array *v* just as declared in the calling subroutine. *ldv* ≥ *nw*.
nh	INTEGER. The number of column of *t*. *nh* ≥ *nw*.
t	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Workspace array with dimension (*ldt*, *nw*).
ldt	INTEGER. The leading dimension of the array *t* just as declared in the calling subroutine. *ldt*≥*nw*.
nv	INTEGER. The number of rows of work array *wv* available for workspace. *nv*≥*nw*.
wv	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Workspace array with dimension (*ldwv*, *nw*).
ldwv	INTEGER. The leading dimension of the array *wv* just as declared in the calling subroutine. *ldwv*≥*nw*.
work	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Workspace array with dimension *lwork*.
lwork	INTEGER. The dimension of the array *work*. *lwork*=2**nw*) is sufficient, but for the optimal performance a greater workspace may be required. If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h	On output *h* has been transformed by an orthogonal/unitary similarity transformation, perturbed, and the returned to Hessenberg form that (it is to be hoped) has some zero subdiagonal entries.
work(1)	On exit *work*(1) is set to an estimate of the optimal value of *lwork* for the given values of the input parameters *n*, *nw*, *ktop*, and *kbot*.
z	If *wantz* is .TRUE., then the orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right.

	If *wantz* is .FALSE., then *z* is unreferenced.
nd	INTEGER. The number of converged eigenvalues uncovered by the routine.
ns	INTEGER. The number of unconverged, that is approximate eigenvalues returned in *sr*, *si* or in *sh* that may be used as shifts by the calling subroutine.
sh	COMPLEX for claqr2 COMPLEX*16 for zlaqr2. Arrays, DIMENSION (*kbot*). The approximate eigenvalues that may be used for shifts are stored in the *sh*(*kbot*-*nd*-*ns*+1)through the *sh*(*kbot*-*nd*). The converged eigenvalues are stored in the *sh*(*kbot*-*nd*+1)through the *sh*(*kbot*).
sr, *si*	REAL for slaqr2 DOUBLE PRECISION for dlaqr2 Arrays, DIMENSION (*kbot*) each. The real and imaginary parts of the approximate eigenvalues that may be used for shifts are stored in the *sr*(*kbot*-*nd*-*ns*+1)through the *sr*(*kbot*-*nd*), and *si*(*kbot*-*nd*-*ns*+1) through the *si*(*kbot*-*nd*), respectively. The real and imaginary parts of converged eigenvalues are stored in the *sr*(*kbot*-*nd*+1)through the *sr*(*kbot*), and *si*(*kbot*-*nd*+1) through the *si*(*kbot*), respectively.

?laqr3

Performs the orthogonal/unitary similarity transformation of a Hessenberg matrix to detect and deflate fully converged eigenvalues from a trailing principal submatrix (aggressive early deflation).

Syntax

```
call slaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call dlaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sr, si, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call claqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
call zlaqr3( wantt, wantz, n, ktop, kbot, nw, h, ldh, iloz, ihiz, z, ldz, ns, nd, sh, v, ldv, nh, t, ldt, nv, wv, ldwv, work, lwork )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine accepts as input an upper Hessenberg matrix *H* and performs an orthogonal/unitary similarity transformation designed to detect and deflate fully converged eigenvalues from a trailing principal submatrix. On output *H* has been overwritten by a new Hessenberg matrix that is a perturbation of an orthogonal/unitary similarity transformation of *H*. It is to be hoped that the final version of *H* has many zero subdiagonal entries.

Input Parameters

wantt	LOGICAL. If *wantt* = .TRUE., then the Hessenberg matrix *H* is fully updated so that the quasi-triangular/triangular Schur factor may be computed (in cooperation with the calling subroutine). If *wantt* = .FALSE., then only enough of *H* is updated to preserve the eigenvalues.

The real and imaginary parts of converged eigenvalues are stored in the *sr*(*kbot-nd*+1)through the *sr*(*kbot*), and *si*(*kbot-nd*+1) through the *si*(*kbot*), respectively.

?laqr4

Computes the eigenvalues of a Hessenberg matrix, and optionally the matrices from the Schur decomposition.

Syntax

call slaqr4(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *h*, *ldh*, *wr*, *wi*, *iloz*, *ihiz*, *z*, *ldz*, *work*, *lwork*, *info*)

call dlaqr4(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *h*, *ldh*, *wr*, *wi*, *iloz*, *ihiz*, *z*, *ldz*, *work*, *lwork*, *info*)

```
call claqr4( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info
)
call zlaqr4( wantt, wantz, n, ilo, ihi, h, ldh, w, iloz, ihiz, z, ldz, work, lwork, info
)
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the eigenvalues of a Hessenberg matrix *H*, and, optionally, the matrices *T* and *Z* from the Schur decomposition $H=Z*T*Z^H$, where *T* is an upper quasi-triangular/triangular matrix (the Schur form), and *Z* is the orthogonal/unitary matrix of Schur vectors.

Optionally *Z* may be postmultiplied into an input orthogonal/unitary matrix *Q* so that this routine can give the Schur factorization of a matrix *A* which has been reduced to the Hessenberg form *H* by the orthogonal/unitary matrix *Q*: $A = Q*H*Q^H = (QZ)*H*(QZ)^H$.

This routine implements one level of recursion for `?laqr0`. It is a complete implementation of the small bulge multi-shift QR algorithm. It may be called by `?laqr0` and, for large enough deflation window size, it may be called by `?laqr3`. This routine is identical to `?laqr0` except that it calls `?laqr2` instead of `?laqr3`.

Input Parameters

wantt	`LOGICAL`. If *wantt* = `.TRUE.`, the full Schur form `T` is required; If *wantt* = `.FALSE.`, only eigenvalues are required.
wantz	`LOGICAL`. If *wantz* = `.TRUE.`, the matrix of Schur vectors *Z* is required; If *wantz* = `.FALSE.`, Schur vectors are not required.
n	`INTEGER`. The order of the Hessenberg matrix *H*. ($n \geq 0$).
ilo, *ihi*	`INTEGER`. It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*, and if $ilo > 1$ then $h(ilo, ilo-1) = 0$. *ilo* and *ihi* are normally set by a previous call to `cgebal`, and then passed to `cgehrd` when the matrix output by `cgebal` is reduced to Hessenberg form. Otherwise, *ilo* and *ihi* should be set to `1` and *n*, respectively. If $n > 0$, then $1 \leq ilo \leq ihi \leq n$. If *n*=0, then *ilo*=1 and *ihi*=0

h	`REAL` for `slaqr4`
	`DOUBLE PRECISION` for `dlaqr4`
	`COMPLEX` for `claqr4`
	`COMPLEX*16` for `zlaqr4`.
	Array, `DIMENSION` (*ldh*, *n*), contains the upper Hessenberg matrix *H*.

ldh	`INTEGER`. The leading dimension of the array *h*. $ldh \geq \max(1, n)$.
iloz, *ihiz*	`INTEGER`. Specify the rows of *Z* to which transformations must be applied if *wantz* is `.TRUE.`, $1 \leq iloz \leq ilo$; $ihi \leq ihiz \leq n$.

z	REAL for slaqr4 DOUBLE PRECISION for dlaqr4 COMPLEX for claqr4 COMPLEX*16 for zlaqr4. Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., *z* is not referenced.
ldz	INTEGER. The leading dimension of the array *z*. If *wantz* is .TRUE., then *ldz* ≥ max(1, *ihiz*). Otherwise, *ldz* ≥ 1.
work	REAL for slaqr4 DOUBLE PRECISION for dlaqr4 COMPLEX for claqr4 COMPLEX*16 for zlaqr4. Workspace array with dimension *lwork*.
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ max(1,*n*) is sufficient, but for the optimal performance a greater workspace may be required, typically as large as 6**n*. It is recommended to use the workspace query to determine the optimal workspace size. If *lwork*=-1, then the routine performs a workspace query: it estimates the optimal workspace size for the given values of the input parameters *n*, *ilo*, and *ihi*. The estimate is returned in *work*(1). No error messages related to the *lwork* is issued by xerbla. Neither *H* nor *Z* are accessed.

Output Parameters

h	If *info*=0 , and *wantt* is .TRUE., then *h* contains the upper quasi-triangular/triangular matrix *T* from the Schur decomposition (the Schur form). If *info*=0 , and *wantt* is .FALSE., then the contents of *h* are unspecified on exit. (The output values of *h* when *info* > 0 are given under the description of the *info* parameter below.) The routines may explicitly set *h*(i,j) for i>j and j=1,2,...*ilo*-1 or j=*ihi*+1, *ihi*+2,...*n*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
w	COMPLEX for claqr4 COMPLEX*16 for zlaqr4. Arrays, DIMENSION(*n*). The computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in *w*(*ilo*:*ihi*). If *wantt* is .TRUE., then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *w*(i) = *h*(i,i).
wr, *wi*	REAL for slaqr4 DOUBLE PRECISION for dlaqr4

Arrays, DIMENSION(*ihi*) each. The real and imaginary parts, respectively, of the computed eigenvalues of *h*(*ilo*:*ihi*, *ilo*:*ihi*) are stored in the *wr*(*ilo*:*ihi*) and *wi*(*ilo*:*ihi*). If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the *i*-th and (*i*+1)-th, with *wi*(*i*)> 0 and *wi*(*i*+1) < 0. If *wantt* is .TRUE. , then the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *h*, with *wr*(i) = *h*(i,i), and if *h*(i:i+1,i:i+1)is a 2-by-2 diagonal block, then *wi*(i)=sqrt(-*h*(i+1,i)*h(i,i+1)).

z — If *wantz* is .TRUE., then *z(ilo:ihi, iloz:ihiz)* is replaced by *z(ilo:ihi, iloz:ihiz)*U*, where *U* is the orthogonal/unitary Schur factor of *h(ilo:ihi, ilo:ihi)*.
If *wantz* is .FALSE., *z* is not referenced.
(The output values of *z* when *info* > 0 are given under the description of the *info* parameter below.)

info — INTEGER.
= 0: the execution is successful.
> 0: if *info* = *i*, then the routine failed to compute all the eigenvalues. Elements 1:*ilo*-1 and i+1:*n* of *wr* and *wi* contain those eigenvalues which have been successfully computed.
> 0: if *wantt* is .FALSE., then the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *h*.
> 0: if *wantt* is .TRUE., then (initial value of *h*)*U = *U**(final value of *h*, where *U* is an orthogonal/unitary matrix. The final value of *h* is upper Hessenberg and quasi-triangular/triangular in rows and columns *info*+1 through *ihi*.
> 0: if *wantz* is .TRUE., then (final value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*))=(initial value of *z*(*ilo*:*ihi*, *iloz*:*ihiz*)*U, where *U* is the orthogonal/unitary matrix in the previous expression (regardless of the value of *wantt*).
> 0: if *wantz* is .FALSE., then *z* is not accessed.

?laqr5

Performs a single small-bulge multi-shift QR sweep.

Syntax

call slaqr5(*wantt*, *wantz*, *kacc22*, *n*, *ktop*, *kbot*, *nshfts*, *sr*, *si*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, v, ldv, u, ldu, nv, wv, *ldwv*, *nh*, *wh*, *ldwh*)

call dlaqr5(*wantt*, *wantz*, *kacc22*, *n*, *ktop*, *kbot*, *nshfts*, *sr*, *si*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, v, ldv, u, ldu, nv, wv, *ldwv*, *nh*, *wh*, *ldwh*)

call claqr5(*wantt*, *wantz*, *kacc22*, *n*, *ktop*, *kbot*, *nshfts*, *s*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, v, ldv, u, ldu, nv, wv, *ldwv*, *nh*, *wh*, *ldwh*)

call zlaqr5(*wantt*, *wantz*, *kacc22*, *n*, *ktop*, *kbot*, *nshfts*, *s*, *h*, *ldh*, *iloz*, *ihiz*, *z*, *ldz*, v, ldv, u, ldu, nv, wv, *ldwv*, *nh*, *wh*, *ldwh*)

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

This auxiliary routine called by `?laqr0` performs a single small-bulge multi-shift QR sweep.

Input Parameters

wantt — `LOGICAL`.
wantt = `.TRUE.` if the quasi-triangular/triangular Schur factor is computed.
wantt is set to `.FALSE.` otherwise.

wantz — `LOGICAL`.
wantz = `.TRUE.` if the orthogonal/unitary Schur factor is computed.
wantz is set to `.FALSE.` otherwise.

kacc22 — `INTEGER`. Possible values are 0, 1, or 2.
Specifies the computation mode of far-from-diagonal orthogonal updates.
= `0`: the routine does not accumulate reflections and does not use matrix-matrix multiply to update far-from-diagonal matrix entries.
= `1`: the routine accumulates reflections and uses matrix-matrix multiply to update the far-from-diagonal matrix entries.
= `2`: the routine accumulates reflections, uses matrix-matrix multiply to update the far-from-diagonal matrix entries, and takes advantage of 2-by-2 block structure during matrix multiplies.

n — `INTEGER`. The order of the Hessenberg matrix *H* upon which the routine operates.

ktop, *kbot* — `INTEGER`.
It is assumed without a check that either *ktop*=1 or *h*(*ktop*,*ktop-1*)=0, and either *kbot*=*n* or *h*(*kbot*+1,*kbot*)=0.

nshfts — `INTEGER`.
Number of simultaneous shifts, must be positive and even.

sr, *si* — `REAL` for `slaqr5`
`DOUBLE PRECISION` for `dlaqr5`
Arrays, `DIMENSION` (*nshfts*) each.
sr contains the real parts and *si* contains the imaginary parts of the *nshfts* shifts of origin that define the multi-shift QR sweep.

s — `COMPLEX` for `claqr5`
`COMPLEX*16` for `zlaqr5`.
Arrays, `DIMENSION` (*nshfts*).
s contains the shifts of origin that define the multi-shift QR sweep.

h — `REAL` for `slaqr5`
`DOUBLE PRECISION` for `dlaqr5`
`COMPLEX` for `claqr5`
`COMPLEX*16` for `zlaqr5`.

	Array, DIMENSION (*ldh*, *n*), on input contains the Hessenberg matrix.
ldh	INTEGER. The leading dimension of the array *h* just as declared in the calling routine. *ldh* ≥ max(1, *n*).
iloz, *ihiz*	INTEGER. Specify the rows of *Z* to which transformations must be applied if *wantz* is .TRUE.. 1 ≤ *iloz* ≤ *ihiz* ≤ *n*.
z	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Array, DIMENSION (*ldz*, *ihi*), contains the matrix *Z* if *wantz* is .TRUE.. If *wantz* is .FALSE., then *z* is not referenced.
ldz	INTEGER. The leading dimension of the array *z* just as declared in the calling routine. *ldz* ≥ *n*.
v	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Workspace array with dimension (*ldv*, *nshfts*/2).
ldv	INTEGER. The leading dimension of the array *v* just as declared in the calling routine. *ldv* ≥ 3.
u	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Workspace array with dimension (*ldu*, 3**nshfts*-3).
ldu	INTEGER. The leading dimension of the array *u* just as declared in the calling routine. *ldu* ≥ 3**nshfts*-3.
nh	INTEGER. The number of column in the array *wh* available for workspace. *nh* ≥ 1.
wh	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5 COMPLEX*16 for zlaqr5. Workspace array with dimension (*ldwh*, *nh*)
ldwh	INTEGER. The leading dimension of the array *wh* just as declared in the calling routine. *ldwh* ≥ 3**nshfts*-3
nv	INTEGER. The number of rows of the array *wv* available for workspace. *nv* ≥ 1.
wv	REAL for slaqr5 DOUBLE PRECISION for dlaqr5 COMPLEX for claqr5

	COMPLEX*16 for zlaqr5. Workspace array with dimension (*ldwv*, 3**nshfts*-3).
ldwv	INTEGER. The leading dimension of the array *wv* just as declared in the calling routine. *ldwv* ≥ *nv*.

Output Parameters

sr, *si*	On output, may be reordered.
h	On output a multi-shift QR Sweep with shifts *sr*(j)+i**si*(j) or *s*(j) is applied to the isolated diagonal block in rows and columns *ktop* through *kbot* .
z	If *wantz* is .TRUE., then the QR Sweep orthogonal/unitary similarity transformation is accumulated into *z(iloz:ihiz, ilo:ihi)* from the right. If *wantz* is .FALSE., then *z* is unreferenced.

?laqsb

Scales a symmetric band matrix, using scaling factors computed by ?pbequ.

Syntax

```
call slaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call dlaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call claqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
call zlaqsb( uplo, n, kd, ab, ldab, s, scond, amax, equed )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine equilibrates a symmetric band matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored. If *uplo* = 'U': upper triangular. If *uplo* = 'L': lower triangular.
n	INTEGER. The order of the matrix *A*. *n* ≥ 0.
kd	INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U', or the number of sub-diagonals if *uplo* = 'L'. *kd* ≥ 0.

ab
REAL for slaqsb
DOUBLE PRECISION for dlaqsb
COMPLEX for claqsb
COMPLEX*16 for zlaqsb
Array, DIMENSION (*ldab*,*n*). On entry, the upper or lower triangle of the symmetric band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', *ab*(*kd*+1+*i*-*j*,*j*) = A(*i*,*j*) for max(1,*j*-*kd*) ≤ *i* ≤ *j*;
if *uplo* = 'L', *ab*(1+*i*-*j*,*j*) = A(*i*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*kd*).

ldab
INTEGER. The leading dimension of the array *ab*.
ldab ≥ *kd*+1.

s
REAL for slaqsb/claqsb
DOUBLE PRECISION for dlaqsb/zlaqsb
Array, DIMENSION (*n*). The scale factors for A.

scond
REAL for slaqsb/claqsb
DOUBLE PRECISION for dlaqsb/zlaqsb
Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax
REAL for slaqsb/claqsb
DOUBLE PRECISION for dlaqsb/zlaqsb
Absolute value of largest matrix entry.

Output Parameters

ab
On exit, if *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization *A* = *U*'**U* or *A* = *L***L*' of the band matrix *A*, in the same storage format as *A*.

equed
CHARACTER*1.
Specifies whether or not equilibration was done.
If *equed* = 'N': No equilibration.
If *equed* = 'Y': Equilibration was done, that is, *A* has been replaced by diag(*s*)**A***diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqsp

Scales a symmetric/Hermitian matrix in packed storage, using scaling factors computed by ?ppequ.

Syntax

```
call slaqsp( uplo, n, ap, s, scond, amax, equed )
call dlaqsp( uplo, n, ap, s, scond, amax, equed )
call claqsp( uplo, n, ap, s, scond, amax, equed )
call zlaqsp( uplo, n, ap, s, scond, amax, equed )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?laqsp` equilibrates a symmetric matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo
: `CHARACTER*1`.
Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored.
If *uplo* = `'U'`: upper triangular.
If *uplo* = `'L'`: lower triangular.

n
: `INTEGER`. The order of the matrix *A*. $n \geq 0$.

ap
: `REAL` for `slaqsp`
`DOUBLE PRECISION` for `dlaqsp`
`COMPLEX` for `claqsp`
`COMPLEX*16` for `zlaqsp`
Array, `DIMENSION` (*n*(*n*+1)/2).
On entry, the upper or lower triangle of the symmetric matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:
if *uplo* = `'U'`, *ap*(i + (*j*-1)*j*/2) = *A*(*i*,*j*) for $1 \leq i \leq j$;
if *uplo* = `'L'`, *ap*(i + (*j*-1)(2*n*-*j*)/2) = *A*(*i*,*j*) for $j \leq i \leq n$.

s
: `REAL` for `slaqsp/claqsp`
`DOUBLE PRECISION` for `dlaqsp/zlaqsp`
Array, `DIMENSION` (*n*). The scale factors for A.

scond
: `REAL` for `slaqsp/claqsp`
`DOUBLE PRECISION` for `dlaqsp/zlaqsp`
Ratio of the smallest *s*(*i*) to the largest *s*(*i*).

amax
: `REAL` for `slaqsp/claqsp`
`DOUBLE PRECISION` for `dlaqsp/zlaqsp`
Absolute value of largest matrix entry.

Output Parameters

ap	On exit, the equilibrated matrix: `diag(`*s*`)*`*A*`*diag(`*s*`)`, in the same storage format as *A*.
equed	`CHARACTER*1`. Specifies whether or not equilibration was done. If *equed* `= 'N'`: No equilibration. If *equed* `= 'Y'`: Equilibration was done, that is, *A* has been replaced by `diag(`*s*`)*`*A*`*diag(`*s*`)`.

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqsy

Scales a symmetric/Hermitian matrix, using scaling factors computed by ?poequ.

Syntax

```
call slaqsy( uplo, n, a, lda, s, scond, amax, equed )
call dlaqsy( uplo, n, a, lda, s, scond, amax, equed )
call claqsy( uplo, n, a, lda, s, scond, amax, equed )
call zlaqsy( uplo, n, a, lda, s, scond, amax, equed )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine equilibrates a symmetric matrix *A* using the scaling factors in the vector *s*.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored. If *uplo* `= 'U'`: upper triangular. If *uplo* `= 'L'`: lower triangular.
n	`INTEGER`. The order of the matrix *A*. *n* ≥ 0.

a	`REAL` for `slaqsy`
	`DOUBLE PRECISION` for `dlaqsy`
	`COMPLEX` for `claqsy`
	`COMPLEX*16` for `zlaqsy`

	Array, DIMENSION (*lda*,*n*). On entry, the symmetric matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(*n*,1).
s	REAL for slaqsy/claqsy DOUBLE PRECISION for dlaqsy/zlaqsy Array, DIMENSION (*n*). The scale factors for A.
scond	REAL for slaqsy/claqsy DOUBLE PRECISION for dlaqsy/zlaqsy Ratio of the smallest *s*(*i*) to the largest *s*(*i*).
amax	REAL for slaqsy/claqsy DOUBLE PRECISION for dlaqsy/zlaqsy Absolute value of largest matrix entry.

Output Parameters

a	On exit, if *equed* = 'Y', the equilibrated matrix: diag(*s*)*A*diag(*s*).
equed	CHARACTER*1. Specifies whether or not equilibration was done. If *equed* = 'N': No equilibration. If *equed* = 'Y': Equilibration was done, i.e., *A* has been replaced by diag(*s*)*A*diag(*s*).

Application Notes

The routine uses internal parameters *thresh*, *large*, and *small*, which have the following meaning. *thresh* is a threshold value used to decide if scaling should be based on the ratio of the scaling factors. If *scond* < *thresh*, scaling is done. *large* and *small* are threshold values used to decide if scaling should be done based on the absolute size of the largest matrix element. If *amax* > *large* or *amax* < *small*, scaling is done.

?laqtr

Solves a real quasi-triangular system of equations, or a complex quasi-triangular system of special form, in real arithmetic.

Syntax

```
call slaqtr( ltran, lreal, n, t, ldt, b, w, scale, x, work, info )
call dlaqtr( ltran, lreal, n, t, ldt, b, w, scale, x, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?laqtr` solves the real quasi-triangular system

op(*T*) * *p* = *scale***c*, if *lreal* = .TRUE.

or the complex quasi-triangular systems

op(*T* + *iB*)*(*p*+*iq*) = *scale**(*c*+*id*), if *lreal* = .FALSE.

in real arithmetic, where *T* is upper quasi-triangular.

If *lreal* = .FALSE., then the first diagonal block of *T* must be 1-by-1, *B* is the specially structured matrix

$$B = \begin{bmatrix} b_1 & b_2 & \dots & \dots & b_n \\ & W & & & \\ & & W & & \\ & & & \dots & \\ & & & & W \end{bmatrix}$$

op(*A*) = *A* or *A*', *A*' denotes the conjugate transpose of matrix *A*.

On input,

$$x = \begin{bmatrix} c \\ d \end{bmatrix}, \text{ on output } x = \begin{bmatrix} p \\ q \end{bmatrix}$$

This routine is designed for the condition number estimation in routine `?trsna`.

Input Parameters

ltran	LOGICAL. On entry, *ltran* specifies the option of conjugate transpose: = .FALSE., op(*T* + *iB*) = *T* + *iB*, = .TRUE., op(*T* + *iB*) = (*T* + *iB*)'.
lreal	LOGICAL. On entry, *lreal* specifies the input matrix structure: = .FALSE., the input is complex = .TRUE., the input is real.
n	INTEGER. On entry, *n* specifies the order of *T* + *iB*. *n* ≥ 0.
t	REAL for `slaqtr` DOUBLE PRECISION for `dlaqtr`

	Array, dimension (*ldt*,*n*). On entry, *t* contains a matrix in Schur canonical form. If *lreal* = .FALSE., then the first diagonal block of *t* must be 1-by-1.
ldt	INTEGER. The leading dimension of the matrix *T*. *ldt* ≥ max(1,*n*).
b	REAL for slaqtr DOUBLE PRECISION for dlaqtr Array, dimension (*n*). On entry, *b* contains the elements to form the matrix *B* as described above. If *lreal* = .TRUE., *b* is not referenced.
w	REAL for slaqtr DOUBLE PRECISION for dlaqtr On entry, *w* is the diagonal element of the matrix *B*. If *lreal* = .TRUE., *w* is not referenced.
x	REAL for slaqtr DOUBLE PRECISION for dlaqtr Array, dimension (2*n*). On entry, *x* contains the right hand side of the system.
work	REAL for slaqtr DOUBLE PRECISION for dlaqtr Workspace array, dimension (*n*).

Output Parameters

scale	REAL for slaqtr DOUBLE PRECISION for dlaqtr On exit, *scale* is the scale factor.
x	On exit, *X* is overwritten by the solution.
info	INTEGER. If *info* = 0: successful exit. If *info* = 1: the some diagonal 1-by-1 block has been perturbed by a small number smin to keep nonsingularity. If *info* = 2: the some diagonal 2-by-2 block has been perturbed by a small number in ?laln2 to keep nonsingularity.

NOTE. For higher speed, this routine does not check the inputs for errors.

?lar1v

Computes the (scaled) r-th column of the inverse of the submatrix in rows b1 through bn of tridiagonal matrix.

Syntax

```
call slar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz,
mingma, r, isuppz, nrminv, resid, rqcorr, work )
```

```
call dlar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz,
mingma, r, isuppz, nrminv, resid, rqcorr, work )
```

```
call clar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz,
mingma, r, isuppz, nrminv, resid, rqcorr, work )
```

```
call zlar1v( n, b1, bn, lambda, d, l, ld, lld, pivmin, gaptol, z, wantnc, negcnt, ztz,
mingma, r, isuppz, nrminv, resid, rqcorr, work )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?lar1v` computes the (scaled) *r*-th column of the inverse of the submatrix in rows *b1* through *bn* of the tridiagonal matrix $L*D*L^T - \lambda*I$. When λ is close to an eigenvalue, the computed vector is an accurate eigenvector. Usually, *r* corresponds to the index where the eigenvector is largest in magnitude.

The following steps accomplish this computation :

- Stationary *qd* transform, $L*D*L^T - \lambda*I = L(+)*D(+)*L(+)^T$
- Progressive *qd* transform, $L*D*L^T - \lambda*I = U(-)*D(-)*U(-)^T$,
- Computation of the diagonal elements of the inverse of $L*D*L^T - \lambda*I$ by combining the above transforms, and choosing *r* as the index where the diagonal of the inverse is (one of the) largest in magnitude.
- Computation of the (scaled) *r*-th column of the inverse using the twisted factorization obtained by combining the top part of the stationary and the bottom part of the progressive transform.

Input Parameters

n	INTEGER. The order of the matrix $L*D*L^T$.
b1	INTEGER. First index of the submatrix of $L*D*L^T$.
bn	INTEGER. Last index of the submatrix of $L*D*L^T$.
lambda	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v The shift. To compute an accurate eigenvector, *lambda* should be a good approximation to an eigenvalue of $L*D*L^T$.
l	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (*n*-1). The (*n*-1) subdiagonal elements of the unit bidiagonal matrix *L*, in elements 1 to *n*-1.
d	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D*.
ld	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (*n*-1).

	The n-1 elements L_i*D_i.
lld	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Array, DIMENSION (n-1). The n-1 elements $L_i*L_i*D_i$.
pivmin	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v The minimum pivot in the Sturm sequence.
gaptol	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Tolerance that indicates when eigenvector entries are negligible with respect to their contribution to the residual.
z	REAL for slar1v DOUBLE PRECISION for dlar1v COMPLEX for clar1v COMPLEX*16 for zlar1v Array, DIMENSION (n). All entries of z must be set to 0.
wantnc	LOGICAL. Specifies whether *negcnt* has to be computed.
r	INTEGER. The twist index for the twisted factorization used to compute z. On input, $0 \le r \le n$. If r is input as 0, r is set to the index where $(L*D*L^T - lambda*I)^{-1}$ is largest in magnitude. If $1 \le r \le n$, r is unchanged.
work	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Workspace array, DIMENSION (4*n).

Output Parameters

z	REAL for slar1v DOUBLE PRECISION for dlar1v COMPLEX for clar1v COMPLEX*16 for zlar1v Array, DIMENSION (n). The (scaled) r-th column of the inverse. $z(r)$ is returned to be 1.
negcnt	INTEGER. If *wantnc* is .TRUE. then *negcnt* = the number of pivots < *pivmin* in the matrix factorization $L*D*L^T$, and *negcnt* = -1 otherwise.
ztz	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v The square of the 2-norm of z.
mingma	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v The reciprocal of the largest (in magnitude) diagonal element of the inverse of $L*D*L^T - lambda*I$.

r	On output, *r* is the twist index used to compute *z*. Ideally, *r* designates the position of the maximum entry in the eigenvector.
isuppz	INTEGER. Array, DIMENSION (2). The support of the vector in *Z*, that is, the vector *z* is nonzero only in elements *isuppz*(1) through *isuppz*(2).
nrminv	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v Equals 1/sqrt(*ztz*).
resid	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v The residual of the FP vector. *resid* = ABS(*mingma*)/sqrt(*ztz*).
rqcorr	REAL for slar1v/clar1v DOUBLE PRECISION for dlar1v/zlar1v The Rayleigh Quotient correction to *lambda*. *rqcorr* = *mingma*/*ztz*.

?lar2v

Applies a vector of plane rotations with real cosines and real/complex sines from both sides to a sequence of 2-by-2 symmetric/Hermitian matrices.

Syntax

```
call slar2v( n, x, y, z, incx, c, s, incc )
call dlar2v( n, x, y, z, incx, c, s, incc )
call clar2v( n, x, y, z, incx, c, s, incc )
call zlar2v( n, x, y, z, incx, c, s, incc )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lar2v applies a vector of real/complex plane rotations with real cosines from both sides to a sequence of 2-by-2 real symmetric or complex Hermitian matrices, defined by the elements of the vectors x, y and z. For i = 1,2,...,*n*

$$\begin{bmatrix} x_i & z_i \\ \mathrm{conjg}(z_i) & y_i \end{bmatrix} := \begin{bmatrix} c(i) & \mathrm{conjg}(s(i)) \\ -s(i) & c(i) \end{bmatrix} \begin{bmatrix} x_i & z_i \\ \mathrm{conjg}(z_i) & y_i \end{bmatrix} \begin{bmatrix} c(i) & -\mathrm{conjg}(s(i)) \\ s(i) & c(i) \end{bmatrix}$$

Input Parameters

n	INTEGER. The number of plane rotations to be applied.
x, *y*, *z*	REAL for slar2v

	DOUBLE PRECISION for dlar2v COMPLEX for clar2v COMPLEX*16 for zlar2v Arrays, DIMENSION (1+(*n*-1)***incx*) each. Contain the vectors x, y and z, respectively. For all flavors of ?lar2v, elements of *x* and *y* are assumed to be real.
incx	INTEGER. The increment between elements of *x*, *y*, and *z*. *incx* > 0.
c	REAL for slar2v/clar2v DOUBLE PRECISION for dlar2v/zlar2v Array, DIMENSION (1+(*n*-1)***incc*). The cosines of the plane rotations.
s	REAL for slar2v DOUBLE PRECISION for dlar2v COMPLEX for clar2v COMPLEX*16 for zlar2v Array, DIMENSION (1+(*n*-1)***incc*). The sines of the plane rotations.
incc	INTEGER. The increment between elements of *c* and *s*. *incc* > 0.

Output Parameters

x, *y*, *z*	Vectors *x*, *y* and *z*, containing the results of transform.

?larf

Applies an elementary reflector to a general rectangular matrix.

Syntax

```
call slarf( side, m, n, v, incv, tau, c, ldc, work )
call dlarf( side, m, n, v, incv, tau, c, ldc, work )
call clarf( side, m, n, v, incv, tau, c, ldc, work )
call zlarf( side, m, n, v, incv, tau, c, ldc, work )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right. *H* is represented in the form

*H = I - tau*v*v'*,

where *tau* is a real/complex scalar and v is a real/complex vector.

If *tau* = 0, then *H* is taken to be the unit matrix. For clarf/zlarf, to apply *H'* (the conjugate transpose of *H*), supply conjg(*tau*) instead of *tau*.

Input Parameters

side	CHARACTER*1.

	If *side* = 'L': form *H***C* If *side* = 'R': form *C***H*.
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
v	REAL for slarf DOUBLE PRECISION for dlarf COMPLEX for clarf COMPLEX*16 for zlarf Array, DIMENSION (1 + (*m*-1)*abs(*incv*)) if *side* = 'L' or (1 + (*n*-1)*abs(*incv*)) if *side* = 'R'. The vector *v* in the representation of *H*. *v* is not used if *tau* = 0.
incv	INTEGER. The increment between elements of *v*. *incv* ≠ 0.
tau	REAL for slarf DOUBLE PRECISION for dlarf COMPLEX for clarf COMPLEX*16 for zlarf The value *tau* in the representation of *H*.
c	REAL for slarf DOUBLE PRECISION for dlarf COMPLEX for clarf COMPLEX*16 for zlarf Array, DIMENSION (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.
ldc	INTEGER. The leading dimension of the array *c*. *ldc* ≥ max(1,*m*).
work	REAL for slarf DOUBLE PRECISION for dlarf COMPLEX for clarf COMPLEX*16 for zlarf Workspace array, DIMENSION (*n*) if *side* = 'L' or (*m*) if *side* = 'R'.

Output Parameters

c	On exit, *C* is overwritten by the matrix *H***C* if *side* = 'L', or *C***H* if *side* = 'R'.

?larfb

Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.

Syntax

```
call slarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
call dlarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
call clarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
call zlarfb( side, trans, direct, storev, m, n, k, v, ldv, t, ldt, c, ldc, work, ldwork )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?larfb` applies a complex block reflector *H* or its transpose *H'* to a complex *m*-by-*n* matrix *C* from either left or right.

Input Parameters

side	CHARACTER*1. If *side* = 'L': apply *H* or *H'* from the left If *side* = 'R': apply *H* or *H'* from the right
trans	CHARACTER*1. If *trans* = 'N': apply *H* (No transpose) If *trans* = 'C': apply *H'* (Conjugate transpose)
direct	CHARACTER*1. Indicates how *H* is formed from a product of elementary reflectors If *direct* = 'F': *H* = *H*(1)*H(2)*. . . *H(*k*) (forward) If *direct* = 'B': *H* = *H*(*k*)* . . . *H*(2)*H(1) (backward)
storev	CHARACTER*1. Indicates how the vectors which define the elementary reflectors are stored: If *storev* = 'C': Column-wise If *storev* = 'R': Row-wise
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
k	INTEGER. The order of the matrix *T* (equal to the number of elementary reflectors whose product defines the block reflector).
v	REAL for `slarfb` DOUBLE PRECISION for `dlarfb`

COMPLEX for clarfb
COMPLEX*16 for zlarfb
Array, DIMENSION
(*ldv*, *k*) if *storev* = 'C'
(*ldv*, *m*) if *storev* = 'R' and *side* = 'L'
(*ldv*, *n*) if *storev* = 'R' and *side* = 'R'
The matrix *v*.

ldv — INTEGER. The leading dimension of the array v.

If *storev* = 'C' and *side* = 'L', *ldv* ≥ max(1,*m*);

if *storev* = 'C' and *side* = 'R', *ldv* ≥ max(1,*n*);

if *storev* = 'R', *ldv* ≥ *k*.

t — REAL for slarfb
DOUBLE PRECISION for dlarfb
COMPLEX for clarfb
COMPLEX*16 for zlarfb
Array, DIMENSION (*ldt*,*k*).
Contains the triangular *k*-by-*k* matrix *T* in the representation of the block reflector.

LDT — INTEGER. The leading dimension of the array *t*.

ldt ≥ *k*.

c — REAL for slarfb
DOUBLE PRECISION for dlarfb
COMPLEX for clarfb
COMPLEX*16 for zlarfb
Array, DIMENSION (*ldc*,*n*).
On entry, the *m*-by-*n* matrix *C*.

ldc — INTEGER. The leading dimension of the array *c*.

ldc ≥ max(1,*m*).

work — REAL for slarfb
DOUBLE PRECISION for dlarfb
COMPLEX for clarfb
COMPLEX*16 for zlarfb
Workspace array, DIMENSION (*ldwork*, *k*).

ldwork — INTEGER. The leading dimension of the array *work*.

If *side* = 'L', *ldwork* ≥ max(1, *n*);

if *side* = 'R', *ldwork* ≥ max(1, *m*).

Output Parameters

c — On exit, *c* is overwritten by *H***C*, or *H*'**C*, or *C***H*, or *C***H*'.

?larfg

Generates an elementary reflector (Householder matrix).

Syntax

```
call slarfg( n, alpha, x, incx, tau )
call dlarfg( n, alpha, x, incx, tau )
call clarfg( n, alpha, x, incx, tau )
call zlarfg( n, alpha, x, incx, tau )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?larfg` generates a real/complex elementary reflector *H* of order *n*, such that

$$H'*\begin{bmatrix} alpha \\ x \end{bmatrix} = \begin{bmatrix} beta \\ 0 \end{bmatrix}, H'*H = I,$$

where *alpha* and *beta* are scalars (with *beta* real for all flavors), and *x* is an (*n*-1)-element real/complex vector. *H* is represented in the form

$$H = I - tau*\begin{bmatrix} 1 \\ v \end{bmatrix}*\begin{bmatrix} 1 & v' \end{bmatrix}$$

where *tau* is a real/complex scalar and v is a real/complex (*n*-1)-element vector. Note that for `clarfg`/`zlarfg`, *H* is not Hermitian.

If the elements of *x* are all zero (and, for complex flavors, *alpha* is real), then *tau* = 0 and *H* is taken to be the unit matrix.

Otherwise, $1 \le tau \le 2$ (for real flavors), or

$1 \le \mathrm{Re}(tau) \le 2$ and $\mathrm{abs}(tau-1) \le 1$ (for complex flavors).

Input Parameters

n	INTEGER. The order of the elementary reflector.
alpha	REAL for `slarfg` DOUBLE PRECISION for `dlarfg` COMPLEX for `clarfg` COMPLEX*16 for `zlarfg` On entry, the value alpha.
x	REAL for `slarfg` DOUBLE PRECISION for `dlarfg`

COMPLEX for clarfg
COMPLEX*16 for zlarfg
Array, DIMENSION (1+(*n*-2)*abs(*incx*)).
On entry, the vector *x*.

incx INTEGER.
The increment between elements of *x*. *incx* > 0.

Output Parameters

alpha On exit, it is overwritten with the value *beta*.

x On exit, it is overwritten with the vector *v*.

tau REAL for slarfg
DOUBLE PRECISION for dlarfg
COMPLEX for clarfg
COMPLEX*16 for zlarfg The value *tau*.

?larfgp

Generates an elementary reflector (Householder matrix) with the non-negative beta.

Syntax

```
call slarfgp( n, alpha, x, incx, tau )
call dlarfgp( n, alpha, x, incx, tau )
call clarfgp( n, alpha, x, incx, tau )
call zlarfgp( n, alpha, x, incx, tau )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?larfgp generates a real/complex elementary reflector *H* of order *n*, such that

$$H'*\begin{bmatrix} alpha \\ x \end{bmatrix} = \begin{bmatrix} beta \\ 0 \end{bmatrix}, H'*H = I,$$

where *alpha* and *beta* are scalars (with *beta* real and non-negative for all flavors), and *x* is an (*n*-1)-element real/complex vector. *H* is represented in the form

$$H = I - tau*\begin{bmatrix} 1 \\ v \end{bmatrix}*\begin{bmatrix} 1 & v' \end{bmatrix}$$

where *tau* is a real/complex scalar and v is a real/complex (*n*-1)-element vector. Note that for `c larfgp/z larfgp`, *H* is not Hermitian.

If the elements of *x* are all zero (and, for complex flavors, *alpha* is real), then *tau* = 0 and *H* is taken to be the unit matrix.

Otherwise, 1 ≤ *tau* ≤ 2 (for real flavors), or

1 ≤ Re(*tau*) ≤ 2 and abs(*tau*-1) ≤ 1 (for complex flavors).

Input Parameters

n	INTEGER. The order of the elementary reflector.
alpha	REAL for slarfgp DOUBLE PRECISION for dlarfgp COMPLEX for c COMPLEX*16 for zlarfgp On entry, the value alpha.
x	REAL for slarfgp DOUBLE PRECISION for dlarfgp COMPLEX for clarfgp COMPLEX*16 for zlarfgp Array, DIMENSION (1+(*n*-2)*abs(*incx*)). On entry, the vector *x*.
incx	INTEGER. The increment between elements of *x*. *incx* > 0.

Output Parameters

alpha	On exit, it is overwritten with the value *beta*.
x	On exit, it is overwritten with the vector *v*.
tau	REAL for slarfgp DOUBLE PRECISION for dlarfgp COMPLEX for clarfgp COMPLEX*16 for zlarfgp The value *tau*.

?larft

*Forms the triangular factor T of a block reflector H = I - V*T*V**H.*

Syntax

```
call slarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call dlarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call clarft( direct, storev, n, k, v, ldv, tau, t, ldt )
call zlarft( direct, storev, n, k, v, ldv, tau, t, ldt )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?larft` forms the triangular factor *T* of a real/complex block reflector *H* of order *n*, which is defined as a product of *k* elementary reflectors.

If *direct* = 'F', *H* = *H*(1)**H*(2)* . . .**H*(*k*) and *T* is upper triangular;

If *direct* = 'B', *H* = *H*(*k*)*. . .**H*(2)**H*(1) and *T* is lower triangular.

If *storev* = 'C', the vector which defines the elementary reflector H(*i*) is stored in the *i*-th column of the array *v*, and *H* = *I* - *V***T***V*' .

If *storev* = 'R', the vector which defines the elementary reflector H(*i*) is stored in the *i*-th row of the array *v*, and *H* = *I* - *V*'**T***V*.

Input Parameters

direct	CHARACTER*1. Specifies the order in which the elementary reflectors are multiplied to form the block reflector: = 'F': *H* = *H*(1)**H*(2)*. . . **H*(*k*) (forward) = 'B': *H* = *H*(*k*)*. . .**H*(2)**H*(1) (backward)
storev	CHARACTER*1. Specifies how the vectors which define the elementary reflectors are stored (see also *Application Notes* below): = 'C': column-wise = 'R': row-wise.
n	INTEGER. The order of the block reflector *H*. *n* ≥ 0.
k	INTEGER. The order of the triangular factor *T* (equal to the number of elementary reflectors). *k* ≥ 1.
v	REAL for slarft DOUBLE PRECISION for dlarft COMPLEX for clarft COMPLEX*16 for zlarft Array, DIMENSION (*ldv*, *k*) if *storev* = 'C' or (*ldv*, *n*) if *storev* = 'R'. The matrix *V*.
ldv	INTEGER. The leading dimension of the array *v*. If *storev* = 'C', *ldv* ≥ max(1,*n*); if *storev* = 'R', *ldv* ≥ *k*.
tau	REAL for slarft DOUBLE PRECISION for dlarft COMPLEX for clarft COMPLEX*16 for zlarft

Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*).

ldt — INTEGER. The leading dimension of the output array *t*. *ldt* ≥ *k*.

Output Parameters

t — REAL for slarft
DOUBLE PRECISION for dlarft
COMPLEX for clarft
COMPLEX*16 for zlarft
Array, DIMENSION (*ldt*,*k*). The *k*-by-*k* triangular factor *T* of the block reflector. If *direct* = 'F', *T* is upper triangular; if *direct* = 'B', *T* is lower triangular. The rest of the array is not used.

v — The matrix *V*.

Application Notes

The shape of the matrix *V* and the storage of the vectors which define the *H*(*i*) is best illustrated by the following example with *n* = 5 and *k* = 3. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

direct = 'F' and *storev* = 'C':

$$\begin{bmatrix} 1 & & \\ v_1 & 1 & \\ v_1 & v_2 & 1 \\ v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \end{bmatrix}$$

direct = 'F' and *storev* = 'R':

$$\begin{bmatrix} 1 & v_1 & v_1 & v_1 & v_1 \\ & 1 & v_2 & v_2 & v_2 \\ & & 1 & v_3 & v_3 \end{bmatrix}$$

direct = 'B' and *storev* = 'C':

$$\begin{bmatrix} v_1 & v_2 & v_3 \\ v_1 & v_2 & v_3 \\ 1 & v_2 & v_3 \\ & 1 & v_3 \\ & & 1 \end{bmatrix}$$

direct = 'B' and *storev* = 'R':

$$\begin{bmatrix} v_1 & v_1 & 1 & & \\ v_2 & v_2 & v_2 & 1 & \\ v_3 & v_3 & v_3 & v_3 & 1 \end{bmatrix}$$

?larfx

Applies an elementary reflector to a general rectangular matrix, with loop unrolling when the reflector has order less than or equal to 10.

Syntax

```
call slarfx( side, m, n, v, tau, c, ldc, work )
call dlarfx( side, m, n, v, tau, c, ldc, work )
call clarfx( side, m, n, v, tau, c, ldc, work )
call zlarfx( side, m, n, v, tau, c, ldc, work )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine ?`larfx` applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right.

H is represented in the form

H = *I* - *tau***v***v'*, where *tau* is a real/complex scalar and v is a real/complex vector.

If *tau* = 0, then *H* is taken to be the unit matrix

Input Parameters

side	CHARACTER*1. If *side* = 'L': form *H***C* If *side* = 'R': form *C***H*.
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
v	REAL for slarfx DOUBLE PRECISION for dlarfx COMPLEX for clarfx COMPLEX*16 for zlarfx Array, DIMENSION (*m*) if *side* = 'L' or (*n*) if *side* = 'R'. The vector *v* in the representation of *H*.
tau	REAL for slarfx DOUBLE PRECISION for dlarfx COMPLEX for clarfx COMPLEX*16 for zlarfx The value *tau* in the representation of *H*.
c	REAL for slarfx DOUBLE PRECISION for dlarfx COMPLEX for clarfx

	COMPLEX*16 for zlarfx Array, DIMENSION (*ldc*,*n*). On entry, the *m*-by-*n* matrix C.
ldc	INTEGER. The leading dimension of the array *c*. *lda* ≥ (1,*m*).
work	REAL for slarfx DOUBLE PRECISION for dlarfx COMPLEX for clarfx COMPLEX*16 for zlarfx Workspace array, DIMENSION (*n*) if *side* = 'L' or (*m*) if *side* = 'R'. *work* is not referenced if *H* has order < 11.

Output Parameters

c	On exit, C is overwritten by the matrix *H***C* if *side* = 'L', or *C***H* if *side* = 'R'.

?largv

Generates a vector of plane rotations with real cosines and real/complex sines.

Syntax

```
call slargv( n, x, incx, y, incy, c, incc )
call dlargv( n, x, incx, y, incy, c, incc )
call clargv( n, x, incx, y, incy, c, incc )
call zlargv( n, x, incx, y, incy, c, incc )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine generates a vector of real/complex plane rotations with real cosines, determined by elements of the real/complex vectors *x* and *y*.

For slargv/dlargv:

$$\begin{bmatrix} c(i) & s(i) \\ -s(i) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} = \begin{bmatrix} a_i \\ 0 \end{bmatrix}, \text{for } i = 1,2,\ldots,n$$

For clargv/zlargv:

$$\begin{bmatrix} c(i) & s(i) \\ -\text{conjg}(s(i)) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} = \begin{bmatrix} r_i \\ 0 \end{bmatrix}, \text{for } i = 1,2,\ldots,n$$

where $c(i)^2$ + abs(s(i))^2 = 1 and the following conventions are used (these are the same as in clartg/zlartg but differ from the BLAS Level 1 routine crotg/zrotg):

If y_i = 0, then $c(i)$ = 1 and $s(i)$ = 0;

If x_i = 0, then $c(i)$ = 0 and $s(i)$ is chosen so that r_i is real.

Input Parameters

n	INTEGER. The number of plane rotations to be generated.
x, *y*	REAL for slargv DOUBLE PRECISION for dlargv COMPLEX for clargv COMPLEX*16 for zlargv Arrays, DIMENSION (1+(*n*-1)**incx*) and (1+(*n*-1)**incy*), respectively. On entry, the vectors *x* and *y*.
incx	INTEGER. The increment between elements of *x*. *incx* > 0.
incy	INTEGER. The increment between elements of *y*. *incy* > 0.
incc	INTEGER. The increment between elements of the output array *c*. *incc* > 0.

Output Parameters

x	On exit, *x*(*i*) is overwritten by a_i (for real flavors), or by r_i (for complex flavors), for *i* = 1,...,*n*.
y	On exit, the sines *s*(*i*) of the plane rotations.
c	REAL for slargv/clargv DOUBLE PRECISION for dlargv/zlargv Array, DIMENSION (1+(*n*-1)**incc*). The cosines of the plane rotations.

?larnv

Returns a vector of random numbers from a uniform or normal distribution.

Syntax

```
call slarnv( idist, iseed, n, x )
call dlarnv( idist, iseed, n, x )
call clarnv( idist, iseed, n, x )
call zlarnv( idist, iseed, n, x )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?larnv returns a vector of *n* random real/complex numbers from a uniform or normal distribution.

This routine calls the auxiliary routine ?laruv to generate random real numbers from a uniform (0,1) distribution, in batches of up to 128 using vectorisable code. The Box-Muller method is used to transform numbers from a uniform to a normal distribution.

Input Parameters

idist	INTEGER. Specifies the distribution of the random numbers: for slarnv and dlanrv: = 1: uniform (0,1) = 2: uniform (-1,1) = 3: normal (0,1). for clarnv and zlanrv: = 1: real and imaginary parts each uniform (0,1) = 2: real and imaginary parts each uniform (-1,1) = 3: real and imaginary parts each normal (0,1) = 4: uniformly distributed on the disc abs(z) < 1 = 5: uniformly distributed on the circle abs(z) = 1
iseed	INTEGER. Array, DIMENSION (4). On entry, the seed of the random number generator; the array elements must be between 0 and 4095, and *iseed*(4) must be odd.
n	INTEGER. The number of random numbers to be generated.

Output Parameters

x	REAL for slarnv DOUBLE PRECISION for dlarnv COMPLEX for clarnv COMPLEX*16 for zlarnv Array, DIMENSION (*n*). The generated random numbers.
iseed	On exit, the seed is updated.

?larra

Computes the splitting points with the specified threshold.

Syntax

```
call slarra( n, d, e, e2, spltol, tnrm, nsplit, isplit, info )
call dlarra( n, d, e, e2, spltol, tnrm, nsplit, isplit, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the splitting points with the specified threshold and sets any "small" off-diagonal elements to zero.

Input Parameters

n INTEGER. The order of the matrix (*n* > 1).

d REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*.

e REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
First (*n*-1) entries contain the subdiagonal elements of the tridiagonal matrix *T*; *e*(*n*) need not be set.

e2 REAL for slarra
DOUBLE PRECISION for dlarra
Array, DIMENSION (*n*).
First (*n*-1) entries contain the squares of the subdiagonal elements of the tridiagonal matrix *T*; *e2*(*n*) need not be set.

spltol REAL for slarra
DOUBLE PRECISION for dlarra
The threshold for splitting. Two criteria can be used: *spltol*<0 : criterion based on absolute off-diagonal value; *spltol*>0 : criterion that preserves relative accuracy.

tnrm REAL for slarra
DOUBLE PRECISION for dlarra
The norm of the matrix.

Output Parameters

e On exit, the entries *e*(*isplit*(i)), 1 ≤ i ≤ *nsplit*, are set to zero, the other entries of *e* are untouched.

e2 On exit, the entries *e2*(*isplit*(i)), 1 ≤ i ≤ *nsplit*, are set to zero.

nsplit INTEGER.
The number of blocks the matrix *T* splits into. 1 ≤ *nsplit* ≤ *n*

isplit INTEGER.
Array, DIMENSION (*n*).
The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), and so on, and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.

info INTEGER.
= 0: successful exit.

?larrb

Provides limited bisection to locate eigenvalues for more accuracy.

Syntax

`call slarrb( n, d, lld, ifirst, ilast, rtol1, rtol2, offset, w, wgap, werr, work, iwork, pivmin, spdiam, twist, info )`

`call dlarrb( n, d, lld, ifirst, ilast, rtol1, rtol2, offset, w, wgap, werr, work, iwork, pivmin, spdiam, twist, info )`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

Given the relatively robust representation (RRR) $L*D*L^T$, the routine does "limited" bisection to refine the eigenvalues of $L*D*L^T$, *w*(*ifirst-offset*) through *w*(*ilast-offset*), to more accuracy. Initial guesses for these eigenvalues are input in *w*. The corresponding estimate of the error in these guesses and their gaps are input in *werr* and *wgap*, respectively. During bisection, intervals [*left*, *right*] are maintained by storing their mid-points and semi-widths in the arrays *w* and *werr* respectively.

Input Parameters

n	INTEGER. The order of the matrix.
d	REAL for slarrb DOUBLE PRECISION for dlarrb Array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D*.
lld	REAL for slarrb DOUBLE PRECISION for dlarrb Array, DIMENSION (*n*-1). The *n*-1 elements $L_i*L_i*D_i$.
ifirst	INTEGER. The index of the first eigenvalue to be computed.
ilast	INTEGER. The index of the last eigenvalue to be computed.
rtol1, *rtol2*	REAL for slarrb DOUBLE PRECISION for dlarrb Tolerance for the convergence of the bisection intervals. An interval [*left*, *right*] has converged if RIGHT-LEFT.LT.MAX(*rtol1**gap, *rtol2**max(|left|,|right|)), where gap is the (estimated) distance to the nearest eigenvalue.
offset	INTEGER. Offset for the arrays *w*, *wgap* and *werr*, that is, the *ifirst-offset* through *ilast-offset* elements of these arrays are to be used.
w	REAL for slarrb DOUBLE PRECISION for dlarrb

Array, DIMENSION (*n*). On input, *w*(*ifirst-offset*) through *w*(*ilast-offset*) are estimates of the eigenvalues of $L*D*L^T$ indexed *ifirst* through *ilast*.

wgap
REAL for slarrb
DOUBLE PRECISION for dlarrb
Array, DIMENSION (*n*-1). The estimated gaps between consecutive eigenvalues of $L*D*L^T$, that is, *wgap*(*i-offset*) is the gap between eigenvalues *i* and *i*+1. Note that if IFIRST.EQ.ILAST then *wgap*(*ifirst-offset*) must be set to 0.

werr
REAL for slarrb
DOUBLE PRECISION for dlarrb
Array, DIMENSION (*n*). On input, *werr*(*ifirst-offset*) through *werr*(*ilast-offset*) are the errors in the estimates of the corresponding elements in *w*.

work
REAL for slarrb
DOUBLE PRECISION for dlarrb
Workspace array, DIMENSION (2**n*).

pivmin
REAL for slarrb
DOUBLE PRECISION for dlarrb
The minimum pivot in the Sturm sequence.

spdiam
REAL for slarrb
DOUBLE PRECISION for dlarrb
The spectral diameter of the matrix.

twist
INTEGER. The twist index for the twisted factorization that is used for the negcount.

twist = *n*: Compute negcount from $L*D*L^T$ - *lambda*i* = $L+*D+*L+^T$

twist = *n*: Compute negcount from $L*D*L^T$ - *lambda*i* = $U-*D-*U-^T$

twist = *n*: Compute negcount from $L*D*L^T$ - *lambda*i* = $N_r*D_r*N_r$

iwork
INTEGER.
Workspace array, DIMENSION (2**n*).

Output Parameters

w
On output, the estimates of the eigenvalues are"refined".

wgap
On output, the gaps are refined.

werr
On output, "refined" errors in the estimates of *w*.

info
INTEGER.
Error flag.

?larrc

Computes the number of eigenvalues of the symmetric tridiagonal matrix.

Syntax

```
call slarrc( jobt, n, vl, vu, d, e, pivmin, eigcnt, lcnt, rcnt, info )
call dlarrc( jobt, n, vl, vu, d, e, pivmin, eigcnt, lcnt, rcnt, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine finds the number of eigenvalues of the symmetric tridiagonal matrix T or of its factorization $L*D*L^T$ in the specified interval.

Input Parameters

jobt	CHARACTER*1. = 'T': computes Sturm count for matrix T. = 'L': computes Sturm count for matrix $L*D*L^T$.
n	INTEGER. The order of the matrix. ($n > 1$).
vl,*vu*	REAL for slarrc DOUBLE PRECISION for dlarrc The lower and upper bounds for the eigenvalues.
d	REAL for slarrc DOUBLE PRECISION for dlarrc Array, DIMENSION (n). If *jobt*= 'T': contains the n diagonal elements of the tridiagonal matrix T. If *jobt*= 'L': contains the n diagonal elements of the diagonal matrix D.
e	REAL for slarrc DOUBLE PRECISION for dlarrc Array, DIMENSION (n). If *jobt*= 'T': contains the (n-1)offdiagonal elements of the matrix T. If *jobt*= 'L': contains the (n-1)offdiagonal elements of the matrix L.
pivmin	REAL for slarrc DOUBLE PRECISION for dlarrc The minimum pivot in the Sturm sequence for the matrix T.

Output Parameters

eigcnt	INTEGER. The number of eigenvalues of the symmetric tridiagonal matrix T that are in the half-open interval (vl, vu].
lcnt,*rcnt*	INTEGER. The left and right negcounts of the interval.
info	INTEGER. Now it is not used and always is set to 0.

?larrd

Computes the eigenvalues of a symmetric tridiagonal matrix to suitable accuracy.

Syntax

call slarrd(*range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *gers*, *reltol*, *d*, *e*, *e2*, *pivmin*, *nsplit*, *isplit*, *m*, *w*, *werr*, *wl*, *wu*, *iblock*, *indexw*, *work*, *iwork*, *info*)

call dlarrd(*range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *gers*, *reltol*, *d*, *e*, *e2*, *pivmin*, *nsplit*, *isplit*, *m*, *w*, *werr*, *wl*, *wu*, *iblock*, *indexw*, *work*, *iwork*, *info*)

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the eigenvalues of a symmetric tridiagonal matrix T to suitable accuracy. This is an auxiliary code to be called from `?stemr`. The user may ask for all eigenvalues, all eigenvalues in the half-open interval (vl, vu], or the il-th through iu-th eigenvalues.

To avoid overflow, the matrix must be scaled so that its largest element is no greater than ($overflow^{1/2}$*$underflow^{1/4}$) in absolute value, and for greatest accuracy, it should not be much smaller than that. (For more details see [Kahan66].

Input Parameters

range	CHARACTER. = 'A': ("All") all eigenvalues will be found. = 'V': ("Value") all eigenvalues in the half-open interval (vl, vu] will be found. = 'I': ("Index") the il-th through iu-th eigenvalues will be found.
order	CHARACTER. = 'B': ("By block") the eigenvalues will be grouped by split-off block (see $iblock$, $isplit$ below) and ordered from smallest to largest within the block. = 'E': ("Entire matrix") the eigenvalues for the entire matrix will be ordered from smallest to largest.
n	INTEGER. The order of the tridiagonal matrix T ($n \geq 1$).
vl,*vu*	REAL for `slarrd`

DOUBLE PRECISION for dlarrd
If *range* = 'V': the lower and upper bounds of the interval to be searched for eigenvalues. Eigenvalues less than or equal to *vl*, or greater than *vu*, will not be returned. *vl* < *vu*.
If *range* = 'A' or 'I': not referenced.

il,*iu*
INTEGER.
If *range* = 'I': the indices (in ascending order) of the smallest and largest eigenvalues to be returned. 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n*=0.
If *range* = 'A' or 'V': not referenced.

gers
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (2**n*).
The *n* Gerschgorin intervals (the i-th Gerschgorin interval is (*gers*(2*i-1), *gers*(2*i)).

reltol
REAL for slarrd
DOUBLE PRECISION for dlarrd
The minimum relative width of an interval. When an interval is narrower than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, that is converged. Note: this should always be at least *radix*machine epsilon*.

d
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*.

e
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*-1).
Contains (*n*-1) off-diagonal elements of the tridiagonal matrix *T*.

e2
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*-1).
Contains (*n*-1) squared off-diagonal elements of the tridiagonal matrix *T*.

pivmin
REAL for slarrd
DOUBLE PRECISION for dlarrd
The minimum pivot in the Sturm sequence for the matrix *T*.

nsplit
INTEGER.
The number of diagonal blocks the matrix *T* . 1 ≤ *nsplit* ≤ *n*

isplit
INTEGER.
Arrays, DIMENSION (*n*).

The splitting points, at which *T* breaks up into submatrices. The first submatrix consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), and so on, and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.
(Only the first *nsplit* elements actually is used, but since the user cannot know a priori value of *nsplit*, *n* words must be reserved for *isplit*.)

work
REAL for slarrd
DOUBLE PRECISION for dlarrd
Workspace array, DIMENSION (4**n*).

iwork
INTEGER.
Workspace array, DIMENSION (4**n*).

Output Parameters

m
INTEGER.
The actual number of eigenvalues found. $0 \le m \le n$. (See also the description of *info*=2,3.)

w
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*).
The first *m* elements of *w* contain the eigenvalue approximations. ?laprd computes an interval $I_j = (a_j, b_j]$ that includes eigenvalue j. The eigenvalue approximation is given as the interval midpoint *w*(j)= $(a_j+b_j)/2$. The corresponding error is bounded by *werr*(j) = $\mathrm{abs}(a_j-b_j)/2$.

werr
REAL for slarrd
DOUBLE PRECISION for dlarrd
Array, DIMENSION (*n*).
The error bound on the corresponding eigenvalue approximation in *w*.

wl, *wu*
REAL for slarrd
DOUBLE PRECISION for dlarrd
The interval (*wl*, *wu*] contains all the wanted eigenvalues.
If *range* = 'V': then *wl*=*vl* and *wu*=*vu*.
If *range* = 'A': then *wl* and *wu* are the global Gerschgorin bounds on the spectrum.
If *range* = 'I': then *wl* and *wu* are computed by ?laebz from the index range specified.

iblock
INTEGER.
Array, DIMENSION (*n*).
At each row/column j where *e*(j) is zero or small, the matrix *T* is considered to split into a block diagonal matrix.
If *info* = 0, then *iblock*(i) specifies to which block (from 1 to the number of blocks) the eigenvalue *w*(i) belongs. (The routine may use the remaining *n*-*m* elements as workspace.)

indexw	INTEGER. Array, DIMENSION (*n*). The indices of the eigenvalues within each block (submatrix); for example, *indexw*(i)= j and *iblock*(i)=k imply that the i-th eigenvalue *w*(i) is the j-th eigenvalue in block k.
info	INTEGER. = 0: successful exit. < 0: if *info* = -i, the i-th argument has an illegal value > 0: some or all of the eigenvalues fail to converge or are not computed: =1 or 3: bisection fail to converge for some eigenvalues; these eigenvalues are flagged by a negative block number. The effect is that the eigenvalues may not be as accurate as the absolute and relative tolerances. =2 or 3: *range*='I' only: not all of the eigenvalues *il*:*iu* are found. =4: *range*='I', and the Gershgorin interval initially used is too small. No eigenvalues are computed.

?larre

Given the tridiagonal matrix T, sets small off-diagonal elements to zero and for each unreduced block T_i, finds base representations and eigenvalues.

Syntax

call slarre(*range*, *n*, *vl*, *vu*, *il*, *iu*, *d*, *e*, *e2*, *rtol1*, *rtol2*, *spltol*, *nsplit*, *isplit*, *m*, *w*, *werr*, *wgap*, *iblock*, *indexw*, *gers*, *pivmin*, *work*, *iwork*, *info*)

call dlarre(*range*, *n*, *vl*, *vu*, *il*, *iu*, *d*, *e*, *e2*, *rtol1*, *rtol2*, *spltol*, *nsplit*, *isplit*, *m*, *w*, *werr*, *wgap*, *iblock*, *indexw*, *gers*, *pivmin*, *work*, *iwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

To find the desired eigenvalues of a given real symmetric tridiagonal matrix *T*, the routine sets any "small" off-diagonal elements to zero, and for each unreduced block T_i, it finds

- a suitable shift at one end of the block spectrum
- the base representation, $T_i - \sigma_i * I = L_i * D_i * L_i^T$, and
- eigenvalues of each $L_i * D_i * L_i^T$.

The representations and eigenvalues found are then used by ?stemr to compute the eigenvectors of a symmetric tridiagonal matrix. The accuracy varies depending on whether bisection is used to find a few eigenvalues or the dqds algorithm (subroutine ?lasq2) to compute all and discard any unwanted one. As an added benefit, ?larre also outputs the *n* Gerschgorin intervals for the matrices $L_i * D_i * L_i^T$.

Input Parameters

range — CHARACTER.
= 'A': ("All") all eigenvalues will be found.
= 'V': ("Value") all eigenvalues in the half-open interval (*vl*, *vu*] will be found.
= 'I': ("Index") the *il*-th through *iu*-th eigenvalues of the entire matrix will be found.

n — INTEGER. The order of the matrix. $n > 0$.

vl, *vu* — REAL for slarre
DOUBLE PRECISION for dlarre
If *range*='V', the lower and upper bounds for the eigenvalues. Eigenvalues less than or equal to *vl*, or greater than *vu*, are not returned. $vl < vu$.

il, *iu* — INTEGER.
If *range*='I', the indices (in ascending order) of the smallest and largest eigenvalues to be returned. $1 \le il \le iu \le n$.

d — REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (*n*).
The *n* diagonal elements of the diagonal matrices *T*.

e — REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (*n*). The first (*n*-1) entries contain the subdiagonal elements of the tridiagonal matrix *T*; *e*(*n*) need not be set.

e2 — REAL for slarre
DOUBLE PRECISION for dlarre
Array, DIMENSION (*n*). The first (*n*-1) entries contain the squares of the subdiagonal elements of the tridiagonal matrix *T*; *e2*(*n*) need not be set.

rtol1, *rtol2* — REAL for slarre
DOUBLE PRECISION for dlarre
Parameters for bisection. An interval [LEFT,RIGHT] has converged if RIGHT-LEFT.LT.MAX(*rtol1**gap, *rtol2**max(|LEFT|,|RIGHT|)).

spltol — REAL for slarre
DOUBLE PRECISION for dlarre
The threshold for splitting.

work — REAL for slarre
DOUBLE PRECISION for dlarre
Workspace array, DIMENSION (6**n*).

iwork — INTEGER.
Workspace array, DIMENSION (5**n*).

Output Parameters

vl, *vu*	On exit, if *range*='I' or ='A', contain the bounds on the desired part of the spectrum.
d	On exit, the *n* diagonal elements of the diagonal matrices D_i .
e	On exit, the subdiagonal elements of the unit bidiagonal matrices L_i . The entries *e*(*isplit*(*i*)), $1 \le i \le nsplit$, contain the base points $sigma_i$ on output.
e2	On exit, the entries *e2*(*isplit*(*i*)), $1 \le i \le nsplit$, have been set to zero.
nsplit	INTEGER. The number of blocks *T* splits into. $1 \le nsplit \le n$.
isplit	INTEGER. Array, DIMENSION (*n*). The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc., and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*.
m	INTEGER. The total number of eigenvalues (of all the $L_i*D_i*L_i^T$) found.
w	REAL for slarre DOUBLE PRECISION for dlarre Array, DIMENSION (*n*). The first *m* elements contain the eigenvalues. The eigenvalues of each of the blocks, $L_i*D_i*L_i^T$, are sorted in ascending order. The routine may use the remaining *n*-*m* elements as workspace.
werr	REAL for slarre DOUBLE PRECISION for dlarre Array, DIMENSION (*n*). The error bound on the corresponding eigenvalue in *w*.
wgap	REAL for slarre DOUBLE PRECISION for dlarre Array, DIMENSION (*n*). The separation from the right neighbor eigenvalue in *w*. The gap is only with respect to the eigenvalues of the same block as each block has its own representation tree. Exception: at the right end of a block the left gap is stored.
iblock	INTEGER. Array, DIMENSION (*n*). The indices of the blocks (submatrices) associated with the corresponding eigenvalues in *w*; *iblock*(*i*)=1 if eigenvalue *w*(*i*) belongs to the first block from the top, =2 if *w*(*i*) belongs to the second block, etc.
indexw	INTEGER. Array, DIMENSION (*n*). The indices of the eigenvalues within each block (submatrix); for example, *indexw*(*i*)= 10 and *iblock*(*i*)=2 imply that the *i*-th eigenvalue *w*(*i*) is the 10-th eigenvalue in the second block.
gers	REAL for slarre DOUBLE PRECISION for dlarre

	Array, DIMENSION (2*n). The n Gerschgorin intervals (the i-th Gerschgorin interval is (gers(2*i-1), gers(2*i)).
pivmin	REAL for slarre DOUBLE PRECISION for dlarre The minimum pivot in the Sturm sequence for T .
info	INTEGER. If info = 0: successful exit If info > 0: A problem occured in ?larre. If info = 5, the Rayleigh Quotient Iteration failed to converge to full accuracy. If info < 0: One of the called subroutines signaled an internal problem. Inspection of the corresponding parameter info for further information is required. • If info = -1, there is a problem in ?larrd • If info = -2, no base representation could be found in maxtry iterations. Increasing maxtry and recompilation might be a remedy. • If info = -3, there is a problem in ?larrb when computing the refined root representation for ?lasq2. • If info = -4, there is a problem in ?larrb when preforming bisection on the desired part of the spectrum. • If info = -5, there is a problem in ?lasq2. • If info = -6, there is a problem in ?lasq2.

?larrf

Finds a new relatively robust representation such that at least one of the eigenvalues is relatively isolated.

Syntax

call slarrf(n, d, l, ld, clstrt, clend, w, wgap, werr, spdiam, clgapl, clgapr, pivmin, sigma, dplus, lplus, work, info)

call dlarrf(n, d, l, ld, clstrt, clend, w, wgap, werr, spdiam, clgapl, clgapr, pivmin, sigma, dplus, lplus, work, info)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

Given the initial representation $L*D*L^T$ and its cluster of close eigenvalues (in a relative measure), $w(clstrt)$, $w(clstrt+1)$, ... $w(clend)$, the routine ?larrf finds a new relatively robust representation

$L*D*L^T - \sigma_i*I = L(+)*D(+)*L(+)^T$

such that at least one of the eigenvalues of $L(+)*D*(+)*L(+)^T$ is relatively isolated.

Input Parameters

n	INTEGER. The order of the matrix (subblock, if the matrix is splitted).
d	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D*.
l	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION (*n*-1). The (*n*-1) subdiagonal elements of the unit bidiagonal matrix *L*.
ld	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION (*n*-1). The *n*-1 elements L_i*D_i.
clstrt	INTEGER. The index of the first eigenvalue in the cluster.
clend	INTEGER. The index of the last eigenvalue in the cluster.
w	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION ≥ (*clend* -*clstrt*+1). The eigenvalue approximations of $L*D*L^T$ in ascending order. $w(clstrt)$ through $w(clend)$ form the cluster of relatively close eigenvalues.
wgap	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION ≥ (*clend* -*clstrt*+1). The separation from the right neighbor eigenvalue in *w*.
werr	REAL for slarrf DOUBLE PRECISION for dlarrf Array, DIMENSION ≥ (*clend* -*clstrt*+1). On input, *werr* contains the semiwidth of the uncertainty interval of the corresponding eigenvalue approximation in *w*.
spdiam	REAL for slarrf DOUBLE PRECISION for dlarrf Estimate of the spectral diameter obtained from the Gerschgorin intervals.
clgapl, *clgapr*	REAL for slarrf DOUBLE PRECISION for dlarrf Absolute gap on each end of the cluster. Set by the calling routine to protect against shifts too close to eigenvalues outside the cluster.

pivmin — REAL for slarrf
DOUBLE PRECISION for dlarrf
The minimum pivot allowed in the Sturm sequence.

work — REAL for slarrf
DOUBLE PRECISION for dlarrf
Workspace array, DIMENSION (2*n).

Output Parameters

wgap — On output, the gaps are refined.

sigma — REAL for slarrf
DOUBLE PRECISION for dlarrf
The shift used to form $L(+)*D*(+)*L(+)^T$.

dplus — REAL for slarrf
DOUBLE PRECISION for dlarrf
Array, DIMENSION (n). The n diagonal elements of the diagonal matrix $D(+)$.

lplus — REAL for slarrf
DOUBLE PRECISION for dlarrf
Array, DIMENSION (n). The first (n-1) elements of *lplus* contain the subdiagonal elements of the unit bidiagonal matrix $L(+)$.

?larrj

Performs refinement of the initial estimates of the eigenvalues of the matrix T.

Syntax

```
call slarrj( n, d, e2, ifirst, ilast, rtol, offset, w, werr, work, iwork, pivmin, spdiam, info )
```

```
call dlarrj( n, d, e2, ifirst, ilast, rtol, offset, w, werr, work, iwork, pivmin, spdiam, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

Given the initial eigenvalue approximations of T, this routine does bisection to refine the eigenvalues of T, $w(ifirst-offset)$ through $w(ilast-offset)$, to more accuracy. Initial guesses for these eigenvalues are input in w, the corresponding estimate of the error in these guesses in *werr*. During bisection, intervals [a,b] are maintained by storing their mid-points and semi-widths in the arrays w and *werr* respectively.

Input Parameters

n — INTEGER. The order of the matrix T.

d — REAL for slarrj
DOUBLE PRECISION for dlarrj
Array, DIMENSION (n).

Contains *n* diagonal elements of the matrix *T*.

e2
REAL for slarrj
DOUBLE PRECISION for dlarrj
Array, DIMENSION (*n*-1).
Contains (*n*-1) squared sub-diagonal elements of the *T*.

ifirst
INTEGER.
The index of the first eigenvalue to be computed.

ilast
INTEGER.
The index of the last eigenvalue to be computed.

rtol
REAL for slarrj
DOUBLE PRECISION for dlarrj
Tolerance for the convergence of the bisection intervals. An interval [a,b] is considered to be converged if (b-a) ≤ *rtol**max(|a|,|b|).

offset
INTEGER.
Offset for the arrays *w* and *werr*, that is the *ifirst-offset* through *ilast-offset* elements of these arrays are to be used.

w
REAL for slarrj
DOUBLE PRECISION for dlarrj
Array, DIMENSION (*n*).
On input, *w*(*ifirst-offset*) through *w*(*ilast-offset*) are estimates of the eigenvalues of $L*D*L^T$ indexed *ifirst* through *ilast*.

werr
REAL for slarrj
DOUBLE PRECISION for dlarrj
Array, DIMENSION (*n*).
On input, *werr*(*ifirst-offset*) through *werr*(*ilast-offset*) are the errors in the estimates of the corresponding elements in *w*.

work
REAL for slarrj
DOUBLE PRECISION for dlarrj
Workspace array, DIMENSION (2**n*).

iwork
INTEGER.
Workspace array, DIMENSION (2**n*).

pivmin
REAL for slarrj
DOUBLE PRECISION for dlarrj
The minimum pivot in the Sturm sequence for the matrix *T*.

spdiam
REAL for slarrj
DOUBLE PRECISION for dlarrj
The spectral diameter of the matrix *T*.

Output Parameters

w
On exit, contains the refined estimates of the eigenvalues.

werr
On exit, contains the refined errors in the estimates of the corresponding elements in *w*.

info
INTEGER.

Now it is not used and always is set to 0.

?larrk

Computes one eigenvalue of a symmetric tridiagonal matrix T to suitable accuracy.

Syntax

```
call slarrk( n, iw, gl, gu, d, e2, pivmin, reltol, w, werr, info )
call dlarrk( n, iw, gl, gu, d, e2, pivmin, reltol, w, werr, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes one eigenvalue of a symmetric tridiagonal matrix *T* to suitable accuracy. This is an auxiliary code to be called from `?stemr`.

To avoid overflow, the matrix must be scaled so that its largest element is no greater than ($overflow^{1/2}$*$underflow^{1/4}$) in absolute value, and for greatest accuracy, it should not be much smaller than that. For more details see [Kahan66].

Input Parameters

n	INTEGER. The order of the matrix *T*. (*n* ≥ 1).
iw	INTEGER. The index of the eigenvalue to be returned.
gl, *gu*	REAL for slarrk DOUBLE PRECISION for dlarrk An upper and a lower bound on the eigenvalue.
d	REAL for slarrk DOUBLE PRECISION for dlarrk Array, DIMENSION (*n*). Contains *n* diagonal elements of the matrix *T*.
e2	REAL for slarrk DOUBLE PRECISION for dlarrk Array, DIMENSION (*n*-1). Contains (*n*-1) squared off-diagonal elements of the *T*.
pivmin	REAL for slarrk DOUBLE PRECISION for dlarrk The minimum pivot in the Sturm sequence for the matrix *T*.
reltol	REAL for slarrk DOUBLE PRECISION for dlarrk The minimum relative width of an interval. When an interval is narrower than *reltol* times the larger (in magnitude) endpoint, then it is considered to be sufficiently small, that is converged. Note: this should always be at least *radix*machine epsilon*.

Output Parameters

w	REAL for slarrk DOUBLE PRECISION for dlarrk Contains the eigenvalue approximation.
werr	REAL for slarrk DOUBLE PRECISION for dlarrk Contains the error bound on the corresponding eigenvalue approximation in *w*.
info	INTEGER. = 0: Eigenvalue converges = -1: Eigenvalue does not converge

?larrr

Performs tests to decide whether the symmetric tridiagonal matrix T warrants expensive computations which guarantee high relative accuracy in the eigenvalues.

Syntax

```
call slarrr( n, d, e, info )
call dlarrr( n, d, e, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine performs tests to decide whether the symmetric tridiagonal matrix *T* warrants expensive computations which guarantee high relative accuracy in the eigenvalues.

Input Parameters

n	INTEGER. The order of the matrix *T*. (*n* > 0).
d	REAL for slarrr DOUBLE PRECISION for dlarrr Array, DIMENSION (*n*). Contains *n* diagonal elements of the matrix *T*.
e	REAL for slarrr DOUBLE PRECISION for dlarrr Array, DIMENSION (*n*). The first (*n*-1) entries contain sub-diagonal elements of the tridiagonal matrix *T*; *e*(*n*) is set to 0.

Output Parameters

info	INTEGER. = 0: the matrix warrants computations preserving relative accuracy (default value).

= -1: the matrix warrants computations guaranteeing only absolute accuracy.

?larrv

*Computes the eigenvectors of the tridiagonal matrix T = L*D*L^T given L, D and the eigenvalues of L*D*L^T.*

Syntax

call slarrv(*n*, *vl*, *vu*, *d*, *l*, *pivmin*, *isplit*, *m*, *dol*, *dou*, *minrgp*, *rtol1*, *rtol2*, *w*, *werr*, *wgap*, *iblock*, *indexw*, *gers*, *z*, *ldz*, *isuppz*, *work*, *iwork*, *info*)

call dlarrv(*n*, *vl*, *vu*, *d*, *l*, *pivmin*, *isplit*, *m*, *dol*, *dou*, *minrgp*, *rtol1*, *rtol2*, *w*, *werr*, *wgap*, *iblock*, *indexw*, *gers*, *z*, *ldz*, *isuppz*, *work*, *iwork*, *info*)

call clarrv(*n*, *vl*, *vu*, *d*, *l*, *pivmin*, *isplit*, *m*, *dol*, *dou*, *minrgp*, *rtol1*, *rtol2*, *w*, *werr*, *wgap*, *iblock*, *indexw*, *gers*, *z*, *ldz*, *isuppz*, *work*, *iwork*, *info*)

call zlarrv(*n*, *vl*, *vu*, *d*, *l*, *pivmin*, *isplit*, *m*, *dol*, *dou*, *minrgp*, *rtol1*, *rtol2*, *w*, *werr*, *wgap*, *iblock*, *indexw*, *gers*, *z*, *ldz*, *isuppz*, *work*, *iwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?larrv computes the eigenvectors of the tridiagonal matrix $T = L*D*L^T$ given L, D and approximations to the eigenvalues of $L*D*L^T$.

The input eigenvalues should have been computed by slarre for real flavors (slarrv/clarrv) and by dlarre for double precision flavors (dlarre/zlarre).

Input Parameters

n
INTEGER. The order of the matrix. $n \geq 0$.

vl, *vu*
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Lower and upper bounds respectively of the interval that contains the desired eigenvalues. $vl < vu$. Needed to compute gaps on the left or right end of the extremal eigenvalues in the desired range.

d
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). On entry, the *n* diagonal elements of the diagonal matrix *D*.

l
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*).
On entry, the (*n*-1) subdiagonal elements of the unit bidiagonal matrix *L* are contained in elements 1 to *n*-1 of *L* if the matrix is not splitted. At the end of each block the corresponding shift is stored as given by slarre for real flavors and by dlarre for double precision flavors.

pivmin
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
The minimum pivot allowed in the Sturm sequence.

isplit
INTEGER. Array, DIMENSION (*n*).
The splitting points, at which *T* breaks up into blocks. The first block consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc.

m
INTEGER. The total number of eigenvalues found.
$0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu* - *il* +1.

dol, *dou*
INTEGER.
If you want to compute only selected eigenvectors from all the eigenvalues supplied, specify an index range *dol*:*dou*. Or else apply the setting *dol*=1, *dou*=*m*. Note that *dol* and *dou* refer to the order in which the eigenvalues are stored in *w*.
If you want to compute only selected eigenpairs, then the columns *dol*-1 to *dou*+1 of the eigenvector space *Z* contain the computed eigenvectors. All other columns of *Z* are set to zero.

minrgp, *rtol1*, *rtol2*
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Parameters for bisection. An interval [LEFT,RIGHT] has converged if RIGHT-LEFT.LT.MAX(*rtol1**gap, *rtol2**max(|LEFT|,|RIGHT|)).

w
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The first *m* elements of *w* contain the approximate eigenvalues for which eigenvectors are to be computed. The eigenvalues should be grouped by split-off block and ordered from smallest to largest within the block (the output array *w* from ?larre is expected here). These eigenvalues are set with respect to the shift of the corresponding root representation for their block.

werr
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The first *m* elements contain the semiwidth of the uncertainty interval of the corresponding eigenvalue in *w*.

wgap
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (*n*). The separation from the right neighbor eigenvalue in *w*.

iblock
INTEGER. Array, DIMENSION (*n*).
The indices of the blocks (submatrices) associated with the corresponding eigenvalues in *w*; *iblock*(*i*)=1 if eigenvalue *w*(*i*) belongs to the first block from the top, =2 if *w*(*i*) belongs to the second block, etc.

indexw
INTEGER. Array, DIMENSION (*n*).

The indices of the eigenvalues within each block (submatrix); for example, *indexw*(*i*)= 10 and *iblock*(*i*)=2 imply that the *i*-th eigenvalue *w*(*i*) is the 10-th eigenvalue in the second block.

gers
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Array, DIMENSION (2*n). The *n* Gerschgorin intervals (the *i*-th Gerschgorin interval is (*gers*(2*i*-1), *gers*(2*i*)). The Gerschgorin intervals should be computed from the original unshifted matrix.

ldz
INTEGER. The leading dimension of the output array *Z*. *ldz* ≥ 1, and if *jobz* = 'V', *ldz* ≥ max(1,*n*).

work
REAL for slarrv/clarrv
DOUBLE PRECISION for dlarrv/zlarrv
Workspace array, DIMENSION (12*n).

iwork
INTEGER.
Workspace array, DIMENSION (7*n).

Output Parameters

d
On exit, *d* may be overwritten.

l
On exit, *l* is overwritten.

w
On exit, *w* holds the eigenvalues of the unshifted matrix.

werr
On exit, *werr* contains refined values of its input approximations.

wgap
On exit, *wgap* contains refined values of its input approximations. Very small gaps are changed.

z
REAL for slarrv
DOUBLE PRECISION for dlarrv
COMPLEX for clarrv
COMPLEX*16 for zlarrv
Array, DIMENSION (*ldz*, max(1,*m*)).
If *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the input eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

NOTE. The user must ensure that at least max(1,*m*) columns are supplied in the array *z*.

isuppz
INTEGER .
Array, DIMENSION (2*max(1,*m*)). The support of the eigenvectors in *z*, that is, the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*).

info
INTEGER.
If *info* = 0: successful exit

If *info* > 0: A problem occured in ?larrv. If *info* = 5, the Rayleigh Quotient Iteration failed to converge to full accuracy.
If *info* < 0: One of the called subroutines signaled an internal problem. Inspection of the corresponding parameter *info* for further information is required.

- If *info* = -1, there is a problem in ?larrb when refining a child eigenvalue;
- If *info* = -2, there is a problem in ?larrf when computing the relatively robust representation (RRR) of a child. When a child is inside a tight cluster, it can be difficult to find an RRR. A partial remedy from the user's point of view is to make the parameter *minrgp* smaller and recompile. However, as the orthogonality of the computed vectors is proportional to 1/*minrgp*, you should be aware that you might be trading in precision when you decrease *minrgp*.
- If *info* = -3, there is a problem in ?larrb when refining a single eigenvalue after the Rayleigh correction was rejected.

?lartg

Generates a plane rotation with real cosine and real/complex sine.

Syntax

```
call slartg( f, g, cs, sn, r )
call dlartg( f, g, cs, sn, r )
call clartg( f, g, cs, sn, r )
call zlartg( f, g, cs, sn, r )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine generates a plane rotation so that

$$\begin{bmatrix} cs & sn \\ -\text{conjg}(sn) & cs \end{bmatrix} \cdot \begin{bmatrix} f \\ g \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

where $cs^2 + |sn|^2 = 1$

This is a slower, more accurate version of the BLAS Level 1 routine ?rotg, except for the following differences.

For slartg/dlartg:

f and *g* are unchanged on return;

If *g*=0, then *cs*=1 and *sn*=0;

If *f*=0 and $g \neq 0$, then *cs*=0 and *sn*=1 without doing any floating point operations (saves work in ?bdsqr when there are zeros on the diagonal);

If *f* exceeds *g* in magnitude, *cs* will be positive.

For clartg/zlartg:

f and *g* are unchanged on return;

If *g*=0, then *cs*=1 and *sn*=0;

If *f*=0, then *cs*=0 and *sn* is chosen so that *r* is real.

Input Parameters

f, *g*	REAL for slartg DOUBLE PRECISION for dlartg COMPLEX for clartg COMPLEX*16 for zlartg The first and second component of vector to be rotated.

Output Parameters

cs	REAL for slartg/clartg DOUBLE PRECISION for dlartg/zlartg The cosine of the rotation.
sn	REAL for slartg DOUBLE PRECISION for dlartg COMPLEX for clartg COMPLEX*16 for zlartg The sine of the rotation.
r	REAL for slartg DOUBLE PRECISION for dlartg COMPLEX for clartg COMPLEX*16 for zlartg The nonzero component of the rotated vector.

?lartv

Applies a vector of plane rotations with real cosines and real/complex sines to the elements of a pair of vectors.

Syntax

```
call slartv( n, x, incx, y, incy, c, s, incc )
call dlartv( n, x, incx, y, incy, c, s, incc )
call clartv( n, x, incx, y, incy, c, s, incc )
call zlartv( n, x, incx, y, incy, c, s, incc )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine applies a vector of real/complex plane rotations with real cosines to elements of the real/complex vectors *x* and *y*. For `i = 1,2,...,n`

$$\begin{bmatrix} x_i \\ y_i \end{bmatrix} := \begin{bmatrix} c(i) & s(i) \\ -\mathrm{conjg}(s(i)) & c(i) \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix}$$

Input Parameters

n	INTEGER. The number of plane rotations to be applied.
x, *y*	REAL for `slartv` DOUBLE PRECISION for `dlartv` COMPLEX for `clartv` COMPLEX*16 for `zlartv` Arrays, DIMENSION (1+(*n*-1)**incx*) and (1+(*n*-1)**incy*), respectively. The input vectors *x* and *y*.
incx	INTEGER. The increment between elements of *x*. *incx* > 0.
incy	INTEGER. The increment between elements of *y*. *incy* > 0.
c	REAL for `slartv/clartv` DOUBLE PRECISION for `dlartv/zlartv` Array, DIMENSION (1+(*n*-1)**incc*). The cosines of the plane rotations.
s	REAL for `slartv` DOUBLE PRECISION for `dlartv` COMPLEX for `clartv` COMPLEX*16 for `zlartv` Array, DIMENSION (1+(*n*-1)**incc*). The sines of the plane rotations.
incc	INTEGER. The increment between elements of *c* and *s*. *incc* > 0.

Output Parameters

x, *y*	The rotated vectors *x* and *y*.

?laruv

Returns a vector of n random real numbers from a uniform distribution.

Syntax

```
call slaruv( iseed, n, x )
call dlaruv( iseed, n, x )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?laruv` returns a vector of *n* random real numbers from a uniform (0,1) distribution (n ≤ 128).

This is an auxiliary routine called by `?larnv`.

Input Parameters

iseed	`INTEGER`. Array, `DIMENSION` (4). On entry, the seed of the random number generator; the array elements must be between 0 and 4095, and *iseed*(4) must be odd.
n	`INTEGER`. The number of random numbers to be generated. *n* ≤ 128.

Output Parameters

x	`REAL` for `slaruv`
	`DOUBLE PRECISION` for `dlaruv`
	Array, `DIMENSION` (*n*). The generated random numbers.

seed	On exit, the seed is updated.

?larz

Applies an elementary reflector (as returned by `?tzrzf`) to a general matrix.

Syntax

```
call slarz( side, m, n, l, v, incv, tau, c, ldc, work )
call dlarz( side, m, n, l, v, incv, tau, c, ldc, work )
call clarz( side, m, n, l, v, incv, tau, c, ldc, work )
call zlarz( side, m, n, l, v, incv, tau, c, ldc, work )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?larz` applies a real/complex elementary reflector *H* to a real/complex *m*-by-*n* matrix *C*, from either the left or the right. *H* is represented in the form

*H = I-tau*v*v'*,

where *tau* is a real/complex scalar and v is a real/complex vector.

If *tau* = 0, then *H* is taken to be the unit matrix.

For complex flavors, to apply H^H (the conjugate transpose of *H*), supply conjg(*tau*) instead of *tau*.

H is a product of *k* elementary reflectors as returned by `?tzrzf`.

Input Parameters

side	CHARACTER*1. If *side* = 'L': form *H*C* If *side* = 'R': form *C*H*
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
l	INTEGER. The number of entries of the vector *v* containing the meaningful part of the Householder vectors. If *side* = 'L', $m \geq L \geq 0$, if *side* = 'R', $n \geq L \geq 0$.
v	REAL for slarz DOUBLE PRECISION for dlarz COMPLEX for clarz COMPLEX*16 for zlarz Array, DIMENSION (1+(*l*-1)*abs(*incv*)). The vector *v* in the representation of *H* as returned by `?tzrzf`. *v* is not used if *tau* = 0.
incv	INTEGER. The increment between elements of *v*. *incv* ≠ 0.
tau	REAL for slarz DOUBLE PRECISION for dlarz COMPLEX for clarz COMPLEX*16 for zlarz The value *tau* in the representation of *H*.
c	REAL for slarz DOUBLE PRECISION for dlarz COMPLEX for clarz COMPLEX*16 for zlarz Array, DIMENSION (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.
ldc	INTEGER. The leading dimension of the array *c*.

	ldc ≥ max(1,*m*).
work	REAL for slarz DOUBLE PRECISION for dlarz COMPLEX for clarz COMPLEX*16 for zlarz Workspace array, DIMENSION (*n*) if *side* = 'L' or (*m*) if *side* = 'R'.

Output Parameters

c	On exit, *C* is overwritten by the matrix *H***C* if *side* = 'L', or *C***H* if *side* = 'R'.

?larzb

Applies a block reflector or its transpose/conjugate-transpose to a general matrix.

Syntax

```
call slarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
call dlarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
call clarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
call zlarzb( side, trans, direct, storev, m, n, k, l, v, ldv, t, ldt, c, ldc, work, ldwork )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine applies a real/complex block reflector *H* or its transpose H^T (or H^H for complex flavors) to a real/complex distributed *m*-by-*n* matrix *C* from the left or the right. Currently, only *storev* = 'R' and *direct* = 'B' are supported.

Input Parameters

side	CHARACTER*1. If *side* = 'L': apply *H* or H^T/H^H from the left If *side* = 'R': apply *H* or H^T/H^H from the right
trans	CHARACTER*1. If *trans* = 'N': apply *H* (No transpose) If *trans*='C': apply H^T/H^H (transpose/conjugate transpose)
direct	CHARACTER*1. Indicates how *H* is formed from a product of elementary reflectors

	= 'F': $H = H(1)*H(2)*...*H(k)$ (forward, not supported) = 'B': $H = H(k)*...*H(2)*H(1)$ (backward)
storev	CHARACTER*1. Indicates how the vectors which define the elementary reflectors are stored: = 'C': Column-wise (not supported) = 'R': Row-wise.
m	INTEGER. The number of rows of the matrix *C*.
n	INTEGER. The number of columns of the matrix *C*.
k	INTEGER. The order of the matrix *T* (equal to the number of elementary reflectors whose product defines the block reflector).
l	INTEGER. The number of columns of the matrix *V* containing the meaningful part of the Householder reflectors. If *side* = 'L', $m \geq l \geq 0$, if *side* = 'R', $n \geq l \geq 0$.
v	REAL for slarzb DOUBLE PRECISION for dlarzb COMPLEX for clarzb COMPLEX*16 for zlarzb Array, DIMENSION (*ldv*, nv). If *storev* = 'C', nv = *k*; if *storev* = 'R', nv = *l*.
ldv	INTEGER. The leading dimension of the array *v*. If *storev* = 'C', *ldv* ≥ *l*; if *storev* = 'R', *ldv* ≥ *k*.
t	REAL for slarzb DOUBLE PRECISION for dlarzb COMPLEX for clarzb COMPLEX*16 for zlarzb Array, DIMENSION (*ldt*,*k*). The triangular *k*-by-*k* matrix *T* in the representation of the block reflector.
ldt	INTEGER. The leading dimension of the array *t*. *ldt* ≥ *k*.
c	REAL for slarzb DOUBLE PRECISION for dlarzb COMPLEX for clarzb COMPLEX*16 for zlarzb Array, DIMENSION (*ldc*,*n*). On entry, the *m*-by-*n* matrix *C*.
ldc	INTEGER. The leading dimension of the array *c*. *ldc* ≥ max(1,*m*).
work	REAL for slarzb DOUBLE PRECISION for dlarzb COMPLEX for clarzb COMPLEX*16 for zlarzb Workspace array, DIMENSION (*ldwork*, *k*).

ldwork INTEGER. The leading dimension of the array *work*.
If *side* = 'L', *ldwork* ≥ max(1, *n*);
if *side* = 'R', *ldwork* ≥ max(1, *m*).

Output Parameters

c On exit, *C* is overwritten by $H*C$, or H^T/H^H*C, or $C*H$, or $C*H^T/H^H$.

?larzt

*Forms the triangular factor T of a block reflector H = I - V*T*V^H.*

Syntax

```
call slarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
call dlarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
call clarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
call zlarzt( direct, storev, n, k, v, ldv, tau, t, ldt )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine forms the triangular factor *T* of a real/complex block reflector *H* of order > *n*, which is defined as a product of *k* elementary reflectors.

If *direct* = 'F', *H* = *H*(1)**H*(2)*...**H*(*k*), and *T* is upper triangular.

If *direct* = 'B', *H* = *H*(*k*)*...**H*(2)**H*(1), and *T* is lower triangular.

If *storev* = 'C', the vector which defines the elementary reflector *H*(*i*) is stored in the *i*-th column of the array *v*, and *H* = *I*-*V***T***V*'

If *storev* = 'R', the vector which defines the elementary reflector *H*(*i*) is stored in the *i*-th row of the array *v*, and *H* = *I*-*V*'**T***V*

Currently, only *storev* = 'R' and *direct* = 'B' are supported.

Input Parameters

direct CHARACTER*1.
Specifies the order in which the elementary reflectors are multiplied to form the block reflector:
If *direct* = 'F': *H* = *H*(1)**H*(2)*...**H*(*k*) (forward, not supported)
If *direct* = 'B': *H* = *H*(*k*)*...**H*(2)**H*(1) (backward)

storev CHARACTER*1.
Specifies how the vectors which define the elementary reflectors are stored (see also *Application Notes* below):
If *storev* = 'C': column-wise (not supported)
If *storev* = 'R': row-wise

n	INTEGER. The order of the block reflector *H*. *n* ≥ 0.
k	INTEGER. The order of the triangular factor *T* (equal to the number of elementary reflectors). *k* ≥ 1.
v	REAL for slarzt DOUBLE PRECISION for dlarzt COMPLEX for clarzt COMPLEX*16 for zlarzt Array, DIMENSION (*ldv*, *k*) if *storev* = 'C' (*ldv*, *n*) if *storev* = 'R' The matrix *V*.
ldv	INTEGER. The leading dimension of the array *v*. If *storev* = 'C', *ldv* ≥ max(1,*n*); if *storev* = 'R', *ldv* ≥ *k*.
tau	REAL for slarzt DOUBLE PRECISION for dlarzt COMPLEX for clarzt COMPLEX*16 for zlarzt Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*).
ldt	INTEGER. The leading dimension of the output array *t*. *ldt* ≥ *k*.

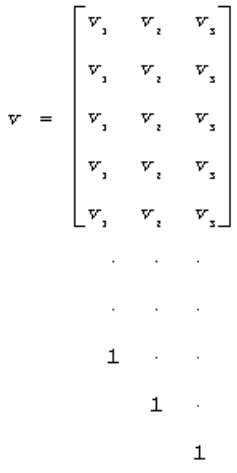
Output Parameters

t	REAL for slarzt DOUBLE PRECISION for dlarzt COMPLEX for clarzt COMPLEX*16 for zlarzt Array, DIMENSION (*ldt*,*k*). The *k*-by-*k* triangular factor *T* of the block reflector. If *direct* = 'F', *T* is upper triangular; if *direct* = 'B', *T* is lower triangular. The rest of the array is not used.
v	The matrix *V*. See *Application Notes* below.

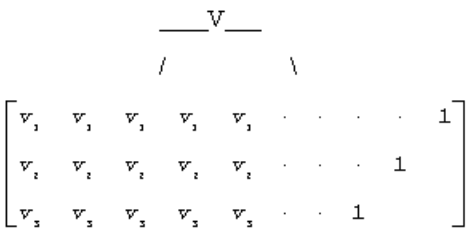
Application Notes

The shape of the matrix *V* and the storage of the vectors which define the *H*(i) is best illustrated by the following example with *n* = 5 and *k* = 3. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

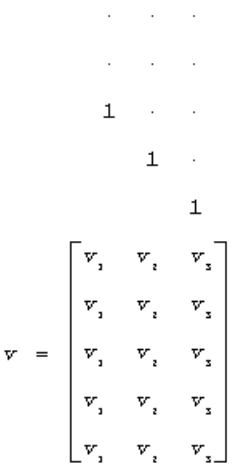
direct = 'F' and *storev* = 'C':



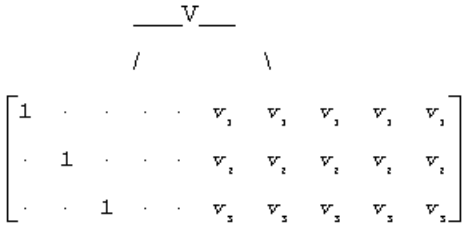
direct = 'F' and *storev* = 'R':



direct = 'B' and *storev* = 'C':



direct = 'B' and *storev* = 'R':



?las2

Computes singular values of a 2-by-2 triangular matrix.

Syntax

```
call slas2( f, g, h, ssmin, ssmax )
call dlas2( f, g, h, ssmin, ssmax )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?las2` computes the singular values of the 2-by-2 matrix

$$\begin{bmatrix} f & g \\ 0 & h \end{bmatrix}$$

On return, *ssmin* is the smaller singular value and *SSMAX* is the larger singular value.

Input Parameters

f, *g*, *h*	REAL for `slas2` DOUBLE PRECISION for `dlas2` The (1,1), (1,2) and (2,2) elements of the 2-by-2 matrix, respectively.

Output Parameters

ssmin, *ssmax*	REAL for `slas2` DOUBLE PRECISION for `dlas2` The smaller and the larger singular values, respectively.

Application Notes

Barring over/underflow, all output quantities are correct to within a few units in the last place (*ulps*), even in the absence of a guard digit in addition/subtraction. In ieee arithmetic, the code works correctly if one matrix element is infinite. Overflow will not occur unless the largest singular value itself overflows, or is within a few ulps of overflow. (On machines with partial overflow, like the Cray, overflow may occur if the largest singular value is within a factor of 2 of overflow.) Underflow is harmless if underflow is gradual. Otherwise, results may correspond to a matrix modified by perturbations of size near the underflow threshold.

?lascl

Multiplies a general rectangular matrix by a real scalar defined as c_{to}/c_{from}.

Syntax

```
call slascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
call dlascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
call clascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
call zlascl( type, kl, ku, cfrom, cto, m, n, a, lda, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine ?lascl multiplies the *m*-by-*n* real/complex matrix *A* by the real scalar c_{to}/c_{from}. The operation is performed without over/underflow as long as the final result c_{to}*A(*i*,*j*)/c_{from} does not over/underflow.

type specifies that *A* may be full, upper triangular, lower triangular, upper Hessenberg, or banded.

Input Parameters

type	CHARACTER*1. This parameter specifies the storage type of the input matrix. = 'G': *A* is a full matrix. = 'L': *A* is a lower triangular matrix. = 'U': *A* is an upper triangular matrix. = 'H': *A* is an upper Hessenberg matrix. = 'B': *A* is a symmetric band matrix with lower bandwidth *kl* and upper bandwidth *ku* and with the only the lower half stored = 'Q': *A* is a symmetric band matrix with lower bandwidth *kl* and upper bandwidth *ku* and with the only the upper half stored. = 'Z': *A* is a band matrix with lower bandwidth *kl* and upper bandwidth *ku*.
kl	INTEGER. The lower bandwidth of *A*. Referenced only if *type* = 'B', 'Q' or 'Z'.
ku	INTEGER. The upper bandwidth of *A*. Referenced only if *type* = 'B', 'Q' or 'Z'.
cfrom, *cto*	REAL for slascl/clascl DOUBLE PRECISION for dlascl/zlascl The matrix *A* is multiplied by *cto*/*cfrom*. *A*(*i*,*j*) is computed without over/underflow if the final result *cto***A*(*i*,*j*)/*cfrom* can be represented without over/underflow. *cfrom* must be nonzero.
m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
a	REAL for slascl DOUBLE PRECISION for dlascl COMPLEX for clascl COMPLEX*16 for zlascl Array, DIMENSION (*lda*, *n*). The matrix to be multiplied by *cto*/*cfrom*. See *type* for the storage type.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*m*).

Output Parameters

a	The multiplied matrix *A*.
info	INTEGER. If *info* = 0 - successful exit If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lasd0

Computes the singular values of a real upper bidiagonal n-by-m matrix B with diagonal d and off-diagonal e. Used by ?bdsdc.

Syntax

```
call slasd0( n, sqre, d, e, u, ldu, vt, ldvt, smlsiz, iwork, work, info )
call dlasd0( n, sqre, d, e, u, ldu, vt, ldvt, smlsiz, iwork, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

Using a divide and conquer approach, the routine `?lasd0` computes the singular value decomposition (SVD) of a real upper bidiagonal *n*-by-*m* matrix *B* with diagonal *d* and offdiagonal *e*, where *m* = *n* + *sqre*.

The algorithm computes orthogonal matrices *U* and *VT* such that *B* = *U*S*VT*. The singular values *S* are overwritten on *d*.

The related subroutine `?lasda` computes only the singular values, and optionally, the singular vectors in compact form.

Input Parameters

n	INTEGER. On entry, the row dimension of the upper bidiagonal matrix. This is also the dimension of the main diagonal array *d*.
sqre	INTEGER. Specifies the column dimension of the bidiagonal matrix. If *sqre* = 0: the bidiagonal matrix has column dimension *m* = *n*. If *sqre* = 1: the bidiagonal matrix has column dimension *m* = *n*+1.
d	REAL for slasd0 DOUBLE PRECISION for dlasd0 Array, DIMENSION (*n*). On entry, *d* contains the main diagonal of the bidiagonal matrix.
e	REAL for slasd0 DOUBLE PRECISION for dlasd0 Array, DIMENSION (*m*-1). Contains the subdiagonal entries of the bidiagonal matrix. On exit, *e* is destroyed.
ldu	INTEGER. On entry, leading dimension of the output array *u*.
ldvt	INTEGER. On entry, leading dimension of the output array *vt*.
smlsiz	INTEGER. On entry, maximum size of the subproblems at the bottom of the computation tree.
iwork	INTEGER. Workspace array, dimension must be at least (8*n*).
work	REAL for slasd0 DOUBLE PRECISION for dlasd0 Workspace array, dimension must be at least ($3m^2+2m$).

Output Parameters

d	On exit *d*, If *info* = 0, contains singular values of the bidiagonal matrix.
u	REAL for slasd0 DOUBLE PRECISION for dlasd0 Array, DIMENSION at least (*ldq*, *n*). On exit, *u* contains the left singular vectors.
vt	REAL for slasd0 DOUBLE PRECISION for dlasd0 Array, DIMENSION at least (*ldvt*, *m*). On exit, *vt*' contains the right singular vectors.
info	INTEGER. If *info* = 0: successful exit. If *info* = -*i* < 0, the *i*-th argument had an illegal value. If *info* = 1, an singular value did not converge.

?lasd1

Computes the SVD of an upper bidiagonal matrix B of the specified size. Used by ?bdsdc.

Syntax

```
call slasd1( nl, nr, sqre, d, alpha, beta, u, ldu, vt, ldvt, idxq, iwork, work, info )
call dlasd1( nl, nr, sqre, d, alpha, beta, u, ldu, vt, ldvt, idxq, iwork, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the SVD of an upper bidiagonal *n*-by-*m* matrix *B*, where *n* = *nl* + *nr* + 1 and *m* = *n* + *sqre*.

The routine ?lasd1 is called from ?lasd0.

A related subroutine ?lasd7 handles the case in which the singular values (and the singular vectors in factored form) are desired.

?lasd1 computes the SVD as follows:

$$VT = U(in)^* \begin{bmatrix} D1(in) & 0 & 0 & 0 \\ Z1' & a & Z2' & b \\ 0 & 0 & D2(in) & 0 \end{bmatrix} ^*VT(in)$$

= *U*(*out*)*(*D*(*out*) 0)**VT*(*out*)

where *Z' = (Z1' a Z2' b) = u'*VT'*, and *u* is a vector of dimension *m* with *alpha* and *beta* in the *nl*+1 and *nl*+2-th entries and zeros elsewhere; and the entry *b* is empty if *sqre = 0*.

The left singular vectors of the original matrix are stored in *u*, and the transpose of the right singular vectors are stored in *vt*, and the singular values are in *d*. The algorithm consists of three stages:

1. The first stage consists of deflating the size of the problem when there are multiple singular values or when there are zeros in the *Z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine ?lasd2.
2. The second stage consists of calculating the updated singular values. This is done by finding the square roots of the roots of the secular equation via the routine ?lasd4 (as called by ?lasd3). This routine also calculates the singular vectors of the current problem.
3. The final stage consists of computing the updated singular vectors directly using the updated singular values. The singular vectors for the current problem are multiplied with the singular vectors from the overall problem.

Input Parameters

nl
INTEGER. The row dimension of the upper block.
nl ≥ 1.

nr
INTEGER. The row dimension of the lower block.
nr ≥ 1.

sqre
INTEGER.
If *sqre = 0*: the lower block is an *nr*-by-*nr* square matrix.
If *sqre = 1*: the lower block is an *nr*-by-(*nr*+1) rectangular matrix.
The bidiagonal matrix has row dimension *n = nl + nr + 1*, and column dimension *m = n + sqre*.

d
REAL for slasd1
DOUBLE PRECISION for dlasd1
Array, DIMENSION (*nl*+*nr*+1). *n = nl*+*nr*+1. On entry *d*(1:*nl*,1:*nl*) contains the singular values of the upper block; and *d*(*nl*+2:*n*) contains the singular values of the lower block.

alpha
REAL for slasd1
DOUBLE PRECISION for dlasd1
Contains the diagonal element associated with the added row.

beta
REAL for slasd1
DOUBLE PRECISION for dlasd1
Contains the off-diagonal element associated with the added row.

u
REAL for slasd1
DOUBLE PRECISION for dlasd1
Array, DIMENSION (*ldu*, *n*). On entry *u*(1:*nl*, 1:*nl*) contains the left singular vectors of the upper block; *u*(*nl*+2:*n*, *nl*+2:*n*) contains the left singular vectors of the lower block.

ldu
INTEGER. The leading dimension of the array *U*.
ldu ≥ max(1, *n*).

vt
REAL for slasd1

DOUBLE PRECISION for dlasd1
Array, DIMENSION (*ldvt*, *m*), where *m* = *n* + *sqre*.
On entry *vt*(1:*nl*+1, 1:*nl*+1)' contains the right singular vectors of the upper block; *vt*(*nl*+2:*m*, *nl*+2:*m*)' contains the right singular vectors of the lower block.

ldvt — INTEGER. The leading dimension of the array *vt*.
ldvt ≥ max(1, *M*).

iwork — INTEGER.
Workspace array, DIMENSION (4*n*).

work — REAL for slasd1
DOUBLE PRECISION for dlasd1
Workspace array, DIMENSION ($3m_2$ + 2*m*).

Output Parameters

d — On exit *d*(1:*n*) contains the singular values of the modified matrix.

alpha — On exit, the diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

beta — On exit, the off-diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

u — On exit *u* contains the left singular vectors of the bidiagonal matrix.

vt — On exit *vt*' contains the right singular vectors of the bidiagonal matrix.

idxq — INTEGER
Array, DIMENSION (*n*). Contains the permutation which will reintegrate the subproblem just solved back into sorted order, that is, *d*(*idxq*(*i* = 1, *n*)) will be in ascending order.

info — INTEGER.
If *info* = 0: successful exit.
If *info* = -*i* < 0, the *i*-th argument had an illegal value.
If *info* = 1, an singular value did not converge.

?lasd2

Merges the two sets of singular values together into a single sorted set. Used by ?bdsdc.

Syntax

call slasd2(*nl*, *nr*, *sqre*, *k*, *d*, *z*, *alpha*, *beta*, *u*, *ldu*, *vt*, *ldvt*, *dsigma*, *u2*, *ldu2*, *vt2*, *ldvt2*, *idxp*, *idx*, *idxp*, *idxq*, *coltyp*, *info*)

call dlasd2(*nl*, *nr*, *sqre*, *k*, *d*, *z*, *alpha*, *beta*, *u*, *ldu*, *vt*, *ldvt*, *dsigma*, *u2*, *ldu2*, *vt2*, *ldvt2*, *idxp*, *idx*, *idxp*, *idxq*, *coltyp*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasd2 merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more singular values are close together or if there is a tiny entry in the *Z* vector. For each such occurrence the order of the related secular equation problem is reduced by one.

The routine ?lasd2 is called from ?lasd1.

Input Parameters

nl	INTEGER. The row dimension of the upper block. *nl* ≥ 1.
nr	INTEGER. The row dimension of the lower block. *nr* ≥ 1.
sqre	INTEGER. If *sqre* = 0): the lower block is an *nr*-by-*nr* square matrix If *sqre* = 1): the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has *n* = *nl* + *nr* + 1 rows and *m* = *n* + *sqre* ≥ *n* columns.
d	REAL for slasd2 DOUBLE PRECISION for dlasd2 Array, DIMENSION (*n*). On entry *d* contains the singular values of the two submatrices to be combined.
alpha	REAL for slasd2 DOUBLE PRECISION for dlasd2 Contains the diagonal element associated with the added row.
beta	REAL for slasd2 DOUBLE PRECISION for dlasd2 Contains the off-diagonal element associated with the added row.
u	REAL for slasd2 DOUBLE PRECISION for dlasd2 Array, DIMENSION (*ldu*, *n*). On entry *u* contains the left singular vectors of two submatrices in the two square blocks with corners at (1,1), (*nl*, *nl*), and (*nl*+2, *nl*+2), (*n*,*n*).
ldu	INTEGER. The leading dimension of the array *u*. *ldu* ≥ *n*.
ldu2	INTEGER. The leading dimension of the output array *u2*. *ldu2* ≥ *n*.
vt	REAL for slasd2 DOUBLE PRECISION for dlasd2 Array, DIMENSION (*ldvt*, *m*). On entry, *vt*' contains the right singular vectors of two submatrices in the two square blocks with corners at (1,1), (*nl*+1, *nl*+1), and (*nl*+2, *nl*+2), (*m*, *m*).
ldvt	INTEGER. The leading dimension of the array *vt*. *ldvt* ≥ *m*.
ldvt2	INTEGER. The leading dimension of the output array *vt2*. *ldvt2* ≥ *m*.

idxp INTEGER.
Workspace array, DIMENSION (*n*). This will contain the permutation used to place deflated values of *D* at the end of the array. On output *idxp*(2:*k*) points to the nondeflated *d*-values and *idxp*(*k*+1:*n*) points to the deflated singular values.

idx INTEGER.
Workspace array, DIMENSION (*n*). This will contain the permutation used to sort the contents of *d* into ascending order.

coltyp INTEGER.
Workspace array, DIMENSION (*n*). As workspace, this array contains a label that indicates which of the following types a column in the *u2* matrix or a row in the *vt2* matrix is:
1 : non-zero in the upper half only
2 : non-zero in the lower half only
3 : dense
4 : deflated.

idxq INTEGER. Array, DIMENSION (*n*). This parameter contains the permutation that separately sorts the two sub-problems in *D* into ascending order. Note that entries in the first half of this permutation must first be moved one position backward; and entries in the second half must first have *nl*+1 added to their values.

Output Parameters

k INTEGER. Contains the dimension of the non-deflated matrix, This is the order of the related secular equation. $1 \leq k \leq n$.

d On exit *D* contains the trailing (*n*-*k*) updated singular values (those which were deflated) sorted into increasing order.

u On exit *u* contains the trailing (*n*-*k*) updated left singular vectors (those which were deflated) in its last *n*-*k* columns.

z REAL for slasd2
DOUBLE PRECISION for dlasd2
Array, DIMENSION (*n*). On exit, *z* contains the updating row vector in the secular equation.

dsigma REAL for slasd2
DOUBLE PRECISION for dlasd2
Array, DIMENSION (*n*). Contains a copy of the diagonal elements (*k*-1 singular values and one zero) in the secular equation.

u2 REAL for slasd2
DOUBLE PRECISION for dlasd2
Array, DIMENSION (*ldu2*, *n*). Contains a copy of the first *k*-1 left singular vectors which will be used by ?lasd3 in a matrix multiply (?gemm) to solve for the new left singular vectors. *u2* is arranged into four blocks. The first block contains a column with 1 at *nl*+1 and zero

	everywhere else; the second block contains non-zero entries only at and above *nl*; the third contains non-zero entries only below *nl*+1; and the fourth is dense.
vt	On exit, *vt*' contains the trailing (*n*-*k*) updated right singular vectors (those which were deflated) in its last *n*-*k* columns. In case *sqre* =1, the last row of *vt* spans the right null space.
vt2	REAL for slasd2 DOUBLE PRECISION for dlasd2 Array, DIMENSION (*ldvt2*, *n*). *vt2*' contains a copy of the first *k* right singular vectors which will be used by ?lasd3 in a matrix multiply (?gemm) to solve for the new right singular vectors. *vt2* is arranged into three blocks. The first block contains a row that corresponds to the special 0 diagonal element in *sigma*; the second block contains non-zeros only at and before *nl* +1; the third block contains non-zeros only at and after *nl* +2.
idxc	INTEGER. Array, DIMENSION (*n*). This will contain the permutation used to arrange the columns of the deflated *u* matrix into three groups: the first group contains non-zero entries only at and above *nl*, the second contains non-zero entries only below *nl*+2, and the third is dense.
coltyp	On exit, it is an array of dimension 4, with *coltyp*(*i*) being the dimension of the *i*-th type columns.
info	INTEGER. If *info* = 0): successful exit If *info* = -*i* < 0, the *i*-th argument had an illegal value.

?lasd3

Finds all square roots of the roots of the secular equation, as defined by the values in D and Z, and then updates the singular vectors by matrix multiplication. Used by ?bdsdc.

Syntax

call slasd3(*nl*, *nr*, *sqre*, *k*, *d*, *q*, *ldq*, *dsigma*, *u*, *ldu*, *u2*, *ldu2*, *vt*, *ldvt*, *vt2*, *ldvt2*, *idxc*, *ctot*, *z*, *info*)

call dlasd3(*nl*, *nr*, *sqre*, *k*, *d*, *q*, *ldq*, *dsigma*, *u*, *ldu*, *u2*, *ldu2*, *vt*, *ldvt*, *vt2*, *ldvt2*, *idxc*, *ctot*, *z*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasd3 finds all the square roots of the roots of the secular equation, as defined by the values in *D* and *Z*.

It makes the appropriate calls to ?lasd4 and then updates the singular vectors by matrix multiplication.

The routine ?lasd3 is called from ?lasd1.

Input Parameters

nl INTEGER. The row dimension of the upper block.
nl ≥ 1.

nr INTEGER. The row dimension of the lower block.
nr ≥ 1.

sqre INTEGER.
If *sqre* = 0): the lower block is an *nr*-by-*nr* square matrix.
If *sqre* = 1): the lower block is an *nr*-by-(*nr*+1) rectangular matrix.
The bidiagonal matrix has *n* = *nl* + *nr* + 1 rows and *m* = *n* + *sqre* ≥ *n* columns.

k INTEGER.The size of the secular equation, 1 ≤ *k* ≤ *n*.

q REAL for slasd3
DOUBLE PRECISION for dlasd3
Workspace array, DIMENSION at least (*ldq*, *k*).

ldq INTEGER. The leading dimension of the array *Q*.
ldq ≥ *k*.

dsigma REAL for slasd3
DOUBLE PRECISION for dlasd3
Array, DIMENSION (*k*). The first *k* elements of this array contain the old roots of the deflated updating problem. These are the poles of the secular equation.

ldu INTEGER. The leading dimension of the array *u*.
ldu ≥ *n*.

u2 REAL for slasd3
DOUBLE PRECISION for dlasd3
Array, DIMENSION (*ldu2*, *n*).
The first *k* columns of this matrix contain the non-deflated left singular vectors for the split problem.

ldu2 INTEGER. The leading dimension of the array *u2*.
ldu2 ≥ *n*.

ldvt INTEGER. The leading dimension of the array *vt*.
ldvt ≥ *n*.

vt2 REAL for slasd3
DOUBLE PRECISION for dlasd3
Array, DIMENSION (*ldvt2*, *n*).
The first *k* columns of *vt2*' contain the non-deflated right singular vectors for the split problem.

ldvt2 INTEGER. The leading dimension of the array *vt2*.
ldvt2 ≥ *n*.

idxc INTEGER. Array, DIMENSION (*n*).

	The permutation used to arrange the columns of u (and rows of *vt*) into three groups: the first group contains non-zero entries only at and above (or before) *nl* +1; the second contains non-zero entries only at and below (or after) *nl*+2; and the third is dense. The first column of *u* and the row of *vt* are treated separately, however. The rows of the singular vectors found by ?lasd4 must be likewise permuted before the matrix multiplies can take place.
ctot	INTEGER. Array, DIMENSION (4). A count of the total number of the various types of columns in *u* (or rows in *vt*), as described in *idxc*. The fourth column type is any column which has been deflated.
z	REAL for slasd3 DOUBLE PRECISION for dlasd3 Array, DIMENSION (*k*). The first *k* elements of this array contain the components of the deflation-adjusted updating row vector.

Output Parameters

d	REAL for slasd3 DOUBLE PRECISION for dlasd3 Array, DIMENSION (*k*). On exit the square roots of the roots of the secular equation, in ascending order.
u	REAL for slasd3 DOUBLE PRECISION for dlasd3 Array, DIMENSION (*ldu*, *n*). The last *n* - *k* columns of this matrix contain the deflated left singular vectors.
vt	REAL for slasd3 DOUBLE PRECISION for dlasd3 Array, DIMENSION (*ldvt*, *m*). The last *m* - *k* columns of *vt*' contain the deflated right singular vectors.
vt2	Destroyed on exit.
z	Destroyed on exit.
info	INTEGER. If *info* = 0): successful exit. If *info* = -*i* < 0, the *i*-th argument had an illegal value. If *info* = 1, an singular value did not converge.

Application Notes

This code makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract, or on those binary machines without guard digits which subtract like the Cray XMP, Cray YMP, Cray C 90, or Cray 2. It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

?lasd4

Computes the square root of the i-th updated eigenvalue of a positive symmetric rank-one modification to a positive diagonal matrix. Used by ?bdsdc.

Syntax

```
call slasd4( n, i, d, z, delta, rho, sigma, work, info)
call dlasd4( n, i, d, z, delta, rho, sigma, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the square root of the *i*-th updated eigenvalue of a positive symmetric rank-one modification to a positive diagonal matrix whose entries are given as the squares of the corresponding entries in the array *d*, and that $0 \le d(i) < d(j)$ for $i < j$ and that $rho > 0$. This is arranged by the calling routine, and is no loss in generality. The rank-one modified system is thus

$diag(d)*diag(d) + rho*Z*Z^T$,

where the Euclidean norm of *Z* is equal to 1.The method consists of approximating the rational functions in the secular equation by simpler interpolating rational functions.

Input Parameters

n	INTEGER. The length of all arrays.
i	INTEGER. The index of the eigenvalue to be computed. $1 \le i \le n$.
d	REAL for slasd4 DOUBLE PRECISION for dlasd4 Array, DIMENSION (*n*). The original eigenvalues. They must be in order, $0 \le d(i) < d(j)$ for $i < j$.
z	REAL for slasd4 DOUBLE PRECISION for dlasd4 Array, DIMENSION (*n*). The components of the updating vector.
rho	REAL for slasd4 DOUBLE PRECISION for dlasd4 The scalar in the symmetric updating formula.
work	REAL for slasd4 DOUBLE PRECISION for dlasd4 Workspace array, DIMENSION (*n*). If $n \ne 1$, *work* contains ($d(j) + sigma_i$) in its *j*-th component. If $n = 1$, then $work(1) = 1$.

Output Parameters

delta	REAL for slasd4 DOUBLE PRECISION for dlasd4 Array, DIMENSION (*n*). If *n* ≠ 1, *delta* contains (*d*(*j*) - *sigma_i*) in its *j*-th component. If *n* = 1, then *delta* (1) = 1. The vector *delta* contains the information necessary to construct the (singular) eigenvectors.
sigma	REAL for slasd4 DOUBLE PRECISION for dlasd4 The computed *sigma_i*, the *i*-th updated eigenvalue.
info	INTEGER. = 0: successful exit > 0: If *info* = 1, the updating process failed.

?lasd5

Computes the square root of the i-th eigenvalue of a positive symmetric rank-one modification of a 2-by-2 diagonal matrix.Used by ?bdsdc.

Syntax

```
call slasd5( i, d, z, delta, rho, dsigma, work )
call dlasd5( i, d, z, delta, rho, dsigma, work )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes the square root of the *i*-th eigenvalue of a positive symmetric rank-one modification of a 2-by-2 diagonal matrix diag(*d*)*diag(*d*)+*rho**Z**Z^T

The diagonal entries in the array *d* must satisfy 0 ≤ *d*(i) < *d*(j) for i<i, *rho* mustbe greater than 0, and that the Euclidean norm of the vector *Z* is equal to 1.

Input Parameters

i	*INTEGER*.The index of the eigenvalue to be computed. *i* = 1 or *i* = 2.
d	REAL for slasd5 DOUBLE PRECISION for dlasd5 Array, dimension (2). The original eigenvalues, 0 ≤ *d*(1) < *d*(2).
z	REAL for slasd5 DOUBLE PRECISION for dlasd5 Array, dimension (2). The components of the updating vector.

rho REAL for slasd5
DOUBLE PRECISION for dlasd5
The scalar in the symmetric updating formula.

work REAL for slasd5
DOUBLE PRECISION for dlasd5.
Workspace array, dimension (2). Contains (*d*(*j*) + *sigma_i*) in its *j*-th component.

Output Parameters

delta REAL for slasd5
DOUBLE PRECISION for dlasd5.
Array, dimension (2).
Contains (*d*(*j*) - *sigma_i*) in its *j*-th component. The vector *delta* contains the information necessary to construct the eigenvectors.

dsigma REAL for slasd5
DOUBLE PRECISION for dlasd5.
The computed *sigma_i* , the *i*-th updated eigenvalue.

?lasd6

Computes the SVD of an updated upper bidiagonal matrix obtained by merging two smaller ones by appending a row. Used by ?bdsdc.

Syntax

call slasd6(*icompq*, *nl*, *nr*, *sqre*, *d*, *vf*, *vl*, *alpha*, *beta*, *idxq*, *perm*, *givptr*, *givcol*, *ldgcol*, *givnum*, *ldgnum*, *poles*, *difl*, *difr*, *z*, *k*, *c*, *s*, *work*, *iwork*, *info*)

call dlasd6(*icompq*, *nl*, *nr*, *sqre*, *d*, *vf*, *vl*, *alpha*, *beta*, *idxq*, *perm*, *givptr*, *givcol*, *ldgcol*, *givnum*, *ldgnum*, *poles*, *difl*, *difr*, *z*, *k*, *c*, *s*, *work*, *iwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasd6 computes the *SVD* of an updated upper bidiagonal matrix *B* obtained by merging two smaller ones by appending a row. This routine is used only for the problem which requires all singular values and optionally singular vector matrices in factored form. *B* is an *n*-by-*m* matrix with *n* = *nl* + *nr* + 1 and *m* = *n* + *sqre*. A related subroutine, ?lasd1, handles the case in which all singular values and singular vectors of the bidiagonal matrix are desired. ?lasd6 computes the *SVD* as follows:

$$B = U(in)^* \begin{bmatrix} D1(in) & 0 & 0 & 0 \\ Z1' & a & Z2' & b \\ 0 & 0 & D2(in) & 0 \end{bmatrix} *VT(in)$$

= *U*(out)*(*D*(out)**VT*(*out*)

where *Z' = (Z1' a Z2' b) = u'*VT'*, and *u* is a vector of dimension *m* with *alpha* and *beta* in the *nl*+1 and *nl*+2-th entries and zeros elsewhere; and the entry b is empty if *sqre* = 0.

The singular values of *B* can be computed using *D1*, *D2*, the first components of all the right singular vectors of the lower block, and the last components of all the right singular vectors of the upper block. These components are stored and updated in *vf* and *vl*, respectively, in ?lasd6. Hence *U* and *VT* are not explicitly referenced.

The singular values are stored in *D*. The algorithm consists of two stages:

1. The first stage consists of deflating the size of the problem when there are multiple singular values or if there is a zero in the *Z* vector. For each such occurrence the dimension of the secular equation problem is reduced by one. This stage is performed by the routine ?lasd7.
2. The second stage consists of calculating the updated singular values. This is done by finding the roots of the secular equation via the routine ?lasd4 (as called by ?lasd8). This routine also updates *vf* and *vl* and computes the distances between the updated singular values and the old singular values. ?lasd6 is called from ?lasda.

Input Parameters

icompq
INTEGER. Specifies whether singular vectors are to be computed in factored form:
= 0: Compute singular values only
= 1: Compute singular vectors in factored form as well.

nl
INTEGER. The row dimension of the upper block.
nl ≥ 1.

nr
INTEGER. The row dimension of the lower block.
nr ≥ 1.

sqre
INTEGER .
= 0: the lower block is an *nr*-by-*nr* square matrix.
= 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix.
The bidiagonal matrix has row dimension *n*=*nl*+*nr*+1, and column dimension *m* = *n* + *sqre*.

d
REAL for slasd6
DOUBLE PRECISION for dlasd6
Array, dimension (*nl*+*nr*+1). On entry *d*(1:*nl*,1:*nl*) contains the singular values of the upper block, and *d*(*nl*+2:*n*) contains the singular values of the lower block.

vf
REAL for slasd6
DOUBLE PRECISION for dlasd6
Array, dimension (*m*).
On entry, *vf*(1:*nl*+1) contains the first components of all right singular vectors of the upper block; and *vf*(*nl*+2:*m*)
contains the first components of all right singular vectors of the lower block.

vl
REAL for slasd6
DOUBLE PRECISION for dlasd6
Array, dimension (*m*).

On entry, *vl*(1:*nl*+1) contains the last components of all right singular vectors of the upper block; and *vl*(*nl*+2:*m*) contains the last components of all right singular vectors of the lower block.

alpha
REAL for slasd6
DOUBLE PRECISION for dlasd6
Contains the diagonal element associated with the added row.

beta
REAL for slasd6
DOUBLE PRECISION for dlasd6
Contains the off-diagonal element associated with the added row.

ldgcol
INTEGER.The leading dimension *of* the output array *givcol*, must be at least *n*.

ldgnum
INTEGER.
The leading dimension of the output arrays *givnum* and *poles*, must be at least *n*.

work
REAL for slasd6
DOUBLE PRECISION for dlasd6
Workspace array, dimension (4*m*).

iwork
INTEGER.
Workspace array, dimension (3*n*).

Output Parameters

d
On exit *d*(1:*n*) contains the singular values of the modified matrix.

vf
On exit, *vf* contains the first components of all right singular vectors of the bidiagonal matrix.

vl
On exit, *vl* contains the last components of all right singular vectors of the bidiagonal matrix.

alpha
On exit, the diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

beta
On exit, the off-diagonal element associated with the added row deflated by max(abs(*alpha*), abs(*beta*), abs(D(I))), I = 1,n.

idxq
INTEGER.
Array, dimension (*n*). This contains the permutation which will reintegrate the subproblem just solved back into sorted order, that is, *d*(*idxq*(*i* = 1, *n*)) will be in ascending order.

perm
INTEGER.
Array, dimension (*n*). The permutations (from deflation and sorting) to be applied to each block. Not referenced if *icompq* = 0.

givptr
INTEGER. The number of Givens rotations which took place in this subproblem. Not referenced if *icompq* = 0.

givcol
INTEGER.

	Array, dimension (*ldgcol*, 2). Each pair of numbers indicates a pair of columns to take place in a Givens rotation. Not referenced if *icompq* = 0.
givnum	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*ldgnum*, 2). Each number indicates the *C* or *S* value to be used in the corresponding Givens rotation. Not referenced if *icompq* = 0.
poles	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*ldgnum*, 2). On exit, *poles*(1,*) is an array containing the new singular values obtained from solving the secular equation, and *poles*(2,*) is an array containing the poles in the secular equation. Not referenced if *icompq* = 0.
difl	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*n*). On exit, *difl*(*i*) is the distance between *i*-th updated (undeflated) singular value and the *i*-th (undeflated) old singular value.
difr	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*ldgnum*, 2) if *icompq* = 1 and dimension (*n*) if *icompq* = 0. On exit, *difr*(*i*, 1) is the distance between *i*-th updated (undeflated) singular value and the *i*+1-th (undeflated) old singular value. If *icompq* = 1, *difr*(1: *k*, 2) is an array containing the normalizing factors for the right singular vector matrix. See ?lasd8 for details on *difl* and *difr*.
z	REAL for slasd6 DOUBLE PRECISION for dlasd6 Array, dimension (*m*). The first elements of this array contain the components of the deflation-adjusted updating row vector.
k	INTEGER. Contains the dimension of the non-deflated matrix. This is the order of the related secular equation. $1 \le k \le n$.
c	REAL for slasd6 DOUBLE PRECISION for dlasd6 *c* contains garbage if *sqre* =0 and the *C*-value of a Givens rotation related to the right null space if *sqre* = 1.
s	REAL for slasd6 DOUBLE PRECISION for dlasd6 *s* contains garbage if *sqre* =0 and the *S*-value of a Givens rotation related to the right null space if *sqre* = 1.
info	INTEGER.

= 0: successful exit.
< 0: if *info* = -*i*, the *i*-th argument had an illegal value.
> 0: if *info* = 1, an singular value did not converge

?lasd7

Merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. Used by ?bdsdc.

Syntax

call slasd7(*icompq*, *nl*, *nr*, *sqre*, *k*, *d*, *z*, *zw*, *vf*, *vfw*, *vl*, *vlw*, *alpha*, *beta*, *dsigma*, *idx*, *idxp*, *idxq*, *perm*, *givptr*, *givcol*, *ldgcol*, *givnum*, *ldgnum*, *c*, *s*, *info*)

call dlasd7(*icompq*, *nl*, *nr*, *sqre*, *k*, *d*, *z*, *zw*, *vf*, *vfw*, *vl*, *vlw*, *alpha*, *beta*, *dsigma*, *idx*, *idxp*, *idxq*, *perm*, *givptr*, *givcol*, *ldgcol*, *givnum*, *ldgnum*, *c*, *s*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasd7 merges the two sets of singular values together into a single sorted set. Then it tries to deflate the size of the problem. There are two ways in which deflation can occur: when two or more singular values are close together or if there is a tiny entry in the *Z* vector. For each such occurrence the order of the related secular equation problem is reduced by one. ?lasd7 is called from ?lasd6.

Input Parameters

icompq — INTEGER. Specifies whether singular vectors are to be computed in compact form, as follows:
= 0: Compute singular values only.
= 1: Compute singular vectors of upper bidiagonal matrix in compact form.

nl — INTEGER. The row dimension of the upper block.
nl ≥ 1.

nr — INTEGER. The row dimension of the lower block.
nr ≥ 1.

sqre — INTEGER.
= 0: the lower block is an *nr*-by-*nr* square matrix.
= 1: the lower block is an *nr*-by-(*nr*+1) rectangular matrix. The bidiagonal matrix has *n* = *nl* + *nr* + 1 rows and *m* = *n* + *sqre* ≥ *n* columns.

d — REAL for slasd7
DOUBLE PRECISION for dlasd7
Array, DIMENSION (*n*). On entry *d* contains the singular values of the two submatrices to be combined.

zw — REAL for slasd7

	DOUBLE PRECISION for dlasd7 Array, DIMENSION (*m*). Workspace for z.
vf	REAL for slasd7 DOUBLE PRECISION for dlasd7 Array, DIMENSION (*m*). On entry, *vf*(1:*nl*+1) contains the first components of all right singular vectors of the upper block; and *vf*(*nl*+2:*m*) contains the first components of all right singular vectors of the lower block.
vfw	REAL for slasd7 DOUBLE PRECISION for dlasd7 Array, DIMENSION (*m*). Workspace for vf.
vl	REAL for slasd7 DOUBLE PRECISION for dlasd7 Array, DIMENSION (*m*). On entry, *vl*(1:*nl*+1) contains the last components of all right singular vectors of the upper block; and *vl*(*nl*+2:*m*) contains the last components of all right singular vectors of the lower block.
VLW	REAL for slasd7 DOUBLE PRECISION for dlasd7 Array, DIMENSION (*m*). Workspace for VL.
alpha	REAL for slasd7 DOUBLE PRECISION for dlasd7. Contains the diagonal element associated with the added row.
beta	REAL for slasd7 DOUBLE PRECISION for dlasd7 Contains the off-diagonal element associated with the added row.
idx	INTEGER. Workspace array, DIMENSION (*n*). This will contain the permutation used to sort the contents of *d* into ascending order.
idxp	INTEGER. Workspace array, DIMENSION (*n*). This will contain the permutation used to place deflated values of *d* at the end of the array.
idxq	INTEGER. Array, DIMENSION (*n*). This contains the permutation which separately sorts the two sub-problems in *d* into ascending order. Note that entries in the first half of this permutation must first be moved one position backward; and entries in the second half must first have *nl*+1 added to their values.
ldgcol	INTEGER.The leading dimension of the output array *givcol*, must be at least *n*.

ldgnum INTEGER. The leading dimension of the output array *givnum*, must be at least *n*.

Output Parameters

k INTEGER. Contains the dimension of the non-deflated matrix, this is the order of the related secular equation.

$1 \leq k \leq n$.

d On exit, *d* contains the trailing (*n*-*k*) updated singular values (those which were deflated) sorted into increasing order.

z REAL for slasd7
DOUBLE PRECISION for dlasd7.
Array, DIMENSION (*m*).
On exit, *Z* contains the updating row vector in the secular equation.

vf On exit, *vf* contains the first components of all right singular vectors of the bidiagonal matrix.

vl On exit, *vl* contains the last components of all right singular vectors of the bidiagonal matrix.

dsigma REAL for slasd7
DOUBLE PRECISION for dlasd7.
Array, DIMENSION (*n*). Contains a copy of the diagonal elements (*k*-1 singular values and one zero) in the secular equation.

idxp On output, *idxp*(2: *k*) points to the nondeflated *d*-values and *idxp*(*k*+1:*n*) points to the deflated singular values.

perm INTEGER.
Array, DIMENSION (*n*).
The permutations (from deflation and sorting) to be applied to each singular block. Not referenced if *icompq* = 0.

givptr INTEGER.
The number of Givens rotations which took place in this subproblem. Not referenced if *icompq* = 0.

givcol INTEGER.
Array, DIMENSION (*ldgcol*, 2). Each pair of numbers indicates a pair of columns to take place in a Givens rotation. Not referenced if *icompq* = 0.

givnum REAL for slasd7
DOUBLE PRECISION for dlasd7.
Array, DIMENSION (*ldgnum*, 2). Each number indicates the *C* or *S* value to be used in the corresponding Givens rotation. Not referenced if *icompq* = 0.

c REAL for slasd7.
DOUBLE PRECISION for dlasd7.
If *sqre* =0, then *c* contains garbage, and if *sqre* = 1, then *c* contains *C*-value of a Givens rotation related to the right null space.

S REAL for slasd7.

	DOUBLE PRECISION for dlasd7. If *sqre* =0, then *s* contains garbage, and if *sqre* = 1, then *s* contains *S*-value of a Givens rotation related to the right null space.
info	INTEGER. = 0: successful exit. < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?lasd8

Finds the square roots of the roots of the secular equation, and stores, for each element in D*, the distance to its two nearest poles. Used by* ?bdsdc.

Syntax

```
call slasd8( icompq, k, d, z, vf, vl, difl, difr, lddifr, dsigma, work, info )
call dlasd8( icompq, k, d, z, vf, vl, difl, difr, lddifr, dsigma, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasd8 finds the square roots of the roots of the secular equation, as defined by the values in *dsigma* and *z*. It makes the appropriate calls to ?lasd4, and stores, for each element in *d*, the distance to its two nearest poles (elements in *dsigma*). It also updates the arrays *vf* and *vl*, the first and last components of all the right singular vectors of the original bidiagonal matrix. ?lasd8 is called from ?lasd6.

Input Parameters

icompq	INTEGER. Specifies whether singular vectors are to be computed in factored form in the calling routine: = 0: Compute singular values only. = 1: Compute singular vectors in factored form as well.
k	INTEGER. The number of terms in the rational function to be solved by ?lasd4. *k* ≥ 1.
z	REAL for slasd8 DOUBLE PRECISION for dlasd8. Array, DIMENSION (*k*). The first *k* elements of this array contain the components of the deflation-adjusted updating row vector.
vf	REAL for slasd8 DOUBLE PRECISION for dlasd8. Array, DIMENSION (*k*). On entry, *vf* contains information passed through dbede8.
vl	REAL for slasd8 DOUBLE PRECISION for dlasd8. Array, DIMENSION (*k*). On entry, *vl* contains information passed through dbede8.

lddifr INTEGER. The leading dimension of the output array *difr*, must be at least *k*.

dsigma REAL for slasd8
DOUBLE PRECISION for dlasd8.
Array, DIMENSION (*k*).
The first *k* elements of this array contain the old roots of the deflated updating problem. These are the poles of the secular equation.

work REAL for slasd8
DOUBLE PRECISION for dlasd8.
Workspace array, DIMENSION at least (3*k*).

Output Parameters

d REAL for slasd8
DOUBLE PRECISION for dlasd8.
Array, DIMENSION (*k*).
On output, *D* contains the updated singular values.

z Updated on exit.

vf On exit, *vf* contains the first *k* components of the first components of all right singular vectors of the bidiagonal matrix.

vl On exit, *vl* contains the first *k* components of the last components of all right singular vectors of the bidiagonal matrix.

difl REAL for slasd8
DOUBLE PRECISION for dlasd8.
Array, DIMENSION (*k*). On exit, *difl*(*i*) = *d*(*i*) - *dsigma*(*i*).

difr REAL for slasd8
DOUBLE PRECISION for dlasd8.
Array,
DIMENSION (*lddifr*, 2) if *icompq* = 1 and
DIMENSION (*k*) if *icompq* = 0.
On exit, *difr*(i,1) = *d*(*i*) - *dsigma*(i+1), *difr*(*k*,1) is not defined and will not be referenced. If *icompq* = 1, *difr*(1:*k*,2) is an array containing the normalizing factors for the right singular vector matrix.

dsigma The elements of this array may be very slightly altered in value.

info INTEGER.
= 0: successful exit.
< 0: if *info* = -*i*, the *i*-th argument had an illegal value.
> 0: If *info* = 1, an singular value did not converge.

?lasd9

Finds the square roots of the roots of the secular equation, and stores, for each element in D, the distance to its two nearest poles. Used by ?bdsdc.

Syntax

```
call slasd9( icompq, ldu, k, d, z, vf, vl, difl, difr, dsigma, work, info )
call dlasd9( icompq, ldu, k, d, z, vf, vl, difl, difr, dsigma, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasd9 finds the square roots of the roots of the secular equation, as defined by the values in *dsigma* and *z*. It makes the appropriate calls to ?lasd4, and stores, for each element in *d*, the distance to its two nearest poles (elements in *dsigma*). It also updates the arrays *vf* and *vl*, the first and last components of all the right singular vectors of the original bidiagonal matrix. ?lasd9 is called from ?lasd7.

Input Parameters

icompq	INTEGER. Specifies whether singular vectors are to be computed in factored form in the calling routine: If *icompq* = 0, compute singular values only; If *icompq* = 1, compute singular vector matrices in factored form also.
k	INTEGER. The number of terms in the rational function to be solved by slasd4. *k* ≥ 1.
dsigma	REAL for slasd9 DOUBLE PRECISION for dlasd9. Array, DIMENSION(*k*). The first *k* elements of this array contain the old roots of the deflated updating problem. These are the poles of the secular equation.
z	REAL for slasd9 DOUBLE PRECISION for dlasd9. Array, DIMENSION (*k*). The first *k* elements of this array contain the components of the deflation-adjusted updating row vector.
vf	REAL for slasd9 DOUBLE PRECISION for dlasd9. Array, DIMENSION(*k*). On entry, *vf* contains information passed through sbede8.
vl	REAL for slasd9 DOUBLE PRECISION for dlasd9. Array, DIMENSION(*k*). On entry, *vl* contains information passed through sbede8.
work	REAL for slasd9 DOUBLE PRECISION for dlasd9. Workspace array, DIMENSION at least (3*k*).

Output Parameters

d	REAL for slasd9 DOUBLE PRECISION for dlasd9. Array, DIMENSION(*k*). *d*(*i*) contains the updated singular values.
vf	On exit, *vf* contains the first *k* components of the first components of all right singular vectors of the bidiagonal matrix.
vl	On exit, *vl* contains the first *k* components of the last components of all right singular vectors of the bidiagonal matrix.
difl	REAL for slasd9 DOUBLE PRECISION for dlasd9. Array, DIMENSION (*k*). On exit, *difl*(*i*) = *d*(*i*) - *dsigma*(*i*).
difr	REAL for slasd9 DOUBLE PRECISION for dlasd9. Array, DIMENSION (*ldu*, 2) if *icompq* =1 and DIMENSION (*k*) if *icompq* = 0. On exit, *difr*(*i*, 1) = *d*(*i*) - *dsigma*(*i*+1), *difr*(*k*, 1) is not defined and will not be referenced. If *icompq* = 1, *difr*(1:*k*, 2) is an array containing the normalizing factors for the right singular vector matrix.
info	INTEGER. = 0: successful exit. < 0: if *info* = -*i*, the *i*-th argument had an illegal value. > 0: If *info* = 1, an singular value did not converge

?lasda

Computes the singular value decomposition (SVD) of a real upper bidiagonal matrix with diagonal d and off-diagonal e. Used by ?bdsdc.

Syntax

call slasda(*icompq*, *smlsiz*, *n*, *sqre*, *d*, *e*, *u*, *ldu*, *vt*, *k*, *difl*, *difr*, *z*, *poles*, *givptr*, *givcol*, *ldgcol*, *perm*, *givnum*, *c*, *s*, *work*, *iwork*, *info*)

call dlasda(*icompq*, *smlsiz*, *n*, *sqre*, *d*, *e*, *u*, *ldu*, *vt*, *k*, *difl*, *difr*, *z*, *poles*, *givptr*, *givcol*, *ldgcol*, *perm*, *givnum*, *c*, *s*, *work*, *iwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

Using a divide and conquer approach, ?lasda computes the singular value decomposition (*SVD*) of a real upper bidiagonal *n*-by-*m* matrix *B* with diagonal *d* and off-diagonal *e*, where *m* = *n* + *sqre*.

The algorithm computes the singular values in the *SVD B = U*S*VT*. The orthogonal matrices *U* and *VT* are optionally computed in compact form. A related subroutine ?lasd0 computes the singular values and the singular vectors in explicit form.

Input Parameters

icompq	INTEGER. Specifies whether singular vectors are to be computed in compact form, as follows: = 0: Compute singular values only. = 1: Compute singular vectors of upper bidiagonal matrix in compact form.
smlsiz	INTEGER. The maximum size of the subproblems at the bottom of the computation tree.
n	INTEGER. The row dimension of the upper bidiagonal matrix. This is also the dimension of the main diagonal array *d*.
sqre	INTEGER. Specifies the column dimension of the bidiagonal matrix. If *sqre* = 0: the bidiagonal matrix has column dimension *m* = *n* If *sqre* = 1: the bidiagonal matrix has column dimension *m* = *n* + 1.
d	REAL for slasda DOUBLE PRECISION for dlasda. Array, DIMENSION (*n*). On entry, *d* contains the main diagonal of the bidiagonal matrix.
e	REAL for slasda DOUBLE PRECISION for dlasda. Array, DIMENSION (*m* - 1). Contains the subdiagonal entries of the bidiagonal matrix. On exit, *e* is destroyed.
ldu	INTEGER. The leading dimension of arrays *u*, *vt*, *difl*, *difr*, *poles*, *givnum*, and *z*. *ldu* ≥ *n*.
ldgcol	INTEGER. The leading dimension of arrays *givcol* and *perm*. *ldgcol* ≥ *n*.
work	REAL for slasda DOUBLE PRECISION for dlasda. Workspace array, DIMENSION ($6n+(smlsiz+1)^2$).
iwork	INTEGER. Workspace array, *Dimension* must be at least (7*n*).

Output Parameters

d	On exit *d*, if *info* = 0, contains the singular values of the bidiagonal matrix.
u	REAL for slasda DOUBLE PRECISION for dlasda. Array, DIMENSION (*ldu*, *smlsiz*) if *icompq* =1.

Not referenced if *icompq* = 0.
If *icompq* = 1, on exit, *u* contains the left singular vector matrices of all subproblems at the bottom level.

vt — REAL for slasda
DOUBLE PRECISION for dlasda.
Array, DIMENSION (*ldu*, *smlsiz*+1) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, *vt*' contains the right singular vector matrices of all subproblems at the bottom level.

k — INTEGER.
Array, DIMENSION (*n*) if *icompq* = 1 and
DIMENSION (1) if *icompq* = 0.
If *icompq* = 1, on exit, *k*(*i*) is the dimension of the *i*-th secular equation on the computation tree.

difl — REAL for slasda
DOUBLE PRECISION for dlasda.
Array, DIMENSION (*ldu*, *nlvl*),
where *nlvl* = floor($\log_2(n/smlsiz)$).

difr — REAL for slasda
DOUBLE PRECISION for dlasda.
Array,
DIMENSION (*ldu*, 2 *nlvl*) if *icompq* = 1 and
DIMENSION (*n*) if *icompq* = 0.
If *icompq* = 1, on exit, *difl*(1:*n*, *i*) and *difr*(1:*n*,2*i* -1) record distances between singular values on the *i*-th level and singular values on the (*i* -1)-th level, and *difr*(1:*n*, 2i) contains the normalizing factors for the right singular vector matrix. See ?lasd8 for details.

z — REAL for slasda
DOUBLE PRECISION for dlasda.
Array,
DIMENSION (*ldu*, *nlvl*) if *icompq* = 1 and
DIMENSION (*n*) if *icompq* = 0. The first *k* elements of *z*(1, *i*) contain the components of the deflation-adjusted updating row vector for subproblems on the *i*-th level.

poles — REAL for slasda
DOUBLE PRECISION for dlasda
Array, DIMENSION (*ldu*, 2**nlvl*)
if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, *poles*(1, 2*i* - 1) and *poles*(1, 2*i*) contain the new and old singular values involved in the secular equations on the *i*-th level.

givptr — INTEGER. Array, DIMENSION (*n*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, *givptr*(*i*) records the number of Givens rotations performed on the *i*-th problem on the computation tree.

givcol — INTEGER .

	Array, DIMENSION (*ldgcol*, 2**nlvl*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, for each *i*, *givcol*(1, 2 *i* - 1) and *givcol*(1, 2 *i*) record the locations of Givens rotations performed on the *i*-th level on the computation tree.
perm	INTEGER . Array, DIMENSION (*ldgcol*, *nlvl*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, *perm* (1, *i*) records permutations done on the *i*-th level of the computation tree.
givnum	REAL for slasda DOUBLE PRECISION for dlasda. Array DIMENSION (*ldu*, 2**nlvl*) if *icompq* = 1, and not referenced if *icompq* = 0. If *icompq* = 1, on exit, for each *i*, *givnum*(1, 2 *i* - 1) and *givnum*(1, 2 *i*) record the *C*- and *S*-values of Givens rotations performed on the *i*-th level on the computation tree.
c	REAL for slasda DOUBLE PRECISION for dlasda. Array, DIMENSION (*n*) if *icompq* = 1, and DIMENSION (1) if *icompq* = 0. If *icompq* = 1 and the *i*-th subproblem is not square, on exit, *c*(*i*) contains the *C*-value of a Givens rotation related to the right null space of the *i*-th subproblem.
s	REAL for slasda DOUBLE PRECISION for dlasda. Array, DIMENSION (*n*) *icompq* = 1, and DIMENSION (1) if *icompq* = 0. If *icompq* = 1 and the *i*-th subproblem is not square, on exit, *s*(*i*) contains the *S*-value of a Givens rotation related to the right null space of the *i*-th subproblem.
info	INTEGER. = 0: successful exit. < 0: if *info* = -*i*, the *i*-th argument had an illegal value > 0: If *info* = 1, an singular value did not converge

?lasdq

Computes the SVD of a real bidiagonal matrix with diagonal d and off-diagonal e. Used by ?bdsdc.

Syntax

```
call slasdq( uplo, sqre, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info
)
```

```
call dlasdq( uplo, sqre, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info
)
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?lasdq` computes the singular value decomposition (*SVD*) of a real (upper or lower) bidiagonal matrix with diagonal *d* and off-diagonal *e*, accumulating the transformations if desired. If *B* is the input bidiagonal matrix, the algorithm computes orthogonal matrices *Q* and *P* such that $B = Q*S*P^T$. The singular values *S* are overwritten on *d*.

The input matrix *U* is changed to *U*Q* if desired.

The input matrix *VT* is changed to P^T*VT if desired.

The input matrix *C* is changed to Q^T*C if desired.

Input Parameters

uplo — `CHARACTER*1`. On entry, *uplo* specifies whether the input bidiagonal matrix is upper or lower bidiagonal.
If *uplo* = `'U'` or `'u'`, *B* is upper bidiagonal;
If *uplo* = `'L'` or `'l'`, *B* is lower bidiagonal.

sqre — `INTEGER`.
= 0: then the input matrix is *n*-by-*n*.
= 1: then the input matrix is *n*-by-(*n*+1) if *uplu* = `'U'` and (*n*+1)-by-*n* if *uplu*
= `'L'`. The bidiagonal matrix has $n = nl + nr + 1$ rows and $m = n + sqre \geq n$ columns.

n — `INTEGER`. On entry, *n* specifies the number of rows and columns in the matrix. *n* must be at least 0.

ncvt — `INTEGER`. On entry, *ncvt* specifies the number of columns of the matrix *VT*. *ncvt* must be at least 0.

nru — `INTEGER`. On entry, *nru* specifies the number of rows of the matrix *U*. *nru* must be at least 0.

ncc — `INTEGER`. On entry, *ncc* specifies the number of columns of the matrix *C*. *ncc* must be at least 0.

d — `REAL` for *slasdq*
`DOUBLE PRECISION` for *dlasdq*.
Array, `DIMENSION` (*n*). On entry, *d* contains the diagonal entries of the bidiagonal matrix.

e — `REAL` for *slasdq*
`DOUBLE PRECISION` for *dlasdq*.
Array, `DIMENSION` is (*n*-1) if *sqre* = 0 and *n* if *sqre* = 1. On entry, the entries of *e* contain the off-diagonal entries of the bidiagonal matrix.

vt — `REAL` for `slasdq`
`DOUBLE PRECISION` for `dlasdq`.
Array, `DIMENSION` (*ldvt*, *ncvt*). On entry, contains a matrix which on exit has been premultiplied by P^T, dimension *n*-by-*ncvt* if *sqre* = 0 and (*n*+1)-by-*ncvt* if *sqre* = 1 (not referenced if *ncvt*=0).

ldvt	INTEGER. On entry, *ldvt* specifies the leading dimension of *vt* as declared in the calling (sub) program. *ldvt* must be at least 1. If *ncvt* is nonzero, *ldvt* must also be at least *n*.
u	REAL for *slasdq* DOUBLE PRECISION for *dlasdq*. Array, DIMENSION (*ldu*, *n*). On entry, contains a matrix which on exit has been postmultiplied by *Q*, dimension *nru*-by-*n* if *sqre* = 0 and *nru*-by-(*n*+1) if *sqre* = 1 (not referenced if *nru*=0).
ldu	INTEGER. On entry, *ldu* specifies the leading dimension of *u* as declared in the calling (sub) program. *ldu* must be at least max(1, *nru*) .
c	REAL for *slasdq* DOUBLE PRECISION for *dlasdq*. Array, DIMENSION (*ldc*, *ncc*). On entry, contains an *n*-by-*ncc* matrix which on exit has been premultiplied by *Q'*, dimension *n*-by-*ncc* if *sqre* = 0 and (*n*+1)-by-*ncc* if *sqre* = 1 (not referenced if *ncc*=0).
ldc	INTEGER. On entry, *ldc* specifies the leading dimension of *C* as declared in the calling (sub) program. *ldc* must be at least 1. If *ncc* is non-zero, *ldc* must also be at least *n*.
work	REAL for slasdq DOUBLE PRECISION for dlasdq. Array, DIMENSION (4*n*). This is a workspace array. Only referenced if one of *ncvt*, *nru*, or *ncc* is nonzero, and if *n* is at least 2.

Output Parameters

d	On normal exit, *d* contains the singular values in ascending order.
e	On normal exit, *e* will contain 0. If the algorithm does not converge, *d* and *e* will contain the diagonal and superdiagonal entries of a bidiagonal matrix orthogonally equivalent to the one given as input.
vt	On exit, the matrix has been premultiplied by *P*'.
u	On exit, the matrix has been postmultiplied by *Q*.
c	On exit, the matrix has been premultiplied by *Q*'.
info	INTEGER. On exit, a value of 0 indicates a successful exit. If *info* < 0, argument number -*info* is illegal. If *info* > 0, the algorithm did not converge, and *info* specifies how many superdiagonals did not converge.

?lasdt

Creates a tree of subproblems for bidiagonal divide and conquer. Used by ?bdsdc.

Syntax

```
call slasdt( n, lvl, nd, inode, ndiml, ndimr, msub )
call dlasdt( n, lvl, nd, inode, ndiml, ndimr, msub )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine creates a tree of subproblems for bidiagonal divide and conquer.

Input Parameters

n	INTEGER. On entry, the number of diagonal elements of the bidiagonal matrix.
msub	INTEGER. On entry, the maximum row dimension each subproblem at the bottom of the tree can be of.

Output Parameters

lvl	INTEGER. On exit, the number of levels on the computation tree.
nd	INTEGER. On exit, the number of nodes on the tree.
inode	INTEGER. Array, DIMENSION (*n*). On exit, centers of subproblems.
ndiml	INTEGER . Array, DIMENSION (*n*). On exit, row dimensions of left children.
ndimr	INTEGER . Array, DIMENSION (*n*). On exit, row dimensions of right children.

?laset

Initializes the off-diagonal elements and the diagonal elements of a matrix to given values.

Syntax

```
call slaset( uplo, m, n, alpha, beta, a, lda )
call dlaset( uplo, m, n, alpha, beta, a, lda )
call claset( uplo, m, n, alpha, beta, a, lda )
call zlaset( uplo, m, n, alpha, beta, a, lda )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine initializes an *m*-by-*n* matrix *A* to *beta* on the diagonal and *alpha* on the off-diagonals.

Input Parameters

uplo	CHARACTER*1. Specifies the part of the matrix *A* to be set. If *uplo* = 'U', upper triangular part is set; the strictly lower triangular part of *A* is not changed. If *uplo* = 'L': lower triangular part is set; the strictly upper triangular part of *A* is not changed.

	Otherwise: All of the matrix *A* is set.
m	INTEGER. The number of rows of the matrix *A*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*. *n* ≥ 0.
alpha, *beta*	REAL for slaset DOUBLE PRECISION for dlaset COMPLEX for claset COMPLEX*16 for zlaset. The constants to which the off-diagonal and diagonal elements are to be set, respectively.
a	REAL for slaset DOUBLE PRECISION for dlaset COMPLEX for claset COMPLEX*16 for zlaset. Array, DIMENSION (*lda*, *n*). On entry, the *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*m*).

Output Parameters

a	On exit, the leading *m*-by-*n* submatrix of *A* is set as follows: if *uplo* = 'U', *A*(*i*,*j*) = *alpha*, 1≤*i*≤*j*-1, 1≤*j*≤*n*, if *uplo* = 'L', *A*(*i*,*j*) = *alpha*, *j*+1≤*i*≤*m*, 1≤*j*≤*n*, otherwise, *A*(*i*,*j*) = *alpha*, 1≤*i*≤*m*, 1≤*j*≤*n*, *i* ≠ *j*, and, for all *uplo*, *A*(*i*,*i*) = *beta*, 1≤*i*≤min(*m*, *n*).

?lasq1

Computes the singular values of a real square bidiagonal matrix. Used by ?bdsqr.

Syntax

```
call slasq1( n, d, e, work, info )
call dlasq1( n, d, e, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasq1 computes the singular values of a real *n*-by-*n* bidiagonal matrix with diagonal *d* and off-diagonal *e*. The singular values are computed to high relative accuracy, in the absence of denormalization, underflow and overflow.

Input Parameters

n	INTEGER.The number of rows and columns in the matrix. $n \geq 0$.
d	REAL for slasq1 DOUBLE PRECISION for dlasq1. Array, DIMENSION (*n*). On entry, *d* contains the diagonal elements of the bidiagonal matrix whose *SVD* is desired.
e	REAL for slasq1 DOUBLE PRECISION for dlasq1. Array, DIMENSION (*n*). On entry, elements *e*(1:*n*-1) contain the off-diagonal elements of the bidiagonal matrix whose *SVD* is desired.
work	REAL for slasq1 DOUBLE PRECISION for dlasq1. Workspace array, DIMENSION (4*n*).

Output Parameters

d	On normal exit, *d* contains the singular values in decreasing order.
e	On exit, *e* is overwritten.
info	INTEGER. = 0: successful exit; < 0: if *info* = -*i*, the *i*-th argument had an illegal value; > 0: the algorithm failed: = 1, a split was marked by a positive value in *e*; = 2, current block of *z* not diagonalized after 30*n* iterations (in inner while loop); = 3, termination criterion of outer while loop not met (program created more than *n* unreduced blocks.

?lasq2

Computes all the eigenvalues of the symmetric positive definite tridiagonal matrix associated with the qd array z to high relative accuracy. Used by ?bdsqr *and* ?stegr.

Syntax

```
call slasq2( n, z, info )
call dlasq2( n, z, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasq2 computes all the eigenvalues of the symmetric positive definite tridiagonal matrix associated with the *qd* array *z* to high relative accuracy, in the absence of denormalization, underflow and overflow.

To see the relation of *z* to the tridiagonal matrix, let *L* be a unit lower bidiagonal matrix with subdiagonals *z*(2,4,6,,..) and let *U* be an upper bidiagonal matrix with 1's above and diagonal *z*(1,3,5,,..). The tridiagonal is *LU* or, if you prefer, the symmetric tridiagonal to which it is similar.

Input Parameters

n	INTEGER. The number of rows and columns in the matrix. $n \geq 0$.
z	REAL for slasq2 DOUBLE PRECISION for dlasq2. Array, DIMENSION (4 * *n*). On entry, *z* holds the *qd* array.

Output Parameters

z	On exit, entries 1 to *n* hold the eigenvalues in decreasing order, *z*(2*n*+1) holds the trace, and *z*(2*n*+2) holds the sum of the eigenvalues. If $n > 2$, then *z*(2*n*+3) holds the iteration count, *z*(2*n*+4) holds ndivs/nin^2, and *z*(2*n*+5) holds the percentage of shifts that failed.
info	INTEGER. = 0: successful exit; < 0: if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*, if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+ *j*); > 0: the algorithm failed: = 1, a split was marked by a positive value in *e*; = 2, current block of *z* not diagonalized after 30**n* iterations (in inner while loop); = 3, termination criterion of outer while loop not met (program created more than *n* unreduced blocks).

Application Notes

The routine ?lasq2 defines a logical variable, *ieee*, which is .TRUE. on machines which follow ieee-754 floating-point standard in their handling of infinities and NaNs, and .FALSE. otherwise. This variable is passed to ?lasq3.

?lasq3

Checks for deflation, computes a shift and calls dqds.
Used by ?bdsqr.

Syntax

call slasq3(*i0*, *n0*, *z*, *pp*, *dmin*, *sigma*, *desig*, *qmax*, *nfail*, *iter*, *ndiv*, *ieee*, *ttype*, *dmin1*, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*)

call dlasq3(*i0*, *n0*, *z*, *pp*, *dmin*, *sigma*, *desig*, *qmax*, *nfail*, *iter*, *ndiv*, *ieee*, *ttype*, *dmin1*, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*)

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?lasq3` checks for deflation, computes a shift *tau*, and calls *dqds*. In case of failure, it changes shifts, and tries again until output is positive.

Input Parameters

i0	`INTEGER`. First index.
n0	`INTEGER`. Last index.
z	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. Array, `DIMENSION` (4*n*). *z* holds the *qd* array.
pp	`INTEGER`. *pp*=0 for ping, *pp*=1 for pong. *pp*=2 indicates that flipping was applied to the *Z* array and that the initial tests for deflation should not be performed.
desig	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. Lower order part of *sigma*.
qmax	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. Maximum value of *q*.
ieee	`LOGICAL`. Flag for `ieee` or non-`ieee` arithmetic (passed to `?lasq5`).
ttype	`INTEGER`. Shift type.
dmin1, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. These scalars are passed as arguments in order to save their values between calls to `?lasq3`.

Output Parameters

dmin	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. Minimum value of *d*.
pp	`INTEGER`. *pp*=0 for ping, *pp*=1 for pong. *pp*=2 indicates that flipping was applied to the *Z* array and that the initial tests for deflation should not be performed.
sigma	`REAL` for `slasq3` `DOUBLE PRECISION` for `dlasq3`. Sum of shifts used in the current segment.
desig	Lower order part of *sigma*.
nfail	`INTEGER`. Number of times shift was too big.
iter	`INTEGER`. Number of iterations.

ndiv	INTEGER. Number of divisions.
ttype	INTEGER. Shift type.
dmin1, *dmin2*, *dn*, *dn1*, *dn2*, *g*, *tau*	REAL for slasq3 DOUBLE PRECISION for dlasq3. These scalars are passed as arguments in order to save their values between calls to ?lasq3.

?lasq4

Computes an approximation to the smallest eigenvalue using values of d from the previous transform. Used by ?bdsqr.

Syntax

```
call slasq4( i0, n0, z, pp, n0in, dmin, dmin1, dmin2, dn, dn1, dn2, tau, ttype, g )
call dlasq4( i0, n0, z, pp, n0in, dmin, dmin1, dmin2, dn, dn1, dn2, tau, ttype, g )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes an approximation *tau* to the smallest eigenvalue using values of d from the previous transform.

Input Parameters

i0	INTEGER. First index.
n0	INTEGER. Last index.
z	REAL for slasq4 DOUBLE PRECISION for dlasq4. Array, DIMENSION (4*n*). *z* holds the *qd* array.
pp	INTEGER. *pp*=0 for ping, *pp*=1 for pong.
n0in	INTEGER. The value of *n0* at start of eigtest.
dmin	REAL for slasq4 DOUBLE PRECISION for dlasq4. Minimum value of *d*.
dmin1	REAL for slasq4 DOUBLE PRECISION for dlasq4. Minimum value of *d*, excluding *d*(*n0*).
dmin2	REAL for slasq4 DOUBLE PRECISION for dlasq4. Minimum value of *d*, excluding *d*(*n0*) and *d*(*n0*-1).
dn	REAL for slasq4 DOUBLE PRECISION for dlasq4. Contains *d*(*n*).

dn1 REAL for slasq4
DOUBLE PRECISION for dlasq4. Contains $d(n-1)$.

dn2 REAL for slasq4
DOUBLE PRECISION for dlasq4. Contains $d(n-2)$.

g REAL for slasq4
DOUBLE PRECISION for dlasq4.
A scalar passed as an argument in order to save its value between calls to ?lasq4.

Output Parameters

tau REAL for slasq4
DOUBLE PRECISION for dlasq4.
Shift.

ttype INTEGER. Shift type.

g REAL for slasq4
DOUBLE PRECISION for dlasq4.
A scalar passed as an argument in order to save its value between calls to ?lasq4.

?lasq5

Computes one dqds transform in ping-pong form. Used by ?bdsqr *and* ?stegr.

Syntax

```
call slasq5( i0, n0, z, pp, tau, dmin, dmin1, dmin2, dn, dnm1, dnm2, ieee )
call dlasq5( i0, n0, z, pp, tau, dmin, dmin1, dmin2, dn, dnm1, dnm2, ieee )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes one dqds transform in ping-pong form: one version for ieee machines, another for non-ieee machines.

Input Parameters

i0 INTEGER. First index.

n0 INTEGER. Last index.

z REAL for slasq5
DOUBLE PRECISION for dlasq5.
Array, DIMENSION ($4n$). *z* holds the qd array. *emin* is stored in *z*(4**n0*) to avoid an extra argument.

pp INTEGER. *pp*=0 for ping, *pp*=1 for pong.

tau REAL for slasq5
DOUBLE PRECISION for dlasq5.

	This is the shift.
ieee	LOGICAL. Flag for IEEE or non-IEEE arithmetic.

Output Parameters

dmin	REAL for slasq5 DOUBLE PRECISION for dlasq5. Minimum value of *d*.
dmin1	REAL for slasq5 DOUBLE PRECISION for dlasq5. Minimum value of *d*, excluding *d*(*n0*).
dmin2	REAL for slasq5 DOUBLE PRECISION for dlasq5. Minimum value of *d*, excluding *d*(*n0*) and *d*(*n0*-1).
dn	REAL for slasq5 DOUBLE PRECISION for dlasq5. Contains *d*(*n0*), the last value of *d*.
dnm1	REAL for slasq5 DOUBLE PRECISION for dlasq5. Contains *d*(*n0*-1).
dnm2	REAL for slasq5 DOUBLE PRECISION for dlasq5. Contains *d*(*n0*-2).

?lasq6

Computes one dqd transform in ping-pong form. Used by ?bdsqr *and* ?stegr.

Syntax

```
call slasq6( i0, n0, z, pp, dmin, dmin1, dmin2, dn, dnm1, dnm2 )
call dlasq6( i0, n0, z, pp, dmin, dmin1, dmin2, dn, dnm1, dnm2 )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasq6 computes one *dqd* (shift equal to zero) transform in ping-pong form, with protection against underflow and overflow.

Input Parameters

i0	INTEGER. First index.
n0	INTEGER. Last index.
z	REAL for slasq6 DOUBLE PRECISION for dlasq6. Array, DIMENSION (4*n*). *Z* holds the qd array. *emin* is stored in *z*(4**n0*) to avoid an extra argument.
pp	INTEGER. *pp*=0 for ping, *pp*=1 for pong.

Output Parameters

dmin	REAL for slasq6 DOUBLE PRECISION for dlasq6. Minimum value of *d*.
dmin1	REAL for slasq6 DOUBLE PRECISION for dlasq6. Minimum value of *d*, excluding *d*(*n0*).
dmin2	REAL for slasq6 DOUBLE PRECISION for dlasq6. Minimum value of *d*, excluding *d*(*n0*) and *d*(*n0*-1).
dn	REAL for slasq6 DOUBLE PRECISION for dlasq6. Contains *d*(*n0*), the last value of *d*.
dnm1	REAL for slasq6 DOUBLE PRECISION for dlasq6. Contains *d*(*n0*-1).
dnm2	REAL for slasq6 DOUBLE PRECISION for dlasq6. Contains *d*(*n0*-2).

?lasr

Applies a sequence of plane rotations to a general rectangular matrix.

Syntax

call slasr(*side*, *pivot*, *direct*, *m*, *n*, *c*, *s*, *a*, *lda*)

call dlasr(*side*, *pivot*, *direct*, *m*, *n*, *c*, *s*, *a*, *lda*)

call clasr(*side*, *pivot*, *direct*, *m*, *n*, *c*, *s*, *a*, *lda*)

call zlasr(*side*, *pivot*, *direct*, *m*, *n*, *c*, *s*, *a*, *lda*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine applies a sequence of plane rotations to a real/complex matrix *A*, from the left or the right.

A := *P***A*, when *side* = 'L' (Left-hand side)

A := *A***P*', when *side* = 'R' (Right-hand side)

where *P* is an orthogonal matrix consisting of a sequence of plane rotations with *z* = *m* when *side* = 'L' and *z* = *n* when *side* = 'R'.

When *direct* = 'F' (Forward sequence), then

P = *P*(*z*-1)*...*P*(2)**P*(1),

and when *direct* = 'B' (Backward sequence), then

P = *P*(1)**P*(2)*...**P*(*z*-1),

where *P*(*k*) is a plane rotation matrix defined by the 2-by-2 plane rotation:

$$R(k) = \begin{bmatrix} c(k) & s(k) \\ -s(k) & c(k) \end{bmatrix}$$

When *pivot* = 'V' (Variable pivot), the rotation is performed for the plane (k, k + 1), that is, $P(k)$ has the form

$$P(k) = \begin{bmatrix} 1 & & & & & & \\ & \cdots & & & & & \\ & & 1 & & & & \\ & & & c(k) & s(k) & & \\ & & & -s(k) & c(k) & & \\ & & & & & 1 & \\ & & & & & & \cdots \\ & & & & & & & 1 \end{bmatrix}$$

where $R(k)$ appears as a rank-2 modification to the identity matrix in rows and columns k and k+1.

When *pivot* = 'T' (Top pivot), the rotation is performed for the plane $(1, k+1)$, so $P(k)$ has the form

$$P(k) = \begin{bmatrix} c(k) & & & & s(k) & & \\ & 1 & & & & & \\ & & \cdots & & & & \\ & & & 1 & & & \\ -s(k) & & & & c(k) & & \\ & & & & & 1 & \\ & & & & & & \cdots \\ & & & & & & & 1 \end{bmatrix}$$

where $R(k)$ appears in rows and columns k and k+1.

Similarly, when *pivot* = 'B' (Bottom pivot), the rotation is performed for the plane (k, z), giving $P(k)$ the form

$$P(k) = \begin{bmatrix} 1 & & & & & & \\ & \ddots & & & & & \\ & & 1 & & & & \\ & & & c(k) & & s(k) & \\ & & & & 1 & & \\ & & & & & \ddots & \\ & & & & & & 1 \\ & & & -s(k) & & c(k) & \end{bmatrix}$$

where $R(k)$ appears in rows and columns k and z. The rotations are performed without ever forming $P(k)$ explicitly.

Input Parameters

side
CHARACTER*1. Specifies whether the plane rotation matrix P is applied to A on the left or the right.
= 'L': left, compute $A := P*A$
= 'R': right, compute $A := A*P'$

direct
CHARACTER*1. Specifies whether P is a forward or backward sequence of plane rotations.
= 'F': forward, $P = P(z-1)*...*P(2)*P(1)$
= 'B': backward, $P = P(1)*P(2)*...*P(z-1)$

pivot
CHARACTER*1. Specifies the plane for which $P(k)$ is a plane rotation matrix.
= 'V': Variable pivot, the plane $(k, k+1)$
= 'T': Top pivot, the plane $(1, k+1)$
= 'B': Bottom pivot, the plane (k, z)

m
INTEGER. The number of rows of the matrix A.
If $m \leq 1$, an immediate return is effected.

n
INTEGER. The number of columns of the matrix A.
If $n \leq 1$, an immediate return is effected.

c, *s*
REAL for slasr/clasr
DOUBLE PRECISION for dlasr/zlasr.
Arrays, DIMENSION
$(m-1)$ if *side* = 'L',
$(n-1)$ if *side* = 'R' .
$c(k)$ and $s(k)$ contain the cosine and sine of the plane rotations respectively that define the 2-by-2 plane rotation part ($R(k)$) of the $P(k)$ matrix as described above in *Description*.

a
REAL for slasr
DOUBLE PRECISION for dlasr
COMPLEX for clasr
COMPLEX*16 for zlasr.

	Array, DIMENSION (*lda*, *n*). The *m*-by-*n* matrix *A*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*m*).

Output Parameters

a	On exit, *A* is overwritten by *P*A* if *side* = 'R', or by *A*P*' if *side* = 'L'.

?lasrt

Sorts numbers in increasing or decreasing order.

Syntax

```
call slasrt( id, n, d, info )
call dlasrt( id, n, d, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasrt sorts the numbers in *d* in increasing order (if *id* = 'I') or in decreasing order (if *id* = 'D'). It uses Quick Sort, reverting to Insertion Sort on arrays of size ≤ 20. Dimension of stack limits *n* to about 2^{32}.

Input Parameters

id	CHARACTER*1. = 'I': sort *d* in increasing order; = 'D': sort *d* in decreasing order.
n	INTEGER. The length of the array *d*.
d	REAL for slasrt DOUBLE PRECISION for dlasrt. On entry, the array to be sorted.

Output Parameters

d	On exit, *d* has been sorted into increasing order (*d*(1) ≤ ... ≤ *d*(*n*)) or into decreasing order (*d*(1) ≥ ... ≥ *d*(*n*)), depending on *id*.
info	INTEGER. = 0: successful exit < 0: if *info* = -i, the *i*-th argument had an illegal value.

?lassq

Updates a sum of squares represented in scaled form.

Syntax

```
call slassq( n, x, incx, scale, sumsq )
call dlassq( n, x, incx, scale, sumsq )
call classq( n, x, incx, scale, sumsq )
call zlassq( n, x, incx, scale, sumsq )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The real routines `slassq`/`dlassq` return the values *scl* and *smsq* such that

$scl^2 * smsq = x(1)^2 + ... + x(n)^2 + scale^2 * sumsq$,

where $x(i) = x(1 + (i - 1) incx)$.

The value of *sumsq* is assumed to be non-negative and *scl* returns the value

$scl = \max(scale, \text{abs}(x(i)))$.

Values *scale* and *sumsq* must be supplied in *scale* and *sumsq*, and *scl* and *smsq* are overwritten on *scale* and *sumsq*, respectively.

The complex routines `classq`/`zlassq` return the values *scl* and *ssq* such that

$scl^2 * ssq = x(1)^2 + ... + x(n)^2 + scale^2 * sumsq$,

where $x(i) = \text{abs}(x(1 + (i - 1) * incx))$.

The value of *sumsq* is assumed to be at least unity and the value of *ssq* will then satisfy $1.0 \le ssq \le sumsq + 2n$

scale is assumed to be non-negative and *scl* returns the value

$scl = \max(scale, \text{abs}(\text{real}(x(i))), \text{abs}(\text{aimag}(x(i))))$.

Values *scale* and *sumsq* must be supplied in *scale* and *sumsq*, and *scl* and *ssq* are overwritten on *scale* and *sumsq*, respectively.

All routines `?lassq` make only one pass through the vector *x*.

Input Parameters

n	`INTEGER`. The number of elements to be used from the vector *x*.

x	`REAL` for `slassq`
	`DOUBLE PRECISION` for `dlassq`
	`COMPLEX` for `classq`
	`COMPLEX*16` for `zlassq`.
	The vector for which a scaled sum of squares is computed: $x(i) = x(1+(i-1)*incx), 1 \le i \le n$.

incx	INTEGER. The increment between successive values of the vector *x*. *incx* > 0.
scale	REAL for slassq/classq DOUBLE PRECISION for dlassq/zlassq. On entry, the value *scale* in the equation above.
sumsq	REAL for slassq/classq DOUBLE PRECISION for dlassq/zlassq. On entry, the value *sumsq* in the equation above.

Output Parameters

scale	On exit, *scale* is overwritten with *scl*, the scaling factor for the sum of squares.
sumsq	For real flavors: On exit, *sumsq* is overwritten with the value *smsq* in the equation above. For complex flavors: On exit, *sumsq* is overwritten with the value *ssq* in the equation above.

?lasv2

Computes the singular value decomposition of a 2-by-2 triangular matrix.

Syntax

```
call slasv2( f, g, h, ssmin, ssmax, snr, csr, snl, csl )
call dlasv2( f, g, h, ssmin, ssmax, snr, csr, snl, csl )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lasv2 computes the singular value decomposition of a 2-by-2 triangular matrix

$$\begin{bmatrix} f & g \\ 0 & h \end{bmatrix}$$

On return, abs(*ssmax*) is the larger singular value, abs(*ssmin*) is the smaller singular value, and (*csl*,*snl*) and (*csr*,*snr*) are the left and right singular vectors for abs(*ssmax*), giving the decomposition

$$\begin{bmatrix} csl & snl \\ -snl & csl \end{bmatrix} \begin{bmatrix} f & g \\ 0 & h \end{bmatrix} \begin{bmatrix} csr & -snr \\ snr & csr \end{bmatrix} = \begin{bmatrix} ssmax & 0 \\ 0 & ssmin \end{bmatrix}$$

Input Parameters

f, *g*, *h*	REAL for slasv2 DOUBLE PRECISION for dlasv2. The (1,1), (1,2) and (2,2) elements of the 2-by-2 matrix, respectively.

Output Parameters

ssmin, *ssmax*	REAL for slasv2 DOUBLE PRECISION for dlasv2. abs(*ssmin*) and abs(*ssmax*) is the smaller and the larger singular value, respectively.
snl, *csl*	REAL for slasv2 DOUBLE PRECISION for dlasv2. The vector (*csl*, *snl*) is a unit left singular vector for the singular value abs(*ssmax*).
snr, *csr*	REAL for slasv2 DOUBLE PRECISION for dlasv2. The vector (*csr*, *snr*) is a unit right singular vector for the singular value abs(*ssmax*).

Application Notes

Any input parameter may be aliased with any output parameter.

Barring over/underflow and assuming a guard digit in subtraction, all output quantities are correct to within a few units in the last place (ulps).

In ieee arithmetic, the code works correctly if one matrix element is infinite. Overflow will not occur unless the largest singular value itself overflows or is within a few ulps of overflow. (On machines with partial overflow, like the Cray, overflow may occur if the largest singular value is within a factor of 2 of overflow.) Underflow is harmless if underflow is gradual. Otherwise, results may correspond to a matrix modified by perturbations of size near the underflow threshold.

?laswp

Performs a series of row interchanges on a general rectangular matrix.

Syntax

```
call slaswp( n, a, lda, k1, k2, ipiv, incx )
call dlaswp( n, a, lda, k1, k2, ipiv, incx )
call claswp( n, a, lda, k1, k2, ipiv, incx )
call zlaswp( n, a, lda, k1, k2, ipiv, incx )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine performs a series of row interchanges on the matrix *A*. One row interchange is initiated for each of rows *k1* through *k2* of *A*.

Input Parameters

n	INTEGER. The number of columns of the matrix *A*.
a	REAL for slaswp DOUBLE PRECISION for dlaswp COMPLEX for claswp COMPLEX*16 for zlaswp. Array, DIMENSION (*lda*, *n*). On entry, the matrix of column dimension *n* to which the row interchanges will be applied.
lda	INTEGER. The leading dimension of the array *a*.
k1	INTEGER. The first element of *ipiv* for which a row interchange will be done.
k2	INTEGER. The last element of *ipiv* for which a row interchange will be done.
ipiv	INTEGER. Array, DIMENSION (*k2**|*incx*|). The vector of pivot indices. Only the elements in positions *k1* through *k2* of *ipiv* are accessed. *ipiv*(*k*) = *l* implies rows *k* and *l* are to be interchanged.
incx	INTEGER. The increment between successive values of *ipiv*. If *ipiv* is negative, the pivots are applied in reverse order.

Output Parameters

a	On exit, the permuted matrix.

?lasy2

Solves the Sylvester matrix equation where the matrices are of order 1 or 2.

Syntax

call slasy2(*ltranl*, *ltranr*, *isgn*, *n1*, *n2*, *tl*, *ldtl*, *tr*, *ldtr*, *b*, *ldb*, *scale*, *x*, *ldx*, *xnorm*, *info*)

call dlasy2(*ltranl*, *ltranr*, *isgn*, *n1*, *n2*, *tl*, *ldtl*, *tr*, *ldtr*, *b*, *ldb*, *scale*, *x*, *ldx*, *xnorm*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine solves for the *n1*-by-*n2* matrix *X*, $1 \le n1, n2 \le 2$, in

op(*TL*)**X* + *isgn***X**op(*TR*) = *scale***B*,

where

TL is *n1*-by-*n1*,

TR is *n2*-by-*n2*,

B is *n1*-by-*n2*,

and *isgn* = 1 or -1. op(*T*) = *T* or T^T, where T^T denotes the transpose of *T*.

Input Parameters

ltranl — LOGICAL.
On entry, *ltranl* specifies the op(*TL*):
= .FALSE., op(*TL*) = *TL*,
= .TRUE., op(*TL*) = $(TL)^T$.

ltranr — LOGICAL.
On entry, *ltranr* specifies the op(*TR*):
= .FALSE., op(*TR*) = *TR*,
= .TRUE., op(*TR*) = $(TR)^T$.

isgn — INTEGER. On entry, *isgn* specifies the sign of the equation as described before. *isgn* may only be 1 or -1.

n1 — INTEGER. On entry, *n1* specifies the order of matrix *TL*.
n1 may only be 0, 1 or 2.

n2 — INTEGER. On entry, *n2* specifies the order of matrix *TR*.
n2 may only be 0, 1 or 2.

tl — REAL for slasy2
DOUBLE PRECISION for dlasy2.
Array, DIMENSION (*ldtl*,2).
On entry, *tl* contains an *n1*-by-*n1* matrix *TL*.

ldtl — INTEGER.The leading dimension of the matrix *TL*.
ldtl ≥ max(1,*n1*).

tr — REAL for slasy2
DOUBLE PRECISION for dlasy2.
Array, DIMENSION (*ldtr*,2). On entry, *tr* contains an *n2*-by-*n2* matrix *TR*.

ldtr — INTEGER. The leading dimension of the matrix *TR*.
ldtr ≥ max(1,*n2*).

b — REAL for slasy2
DOUBLE PRECISION for dlasy2.
Array, DIMENSION (*ldb*,2). On entry, the *n1*-by-*n2* matrix *B* contains the right-hand side of the equation.

ldb — INTEGER. The leading dimension of the matrix *B*.
ldb ≥ max(1,*n1*).

ldx — INTEGER. The leading dimension of the output matrix *X*.
ldx ≥ max(1,*n1*).

Output Parameters

scale	REAL for slasy2 DOUBLE PRECISION for dlasy2. On exit, *scale* contains the scale factor. *scale* is chosen less than or equal to 1 to prevent the solution overflowing.
x	REAL for slasy2 DOUBLE PRECISION for dlasy2. Array, DIMENSION (*ldx*,2). On exit, *x* contains the *n1*-by-*n2* solution.
xnorm	REAL for slasy2 DOUBLE PRECISION for dlasy2. On exit, *xnorm* is the infinity-norm of the solution.
info	INTEGER. On exit, *info* is set to 0: successful exit. 1: *TL* and *TR* have too close eigenvalues, so *TL* or *TR* is perturbed to get a nonsingular equation.

NOTE. For higher speed, this routine does not check the inputs for errors.

?lasyf

Computes a partial factorization of a real/complex symmetric matrix, using the diagonal pivoting method.

Syntax

```
call slasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call dlasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call clasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call zlasyf( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?*lasyf* computes a partial factorization of a real/complex symmetric matrix *A* using the Bunch-Kaufman diagonal pivoting method. The partial factorization has the form:

$$A = \begin{bmatrix} I & U_{12} \\ 0 & U_{12} \end{bmatrix} \begin{bmatrix} A_{11} & 0 \\ 0 & D \end{bmatrix} \begin{bmatrix} I & 0 \\ U_{12}' & U_{12}' \end{bmatrix} \text{ if } uplo = \text{'U'}, \text{ or}$$

$$A = \begin{bmatrix} L_{11} & 0 \\ L_{21} & I \end{bmatrix} \begin{bmatrix} D & 0 \\ 0 & A_{22} \end{bmatrix} \begin{bmatrix} L_{11}' & L_{21}' \\ 0 & I \end{bmatrix} \text{ if } uplo = 'L'$$

where the order of D is at most nb.

The actual order is returned in the argument kb, and is either nb or nb-1, or n if $n \leq nb$.

This is an auxiliary routine called by ?sytrf. It uses blocked code (calling Level 3 BLAS) to update the submatrix A_{11} (if $uplo$ = 'U') or A_{22} (if $uplo$ = 'L').

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored: = 'U': Upper triangular = 'L': Lower triangular
n	INTEGER. The order of the matrix *A*. $n \geq 0$.
nb	INTEGER. The maximum number of columns of the matrix *A* that should be factored. *nb* should be at least 2 to allow for 2-by-2 pivot blocks.
a	REAL for slasyf DOUBLE PRECISION for dlasyf COMPLEX for clasyf COMPLEX*16 for zlasyf. Array, DIMENSION (*lda*, *n*). If $uplo$ = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If $uplo$ = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. $lda \geq \max(1,n)$.
w	REAL for slasyf DOUBLE PRECISION for dlasyf COMPLEX for clasyf COMPLEX*16 for zlasyf. Workspace array, DIMENSION (*ldw*, *nb*).
ldw	INTEGER. The leading dimension of the array *w*. $ldw \geq \max(1,n)$.

Output Parameters

kb	INTEGER. The number of columns of *A* that were actually factored *kb* is either *nb*-1 or *nb*, or *n* if $n \leq nb$.
a	On exit, *a* contains details of the partial factorization.

ipiv	INTEGER. Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D*. If *uplo* = 'U', only the last *kb* elements of *ipiv* are set; if *uplo* = 'L', only the first *kb* elements are set. If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and *D*(*k*, *k*) is a 1-by-1 diagonal block. If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*-1) < 0, then rows and columns *k*-1 and -*ipiv*(*k*) were interchanged and *D*(*k*-1:*k*, *k*-1:*k*) is a 2-by-2 diagonal block. If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1) < 0, then rows and columns *k*+1 and -*ipiv*(*k*) were interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.
info	INTEGER. = 0: successful exit > 0: if *info* = *k*, *D*(*k*, *k*) is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular.

?lahef

Computes a partial factorization of a complex Hermitian indefinite matrix, using the diagonal pivoting method.

Syntax

```
call clahef( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
call zlahef( uplo, n, nb, kb, a, lda, ipiv, w, ldw, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?lahef` computes a partial factorization of a complex Hermitian matrix *A*, using the Bunch-Kaufman diagonal pivoting method. The partial factorization has the form:

$$A = \begin{bmatrix} I & U_{12} \\ 0 & U_{12} \end{bmatrix} \begin{bmatrix} A_{11} & 0 \\ 0 & D \end{bmatrix} \begin{bmatrix} I & 0 \\ U_{12}' & U_{12}' \end{bmatrix} \text{ if } uplo = \text{'U'}, \text{ or}$$

$$A = \begin{bmatrix} L_{11} & 0 \\ L_{21} & I \end{bmatrix} \begin{bmatrix} D & 0 \\ 0 & A_{22} \end{bmatrix} \begin{bmatrix} L_{12}' & L_{21}' \\ 0 & I \end{bmatrix} \text{ if } uplo = \text{'L'}$$

where the order of *D* is at most *nb*.

The actual order is returned in the argument *kb*, and is either *nb* or *nb*-1, or *n* if $n \leq nb$.

Note that *U'* denotes the conjugate transpose of *U*.

This is an auxiliary routine called by ?hetrf. It uses blocked code (calling Level 3 BLAS) to update the submatrix A_{11} (if *uplo* = 'U') or A_{22} (if *uplo* = 'L').

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored: = 'U': upper triangular = 'L': lower triangular
n	INTEGER. The order of the matrix *A*. $n \geq 0$.
nb	INTEGER. The maximum number of columns of the matrix *A* that should be factored. *nb* should be at least 2 to allow for 2-by-2 pivot blocks.
a	COMPLEX for clahef COMPLEX*16 for zlahef. Array, DIMENSION (*lda*, *n*). On entry, the Hermitian matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *A* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *A* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* $\geq$ max(1,*n*).
w	COMPLEX for clahef COMPLEX*16 for zlahef. Workspace array, DIMENSION (*ldw*, *nb*).
ldw	INTEGER. The leading dimension of the array *w*. *ldw* $\geq$ max(1,*n*).

Output Parameters

kb	INTEGER. The number of columns of *A* that were actually factored *kb* is either *nb*-1 or *nb*, or *n* if $n \leq nb$.
a	On exit, *A* contains details of the partial factorization.
ipiv	INTEGER. Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D*. If *uplo* = 'U', only the last *kb* elements of *ipiv* are set; if *uplo* = 'L', only the first *kb* elements are set. If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) are interchanged and *D*(*k*, *k*) is a 1-by-1 diagonal block. If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*-1) < 0, then rows and columns *k*-1 and -*ipiv*(*k*) are interchanged and *D*(*k*-1:*k*, *k*-1:*k*) is a 2-by-2 diagonal block.

	If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1) < 0, then rows and columns *k*+1 and -*ipiv*(*k*) are interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.
info	INTEGER. = 0: successful exit > 0: if *info* = *k*, *D*(*k*, *k*) is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular.

?latbs

Solves a triangular banded system of equations.

Syntax

```
call slatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
call dlatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
call clatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
call zlatbs( uplo, trans, diag, normin, n, kd, ab, ldab, x, scale, cnorm, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine solves one of the triangular systems

*A*x = s*b,* or A^T*x = s*b,* or A^H*x = s*b* (for complex flavors)

with scaling to prevent overflow, where *A* is an upper or lower triangular band matrix. Here A^T denotes the transpose of *A*, A^H denotes the conjugate transpose of *A*, *x* and *b* are *n*-element vectors, and *s* is a scaling factor, usually less than or equal to 1, chosen so that the components of *x* will be less than the overflow threshold. If the unscaled problem will not cause overflow, the Level 2 BLAS routine ?tbsv is called. If the matrix *A* is singular (*A*(*j*, *j*)=0 for some *j*), then *s* is set to 0 and a non-trivial solution to *A*x = 0 is returned.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular. = 'U': upper triangular = 'L': lower triangular
trans	CHARACTER*1. Specifies the operation applied to *A*. = 'N': solve *A*x = s*b* (no transpose) = 'T': solve A^T*x = s*b* (transpose) = 'C': solve A^H*x = s*b* (conjugate transpose)
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular = 'N': non-unit triangular = 'U': unit triangular

normin CHARACTER*1.
Specifies whether *cnorm* is set.
= 'Y': *cnorm* contains the column norms on entry;
= 'N': *cnorm* is not set on entry. On exit, the norms is computed and stored in *cnorm*.

n INTEGER. The order of the matrix *A*. $n \geq 0$.

kd INTEGER. The number of subdiagonals or superdiagonals in the triangular matrix *A*. $kb \geq 0$.

ab REAL for slatbs
DOUBLE PRECISION for dlatbs
COMPLEX for clatbs
COMPLEX*16 for zlatbs.
Array, DIMENSION (*ldab*, *n*).
The upper or lower triangular band matrix *A*, stored in the first *kb*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:
if *uplo* = 'U', $ab(kd+1+i-j,j) = A(i,j)$ for $\max(1, j-kd) \leq i \leq j$;
if *uplo* = 'L', $ab(1+i-j,j) = A(i,j)$ for $j \leq i \leq \min(n, j+kd)$.

ldab INTEGER. The leading dimension of the array *ab*. $ldab \geq kb+1$.

x REAL for slatbs
DOUBLE PRECISION for dlatbs
COMPLEX for clatbs
COMPLEX*16 for zlatbs.
Array, DIMENSION (*n*).
On entry, the right hand side *b* of the triangular system.

cnorm REAL for slatbs/clatbs
DOUBLE PRECISION for dlatbs/zlatbs.
Array, DIMENSION (*n*).
If *NORMIN* = 'Y', *cnorm* is an input argument and *cnorm*(*j*) contains the norm of the off-diagonal part of the *j*-th column of *A*.
If *trans* = 'N', *cnorm*(*j*) must be greater than or equal to the infinity-norm, and if *trans* = 'T' or 'C' , *cnorm*(*j*) must be greater than or equal to the 1-norm.

Output Parameters

scale REAL for slatbs/clatbs
DOUBLE PRECISION for dlatbs/zlatbs.
The scaling factor s for the triangular system as described above. If *scale* = 0, the matrix *A* is singular or badly scaled, and the vector *x* is an exact or approximate solution to $Ax = 0$.

cnorm	If *normin* = 'N', *cnorm* is an output argument and *cnorm*(*j*) returns the 1-norm of the off-diagonal part of the *j*-th column of *A*.
info	INTEGER. = 0: successful exit < 0: if *info* = -*k*, the *k*-th argument had an illegal value

?latdf

Uses the LU factorization of the n-by-n matrix computed by ?getc2 *and computes a contribution to the reciprocal Dif-estimate.*

Syntax

```
call slatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
call dlatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
call clatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
call zlatdf( ijob, n, z, ldz, rhs, rdsum, rdscal, ipiv, jpiv )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?latdf uses the *LU* factorization of the *n*-by-*n* matrix *Z* computed by ?getc2 and computes a contribution to the reciprocal Dif-estimate by solving *Z*x* = *b* for *x*, and choosing the right-hand side *b* such that the norm of *x* is as large as possible. On entry *rhs* = *b* holds the contribution from earlier solved sub-systems, and on return *rhs* = *x*.

The factorization of *Z* returned by ?getc2 has the form *Z* = *P*L*U*Q*, where *P* and *Q* are permutation matrices. *L* is lower triangular with unit diagonal elements and *U* is upper triangular.

Input Parameters

ijob	INTEGER. *ijob* = 2: First compute an approximative null-vector *e* of *Z* using ?gecon, *e* is normalized, and solve for *Z*x* = ±*e*-*f* with the sign giving the greater value of 2-norm(*x*). This option is about 5 times as expensive as default. *ijob* ≠ 2 (default): Local look ahead strategy where all entries of the right-hand side *b* is chosen as either +1 or -1 .
n	INTEGER. The number of columns of the matrix *Z*.
z	REAL for slatdf/clatdf DOUBLE PRECISION for dlatdf/zlatdf. Array, DIMENSION (*ldz*, *n*) On entry, the *LU* part of the factorization of the *n*-by-*n* matrix *Z* computed by ?getc2: *Z* = *P*L*U*Q*.
ldz	INTEGER. The leading dimension of the array *Z*. *lda* ≥ max(1, *n*).

rhs
REAL for slatdf/clatdf
DOUBLE PRECISION for dlatdf/zlatdf.
Array, DIMENSION (*n*).
On entry, *rhs* contains contributions from other subsystems.

rdsum
REAL for slatdf/clatdf
DOUBLE PRECISION for dlatdf/zlatdf.
On entry, the sum of squares of computed contributions to the *D*if-estimate under computation by ?tgsyL, where the scaling factor *rdscal* has been factored out. If *trans* = 'T', *rdsum* is not touched.
Note that *rdsum* only makes sense when ?tgsy2 is called by ?tgsyL.

rdscal
REAL for slatdf/clatdf
DOUBLE PRECISION for dlatdf/zlatdf.
On entry, scaling factor used to prevent overflow in *rdsum*.
If *trans* = *T'*, *rdscal* is not touched.
Note that *rdscal* only makes sense when ?tgsy2 is called by ?tgsyL.

ipiv
INTEGER.
Array, DIMENSION (*n*).
The pivot indices; for 1 ≤ i ≤ *n*, row *i* of the matrix has been interchanged with row *ipiv*(*i*).

jpiv
INTEGER.
Array, DIMENSION (*n*).
The pivot indices; for 1 ≤j≤ *n*, column *j* of the matrix has been interchanged with column *jpiv*(*j*).

Output Parameters

rhs
On exit, *rhs* contains the solution of the subsystem with entries according to the value of *ijob*.

rdsum
On exit, the corresponding sum of squares updated with the contributions from the current sub-system.
If *trans* = 'T', *rdsum* is not touched.

rdscal
On exit, *rdscal* is updated with respect to the current contributions in *rdsum*.
If *trans* = 'T', *rdscal* is not touched.

?latps

Solves a triangular system of equations with the matrix held in packed storage.

Syntax

```
call slatps( uplo, trans, diag, normin, n, ap, x, scale, cnorm, info )
call dlatps( uplo, trans, diag, normin, n, ap, x, scale, cnorm, info )
call clatps( uplo, trans, diag, normin, n, ap, x, scale, cnorm, info )
```

```
call zlatps( uplo, trans, diag, normin, n, ap, x, scale, cnorm, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?latps` solves one of the triangular systems

$A*x = s*b$, or $A^T*x = s*b$, or $A^H*x = s*b$ (for complex flavors)

with scaling to prevent overflow, where A is an upper or lower triangular matrix stored in packed form. Here A^T denotes the transpose of A, A^H denotes the conjugate transpose of A, x and b are n-element vectors, and s is a scaling factor, usually less than or equal to 1, chosen so that the components of x will be less than the overflow threshold. If the unscaled problem does not cause overflow, the Level 2 BLAS routine `?tpsv` is called. If the matrix A is singular ($A(j, j) = 0$ for some j), then s is set to 0 and a non-trivial solution to $A*x = 0$ is returned.

Input Parameters

uplo
CHARACTER*1.
Specifies whether the matrix A is upper or lower triangular.
= 'U': upper triangular
= 'L': uower triangular

trans
CHARACTER*1.
Specifies the operation applied to A.
= 'N': solve $A*x = s*b$ (no transpose)
= 'T': solve $A^T*x = s*b$ (transpose)
= 'C': solve $A^H*x = s*b$ (conjugate transpose)

diag
CHARACTER*1.
Specifies whether the matrix A is unit triangular.
= *'N*': non-unit triangular
= 'U': unit triangular

normin
CHARACTER*1.
Specifies whether *cnorm* is set.
= 'Y': *cnorm* contains the column norms on entry;
= 'N': *cnorm* is not set on entry. On exit, the norms will be computed and stored in cnorm.

n
INTEGER. The order of the matrix A. $n \geq 0$.

ap
REAL for `slatps`
DOUBLE PRECISION for `dlatps`
COMPLEX for `clatps`
COMPLEX*16 for `zlatps`.
Array, DIMENSION ($n(n+1)/2$).
The upper or lower triangular matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array *ap* as follows:
if *uplo* = 'U', $ap(i + (j-1)j/2) = A(i,j)$ for $1 \leq i \leq j$;
if *uplo* = 'L', $ap(i + (j-1)(2n-j)/2) = A(i, j)$ for $j \leq i \leq n$.

x
REAL for `slatps` DOUBLE PRECISION for `dlatps`
COMPLEX for `clatps`

COMPLEX*16 for zlatps.
Array, DIMENSION (*n*)
On entry, the right hand side *b* of the triangular system.

cnorm REAL for slatps/clatps
DOUBLE PRECISION for dlatps/zlatps.
Array, DIMENSION (*n*).
If *normin* = 'Y', *cnorm* is an input argument and *cnorm*(*j*) contains the norm of the off-diagonal part of the *j*-th column of *A*.
If *trans* = 'N', *cnorm*(*j*) must be greater than or equal to the infinity-norm, and if *trans* = 'T' or 'C' , *cnorm*(*j*) must be greater than or equal to the 1-norm.

Output Parameters

x On exit, *x* is overwritten by the solution vector *x*.

scale REAL for slatps/clatps
DOUBLE PRECISION for dlatps/zlatps.
The scaling factor *s* for the triangular system as described above.
If *scale* = 0, the matrix *A* is singular or badly scaled, and the vector *x* is an exact or approximate solution to *A*x* = 0.

cnorm If *normin* = 'N', *cnorm* is an output argument and *cnorm*(*j*) returns the 1-norm of the off-diagonal part of the *j*-th column of *A*.

info INTEGER.
= 0: successful exit
< 0: if *info* = -*k*, the *k*-th argument had an illegal value

?latrd

Reduces the first nb rows and columns of a symmetric/Hermitian matrix A to real tridiagonal form by an orthogonal/unitary similarity transformation.

Syntax

```
call slatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
call dlatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
call clatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
call zlatrd( uplo, n, nb, a, lda, e, tau, w, ldw )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?latrd reduces *nb* rows and columns of a real symmetric or complex Hermitian matrix *A* to symmetric/Hermitian tridiagonal form by an orthogonal/unitary similarity transformation Q^T*A*Q for real flavors, Q^H*A*Q for complex flavors, and returns the matrices *V* and *W* which are needed to apply the transformation to the unreduced part of *A*.

If *uplo* = 'U', ?latrd reduces the last *nb* rows and columns of a matrix, of which the upper triangle is supplied; if *uplo* = 'L', ?latrd reduces the first *nb* rows and columns of a matrix, of which the lower triangle is supplied.

This is an auxiliary routine called by ?sytrd/?hetrd.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix *A* is stored: = 'U': upper triangular = 'L': lower triangular
n	INTEGER. The order of the matrix *A*.
nb	INTEGER. The number of rows and columns to be reduced.
a	REAL for slatrd DOUBLE PRECISION for dlatrd COMPLEX for clatrd COMPLEX*16 for zlatrd. Array, DIMENSION (*lda*, *n*). On entry, the symmetric/Hermitian matrix *A* If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ (1,*n*).
ldw	INTEGER. The leading dimension of the output array *w*. *ldw* ≥ max(1,*n*).

Output Parameters

a	On exit, if *uplo* = 'U', the last *nb* columns have been reduced to tridiagonal form, with the diagonal elements overwriting the diagonal elements of *a*; the elements above the diagonal with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors; if *uplo* = 'L', the first *nb* columns have been reduced to tridiagonal form, with the diagonal elements overwriting the diagonal elements of *a*; the elements below the diagonal with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
e	REAL for slatrd/clatrd DOUBLE PRECISION for dlatrd/zlatrd. If *uplo* = 'U', *e*(*n*-*nb*:*n*-1) contains the superdiagonal elements of the last *nb* columns of the reduced matrix; if *uplo* = 'L', *e*(1:*nb*) contains the subdiagonal elements of the first *nb* columns of the reduced matrix.

tau REAL for slatrd
DOUBLE PRECISION for dlatrd
COMPLEX for clatrd
COMPLEX*16 for zlatrd.
Array, DIMENSION (*lda*, *n*).
The scalar factors of the elementary reflectors, stored in *tau*(*n*-*nb*:*n*-1) if *uplo* = 'U', and in *tau*(1:*nb*) if *uplo* = 'L'.

w REAL for slatrd
DOUBLE PRECISION for dlatrd
COMPLEX for clatrd
COMPLEX*16 for zlatrd.
Array, DIMENSION (*ldw*, *n*).
The *n*-by-*nb* matrix *W* required to update the unreduced part of *A*.

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*n*)**H*(*n*-1)*...**H*(*n*-*nb*+1)

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*i*:*n*) = 0 and *v*(*i*-1) = 1; *v*(1:*i*-1) is stored on exit in *a*(1: *i*-1, *i*), and *tau* in *tau*(*i*-1).

If *uplo* = 'L', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*nb*)

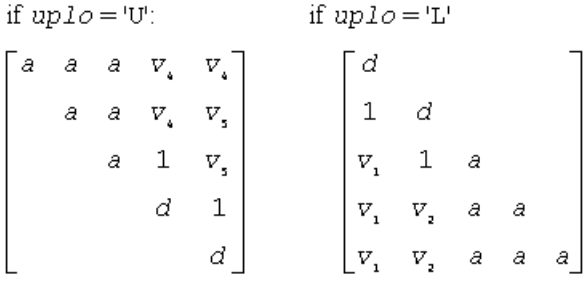
Each *H*(*i*) has the form *H*(*i*) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1: *i*) = 0 and *v*(*i*+1) = 1; *v*(*i*+1:n) is stored on exit in *a*(*i*+1:*n*, *i*), and *tau* in *tau*(*i*).

The elements of the vectors *v* together form the *n*-by-*nb* matrix *V* which is needed, with *W*, to apply the transformation to the unreduced part of the matrix, using a symmetric/Hermitian rank-2k update of the form:

A := *A* - *VW*' - *WV*'.

The contents of *a* on exit are illustrated by the following examples with *n* = 5 and *nb* = 2:



where *d* denotes a diagonal element of the reduced matrix, *a* denotes an element of the original matrix that is unchanged, and v_i denotes an element of the vector defining *H*(*i*).

?latrs

Solves a triangular system of equations with the scale factor set to prevent overflow.

Syntax

```
call slatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
call dlatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
call clatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
call zlatrs( uplo, trans, diag, normin, n, a, lda, x, scale, cnorm, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine solves one of the triangular systems

*A*x = s*b*, or A^T*x = s*b*, or A^H*x = s*b* (for complex flavors)

with scaling to prevent overflow. Here *A* is an upper or lower triangular matrix, A^T denotes the transpose of *A*, A^H denotes the conjugate transpose of *A*, *x* and *b* are *n*-element vectors, and *s* is a scaling factor, usually less than or equal to 1, chosen so that the components of *x* will be less than the overflow threshold. If the unscaled problem will not cause overflow, the Level 2 BLAS routine `?trsv` is called. If the matrix *A* is singular (*A*(*j*,*j*) = 0 for some *j*), then *s* is set to 0 and a non-trivial solution to *A*x = 0 is returned.

Input Parameters

uplo
CHARACTER*1.
Specifies whether the matrix *A* is upper or lower triangular.
= 'U': Upper triangular
= 'L': Lower triangular

trans
CHARACTER*1.
Specifies the operation applied to *A*.
= 'N': solve *A*x = s*b* (no transpose)
= 'T': solve A^T*x = s*b* (transpose)
= 'C': solve A^H*x = s*b* (conjugate transpose)

diag
CHARACTER*1.
Specifies whether or not the matrix *A* is unit triangular.
= 'N': non-unit triangular
= 'N': non-unit triangular

normin
CHARACTER*1.
Specifies whether *cnorm* has been set or not.
= 'Y': *cnorm* contains the column norms on entry;
= 'N': *cnorm* is not set on entry. O
n exit, the norms will be computed and stored in *cnorm*.

n INTEGER. The order of the matrix *A*. $n \geq 0$

a REAL for slatrs
DOUBLE PRECISION for dlatrs
COMPLEX for clatrs
COMPLEX*16 for zlatrs.
Array, DIMENSION (*lda*, *n*). Contains the triangular matrix *A*.
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *A* is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *A* is not referenced.
If *diag* = 'U', the diagonal elements of *A* are also not referenced and are assumed to be 1.

lda INTEGER. The leading dimension of the array *a*. $lda \geq \max(1, n)$.

x REAL for slatrs
DOUBLE PRECISION for dlatrs
COMPLEX for clatrs
COMPLEX*16 for zlatrs.
Array, DIMENSION (*n*).
On entry, the right hand side *b* of the triangular system.

cnorm REAL for slatrs/clatrs
DOUBLE PRECISION for dlatrs/zlatrs.
Array, DIMENSION (*n*).
If *normin* = 'Y', *cnorm* is an input argument and *cnorm* (*j*) contains the norm of the off-diagonal part of the *j*-th column of *A*.
If *trans* = 'N', *cnorm* (*j*) must be greater than or equal to the infinity-norm, and if *trans* = 'T' or 'C', *cnorm*(*j*) must be greater than or equal to the 1-norm.

Output Parameters

x On exit, *x* is overwritten by the solution vector *x*.

scale REAL for slatrs/clatrs
DOUBLE PRECISION for dlatrs/zlatrs.
Array, DIMENSION (*lda*, *n*). The scaling factor *s* for the triangular system as described above.
If *scale* = 0, the matrix *A* is singular or badly scaled, and the vector *x* is an exact or approximate solution to *A***x* = 0.

cnorm If *normin* = 'N', *cnorm* is an output argument and *cnorm*(*j*) returns the 1-norm of the off-diagonal part of the *j*-th column of *A*.

info INTEGER.
= 0: successful exit
< 0: if *info* = -*k*, the *k*-th argument had an illegal value

Application Notes

A rough bound on x is computed; if that is less than overflow, ?trsv is called, otherwise, specific code is used which checks for possible overflow or divide-by-zero at every operation.

A columnwise scheme is used for solving $Ax = b$. The basic algorithm if A is lower triangular is

$x[1:n]$:= $b[1:n]$

for $j = 1, \ldots, n$

$x(j)$:= $x(j)$ / $A(j,j)$

$x[j+1:n]$:= $x[j+1:n]$ - $x(j)*a[j+1:n,j]$

end

Define bounds on the components of x after j iterations of the loop:

$M(j)$ = bound on $x[1:j]$

$G(j)$ = bound on $x[j+1:n]$

Initially, let $M(0) = 0$ and $G(0) = \max\{x(i), i=1,\ldots,n\}$.

Then for iteration $j+1$ we have

$M(j+1) \le G(j) / |a(j+1,j+1)|$

$G(j+1) \le G(j) + M(j+1)*|a[j+2:n,j+1]|$

$\le G(j)(1 + cnorm(j+1)/|a(j+1,j+1)|,$

where $cnorm(j+1)$ is greater than or equal to the infinity-norm of column $j+1$ of a, not counting the diagonal. Hence

$$G(j) \le G(0) \prod_{1 \le i \le j} (1 + cnorm(i)/|A(i,i)|)$$

and

$$|x(j)| \le (G(0)/|A(j,j)|) \prod_{1 \le i \le j} (1 + cnorm(i)/|A(i,i)|)$$

Since $|x(j)| \le M(j)$, we use the Level 2 BLAS routine ?trsv if the reciprocal of the largest $M(j)$, $j=1,..,n$, is larger than $\max(underflow, 1/overflow)$.

The bound on $x(j)$ is also used to determine when a step in the columnwise method can be performed without fear of overflow. If the computed bound is greater than a large constant, x is scaled to prevent overflow, but if the bound overflows, x is set to 0, $x(j)$ to 1, and scale to 0, and a non-trivial solution to $Ax = 0$ is found.

Similarly, a row-wise scheme is used to solve $A^T x = b$ or $A^H x = b$. The basic algorithm for A upper triangular is

for j = 1, ..., n

$x(j)$:= ($b(j)$ - $A[1:j-1,j]'$ $x[1:j-1]$) / $A(j,j)$

end

We simultaneously compute two bounds

$G(j)$ = bound on ($b(i)$ - $A[1:i-1,i]'*x[1:i-1]$), $1 \le i \le j$

$M(j)$ = bound on $x(i)$, $1 \le i \le j$

The initial values are $G(0) = 0$, $M(0) = \max\{ b(i), i=1,..,n\}$, and we add the constraint $G(j) \ge G(j-1)$ and $M(j) \ge M(j-1)$ for $j \ge 1$.

Then the bound on $x(j)$ is

$M(j) \le M(j-1) * (1 + cnorm(j)) / |A(j,j)|$

$$\le M(0) \prod_{1 \le i \le j} (1 + cnorm(i)/|A(i,i)|)$$

and we can safely call ?trsv if $1/M(n)$ and $1/G(n)$ are both greater than $\max(underflow, 1/overflow)$.

?latrz

Factors an upper trapezoidal matrix by means of orthogonal/unitary transformations.

Syntax

```
call slatrz( m, n, l, a, lda, tau, work )
call dlatrz( m, n, l, a, lda, tau, work )
call clatrz( m, n, l, a, lda, tau, work )
call zlatrz( m, n, l, a, lda, tau, work )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?latrz factors the m-by-(m+l) real/complex upper trapezoidal matrix

$[A1\ A2] = [A(1:m,1:m)\ A(1:\ m,\ n-l+1:n)]$

as (R 0)* Z, by means of orthogonal/unitary transformations. Z is an (m+l)-by-(m+l) orthogonal/unitary matrix and R and $A1$ are m-by -m upper triangular matrices.

Input Parameters

m INTEGER. The number of rows of the matrix A. $m \ge 0$.

n	INTEGER. The number of columns of the matrix *A*. $n \geq 0$.
l	INTEGER. The number of columns of the matrix *A* containing the meaningful part of the Householder vectors. $n-m \geq l \geq 0$.
a	REAL for slatrz DOUBLE PRECISION for dlatrz COMPLEX for clatrz COMPLEX*16 for zlatrz. Array, DIMENSION (*lda*, *n*). On entry, the leading *m*-by-*n* upper trapezoidal part of the array *a* must contain the matrix to be factorized.
lda	INTEGER. The leading dimension of the array *a*. $lda \geq \max(1,m)$.
work	REAL for slatrz DOUBLE PRECISION for dlatrz COMPLEX for clatrz COMPLEX*16 for zlatrz. Workspace array, DIMENSION (*m*).

Output Parameters

a	On exit, the leading *m*-by-*m* upper triangular part of *a* contains the upper triangular matrix *R*, and elements *n*-*l*+1 to *n* of the first *m* rows of *a*, with the array *tau*, represent the orthogonal/unitary matrix *Z* as a product of *m* elementary reflectors.
tau	REAL for slatrz DOUBLE PRECISION for dlatrz COMPLEX for clatrz COMPLEX*16 for zlatrz. Array, DIMENSION (*m*). The scalar factors of the elementary reflectors.

Application Notes

The factorization is obtained by Householder's method. The *k*-th transformation matrix, *z*(*k*), which is used to introduce zeros into the (*m* - *k* + 1)-th row of *A*, is given in the form

$$Z(k)=\begin{bmatrix} I & 0 \\ 0 & T(k) \end{bmatrix}$$

where

$$T(k) = I - tau * u(k) * T(k)', \quad u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

tau is a scalar and *z*(*k*) is an *l*-element vector. *tau* and *z*(*k*) are chosen to annihilate the elements of the *k*-th row of *A*2.

The scalar *tau* is returned in the *k*-th element of *tau* and the vector *u*(*k*) in the *k*-th row of *A*2, such that the elements of *z*(*k*) are in *a*(*k*, *l*+1), ..., *a*(*k*, *n*).

The elements of *r* are returned in the upper triangular part of *A*1.

Z is given by

Z = *Z*(1)*Z*(2)*...*Z*(*m*).

?lauu2

*Computes the product U*U^T(U*U^H) or L^T*L (L^H*L), where U and L are upper or lower triangular matrices (unblocked algorithm).*

Syntax

```
call slauu2( uplo, n, a, lda, info )
call dlauu2( uplo, n, a, lda, info )
call clauu2( uplo, n, a, lda, info )
call zlauu2( uplo, n, a, lda, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine ?lauu2 computes the product $U*U^T$ or L^T*L for real flavors, and L^H*L or L^H*L for complex flavors. Here the triangular factor *U* or *L* is stored in the upper or lower triangular part of the array *a*.

If *uplo* = 'U' or 'u' , then the upper triangle of the result is stored, overwriting the factor *U* in *A*.

If *uplo* = 'L' or 'l', then the lower triangle of the result is stored, overwriting the factor *L* in *A*.

This is the unblocked form of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo — CHARACTER*1.
Specifies whether the triangular factor stored in the array *a* is upper or lower triangular:
= 'U': Upper triangular
= 'L': Lower triangular

n — INTEGER. The order of the triangular factor *U* or *L*. *n* ≥ 0.

a	REAL for slauu2 DOUBLE PRECISION for dlauu2 COMPLEX for clauu2 COMPLEX*16 for zlauu2. Array, DIMENSION (*lda*, *n*). On entry, the triangular factor *U* or *L*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

Output Parameters

a	On exit, if *uplo* = 'U', then the upper triangle of *a* is overwritten with the upper triangle of the product $U*U^T$($U*U^H$); if *uplo* = 'L', then the lower triangle of *a* is overwritten with the lower triangle of the product L^T*L (L^H*L).
info	INTEGER. = 0: successful exit < 0: if *info* = -*k*, the *k*-th argument had an illegal value

?lauum

Computes the product $U*U^T$($U*U^H$) or L^T*L (L^H*L), where U and L are upper or lower triangular matrices (blocked algorithm).

Syntax

```
call slauum( uplo, n, a, lda, info )
call dlauum( uplo, n, a, lda, info )
call clauum( uplo, n, a, lda, info )
call zlauum( uplo, n, a, lda, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lauum computes the product $U*U^T$ or L^T*L for real flavors, and L^H*L or L^H*L for complex flavors. Here the triangular factor *U* or *L* is stored in the upper or lower triangular part of the array *a*.

If *uplo* = 'U' or 'u', then the upper triangle of the result is stored, overwriting the factor *U* in *A*.

If *uplo* = 'L' or 'l', then the lower triangle of the result is stored, overwriting the factor *L* in *A*.

This is the blocked form of the algorithm, calling BLAS Level 3 Routines.

Input Parameters

uplo	CHARACTER*1. Specifies whether the triangular factor stored in the array *a* is upper or lower triangular: = 'U': Upper triangular

= 'L': Lower triangular

n — INTEGER. The order of the triangular factor *U* or *L*. *n* ≥ 0.

a — REAL for slauum
DOUBLE PRECISION for dlauum
COMPLEX for clauum
COMPLEX*16 for zlauum .
Array, DIMENSION (*lda*, *n*).
On entry, the triangular factor *U* or *L*.

lda — INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

Output Parameters

a — On exit,
if *uplo* = 'U', then the upper triangle of *a* is overwritten with the upper triangle of the product $U*U^T$($U*U^H$);
if *uplo* = 'L', then the lower triangle of *a* is overwritten with the lower triangle of the product L^T*L (L^H*L).

info — INTEGER.
= 0: successful exit
< 0: if *info* = -*k*, the *k*-th argument had an illegal value

?org2l/?ung2l

Generates all or part of the orthogonal/unitary matrix Q from a QL factorization determined by ?geqlf *(unblocked algorithm).*

Syntax

```
call sorg2l( m, n, k, a, lda, tau, work, info )
call dorg2l( m, n, k, a, lda, tau, work, info )
call cung2l( m, n, k, a, lda, tau, work, info )
call zung2l( m, n, k, a, lda, tau, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?org2l/?ung2l generates an *m*-by-*n* real/complex matrix *Q* with orthonormal columns, which is defined as the last *n* columns of a product of *k* elementary reflectors of order *m*:

Q = *H*(*k*)*...*H*(2)*H*(1) as returned by ?geqlf.

Input Parameters

m — INTEGER. The number of rows of the matrix *Q*. *m* ≥ 0.

n — INTEGER. The number of columns of the matrix *Q*. *m* ≥ *n* ≥ 0.

k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. $n \geq k \geq 0$.
a	REAL for sorg2l DOUBLE PRECISION for dorg2l COMPLEX for cung2l COMPLEX*16 for zung2l. Array, DIMENSION (*lda*,*n*). On entry, the ($n-k+i$)-th column must contain the vector which defines the elementary reflector $H(i)$, for $i = 1,2,...,k$, as returned by ?geqlf in the last *k* columns of its array argument *A*.
lda	INTEGER. The first dimension of the array *a*. $lda \geq \max(1,m)$.
tau	REAL for sorg2l DOUBLE PRECISION for dorg2l COMPLEX for cung2l COMPLEX*16 for zung2l. Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector $H(i)$, as returned by ?geqlf.
work	REAL for sorg2l DOUBLE PRECISION for dorg2l COMPLEX for cung2l COMPLEX*16 for zung2l. Workspace array, DIMENSION (*n*).

Output Parameters

a	On exit, the *m*-by-*n* matrix *Q*.
info	INTEGER. = 0: successful exit < 0: if $info = -i$, the *i*-th argument has an illegal value

?org2r/?ung2r

Generates all or part of the orthogonal/unitary matrix Q from a QR factorization determined by ?geqrf *(unblocked algorithm).*

Syntax

```
call sorg2r( m, n, k, a, lda, tau, work, info )
call dorg2r( m, n, k, a, lda, tau, work, info )
call cung2r( m, n, k, a, lda, tau, work, info )
call zung2r( m, n, k, a, lda, tau, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?org2r/?ung2r` generates an *m*-by-*n* real/complex matrix *Q* with orthonormal columns, which is defined as the first *n* columns of a product of *k* elementary reflectors of order *m*

Q = *H*(1)**H*(2)*...**H*(*k*)

as returned by `?geqrf`.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q*. *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *Q*. *m* ≥ *n* ≥ 0.
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. *n* ≥ *k* ≥ 0.
a	REAL for sorg2r DOUBLE PRECISION for dorg2r COMPLEX for cung2r COMPLEX*16 for zung2r. Array, DIMENSION (*lda*, *n*). On entry, the *i*-th column must contain the vector which defines the elementary reflector *H*(*i*), for *i* = 1,2,..., *k*, as returned by `?geqrf` in the first *k* columns of its array argument *a*.
lda	INTEGER. The first DIMENSION of the array *a*. *lda* ≥ max(1,*m*).
tau	REAL for sorg2r DOUBLE PRECISION for dorg2r COMPLEX for cung2r COMPLEX*16 for zung2r. Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by `?geqrf`.
work	REAL for sorg2r DOUBLE PRECISION for dorg2r COMPLEX for cung2r COMPLEX*16 for zung2r. Workspace array, DIMENSION (*n*).

Output Parameters

a	On exit, the *m*-by-*n* matrix *Q*.
info	INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument has an illegal value

?orgl2/?ungl2

Generates all or part of the orthogonal/unitary matrix Q from an LQ factorization determined by ?gelqf *(unblocked algorithm).*

Syntax

```
call sorgl2( m, n, k, a, lda, tau, work, info )
call dorgl2( m, n, k, a, lda, tau, work, info )
call cungl2( m, n, k, a, lda, tau, work, info )
call zungl2( m, n, k, a, lda, tau, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?orgl2/?ungl2 generates a *m*-by-*n* real/complex matrix *Q* with orthonormal rows, which is defined as the first *m* rows of a product of *k* elementary reflectors of order n

$Q = H(k)*...*H(2)*H(1)$ for real flavors, or $Q = (H(k))^H*...*(H(2))^H*(H(1))^H$ for complex flavors as returned by ?gelqf.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q*. $m \geq 0$.
n	INTEGER. The number of columns of the matrix *Q*. $n \geq m$.
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. $m \geq k \geq 0$.
a	REAL for sorgl2 DOUBLE PRECISION for dorgl2 COMPLEX for cungl2 COMPLEX*16 for zungl2. Array, DIMENSION (*lda*, *n*). On entry, the *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), for *i* = 1,2,..., *k*, as returned by ?gelqf in the first *k* rows of its array argument *a*.
lda	INTEGER. The first dimension of the array *a*. $lda \geq \max(1,m)$.
tau	REAL for sorgl2 DOUBLE PRECISION for dorgl2 COMPLEX for cungl2 COMPLEX*16 for zungl2. Array, DIMENSION (*k*). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by ?gelqf.
work	REAL for sorgl2

DOUBLE PRECISION for dorgl2
COMPLEX for cungl2
COMPLEX*16 for zungl2.
Workspace array, DIMENSION (*m*).

Output Parameters

a — On exit, the *m*-by-*n* matrix *Q*.

info — INTEGER.
= 0: successful exit
< 0: if *info* = -*i*, the *i*-th argument has an illegal value.

?orgr2/?ungr2

Generates all or part of the orthogonal/unitary matrix Q from an RQ factorization determined by ?gerqf *(unblocked algorithm).*

Syntax

```
call sorgr2( m, n, k, a, lda, tau, work, info )
call dorgr2( m, n, k, a, lda, tau, work, info )
call cungr2( m, n, k, a, lda, tau, work, info )
call zungr2( m, n, k, a, lda, tau, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?orgr2/?ungr2 generates an *m*-by-*n* real matrix *Q* with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors of order *n*

Q = *H*(1)**H*(2)*...**H*(*k*) for real flavors, or *Q* = $(H(1))^H$*$(H(2))^H$*...*$(H(k))^H$ for complex flavors as returned by ?gerqf.

Input Parameters

m — INTEGER. The number of rows of the matrix *Q*. *m* ≥ 0.

n — INTEGER. The number of columns of the matrix *Q*. *n* ≥ *m*

k — INTEGER.
The number of elementary reflectors whose product defines the matrix *Q*. *m* ≥ *k* ≥ 0.

a — REAL for sorgr2
DOUBLE PRECISION for dorgr2
COMPLEX for cungr2
COMPLEX*16 for zungr2.
Array, DIMENSION (*lda*, *n*).

	On entry, the (*m*- *k*+i)-th row must contain the vector which defines the elementary reflector *H*(*i*), for *i* = 1,2,..., *k*, as returned by ?gerqf in the last *k* rows of its array argument *a*.
lda	INTEGER. The first dimension of the array *a*. *lda* ≥ max(1,*m*).
tau	REAL for sorgr2 DOUBLE PRECISION for dorgr2 COMPLEX for cungr2 COMPLEX*16 for zungr2. Array, DIMENSION (*k*).*tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by ?gerqf.
work	REAL for sorgr2 DOUBLE PRECISION for dorgr2 COMPLEX for cungr2 COMPLEX*16 for zungr2. Workspace array, DIMENSION (*m*).

Output Parameters

a	On exit, the *m*-by-*n* matrix *Q*.
info	INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument has an illegal value

?orm2l/?unm2l

Multiplies a general matrix by the orthogonal/unitary matrix from a QL factorization determined by ?geqlf *(unblocked algorithm).*

Syntax

```
call sorm2l( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
call dorm2l( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
call cunm2l( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
call zunm2l( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?orm2l/?unm2l overwrites the general real/complex *m*-by-*n* matrix *C* with

*Q***C* if *side* = 'L' and *trans* = 'N', or

Q^T**C* / Q^H**C* if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

*C***Q* if *side* = 'R' and *trans* = 'N', or

*C**Q^T / *C**Q^H if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

Here Q is a real orthogonal or complex unitary matrix defined as the product of k elementary reflectors

$Q = H(k)*...*H(2)*H(1)$ as returned by ?geqlf.

Q is of order m if $side$ = 'L' and of order n if $side$ = 'R'.

Input Parameters

side	CHARACTER*1. = 'L': apply Q or Q^T / Q^H from the left = 'R': apply Q or Q^T / Q^H from the right
trans	CHARACTER*1. = 'N': apply Q (no transpose) = 'T': apply Q^T (transpose, for real flavors) = 'C': apply Q^H (conjugate transpose, for complex flavors)
m	INTEGER. The number of rows of the matrix C. $m \geq 0$.
n	INTEGER. The number of columns of the matrix C. $n \geq 0$.
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. If $side$ = 'L', $m \geq k \geq 0$; if $side$ = 'R', $n \geq k \geq 0$.
a	REAL for sorm2l DOUBLE PRECISION for dorm2l COMPLEX for cunm2l COMPLEX*16 for zunm2l. Array, DIMENSION (lda,k). The i-th column must contain the vector which defines the elementary reflector $H(i)$, for i = 1,2,..., k, as returned by ?geqlf in the last k columns of its array argument a. The array a is modified by the routine but restored on exit.
lda	INTEGER. The leading dimension of the array a. If $side$ = 'L', $lda \geq \max(1, m)$ if $side$ = 'R', $lda \geq \max(1, n)$.
tau	REAL for sorm2l DOUBLE PRECISION for dorm2l COMPLEX for cunm2l COMPLEX*16 for zunm2l. Array, DIMENSION (k). $tau(i)$ must contain the scalar factor of the elementary reflector $H(i)$, as returned by ?geqlf.
c	REAL for sorm2l DOUBLE PRECISION for dorm2l COMPLEX for cunm2l COMPLEX*16 for zunm2l. Array, DIMENSION (ldc, n). On entry, the m-by-n matrix C.

ldc	INTEGER. The leading dimension of the array *C*. *ldc* ≥ max(1,*m*).
work	REAL for sorm2l DOUBLE PRECISION for dorm2l COMPLEX for cunm2l COMPLEX*16 for zunm2l. Workspace array, DIMENSION: (*n*) if *side* = 'L', (*m*) if *side* = 'R'.

Output Parameters

c	On exit, *c* is overwritten by $Q*C$ or Q^T*C / Q^H*C, or $C*Q$, or $C*Q^T$ / $C*Q^H$.
info	INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument had an illegal value

?orm2r/?unm2r

Multiplies a general matrix by the orthogonal/unitary matrix from a QR factorization determined by ?geqrf *(unblocked algorithm).*

Syntax

```
call sorm2r( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
call dorm2r( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
call cunm2r( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
call zunm2r( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?orm2r/?unm2r overwrites the general real/complex *m*-by-*n* matrix *C* with

$Q*C$ if *side* = 'L' and *trans* = 'N', or

Q^T*C / Q^H*C if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

$C*Q$ if *side* = 'R' and *trans* = 'N', or

$C*Q^T$ / $C*Q^H$ if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

Here Q is a real orthogonal or complex unitary matrix defined as the product of *k* elementary reflectors

$Q = H(1)*H(2)*...*H(k)$ as returned by ?geqrf.

Q is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	CHARACTER*1.

= 'L': apply Q or Q^T / Q^H from the left
= 'R': apply Q or Q^T / Q^H from the right

trans CHARACTER*1.
= 'N': apply Q (no transpose)
= 'T': apply Q^T (transpose, for real flavors)
= 'C': apply Q^H (conjugate transpose, for complex flavors)

m INTEGER. The number of rows of the matrix C. $m \geq 0$.

n INTEGER. The number of columns of the matrix C. $n \geq 0$.

k INTEGER. The number of elementary reflectors whose product defines the matrix Q.

If *side* = 'L', $m \geq k \geq 0$;

if *side* = 'R', $n \geq k \geq 0$.

a REAL for sorm2r
DOUBLE PRECISION for dorm2r

call zunml2( side, trans, m, n, k, a, lda, tau, c, ldc, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?orml2/?unml2 overwrites the general real/complex *m*-by-*n* matrix *C* with

*Q*C* if *side* = 'L' and *trans* = 'N', or

Q^T*C / Q^H*C if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

*C*Q* if *side* = 'R' and *trans* = 'N', or

$C*Q^T$ / $C*Q^H$ if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

Here *Q* is a real orthogonal or complex unitary matrix defined as the product of *k* elementary reflectors

$Q = H(k)*...*H(2)*H(1)$ for real flavors, or $Q = (H(k))^H*...*(H(2))^H*(H(1))^H$ for complex flavors as returned by ?gelqf.

Q is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	CHARACTER*1. = 'L': apply *Q* or Q^T / Q^H from the left = 'R': apply *Q* or Q^T / Q^H from the right
trans	CHARACTER*1. = 'N': apply *Q* (no transpose)

?pbtf2

Computes the Cholesky factorization of a symmetric/ Hermitian positive-definite band matrix (unblocked algorithm).

Syntax

```
call spbtf2( uplo, n, kd, ab, ldab, info )
call dpbtf2( uplo, n, kd, ab, ldab, info )
call cpbtf2( uplo, n, kd, ab, ldab, info )
call zpbtf2( uplo, n, kd, ab, ldab, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the Cholesky factorization of a real symmetric or complex Hermitian positive definite band matrix *A*.

The factorization has the form

$A = U^T*U$ for real flavors, $A = U^H*U$ for complex flavors if *uplo* = 'U', or

$A = L*L^T$ for real flavors, $A = L*L^H$ for complex flavors if *uplo* = 'L',

where *U* is an upper triangular matrix, and *L* is lower triangular. This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix *A* is stored: = 'U': upper triangular = 'L': lower triangular
n	INTEGER. The order of the matrix *A*. $n \geq 0$.
kd	INTEGER. The number of super-diagonals of the matrix *A* if *uplo* = 'U' , or the number of sub-diagonals if *uplo* = 'L'. $kd \geq 0$.
ab	REAL for spbtf2 DOUBLE PRECISION for dpbtf2 COMPLEX for cpbtf2 COMPLEX*16 for zpbtf2. Array, DIMENSION (*ldab*, *n*). On entry, the upper or lower triangle of the symmetric/ Hermitian band matrix *A*, stored in the first *kd*+1 rows of the array. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

if *uplo* = 'U', *ab*(*kd*+1+*i* -*j*,*j*) = *A*(*i*, *j* for max(1, *j*-*kd*) ≤ *i* ≤ *j*;

if *uplo* = 'L', *ab*(1+*i* -*j*,*j*) = *A*(*i*, *j* for *j* ≤ *i* ≤ min(*n*, *j*+*kd*).

ldab — INTEGER. The leading dimension of the array *ab*. *ldab* ≥ *kd*+1.

Output Parameters

ab — On exit, If *info* = 0, the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ ($A=U^H*U$), or $A= L*L^T$ ($A = L*L^H$) of the band matrix *A*, in the same storage format as *A*.

info — INTEGER.
= 0: successful exit
< 0: if *info* = -*k*, the *k*-th argument had an illegal value
> 0: if *info* = *k*, the leading minor of order *k* is not positive definite, and the factorization could not be completed.

?potf2

Computes the Cholesky factorization of a symmetric/Hermitian positive-definite matrix (unblocked algorithm).

Syntax

```
call spotf2( uplo, n, a, lda, info )
call dpotf2( uplo, n, a, lda, info )
call cpotf2( uplo, n, a, lda, info )
call zpotf2( uplo, n, a, lda, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine ?potf2 computes the Cholesky factorization of a real symmetric or complex Hermitian positive definite matrix *A*. The factorization has the form

$A = U^T*U$ for real flavors, $A = U^H*U$ for complex flavors if *uplo* = 'U', or

$A = L*L^T$ for real flavors, $A = L*L^H$ for complex flavors if *uplo* = 'L',

where *U* is an upper triangular matrix, and *L* is lower triangular.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines

Input Parameters

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix *A* is stored.

= 'U': upper triangular
= 'L': lower triangular

n — INTEGER. The order of the matrix *A*. *n* ≥ 0.

a — REAL for spotf2
DOUBLE PRECISION or dpotf2
COMPLEX for cpotf2
COMPLEX*16 for zpotf2.
Array, DIMENSION (*lda*, *n*).
On entry, the symmetric/Hermitian matrix *A*.
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*.
lda ≥ max(1,*n*).

Output Parameters

a — On exit, If *info* = 0, the factor *U* or *L* from the Cholesky factorization $A=U^T*U$ ($A=U^H*U$), or $A= L*L^T$ ($A = L*L^H$).

info — INTEGER.
= 0: successful exit
< 0: if *info* = -*k*, the *k*-th argument had an illegal value
> 0: if *info* = *k*, the leading minor of order *k* is not positive definite, and the factorization could not be completed.

?ptts2

*Solves a tridiagonal system of the form A*X=B using the $L*D*L^H$/$L*D*L^H$ factorization computed by* ?pttrf.

Syntax

```
call sptts2( n, nrhs, d, e, b, ldb )
call dptts2( n, nrhs, d, e, b, ldb )
call cptts2( iuplo, n, nrhs, d, e, b, ldb )
call zptts2( iuplo, n, nrhs, d, e, b, ldb )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?ptts2 solves a tridiagonal system of the form

*A*X = B*

Real flavors sptts2/dptts2 use the $L*D*L^T$ factorization of A computed by spttrf/dpttrf, and complex flavors cptts2/zptts2 use the U^H*D*U or $L*D*L^H$ factorization of A computed by cpttrf/zpttrf.

D is a diagonal matrix specified in the vector d, U (or L) is a unit bidiagonal matrix whose superdiagonal (subdiagonal) is specified in the vector e, and X and B are n-by-$nrhs$ matrices.

Input Parameters

iuplo
INTEGER. Used with complex flavors only.
Specifies the form of the factorization, and whether the vector e is the superdiagonal of the upper bidiagonal factor U or the subdiagonal of the lower bidiagonal factor L.
= 1: $A = U^H*D*U$, e is the superdiagonal of U;
= 0: $A = L*D*L^H$, e is the subdiagonal of L

n
INTEGER. The order of the tridiagonal matrix A. $n \geq 0$.

nrhs
INTEGER. The number of right hand sides, that is, the number of columns of the matrix B. nrhs ≥ 0.

d
REAL for sptts2/cptts2
DOUBLE PRECISION for dptts2/zptts2.
Array, DIMENSION (n).
The n diagonal elements of the diagonal matrix D from the factorization of A.

e
REAL for sptts2
DOUBLE PRECISION for dptts2
COMPLEX for cptts2
COMPLEX*16 for zptts2.
Array, DIMENSION (n-1).
Contains the (n-1) subdiagonal elements of the unit bidiagonal factor L from the $L*D*L^T$ (for real flavors) or $L*D*L^H$ (for complex flavors when $iuplo = 0$) factorization of A.
For complex flavors when $iuplo = 1$, e contains the (n-1) superdiagonal elements of the unit bidiagonal factor U from the factorization $A = U^H*D*U$.

B
REAL for sptts2/cptts2
DOUBLE PRECISION for dptts2/zptts2.
Array, DIMENSION (ldb, $nrhs$).
On entry, the right hand side vectors B for the system of linear equations.

ldb
INTEGER. The leading dimension of the array B. $ldb \geq \max(1,n)$.

Output Parameters

b
On exit, the solution vectors, X.

?rscl

Multiplies a vector by the reciprocal of a real scalar.

Syntax

```
call srscl( n, sa, sx, incx )
call drscl( n, sa, sx, incx )
call csrscl( n, sa, sx, incx )
call zdrscl( n, sa, sx, incx )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?rscl` multiplies an *n*-element real/complex vector *x* by the real scalar 1/*a*. This is done without overflow or underflow as long as the final result *x*/*a* does not overflow or underflow.

Input Parameters

n	`INTEGER`. The number of components of the vector *x*.
sa	`REAL` for `srscl/csrscl` `DOUBLE PRECISION` for `drscl/zdrscl`. The scalar a which is used to divide each component of the vector *x*. sa must be ≥ 0, or the subroutine will divide by zero.

sx	`REAL` for `srscl`
	`DOUBLE PRECISION` for `drscl`
	`COMPLEX` for `csrscl`
	`COMPLEX*16` for `zdrscl`.
	Array, `DIMENSION (1+(`*n*`-1)* |`*incx*`|)`.
	The *n*-element vector *x*.

incx	`INTEGER`. The increment between successive values of the vector *sx*. If *incx* `> 0`, *sx*`(1)=`*x*`(1)`, and *sx*`(1+(i-1)*`*incx*`)=`*x*`(`*i*`)`, `1<`*i*≤*n*.

Output Parameters

sx	On exit, the result *x*/*a*.

?sygs2/?hegs2

Reduces a symmetric/Hermitian definite generalized eigenproblem to standard form, using the factorization results obtained from `?potrf` *(unblocked algorithm).*

Syntax

```
call ssygs2( itype, uplo, n, a, lda, b, ldb, info )
call dsygs2( itype, uplo, n, a, lda, b, ldb, info )
```

```
call chegs2( itype, uplo, n, a, lda, b, ldb, info )
call zhegs2( itype, uplo, n, a, lda, b, ldb, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine ?sygs2/?hegs2 reduces a real symmetric-definite or a complex Hermitian-definite generalized eigenproblem to standard form.

If *itype* = 1, the problem is

*A*x* = λ*B*x*

and *A* is overwritten by inv(*U*')*A*inv(*U*), or inv(*L*)*A*inv(*L*').

If *itype* = 2 or 3, the problem is

*A*B*x* = λ*x*, or *B*A*x* = λ*x*,

and *A* is overwritten by *U*A*U*' or *L*'*A*L*. Here *U*'(*L*') is the transpose (conjugate transpose) of *U* (*L*).

B must be previously factorized as *U*'*U* or *L*L*' by ?potrf.

Input Parameters

itype	INTEGER. = 1: compute inv(*U*')*A*inv(*U*), or inv(*L*)*A*inv(*L*'); = 2 or 3: compute *U*A*U*', or *L*'*A*L*.
uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix *A* is stored, and how *B* has been factorized. = 'U': upper triangular = 'L': lower triangular
n	INTEGER. The order of the matrices *A* and *B*. *n* ≥ 0.
a	REAL for ssygs2 DOUBLE PRECISION for dsygs2 COMPLEX for chegs2 COMPLEX*16 for zhegs2. Array, DIMENSION (*lda*, *n*). On entry, the symmetric/Hermitian matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).
b	REAL for ssygs2

	DOUBLE PRECISION for dsygs2 COMPLEX for chegs2 COMPLEX*16 for zhegs2. Array, DIMENSION (*ldb*, *n*). The triangular factor from the Cholesky factorization of *B* as returned by ?potrf.
ldb	INTEGER. The leading dimension of the array *b*. *ldb* ≥ max(1,*n*).

Output Parameters

a	On exit, If *info* = 0, the transformed matrix, stored in the same format as *A*.
info	INTEGER. = 0: successful exit. < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?sytd2/?hetd2

Reduces a symmetric/Hermitian matrix to real symmetric tridiagonal form by an orthogonal/unitary similarity transformation(unblocked algorithm).

Syntax

```
call ssytd2( uplo, n, a, lda, d, e, tau, info )
call dsytd2( uplo, n, a, lda, d, e, tau, info )
call chetd2( uplo, n, a, lda, d, e, tau, info )
call zhetd2( uplo, n, a, lda, d, e, tau, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?sytd2/?hetd2 reduces a real symmetric/complex Hermitian matrix *A* to real symmetric tridiagonal form *T* by an orthogonal/unitary similarity transformation: $Q^T*A*Q = T$ ($Q^H*A*Q = T$).

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix *A* is stored: = 'U': upper triangular = 'L': lower triangular
n	INTEGER. The order of the matrix *A*. *n* ≥ 0.
a	REAL for ssytd2 DOUBLE PRECISION for dsytd2 COMPLEX for chetd2

COMPLEX*16 for zhetd2.
Array, DIMENSION (*lda*, *n*).
On entry, the symmetric/Hermitian matrix *A*.
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

Output Parameters

a — On exit, if *uplo* = 'U', the diagonal and first superdiagonal of *a* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors;
if *uplo* = 'L', the diagonal and first subdiagonal of *a* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.

d
REAL for ssytd2/chetd2
DOUBLE PRECISION for dsytd2/zhetd2.
Array, DIMENSION (*n*).
The diagonal elements of the tridiagonal matrix *T*:
d(*i*) = *a*(*i*,*i*).

e
REAL for ssytd2/chetd2
DOUBLE PRECISION for dsytd2/zhetd2.
Array, DIMENSION (*n*-1).
The off-diagonal elements of the tridiagonal matrix *T*:
e(*i*) = *a*(*i*,*i*+1) if *uplo* = 'U',
e(*i*) = *a*(*i*+1,*i*) if *uplo* = 'L'.

tau
REAL for ssytd2
DOUBLE PRECISION for dsytd2
COMPLEX for chetd2
COMPLEX*16 for zhetd2.
Array, DIMENSION (*n*).
The first *n*-1 elements contain scalar factors of the elementary reflectors. *tau*(*n*) is used as workspace.

info
INTEGER.
= 0: successful exit
< 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?sytf2

Computes the factorization of a real/complex symmetric indefinite matrix, using the diagonal pivoting method (unblocked algorithm).

Syntax

```
call ssytf2( uplo, n, a, lda, ipiv, info )
call dsytf2( uplo, n, a, lda, ipiv, info )
call csytf2( uplo, n, a, lda, ipiv, info )
call zsytf2( uplo, n, a, lda, ipiv, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?sytf2` computes the factorization of a real/complex symmetric matrix *A* using the Bunch-Kaufman diagonal pivoting method:

$A = U*D*U^T$ ($A = U*D*U^H$), or $A = L*D*L^T$ ($A = L*D*L^H$),

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored = 'U': upper triangular = 'L': lower triangular
n	INTEGER. The order of the matrix *A*. $n \geq 0$.
a	REAL for ssytf2 DOUBLE PRECISION for dsytf2 COMPLEX for csytf2 COMPLEX*16 for zsytf2. Array, DIMENSION (*lda*, *n*). On entry, the symmetric matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. $lda \geq \max(1,n)$.

Output Parameters

a	On exit, the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L*.
ipiv	INTEGER. Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D* If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) are interchanged and *D*(*k*,*k*) is a 1-by-1 diagonal block. If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*-1) < 0, then rows and columns *k*-1 and -*ipiv*(*k*) are interchanged and *D*(*k*,*k*) is a 2-by-2 diagonal block. If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1)< 0, then rows and columns *k*+1 and -*ipiv*(*k*) were interchanged and *D*(*k*:*k*+1,*k*:*k*+1) is a 2-by-2 diagonal block.
info	INTEGER. = 0: successful exit < 0: if *info* = -*k*, the *k*-th argument has an illegal value > 0: if *info* = *k*, *D*(*k*,*k*) is exactly zero. The factorization are completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?hetf2

Computes the factorization of a complex Hermitian matrix, using the diagonal pivoting method (unblocked algorithm).

Syntax

```
call chetf2( uplo, n, a, lda, ipiv, info )
call zhetf2( uplo, n, a, lda, ipiv, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the factorization of a complex Hermitian matrix *A* using the Bunch-Kaufman diagonal pivoting method:

A = *U***D***U'* or *A* = *L***D***L'*

where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, *U'* is the conjugate transpose of *U*, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

This is the unblocked version of the algorithm, calling BLAS Level 2 Routines.

Input Parameters

uplo	CHARACTER*1.

	Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored: = 'U': Upper triangular = 'L': Lower triangular
n	INTEGER. The order of the matrix *A*. *n* ≥ 0.
A	COMPLEX for chetf2 COMPLEX*16 for zhetf2. Array, DIMENSION (*lda*, *n*). On entry, the Hermitian matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *A* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *A* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

Output Parameters

a	On exit, the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L*.
ipiv	INTEGER. Array, DIMENSION (*n*). Details of the interchanges and the block structure of *D* If *ipiv*(*k*) > 0, then rows and columns *k* and *ipiv*(*k*) were interchanged and *D(k,k)* is a 1-by-1 diagonal block. If *uplo* = 'U' and *ipiv*(*k*) = *ipiv*(*k*-1) < 0, then rows and columns *k*-1 and -*ipiv*(*k*) were interchanged and *D(k-1:k,k-1:k)* is a 2-by-2 diagonal block. If *uplo* = 'L' and *ipiv*(*k*) = *ipiv*(*k*+1) < 0, then rows and columns *k*+1 and -*ipiv*(*k*) were interchanged and *D(k:k*+1, *k:k*+1) is a 2-by-2 diagonal block.
info	INTEGER. = 0: successful exit < 0: if *info* = -*k*, the *k*-th argument had an illegal value > 0: if *info* = *k*, *D(k,k)* is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

?tgex2

Swaps adjacent diagonal blocks in an upper (quasi) triangular matrix pair by an orthogonal/unitary equivalence transformation.

Syntax

```
call stgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, n1, n2, work, lwork, info )
call dtgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, n1, n2, work, lwork, info )
call ctgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, info )
call ztgex2( wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, j1, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The real routines `stgex2/dtgex2` swap adjacent diagonal blocks (*A*11, *B*11) and (*A*22, *B*22) of size 1-by-1 or 2-by-2 in an upper (quasi) triangular matrix pair (*A*, *B*) by an orthogonal equivalence transformation. (*A*, *B*) must be in generalized real Schur canonical form (as returned by `sgges/dgges`), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks. *B* is upper triangular.

The complex routines `ctgex2/ztgex2` swap adjacent diagonal 1-by-1 blocks (*A*11, *B*11) and (*A*22, *B*22) in an upper triangular matrix pair (*A*, *B*) by an unitary equivalence transformation.

(*A*, *B*) must be in generalized Schur canonical form, that is, *A* and *B* are both upper triangular.

All routines optionally update the matrices *Q* and *Z* of generalized Schur vectors:

Q(in)**A*(in)**Z*(in)' = *Q*(out)**A*(out)**Z*(out)'

Q(in)**B*(in)**Z*(in)' = *Q*(out)**B*(out)**Z*(out)', where *Z*' is the transpose (conjugate transpose) of *Z*.

Input Parameters

wantq	LOGICAL. If *wantq* = .TRUE. : update the left transformation matrix *Q*; If *wantq* = .FALSE. : do not update *Q*.
wantz	LOGICAL. If *wantz* = .TRUE. : update the right transformation matrix *Z*; If *wantz* = .FALSE.: do not update *Z*.
n	INTEGER. The order of the matrices *A* and *B*. *n* ≥ 0.
a, *b*	REAL for stgex2 DOUBLE PRECISION for dtgex2 COMPLEX for ctgex2 COMPLEX*16 for ztgex2. Arrays, DIMENSION (*lda*, *n*) and (*ldb*, *n*), respectively. On entry, the matrices *A* and *B* in the pair (*A*, *B*).
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

ldb	INTEGER. The leading dimension of the array *b*. *ldb* ≥ max(1,*n*).
q, *z*	REAL for stgex2 DOUBLE PRECISION for dtgex2 COMPLEX for ctgex2 COMPLEX*16 for ztgex2. Arrays, DIMENSION (*ldq*, *n*) and (*ldz*, *n*), respectively. On entry, if *wantq* = .TRUE., *q* contains the orthogonal/unitary matrix *Q*, and if *wantz* = .TRUE., *z* contains the orthogonal/unitary matrix *Z*.
ldq	INTEGER. The leading dimension of the array *q*. *ldq* ≥ 1. If *wantq* = .TRUE., *ldq* ≥ *n*.
ldz	INTEGER. The leading dimension of the array *z*. *ldz* ≥ 1. If *wantz* = .TRUE., *ldz* ≥ *n*.
j1	INTEGER. The index to the first block (*A*11, *B*11). 1 ≤ *j1* ≤ *n*.
n1	INTEGER. Used with real flavors only. The order of the first block (*A*11, *B*11). *n1* = 0, 1 or 2.
n2	INTEGER. Used with real flavors only. The order of the second block (*A*22, *B*22). *n2* = 0, 1 or 2.
work	REAL for stgex2 DOUBLE PRECISION for dtgex2. Workspace array, DIMENSION (max(1, *lwork*)). Used with real flavors only.
lwork	INTEGER. The dimension of the array *work*. *lwork*≥max(*n**(*n2*+*n1*), 2*(*n2*+*n1*)^2)

Output Parameters

a	On exit, the updated matrix *A*.
B	On exit, the updated matrix *B*.
Q	On exit, the updated matrix *Q*. Not referenced if *wantq* = .FALSE..
z	On exit, the updated matrix *Z*. Not referenced if *wantz* = .FALSE..
info	INTEGER. =0: Successful exit For stgex2/dtgex2: If *info* = 1, the transformed matrix (*A*, *B*) would be too far from generalized Schur form; the blocks are not swapped and (*A*, *B*) and (*Q*, *Z*) are unchanged. The problem of swapping is too ill-conditioned. If *info* = -16: *lwork* is too small. Appropriate value for *lwork* is returned in *work*(1). For ctgex2/ztgex2: If *info* = 1, the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is ill-conditioned.

?tgsy2

Solves the generalized Sylvester equation (unblocked algorithm).

Syntax

```
call stgsy2( trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale, rdsum, rdscal, iwork, pq, info )
call dtgsy2( trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale, rdsum, rdscal, iwork, pq, info )
call ctgsy2( trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale, rdsum, rdscal, iwork, pq, info )
call ztgsy2( trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale, rdsum, rdscal, iwork, pq, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?tgsy2` solves the generalized Sylvester equation:

*A*R-L*B=scale*C* (1)

*D*R-L*E=scale*F*

using Level 1 and 2 BLAS, where *R* and *L* are unknown *m*-by-*n* matrices, (*A*, *D*), (*B*, *E*) and (*C*, *F*) are given matrix pairs of size *m*-by -*m*, *n*-by-*n* and *m*-by-*n*, respectively. For `stgsy2`/`dtgsy2`, pairs (*A*, *D*) and (*B*, *E*) must be in generalized Schur canonical form, that is, *A*, *B* are upper quasi triangular and *D*, *E* are upper triangular. For `ctgsy2`/`ztgsy2`, matrices *A*, *B*, *D* and *E* are upper triangular (that is, (*A*, *D*) and (*B*, *E*) in generalized Schur form).

The solution (*R*, *L*) overwrites (*C*, *F*).

`0` ≤ *scale* ≤ `1` is an output scaling factor chosen to avoid overflow.

In matrix notation, solving equation (1) corresponds to solve

*Z*x* = scale**b*

where *Z* is defined as

$$Z = \begin{bmatrix} \mathrm{kron}(I_n, A) & -\mathrm{kron}(B', I_m) \\ \mathrm{kron}(I_n, D) & -\mathrm{kron}(E', I_m) \end{bmatrix} \quad (2)$$

Here I_k is the identity matrix of size *k* and *X*' is the transpose (conjugate transpose) of *X*. `kron`(*X*, *Y*) denotes the Kronecker product between the matrices *X* and *Y*.

If *trans* = `'T'` , solve the transposed (conjugate transposed) system

*Z'*y* = scale**b*

for *y*, which is equivalent to solve for *R* and *L* in

```
A'*R+D'*L=scale*C                    (3)
R*B'+L*E'=scale*(-F)
```

This case is used to compute an estimate of `Dif[(A,D),(B,E)] = sigma_min(Z)` using reverse communication with `?lacon`.

`?tgsy2` also (for *ijob* ≥ 1) contributes to the computation in `?tgsyl` of an upper bound on the separation between two matrix pairs. Then the input (*A*, *D*), (*B*, *E*) are sub-pencils of the matrix pair (two matrix pairs) in `?tgsyl`. See `?tgsyl` for details.

Input Parameters

trans	CHARACTER*1. If *trans* = 'N', solve the generalized Sylvester equation (1); If *trans* = 'T': solve the 'transposed' system (3).
ijob	INTEGER. Specifies what kind of functionality is to be performed. If *ijob* = 0: solve (1) only. If *ijob* = 1: a contribution from this subsystem to a Frobenius norm-based estimate of the separation between two matrix pairs is computed (look ahead strategy is used); If *ijob* = 2: a contribution from this subsystem to a Frobenius norm-based estimate of the separation between two matrix pairs is computed (?gecon on sub-systems is used). Not referenced if *trans* = 'T'.
m	INTEGER. On entry, *m* specifies the order of *A* and *D*, and the row dimension of *C*, *F*, *R* and *L*.
n	INTEGER. On entry, *n* specifies the order of *B* and *E*, and the column dimension of *C*, *F*, *R* and *L*.
a, *b*	REAL for stgsy2 DOUBLE PRECISION for dtgsy2 COMPLEX for ctgsy2 COMPLEX*16 for ztgsy2. Arrays, DIMENSION (*lda*, *m*) and (*ldb*, *n*), respectively. On entry, *a* contains an upper (quasi) triangular matrix *A*, and *b* contains an upper (quasi) triangular matrix *B*.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1, *m*).
ldb	INTEGER. The leading dimension of the array *b*. *ldb* ≥ max(1, *n*).
c, *f*	REAL for stgsy2 DOUBLE PRECISION for dtgsy2 COMPLEX for ctgsy2 COMPLEX*16 for ztgsy2. Arrays, DIMENSION (*ldc*, *n*) and (*ldf*, *n*), respectively. On entry, *c* contains the right-hand-side of the first matrix equation in (1), and *f* contains the right-hand-side of the second matrix equation in (1).

ldc INTEGER. The leading dimension of the array *c*. *ldc* ≥ max(1, *m*).

d, *e* REAL for stgsy2
DOUBLE PRECISION for dtgsy2
COMPLEX for ctgsy2
COMPLEX*16 for ztgsy2.
Arrays, DIMENSION (*ldd*, *m*) and (*lde*, *n*), respectively. On entry, *d* contains an upper triangular matrix *D*, and *e* contains an upper triangular matrix *E*.

ldd INTEGER. The leading dimension of the array *d*. *ldd* ≥ max(1, *m*).

lde INTEGER. The leading dimension of the array *e*. *lde* ≥ max(1, *n*).

ldf INTEGER. The leading dimension of the array *f*. *ldf* ≥ max(1, *m*).

rdsum REAL for stgsy2/ctgsy2
DOUBLE PRECISION for dtgsy2/ztgsy2.
On entry, the sum of squares of computed contributions to the Dif-estimate under computation by ?tgsyL, where the scaling factor *rdscal* has been factored out.

rdscal REAL for stgsy2/ctgsy2
DOUBLE PRECISION for dtgsy2/ztgsy2.
On entry, scaling factor used to prevent overflow in *rdsum*.

iwork INTEGER. Used with real flavors only.
Workspace array, DIMENSION (*m*+*n*+2).

Output Parameters

c On exit, if *ijob* = 0, *c* is overwritten by the solution *R*.

f On exit, if *ijob* = 0, *f* is overwritten by the solution *L*.

scale REAL for stgsy2/ctgsy2
DOUBLE PRECISION for dtgsy2/ztgsy2.
On exit, 0 ≤ *scale* ≤ 1. If 0 < *scale* < 1, the solutions *R* and *L* (*C* and *F* on entry) hold the solutions to a slightly perturbed system, but the input matrices *A*, *B*, *D* and *E* are not changed. If *scale* = 0, *R* and *L* hold the solutions to the homogeneous system with *C* = *F* = 0. Normally *scale* = 1.

rdsum On exit, the corresponding sum of squares updated with the contributions from the current sub-system.
If *trans* = 'T', *rdsum* is not touched.
Note that *rdsum* only makes sense when ?tgsy2 is called by ?tgsyl.

rdscal On exit, *rdscal* is updated with respect to the current contributions in *rdsum*.
If *trans* = 'T' , *rdscal* is not touched.
Note that *rdscal* only makes sense when ?tgsy2 is called by ?tgsyl.

pq INTEGER. Used with real flavors only.

	On exit, the number of subsystems (of size 2-by-2, 4-by-4 and 8-by-8) solved by the routine `stgsy2/dtgsy2`.
info	`INTEGER`. On exit, if *info* is set to = 0: Successful exit < 0: If *info* = -*i*, the *i*-th argument has an illegal value. > 0: The matrix pairs (*A*, *D*) and (*B*, *E*) have common or very close eigenvalues.

?trti2

Computes the inverse of a triangular matrix (unblocked algorithm).

Syntax

```
call strti2( uplo, diag, n, a, lda, info )
call dtrti2( uplo, diag, n, a, lda, info )
call ctrti2( uplo, diag, n, a, lda, info )
call ztrti2( uplo, diag, n, a, lda, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine `?trti2` computes the inverse of a real/complex upper or lower triangular matrix.

This is the *Level 2 BLAS* version of the algorithm.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the matrix *A* is upper or lower triangular. = `'U'`: upper triangular = `'L'`: lower triangular
diag	`CHARACTER*1`. Specifies whether or not the matrix *A* is unit triangular. = `'N'`: non-unit triangular = `'N'`: non-unit triangular
n	`INTEGER`. The order of the matrix *A*. *n* ≥ 0.

a	`REAL` for `strti2`
	`DOUBLE PRECISION` for `dtrti2`
	`COMPLEX` for `ctrti2`
	`COMPLEX*16` for `ztrti2`.
	Array, `DIMENSION` (*lda*, *n*).
	On entry, the triangular matrix *A*.
	If *uplo* = `'U'`, the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.
If *diag* = 'U', the diagonal elements of *a* are also not referenced and are assumed to be 1.

lda — INTEGER. The leading dimension of the array *a*. *lda* ≥ max(1,*n*).

Output Parameters

a — On exit, the (triangular) inverse of the original matrix, in the same storage format.

info — INTEGER.
= 0: successful exit
< 0: if *info* = -*k*, the *k*-th argument had an illegal value

clag2z

Converts a complex single precision matrix to a complex double precision matrix.

Syntax

```
call clag2z( m, n, sa, ldsa, a, lda, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine converts a complex single precision matrix *SA* to a complex double precision matrix *A*.

Note that while it is possible to overflow while converting from double to single, it is not possible to overflow when converting from single to double.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m — INTEGER. The number of lines of the matrix *A* (*m* ≥ 0).

n — INTEGER. The number of columns in the matrix *A* (*n* ≥ 0).

ldsa — INTEGER. The leading dimension of the array *sa*; *ldsa* ≥ max(1, *m*).

a — DOUBLE PRECISION array, DIMENSION (*lda*, *n*).
On entry, contains the *m*-by-*n* coefficient matrix *A*.

lda — INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *m*).

Output Parameters

sa — REAL array, DIMENSION (*ldsa*, *n*).
On exit, contains the *m*-by-*n* coefficient matrix *SA*.

info — INTEGER.

If *info* = 0, the execution is successful.

dlag2s

Converts a double precision matrix to a single precision matrix.

Syntax

```
call dlag2s( m, n, a, lda, sa, ldsa, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine converts a double precision matrix *SA* to a single precision matrix *A*.

RMAX is the overflow for the single precision arithmetic. dlag2s checks that all the entries of *A* are between -RMAX and RMAX. If not, the convertion is aborted and a flag is raised.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m	INTEGER. The number of lines of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in the matrix *A* (*n* ≥ 0).
a	DOUBLE PRECISION array, DIMENSION (*lda*, *n*). On entry, contains the *m*-by-*n* coefficient matrix *A*.
lda	INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *m*).
ldsa	INTEGER. The leading dimension of the array *sa*; *ldsa* ≥ max(1, *m*).

Output Parameters

sa	REAL array, DIMENSION (*ldsa*, *n*). On exit, if *info* = 0, contains the *m*-by-*n* coefficient matrix *SA*; if *info* > 0, the content of *sa* is unspecified.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, an entry of the matrix *A* is greater than the single precision overflow threshold; in this case, the content of *sa* on exit is unspecified.

slag2d

Converts a single precision matrix to a double precision matrix.

Syntax

```
call slag2d( m, n, sa, ldsa, a, lda, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine converts a single precision matrix *SA* to a double precision matrix *A*.

Note that while it is possible to overflow while converting from double to single, it is not possible to overflow when converting from single to double.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m	INTEGER. The number of lines of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in the matrix *A* (*n* ≥ 0).
sa	REAL array, DIMENSION (*ldsa*, *n*). On entry, contains the *m*-by-*n* coefficient matrix *SA*.
ldsa	INTEGER. The leading dimension of the array *sa*; *ldsa* ≥ max(1, *m*).
lda	INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *m*).

Output Parameters

a	DOUBLE PRECISION array, DIMENSION (*lda*, *n*). On exit, contains the *m*-by-*n* coefficient matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful.

zlag2c

Converts a complex double precision matrix to a complex single precision matrix.

Syntax

```
call zlag2c( m, n, a, lda, sa, ldsa, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine converts a double precision complex matrix *SA* to a single precision complex matrix *A*.

RMAX is the overflow for the single precision arithmetic. `zlag2c` checks that all the entries of *A* are between -RMAX and RMAX. If not, the convertion is aborted and a flag is raised.

This is an auxiliary routine so there is no argument checking.

Input Parameters

m	INTEGER. The number of lines of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in the matrix *A* (*n* ≥ 0).

a	DOUBLE COMPLEX array, DIMENSION (*lda*, *n*). On entry, contains the *m*-by-*n* coefficient matrix *A*.
lda	INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *m*).
ldsa	INTEGER. The leading dimension of the array *sa*; *ldsa* ≥ max(1, *m*).

Output Parameters

sa	COMPLEX array, DIMENSION (*ldsa*, *n*). On exit, if *info* = 0, contains the *m*-by-*n* coefficient matrix *SA*; if *info* > 0, the content of *sa* is unspecified.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, an entry of the matrix *A* is greater than the single precision overflow threshold; in this case, the content of *sa* on exit is unspecified.

?larfp

Generates a real or complex elementary reflector.

Syntax

FORTRAN 77:

```
call slarfp(n, alpha, x, incx, tau)
call dlarfp(n, alpha, x, incx, tau)
call clarfp(n, alpha, x, incx, tau)
call zlarfp(n, alpha, x, incx, tau)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The ?larfp routines generate a real or complex elementary reflector *H* of order *n*, such that

```
H * (alpha) = (beta),
    (  x  )   ( 0  )
```

and *H*'**H* =*I* for real flavors, conjg(*H*)'**H* =*I* for complex flavors.

Here

alpha and *beta* are scalars, *beta* is real and non-negative,

x is (*n*-1)-element vector.

H is represented in the form

```
H = I - tau*( 1 )* (1  v'),
            ( v )
```

where *tau* is scalar, and *v* is (*n*-1)-element vector .

For real flavors if the elements of *x* are all zero, then *tau* = 0 and *H* is taken to be the unit matrix. Otherwise 1 ≤ *tau* ≤ 2.

For complex flavors if the elements of *x* are all zero and *alpha* is real, then *tau* = 0 and *H* is taken to be the unit matrix. Otherwise 1 ≤ real(*tau*) ≤ 2, and abs (*tau*-1) ≤ 1.

Input Parameters

n	INTEGER. Specifies the order of the elementary reflector.
alpha	REAL for slarfp DOUBLE PRECISION for dlarfp COMPLEX for clarfp DOUBLE COMPLEX for zlarfp Specifies the scalar *alpha*.
x	REAL for slarfp DOUBLE PRECISION for dlarfp COMPLEX for clarfp DOUBLE COMPLEX for zlarfp Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). It contains the vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

alpha	Overwritten by the value *beta*.
y	Overwritten by the vector *v*.
tau	REAL for slarfp DOUBLE PRECISION for dlarfp COMPLEX for clarfp DOUBLE COMPLEX for zlarfp Contains the scalar *tau*.

ila?lc

Scans a matrix for its last non-zero column.

Syntax

FORTRAN 77:

value = ilaslc(*m*, *n*, *a*, *lda*)

value = iladlc(*m*, *n*, *a*, *lda*)

value = ilaclc(*m*, *n*, *a*, *lda*)

value = ilazlc(*m*, *n*, *a*, *lda*)

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The `ila?lc` routines scan a matrix *A* for its last non-zero column.

Input Parameters

m	`INTEGER`. Specifies number of rows in the matrix *A*.
n	`INTEGER`. Specifies number of columns in the matrix *A*.

a	`REAL` for `ilaslc`
	`DOUBLE PRECISION` for `iladlc`
	`COMPLEX` for `ilaclc`
	`DOUBLE COMPLEX` for `ilazlc`
	Array, `DIMENSION (`*lda*`, *)`. The second dimension of *a* must be at least `max(1, `*n*`)`.
	Before entry the leading *n*-by-*n* part of the array *a* must contain the matrix *A*.

lda	`INTEGER`. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, `*m*`)`.

Output Parameters

value	`INTEGER` Number of the last non-zero column.

ila?lr

Scans a matrix for its last non-zero row.

Syntax

FORTRAN 77:

value = `ilaslr(`*m*`, `*n*`, `*a*`, `*lda*`)`

value = `iladlr(`*m*`, `*n*`, `*a*`, `*lda*`)`

value = `ilaclr(`*m*`, `*n*`, `*a*`, `*lda*`)`

value = `ilazlr(`*m*`, `*n*`, `*a*`, `*lda*`)`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The `ila?lr` routines scan a matrix *A* for its last non-zero row.

Input Parameters

m	`INTEGER`. Specifies number of rows in the matrix *A*.
n	`INTEGER`. Specifies number of columns in the matrix *A*.
a	`REAL` for `ilaslr`

DOUBLE PRECISION for iladlr
COMPLEX for ilaclr
DOUBLE COMPLEX for idazlr
Array, DIMENSION (*lda*, *). The second dimension of *a* must be at least max(1, *n*).
Before entry the leading *n*-by-*n* part of the array *a* must contain the matrix *A*.

lda — INTEGER. Specifies the leading dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

value — INTEGER
Number of the last non-zero row.

?gsvj0

Pre-processor for the routine ?gesvj.

Syntax

FORTRAN 77:

```
call sgsvj0(jobv, m, n, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
```

```
call dgsvj0(jobv, m, n, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, and in mkl_lapack.h for C interface.

This routine is called from ?gesvj as a pre-processor and that is its main purpose. It applies Jacobi rotations in the same way as ?gesvj does, but it does not check convergence (stopping criterion).

The routine ?gsvj0 enables ?gesvj to use a simplified version of itself to work on a submatrix of the original matrix.

Input Parameters

jobv — CHARACTER*1. Must be 'V', 'A', or 'N'.
Specifies whether the output from this routine is used to compute the matrix *V*.
If *jobv* = 'V', the product of the Jacobi rotations is accumulated by post-multiplying the *n*-by-*n* array *v*.
If *jobv* = 'A', the product of the Jacobi rotations is accumulated by post-multiplying the *mv*-by-*n* array *v*.
If *jobv* = 'N', the Jacobi rotations are not accumulated.

m — INTEGER. The number of rows of the input matrix *A* ($m \geq 0$).

n — INTEGER. The number of columns of the input matrix *B* ($m \geq n \geq 0$).

a	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. Arrays, DIMENSION (*lda*, *). Contains the *m*-by-*n* matrix *A* , such that *A**diag(*D*) represents the input matrix. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The leading dimension of *a*; at least max(1, *m*).
d	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. Arrays, DIMENSION (*n*). Contains the diagonal matrix *D* that accumulates the scaling factors from the fast scaled Jacobi rotations. On entry *A**diag(*D*) represents the input matrix.
sva	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. Arrays, DIMENSION (*n*). Contains the Euclidean norms of the columns of the matrix *A**diag(*D*).
mv	INTEGER. The first dimension of *b*; at least max(1, *p*). If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'N', then *mv* is not referenced .
v	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. Array, DIMENSION (*ldv*, *). The second dimension of *a* must be at least max(1, *n*). If *jobv* = 'V', then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'N', then *v* is not referenced.
ldv	INTEGER. The leading dimension of the array *v*; *ldv* ≥ 1 *ldv* ≥*n* if *jobv* = 'V'; *ldv* ≥*mv* if *jobv* = 'A'.
eps	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. The relative machine precision (epsilon) returned by the routine ?lamch.
sfmin	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. Value of safe minimum returned by the routine ?lamch.
tol	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. The threshold for Jacobi rotations. For a pair *A*(:,p), *A*(:,q) of pivot columns, the Jacobi rotation is applied only if abs(cos(angle(*A*(:,p),*A*(:,q))))> *tol*.
nsweep	INTEGER.

	The number of sweeps of Jacobi rotations to be performed.
work	REAL for sgsvj0 DOUBLE PRECISION for dgsvj0. Workspace array, DIMENSION (*lwork*).
lwork	INTEGER. The size of the array *work*; at least max(1, *m*).

Output Parameters

a	On exit, *A**diag(*D*) represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively
d	On exit, *A**diag(*D*) represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively.
sva	On exit, contains the Euclidean norms of the columns of the output matrix *A**diag(*D*).
v	If *jobv* = 'V', then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'N', then *v* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?gsvj1

Pre-processor for the routine ?gesvj *, applies Jacobi rotations targeting only particular pivots.*

Syntax

FORTRAN 77:

```
call sgsvj1(jobv, m, n, n1, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
```

```
call dgsvj1(jobv, m, n, n1, a, lda, d, sva, mv, v, ldv, eps, sfmin, tol, nsweep, work, lwork, info)
```

Description

The routine ?gsvj1 is declared in mkl_lapack.fi for FORTRAN 77 interface, and in mkl_lapack.h for C interface.

This routine is called from ?gesvj as a pre-processor and that is its main purpose. It applies Jacobi rotations in the same way as ?gesvj does, but it targets only particular pivots and it does not check convergence (stopping criterion).

The routine ?gsvj1 applies few sweeps of Jacobi rotations in the column space of the input *m*-by-*n* matrix *A*. The pivot pairs are taken from the (1,2) off-diagonal block in the corresponding *n*-by-*n* Gram matrix *A*'**A*. The block-entries (*tiles*) of the (1,2) off-diagonal block are marked by the [x]'s in the following scheme:

```
|  *   *   * [x] [x] [x] |
|  *   *   * [x] [x] [x] |
|  *   *   * [x] [x] [x] |
| [x] [x] [x]  *   *   *  |
| [x] [x] [x]  *   *   *  |
| [x] [x] [x]  *   *   *  |
```

row-cycling in the *nblr*-by-*nblc* [x] blocks, row-cyclic pivoting inside each [x] block

In terms of the columns of the matrix *A*, the first *n1* columns are rotated 'against' the remaining *n-n1* columns, trying to increase the angle between the corresponding subspaces. The off-diagonal block is *n1*-by-(*n-n1*) and it is tiled using quadratic tiles. The number of sweeps is specified by *nsweep*, and the orthogonality threshold is set by *tol*.

Input Parameters

jobv
CHARACTER*1. Must be 'V', 'A', or 'N'.
Specifies whether the output from this routine is used to compute the matrix *V*.
If *jobv* = 'V', the product of the Jacobi rotations is accumulated by post-multiplying the *n*-by-*n* array *v*.
If *jobv* = 'A', the product of the Jacobi rotations is accumulated by post-multiplying the *mv*-by-*n* array *v*.
If *jobv* = 'N', the Jacobi rotations are not accumulated.

m
INTEGER. The number of rows of the input matrix *A* ($m \geq 0$).

n
INTEGER. The number of columns of the input matrix *B* ($m \geq n \geq 0$).

n1
INTEGER. Specifies the 2-by-2 block partition. The first *n1* columns are rotated 'against' the remaining *n-n1* columns of the matrix *A*.

a
REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
Arrays, DIMENSION (*lda*, *). Contains the *m*-by-*n* matrix *A* , such that *A*diag(*D*) represents the input matrix. The second dimension of *a* must be at least max(1, *n*).

lda
INTEGER. The leading dimension of *a*; at least max(1, *m*).

d
REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
Arrays, DIMENSION (*n*). Contains the diagonal matrix *D* that accumulates the scaling factors from the fast scaled Jacobi rotations. On entry *A*diag(*D*) represents the input matrix.

sva
REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
Arrays, DIMENSION (*n*). Contains the Euclidean norms of the columns of the matrix *A*diag(*D*).

mv
INTEGER. The first dimension of *b*; at least max(1, *p*).

If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations.
If *jobv* = 'N', then *mv* is not referenced .

v — REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
Array, DIMENSION (*ldv*, *). The second dimension of *a* must be at least max(1, *n*).
If *jobv* = 'V', then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations.
If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations.
If *jobv* = 'N', then *v* is not referenced.

ldv — INTEGER. The leading dimension of the array *v*; *ldv* ≥ 1

ldv ≥ *n* if *jobv* = 'V';

ldv ≥ *mv* if *jobv* = 'A'.

eps — REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
The relative machine precision (epsilon) returned by the routine ?lamch.

sfmin — REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
Value of safe minimum returned by the routine ?lamch.

tol — REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
The threshold for Jacobi rotations. For a pair *A*(:,p), *A*(:,q) of pivot columns, the Jacobi rotation is applied only if abs(cos(angle(*A*(:,p),*A*(:,q))))> *tol*.

nsweep — INTEGER.
The number of sweeps of Jacobi rotations to be performed.

work — REAL for sgsvj1
DOUBLE PRECISION for dgsvj1.
Workspace array, DIMENSION (*lwork*).

lwork — INTEGER. The size of the array *work*; at least max(1, *m*).

Output Parameters

a — On exit, *A**diag(*D*) represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively

d — On exit, *A**diag(*D*) represents the input matrix post-multiplied by a sequence of Jacobi rotations, where the rotation threshold and the total number of sweeps are given in *tol* and *nsweep*, respectively.

sva — On exit, contains the Euclidean norms of the columns of the output matrix *A**diag(*D*).

v	If *jobv* = 'V', then *n* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'A', then *mv* rows of *v* are post-multiplied by a sequence of Jacobi rotations. If *jobv* = 'N', then *v* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?sfrk

Performs a symmetric rank-k operation for matrix in RFP format.

Syntax

FORTRAN 77:

```
call ssfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
call dsfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, and in `mkl_lapack.h` for C interface.

The `?sfrk` routines perform a matrix-matrix operation using symmetric matrices. The operation is defined as

C := *alpha***A***A*' + *beta***C*,

or

C := *alpha***A*'**A* + *beta***C*,

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix in rectangular full packed (RFP) format,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

transr	CHARACTER*1. if *transr* = 'N' or 'n', the normal form of RFP *C* is stored; if *transr*= 'T' or 't', the transpose form of RFP *C* is stored.
uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *c* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *c* is used.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *C* := *alpha***A***A*' + *beta***C*;

	if *trans* = 'T' or 't', then *C* := *alpha**A'*A + *beta**C*;
n	INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *A*, and on entry with *trans* = 'T' or 't' , *k* specifies the number of rows of the matrix *A*. The value of *k* must be at least zero.
alpha	REAL for ssfrk DOUBLE PRECISION for dsfrk Specifies the scalar *alpha*.
a	REAL for ssfrk DOUBLE PRECISION for dsfrk Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1,*n*), otherwise *lda* must be at least max(1, *k*).
beta	REAL for ssfrk DOUBLE PRECISION for dsfrk Specifies the scalar *beta*.
c	REAL for ssfrk DOUBLE PRECISION for dsfrk Array, DIMENSION (*n**(*n*+1)/2). Before entry contains the symmetric matrix *C* in RFP format.

Output Parameters

c	If *trans* = 'N' or 'n', then *c* contains *C* := *alpha***A***A*' + *beta***C*; if *trans* = 'T' or 't', then *c* contains *C* := *alpha***A*'**A* + *beta***C*;

?hfrk

Performs a Hermitian rank-k operation for matrix in RFP format.

Syntax

```
call chfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
call zhfrk(transr, uplo, trans, n, k, alpha, a, lda, beta, c)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, and in mkl_lapack.h for C interface.

The ?hfrk routines perform a matrix-matrix operation using Hermitian matrices. The operation is defined as *C* := *alpha***A**conjg(*A*') + *beta***C*,

or

C := *alpha**conjg(*A*')**A* + *beta***C*,

where:

alpha and *beta* are real scalars,

C is an *n*-by-*n* Hermitian matrix in RFP format,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

transr	CHARACTER*1. if *transr* = 'N' or 'n', the normal form of RFP *C* is stored; if *transr* = 'C' or 'c', the conjugate-transpose form of RFP *C* is stored.
uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *c* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *c* is used.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *C* := *alpha***A**conjg(*A*') + *beta***C*; if *trans* = 'C' or 'c', then *C* := *alpha**conjg(*A*')**A* + *beta***C*.
n	INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *a*, and on entry with *trans* = 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the matrix *a*. The value of *k* must be at least zero.
alpha	COMPLEX for chfrk DOUBLE COMPLEX for zhfrk Specifies the scalar *alpha*.
a	COMPLEX for chfrk DOUBLE COMPLEX for zhfrk Array, DIMENSION (*lda*,*ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1,*n*), otherwise *lda* must be at least max(1, *k*).
beta	COMPLEX for chfrk DOUBLE COMPLEX for zhfrk Specifies the scalar *beta*.
c	COMPLEX for chfrk

DOUBLE COMPLEX for zhfrk
Array, DIMENSION (*n**(*n*+1)/2). Before entry contains the Hermitian matrix *C* in in RFP format.

Output Parameters

c — If *trans* = 'N' or 'n', then *c* contains *C* := *alpha***A**conjg(*A*') + *beta***C*;
if *trans* = 'C' or 'c', then *c* contains *C* := *alpha**conjg(*A*')**A* + *beta***C* ;

?tfsm

Solves a matrix equation (one operand is a triangular matrix in RFP format).

Syntax

FORTRAN 77:

```
call stfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
call dtfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
call ctfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
call ztfsm(transr, side, uplo, trans, diag, m, n, alpha, a, b, ldb)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The ?tfsm routines solve one of the following matrix equations:
op(*A*)**X* = *alpha***B*,

or
*X**op(*A*) = *alpha***B*,

where:

alpha is a scalar,

X and *B* are *m*-by-*n* matrices,

A is a unit, or non-unit, upper or lower triangular matrix in rectangular full packed (RFP) format.

op(*A*) is one of op(*A*) = *A*, or op(*A*) = *A*', or op(*A*) = conjg(*A*').

The matrix *B* is overwritten by the solution matrix *X*.

Input Parameters

transr — CHARACTER*1.
if *transr* = 'N' or 'n', the normal form of RFP *A* is stored;
if *transr* = 'T' or 't', the transpose form of RFP *A* is stored;

	if *transr* = 'C' or 'c', the conjugate-transpose form of RFP *A* is stored.
side	CHARACTER*1. Specifies whether op(*A*) appears on the left or right of *X* in the equation: if *side* = 'L' or 'l', then op(*A*)**X* = *alpha***B*; if *side* = 'R' or 'r', then *X**op(*A*) = *alpha***B*.
uplo	CHARACTER*1. Specifies whether the RFP matrix *A* is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
trans	CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication: if *trans* = 'N' or 'n', then op(*A*) = *A*; if *trans* = 'T' or 't', then op(*A*) = *A*'; if *trans* = 'C' or 'c', then op(*A*) = conjg(*A*').
diag	CHARACTER*1. Specifies whether the RFP matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
m	INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.
alpha	REAL for stfsm DOUBLE PRECISION for dtfsm COMPLEX for ctfsm DOUBLE COMPLEX for ztfsm Specifies the scalar *alpha*. When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.
a	REAL for stfsm DOUBLE PRECISION for dtfsm COMPLEX for ctfsm DOUBLE COMPLEX for ztfsm Array, DIMENSION (*n**(*n*+1)/2). Contains the matrix *A* in RFP format.
b	REAL for stfsm DOUBLE PRECISION for dtfsm COMPLEX for ctfsm DOUBLE COMPLEX for ztfsm Array, DIMENSION (*ldb*,*n*). Before entry, the leading *m*-by-*n* part of the array *b* must contain the right-hand side matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, +*m*).

Output Parameters

b	Overwritten by the solution matrix *X*.

?lansf

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a symmetric matrix in RFP format.

Syntax

val = slansf(*norm*, *transr*, *uplo*, *n*, *a*, *work*)

val = dlansf(*norm*, *transr*, *uplo*, *n*, *a*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lansf returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* real symmetric matrix *A* in the rectangular full packed (RFP) format .

Input Parameters

norm
CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

transr
CHARACTER*1.
Specifies whether the RFP format of matrix *A* is normal or transposed format.
If *transr* = 'N': RFP format is normal;
if *transr* = 'T': RFP format is transposed.

uplo
CHARACTER*1.
Specifies whether the RFP matrix *A* came from upper or lower triangular matrix.
If *uplo* = 'U': RFP matrix *A* came from an upper triangular matrix;
if *uplo* = 'L': RFP matrix *A* came from a lower triangular matrix.

n
INTEGER. The order of the matrix *A*. $n \geq 0$.
When *n* = 0, ?lansf is set to zero.

a
REAL for slansf
DOUBLE PRECISION for dlansf
Array, DIMENSION (*n**(*n*+1)/2).
The upper (if *uplo* = 'U') or lower (if *uplo* = 'L') part of the symetric matrix *A* stored in RFP format.

work
REAL for slansf.
DOUBLE PRECISION for dlansf.

	Workspace array, DIMENSION (max(1, *lwork*)), where *lwork* ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val	REAL for slansf DOUBLE PRECISION for dlansf Value returned by the function.

?lanhf

Returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a Hermitian matrix in RFP format.

Syntax

val = clanhf(*norm*, *transr*, *uplo*, *n*, *a*, *work*)

val = zlanhf(*norm*, *transr*, *uplo*, *n*, *a*, *work*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lanhf returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an *n*-by-*n* complex Hermitian matrix *A* in the rectangular full packed (RFP) format.

Input Parameters

norm	CHARACTER*1. Specifies the value to be returned by the routine: = 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*. = '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum), = 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum), = 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).
transr	CHARACTER*1. Specifies whether the RFP format of matrix *A* is normal or conjugate-transposed format. If *transr* = 'N': RFP format is normal; if *transr* = 'C': RFP format is conjugate-transposed.
uplo	CHARACTER*1. Specifies whether the RFP matrix *A* came from upper or lower triangular matrix. If *uplo* = 'U': RFP matrix *A* came from an upper triangular matrix;

if *uplo* = 'L': RFP matrix *A* came from a lower triangular matrix.

n — INTEGER. The order of the matrix *A*. $n \geq 0$.
When *n* = 0, ?lanhf is set to zero.

a — COMPLEX for clanhf
DOUBLE COMPLEX for zlanhf
Array, DIMENSION (*n**(*n*+1)/2).
The upper (if *uplo* = 'U') or lower (if *uplo* = 'L') part of the Hermitian matrix *A* stored in RFP format.

work — COMPLEX for clanhf.
DOUBLE COMPLEX for zlanhf.
Workspace array, DIMENSION (max(1, *lwork*)), where
lwork ≥ *n* when *norm* = 'I' or '1' or 'O'; otherwise, *work* is not referenced.

Output Parameters

val — COMPLEX for clanhf
DOUBLE COMPLEX for zlanhf
Value returned by the function.

?tfttp

Copies a triangular matrix from the rectangular full packed format (TF) to the standard packed format (TP)
.

Syntax

```
call stfttp( transr, uplo, n, arf, ap, info )
call dtfttp( transr, uplo, n, arf, ap, info )
call ctfttp( transr, uplo, n, arf, ap, info )
call ztfttp( transr, uplo, n, arf, ap, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine copies a triangular matrix *A* from the Rectangular Full Packed (RFP) format to the standard packed format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr — CHARACTER*1.
= 'N': *arf* is in the Normal format,
= 'T': *arf* is in the Transpose format (for stfttp and dtfttp),
= 'C': *arf* is in the Conjugate-transpose format (for ctfttp and ztfttp).

uplo — CHARACTER*1.

	Specifies whether *A* is upper or lower triangular: = 'U': A is upper triangular, = 'L': A is lower triangular.
n	INTEGER. The order of the matrix *A*. $n \geq 0$.
arf	REAL for stfttp, DOUBLE PRECISION for dtfttp, COMPLEX for ctfttp, DOUBLE COMPLEX for ztfttp. Array, DIMENSION at least *max* (1, *n**(*n*+1)/2). On entry, the upper or lower triangular matrix *A* stored in the RFP format.

Output Parameters

ap	REAL for stfttp, DOUBLE PRECISION for dtfttp, COMPLEX for ctfttp, DOUBLE COMPLEX for ztfttp. Array, DIMENSION at least *max* (1, *n**(*n*+1)/2). On exit, the upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows: if *uplo* = 'U', *ap(i + (j-1)*j/2) = A(i,j)* for $1 \leq i \leq j$, if *uplo* = 'L', *ap(i + (j-1)*(2n-j)/2) = A(i,j)* for $j \leq i \leq n$.
info	INTEGER. =0: successful exit, < 0: if *info* = -*i*, the *i*-th parameter had an illegal value.

?tfttr

Copies a triangular matrix from the rectangular full packed format (TF) to the standard full format (TR) .

Syntax

```
call stfttr( transr, uplo, n, arf, a, lda, info )
call dtfttr( transr, uplo, n, arf, a, lda, info )
call ctfttr( transr, uplo, n, arf, a, lda, info )
call ztfttr( transr, uplo, n, arf, a, lda, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine copies a triangular matrix *A* from the Rectangular Full Packed (RFP) format to the standard full format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr	CHARACTER*1. = 'N': *arf* is in the Normal format, = 'T': *arf* is in the Transpose format (for stfttr and dtfttr), = 'C': *arf* is in the Conjugate-transpose format (for ctfttr and ztfttr).
uplo	CHARACTER*1. Specifies whether *A* is upper or lower triangular: = 'U': A is upper triangular, = 'L': A is lower triangular.
n	INTEGER. The order of the matrices *arf* and *a*. *n* ≥ 0.
arf	REAL for stfttr, DOUBLE PRECISION for dtfttr, COMPLEX for ctfttr, DOUBLE COMPLEX for ztfttr. Array, DIMENSION at least *max* (1, *n**(*n*+1)/2). On entry, the upper or lower triangular matrix *A* stored in the RFP format.
lda	INTEGER. The leading dimension of the array *a*. *lda* ≥ *max*(1,*n*).

Output Parameters

a	REAL for stfttr, DOUBLE PRECISION for dtfttr, COMPLEX for ctfttr, DOUBLE COMPLEX for ztfttr. Array, DIMENSION (*lda, **). On exit, the triangular matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.
info	INTEGER. =0: successful exit, < 0: if *info* = -*i*, the *i*-th parameter had an illegal value.

?tpttf

Copies a triangular matrix from the standard packed format (TP) to the rectangular full packed format (TF).

Syntax

```
call stpttf( transr, uplo, n, ap, arf, info )
call dtpttf( transr, uplo, n, ap, arf, info )
```

```
call ctpttf( transr, uplo, n, ap, arf, info )
call ztpttf( transr, uplo, n, ap, arf, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine copies a triangular matrix *A* from the standard packed format to the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr	CHARACTER*1. = 'N': *arf* must be in the Normal format, = 'T': *arf* must be in the Transpose format (for stpttf and dtpttf), = 'C': *arf* must be in the Conjugate-transpose format (for ctpttf and ztpttf).
uplo	CHARACTER*1. Specifies whether *A* is upper or lower triangular: = 'U': A is upper triangular, = 'L': A is lower triangular.
n	INTEGER. The order of the matrix *A*. $n \geq 0$.
ap	REAL for stpttf, DOUBLE PRECISION for dtpttf, COMPLEX for ctpttf, DOUBLE COMPLEX for ztpttf. Array, DIMENSION at least *max* (1, *n**(*n*+1)/2). On entry, the upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows: if *uplo* = 'U', $ap(i + (j-1)*j/2) = A(i,j)$ for $1 \leq i \leq j$, if *uplo* = 'L', $ap(i + (j-1)*(2n-j)/2) = A(i,j)$ for $j \leq i \leq n$.

Output Parameters

arf	REAL for stpttf, DOUBLE PRECISION for dtpttf, COMPLEX for ctfttp, DOUBLE COMPLEX for ztpttf. Array, DIMENSION at least *max* (1, *n**(*n*+1)/2). On exit, the upper or lower triangular matrix *A* stored in the RFP format.
info	INTEGER. =0: successful exit, < 0: if *info* = -*i*, the *i*-th parameter had an illegal value.

?tpttr

Copies a triangular matrix from the standard packed format (TP) to the standard full format (TR) .

Syntax

```
call stpttr( uplo, n, ap, a, lda, info )
call dtpttr( uplo, n, ap, a, lda, info )
call ctpttr( uplo, n, ap, a, lda, info )
call ztpttr( uplo, n, ap, a, lda, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine copies a triangular matrix *A* from the standard packed format to the standard full format.

Input Parameters

uplo
: CHARACTER*1.
Specifies whether *A* is upper or lower triangular:
= 'U': A is upper triangular,
= 'L': A is lower triangular.

n
: INTEGER. The order of the matrices *ap* and *a*. $n \geq 0$.

ap
: REAL for stpttr,
DOUBLE PRECISION for dtpttr,
COMPLEX for ctpttr,
DOUBLE COMPLEX for ztpttr.
Array, DIMENSION at least *max* (1, *n**(*n*+1)/2).
On entry, the upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:
if *uplo* = 'U', *ap(i + (j-1)*j/2) = A(i,j)* for $1 \leq i \leq j$,
if *uplo* = 'L', *ap(i + (j-1)*(2n-j)/2) = A(i,j)* for $j \leq i \leq n$.

lda
: INTEGER. The leading dimension of the array *a*. *lda* $\geq max(1,n)$.

Output Parameters

a
: REAL for stpttr,
DOUBLE PRECISION for dtpttr,
COMPLEX for ctpttr,
DOUBLE COMPLEX for ztpttr.
Array, DIMENSION (*lda, **).
On exit, the triangular matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced.

	If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.
info	INTEGER. =0: successful exit, < 0: if *info* = -*i*, the *i*-th parameter had an illegal value.

?trttf

Copies a triangular matrix from the standard full format (TR) to the rectangular full packed format (TF).

Syntax

```
call strttf( transr, uplo, n, a, lda, arf, info )
call dtrttf( transr, uplo, n, a, lda, arf, info )
call ctrttf( transr, uplo, n, a, lda, arf, info )
call ztrttf( transr, uplo, n, a, lda, arf, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine copies a triangular matrix *A* from the standard full format to the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr	CHARACTER*1. = 'N': *arf* must be in the Normal format, = 'T': *arf* must be in the Transpose format (for strttf and dtrttf), = 'C': *arf* must be in the Conjugate-transpose format (for ctrttf and ztrttf).
uplo	CHARACTER*1. Specifies whether *A* is upper or lower triangular: = 'U': A is upper triangular, = 'L': A is lower triangular.
n	INTEGER. The order of the matrix *A*. $n \geq 0$.
a	REAL for strttf, DOUBLE PRECISION for dtrttf, COMPLEX for ctrttf, DOUBLE COMPLEX for ztrttf. Array, DIMENSION (*lda, **). On entry, the triangular matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced. If *uplo* =

'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.

lda INTEGER. The leading dimension of the array *a*. *lda* ≥ *max*(1,*n*).

Output Parameters

arf REAL for strttf,
DOUBLE PRECISION for dtrttf,
COMPLEX for ctrttf,
DOUBLE COMPLEX for ztrttf.
Array, DIMENSION at least *max* (1, *n**(*n*+1)/2).
On exit, the upper or lower triangular matrix *A* stored in the RFP format.

info INTEGER.
=0: successful exit,
< 0: if *info* = -*i*, the *i*-th parameter had an illegal value.

?trttp

Copies a triangular matrix from the standard full format (TR) to the standard packed format (TP) .

Syntax

```
call strttp( uplo, n, a, lda, ap, info )
call dtrttp( uplo, n, a, lda, ap, info )
call ctrttp( uplo, n, a, lda, ap, info )
call ztrttp( uplo, n, a, lda, ap, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine copies a triangular matrix *A* from the standard full format to the standard packed format.

Input Parameters

uplo CHARACTER*1.
Specifies whether *A* is upper or lower triangular:
= 'U': A is upper triangular,
= 'L': A is lower triangular.

n INTEGER. The order of the matrices *a* and *ap*. *n* ≥ 0.

a REAL for strttp,
DOUBLE PRECISION for dtrttp,
COMPLEX for ctrttp,
DOUBLE COMPLEX for ztrttp.

Array, DIMENSION (*lda, n*).
On entry, the triangular matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.

lda — INTEGER. The leading dimension of the array *a*. *lda* ≥ *max*(1,*n*).

Output Parameters

ap — REAL for strttp,
DOUBLE PRECISION for dtrttp,
COMPLEX for ctrttp,
DOUBLE COMPLEX for ztrttp.
Array, DIMENSION at least *max* (1, *n**(*n*+1)/2).
On exit, the upper or lower triangular matrix *A*, packed columnwise in a linear array. The *j*-th column of *A* is stored in the array *ap* as follows:
if *uplo* = 'U', *ap(i + (j-1)*j/2) = A(i,j)* for 1 ≤ *i* ≤ *j*,
if *uplo* = 'L', *ap(i + (j-1)*(2n-j)/2) = A(i,j)* for *j* ≤ *i* ≤ *n*.

info — INTEGER.
=0: successful exit,
< 0: if *info* = -*i*, the *i*-th parameter had an illegal value.

?pstf2

Computes the Cholesky factorization with complete pivoting of a real symmetric or complex Hermitian positive semi-definite matrix.

Syntax

```
call spstf2( uplo, n, a, lda, piv, rank, tol, work, info )
call dpstf2( uplo, n, a, lda, piv, rank, tol, work, info )
call cpstf2( uplo, n, a, lda, piv, rank, tol, work, info )
call zpstf2( uplo, n, a, lda, piv, rank, tol, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The real flavors spstf2 and dpstf2 compute the Cholesky factorization with complete pivoting of a real symmetric positive semi-definite matrix *A*. The complex flavors cpstf2 and zpstf2 compute the Cholesky factorization with complete pivoting of a complex Hermitian positive semi-definite matrix *A*. The factorization has the form:

*P' * A * P = U' * U*, if *uplo* = 'U',

*P' * A * P = L * L'*, if *uplo* = 'L',

where *U* is an upper triangular matrix and *L* is lower triangular, and *P* is stored as vector *piv*. This algorithm does not check that *A* is positive semi-definite. This version of the algorithm calls level 2 BLAS.

Input Parameters

uplo — CHARACTER*1.
Specifies whether the upper or lower triangular part of the symmetric or Hermitian matrix *A* is stored:
= 'U': Upper triangular,
= 'L': Lower triangular.

n — INTEGER. The order of the matrix *A*. $n \geq 0$.

a — REAL for spstf2,
DOUBLE PRECISION for dpstf2,
COMPLEX for cpstf2,
DOUBLE COMPLEX for zpstf2.
Array, DIMENSION (*lda, **).
On entry, the symmetric matrix *A*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *a* is not referenced.

tol — REAL for spstf2 and cpstf2,
DOUBLE PRECISION for dpstf2 and zpstf2.
A user-defined tolerance.
If *tol* < 0, *n*ulp*max(A(k,k))* will be used (*ulp* is the Unit in the Last Place, or Unit of Least Precision). The algorithm terminates at the (*k* - 1)-st step if the pivot is not greater than *tol*.

lda — INTEGER. The leading dimension of the matrix *A*. *lda* ≥ *max*(1,*n*).

work — REAL for spstf2 and cpstf2,
DOUBLE PRECISION for dpstf2 and zpstf2.
Array, DIMENSION at least *max* (1, *2*n)*.
Work space.

Output Parameters

piv — INTEGER. Array. DIMENSION at least *max (1,n)*.
piv is such that the non-zero entries are *P* (*piv* (*k*), *k*) = 1.

a — On exit, if *info* = 0, the factor U or L from the Cholesky factorization stored the same way as the matrix *A* is stored on entry.

rank — INTEGER.
The rank of *A*, determined by the number of steps the algorithm completed.

info — INTEGER.
< 0: if *info* = -*k*, the *k*-th parameter had an illegal value,
=0: the algorithm completed successfully,

> 0: the matrix *A* is rank-deficient with the computed rank, returned in *rank*, or indefinite.

dlat2s

Converts a double-precision triangular matrix to a single-precision triangular matrix.

Syntax

```
call dlat2s( uplo, n, a, lda, sa, ldsa, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine converts a double-precision triangular matrix *A* to a single-precision triangular matrix *SA*. `dlat2s` checks that all the elements of *A* are between *-RMAX* and *RMAX*, where *RMAX* is the overflow for the single-precision arithmetic. If this condition is not met, the conversion is aborted and a flag is raised. The routine does no parameter checking.

Input Parameters

uplo — `CHARACTER*1`.
Specifies whether the matrix *A* is upper or lower triangular:
= 'U': *A* is upper triangular,
= 'L': *A* is lower triangular.

n — `INTEGER`. The number of rows and columns of the matrix *A*. $n \geq 0$.

a — `DOUBLE PRECISION`.
Array, `DIMENSION (lda, *)`.
On entry, the *n*-by-*n* triangular matrix *A*.

lda — `INTEGER`. The leading dimension of the array *a*. $lda \geq max(1,n)$.

ldsa — `INTEGER`. The leading dimension of the array *sa*. $ldsa \geq max(1,n)$.

Output Parameters

sa — `REAL`.
Array, `DIMENSION (ldsa, *)`.
Only the part of *sa* determined by *uplo* is referenced. On exit,

- if *info* = 0, the *n*-by-*n* triangular matrix *SA*,
- if *info* > 0, the content of the part of *sa* determined by *uplo* is unspecified.

info — `INTEGER`.
=0: successful exit,
> 0: an element of the matrix *A* is greater than the single-precision overflow threshold; in this case, the content of the part of *sa* determined by *uplo* is unspecified on exit.

zlat2c

Converts a double complex triangular matrix to a complex triangular matrix.

Syntax

```
call zlat2c( uplo, n, a, lda, sa, ldsa, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine converts a `DOUBLE COMPLEX` triangular matrix *A* to a `COMPLEX` triangular matrix *SA*. `zlat2c` checks that the real and complex parts of all the elements of *A* are between *-RMAX* and *RMAX*, where *RMAX* is the overflow for the single-precision arithmetic. If this condition is not met, the conversion is aborted and a flag is raised. The routine does no parameter checking.

Input Parameters

uplo — `CHARACTER*1`.
Specifies whether the matrix *A* is upper or lower triangular:
= 'U': *A* is upper triangular,
= 'L': *A* is lower triangular.

n — `INTEGER`. The number of rows and columns in the matrix *A*. $n \geq 0$.

a — `DOUBLE COMPLEX`.
Array, `DIMENSION (lda, *)`.
On entry, the *n*-by-*n* triangular matrix *A*.

lda — `INTEGER`. The leading dimension of the array *a*. $lda \geq max(1,n)$.

ldsa — `INTEGER`. The leading dimension of the array *sa*. $ldsa \geq max(1,n)$.

Output Parameters

sa — `COMPLEX`.
Array, `DIMENSION (ldsa, *)`.
Only the part of *sa* determined by *uplo* is referenced. On exit,

- if *info* = 0, the *n*-by-*n* triangular matrix *sa*,
- if *info* > 0, the content of the part of *sa* determined by *uplo* is unspecified.

info — `INTEGER`.
=0: successful exit,
> 0: the real or complex part of an element of the matrix *A* is greater than the single-precision overflow threshold; in this case, the content of the part of *sa* determined by *uplo* is unspecified on exit.

Utility Functions and Routines

This section describes LAPACK utility functions and routines. Summary information about these routines is given in the following table:

Table 5-2 LAPACK Utility Routines

Routine Name	Data Types	Description
ilaver		Returns the version of the Lapack library.
ilaenv		Environmental enquiry function which returns values for tuning algorithmic performance.
iparmq		Environmental enquiry function which returns values for tuning algorithmic performance.
ieeeck		Checks if the infinity and NaN arithmetic is safe. Called by ilaenv.
lsame		Tests two characters for equality regardless of case.
lsamen		Tests two character strings for equality regardless of case.
?labad	s, d	Returns the square root of the underflow and overflow thresholds if the exponent-range is very large.
?lamch	s, d	Determines machine parameters for floating-point arithmetic.
?lamc1	s, d	Called from ?lamc2. Determines machine parameters given by *beta*, *t*, *rnd*, *ieee1*.
?lamc2	s, d	Used by ?lamch. Determines machine parameters specified in its arguments list.
?lamc3	s, d	Called from ?lamc1-?lamc5. Intended to force *a* and *b* to be stored prior to doing the addition of *a* and *b*.
?lamc4	s, d	This is a service routine for ?lamc2.
?lamc5	s, d	Called from ?lamc2. Attempts to compute the largest machine floating-point number, without overflow.
second/dsecnd		Return user time for a process.
chla_transtype		Translates a BLAST-specified integer constant to the character string specifying a transposition operation.
iladiag		Translates a character string specifying whether a matrix has a unit diagonal or not to the relevant BLAST-specified integer constant.
ilaprec		Translates a character string specifying an intermediate precision to the relevant BLAST-specified integer constant.

Routine Name	Data Types	Description
ilatrans		Translates a character string specifying a transposition operation to the BLAST-specified integer constant.
ilauplo		Translates a character string specifying an upper- or lower-triangular matrix to the relevant BLAST-specified integer constant.
xerbla		Error handling routine called by LAPACK routines.
xerbla_array		Assists other languages in calling the xerbla function.

ilaver

Returns the version of the LAPACK library.

Syntax

`call ilaver( vers_major, vers_minor, vers_patch )`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine returns the version of the LAPACK library.

Output Parameters

vers_major	INTEGER. Returns the major version of the LAPACK library.
vers_minor	INTEGER. Returns the minor version from the major version of the LAPACK library.
vers_patch	INTEGER. Returns the patch version from the minor version of the LAPACK library.

ilaenv

Environmental enquiry function that returns values for tuning algorithmic performance.

Syntax

`value = ilaenv( ispec, name, opts, n1, n2, n3, n4 )`

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The enquiry function `ilaenv` is called from the LAPACK routines to choose problem-dependent parameters for the local environment. See *ispec* below for a description of the parameters.

This version provides a set of parameters that should give good, but not optimal, performance on many of the currently available computers. Users are encouraged to modify this subroutine to set the tuning parameters for their particular machine using the option and problem size information in the arguments.

This routine will not function correctly if it is converted to all lower case. Converting it to all upper case is allowed.

Input Parameters

ispec — INTEGER.
Specifies the parameter to be returned as the value of ilaenv:
= 1: the optimal blocksize; if this value is 1, an unblocked algorithm will give the best performance.
= 2: the minimum block size for which the block routine should be used; if the usable block size is less than this value, an unblocked routine should be used.
= 3: the crossover point (in a block routine, for *n* less than this value, an unblocked routine should be used)
= 4: the number of shifts, used in the nonsymmetric eigenvalue routines (deprecated)
= 5: the minimum column dimension for blocking to be used; rectangular blocks must have dimension at least *k*-by-*m*, where k is given by ilaenv(2,...) and m by ilaenv(5,...)
= 6: the crossover point for the SVD (when reducing an *m*-by-*n* matrix to bidiagonal form, if max(m,n)/min(m,n) exceeds this value, a *QR* factorization is used first to reduce the matrix to a triangular form.)
= 7: the number of processors
= 8: the crossover point for the multishift *QR* and *QZ* methods for nonsymmetric eigenvalue problems (deprecated).
= 9: maximum size of the subproblems at the bottom of the computation tree in the divide-and-conquer algorithm (used by ?gelsd and ?gesdd)
=10: ieee NaN arithmetic can be trusted not to trap
=11: infinity arithmetic can be trusted not to trap
$12 \le ispec \le 16$: ?hseqr or one of its subroutines, see iparmq for detailed explanation.

name — CHARACTER*(*). The name of the calling subroutine, in either upper case or lower case.

opts — CHARACTER*(*). The character options to the subroutine *name*, concatenated into a single character string. For example, *uplo* = 'U', *trans* = 'T', and *diag* = 'N' for a triangular routine would be specified as *opts* = 'UTN'.

n1, *n2*, *n3*, *n4* — INTEGER. Problem dimensions for the subroutine *name*; these may not all be required.

Output Parameters

value — INTEGER.
If *value* $\ge$ 0: the value of the parameter specified by *ispec*;

If *value* = -k < 0: the k-th argument had an illegal value.

Application Notes

The following conventions have been used when calling ilaenv from the LAPACK routines:

1. *opts* is a concatenation of all of the character options to subroutine *name*, in the same order that they appear in the argument list for *name*, even if they are not used in determining the value of the parameter specified by *ispec*.
2. The problem dimensions *n1*, *n2*, *n3*, *n4* are specified in the order that they appear in the argument list for *name*. *n1* is used first, *n2* second, and so on, and unused problem dimensions are passed a value of -1.
3. The parameter value returned by ilaenv is checked for validity in the calling subroutine. For example, ilaenv is used to retrieve the optimal blocksize for strtri as follows:

```
nb = ilaenv( 1, 'strtri', uplo // diag, n, -1, -1, -1> )
if( nb.le.1 ) nb = max( 1, n )
```

Below is an example of ilaenv usage in C language:

```
#include <stdio.h>
#include "mkl.h"
int main(void)
{
   int size = 1000;
   int ispec = 1;
   int dummy = -1;
   int blockSize1 = ilaenv(&ispec, "dsytrd", "U", &size, &dummy, &dummy, &dummy);
   int blockSize2 = ilaenv(&ispec, "dormtr", "LUN", &size, &size, &dummy, &dummy);
   printf("DSYTRD blocksize = %d\n", blockSize1);
   printf("DORMTR blocksize = %d\n", blockSize2);
   return 0;
}
```

iparmq

Environmental enquiry function which returns values for tuning algorithmic performance.

Syntax

value = iparmq(*ispec*, *name*, *opts*, *n*, *ilo*, *ihi*, *lwork*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function sets problem and machine dependent parameters useful for ?hseqr and its subroutines. It is called whenever ilaenv is called with 12≤*ispec*≤16.

Input Parameters

ispec	INTEGER. Specifies the parameter to be returned as the value of iparmq: = 12: (*inmin*) Matrices of order *nmin* or less are sent directly to ?lahqr, the implicit double shift QR algorithm. *nmin* must be at least 11. = 13: (*inwin*) Size of the deflation window. This is best set greater than or equal to the number of simultaneous shifts *ns*. Larger matrices benefit from larger deflation windows. = 14: (*inibl*) Determines when to stop nibbling and invest in an (expensive) multi-shift QR sweep. If the aggressive early deflation subroutine finds *ld* converged eigenvalues from an order *nw* deflation window and *ld*>(*nw***nibble*)/100, then the next QR sweep is skipped and early deflation is applied immediately to the remaining active diagonal block. Setting iparmq(*ispec*=14)=0 causes TTQRE to skip a multi-shift QR sweep whenever early deflation finds a converged eigenvalue. Setting iparmq(*ispec*=14) greater than or equal to 100 prevents TTQRE from skipping a multi-shift QR sweep. = 15: (*nshfts*) The number of simultaneous shifts in a multi-shift QR iteration. = 16: (*iacc22*) iparmq is set to 0, 1 or 2 with the following meanings. 0: During the multi-shift QR sweep, ?laqr5 does not accumulate reflections and does not use matrix-matrix multiply to update the far-from-diagonal matrix entries. 1: During the multi-shift QR sweep, ?laqr5 and/or ?laqr3 accumulates reflections and uses matrix-matrix multiply to update the far-from-diagonal matrix entries. 2: During the multi-shift QR sweep, ?laqr5 accumulates reflections and takes advantage of 2-by-2 block structure during matrix-matrix multiplies. (If ?trrm is slower than ?gemm, then iparmq(*ispec*=16)=1 may be more efficient than iparmq(*ispec*=16)=2 despite the greater level of arithmetic work implied by the latter choice.)
name	CHARACTER*(*). The name of the calling subroutine.
opts	CHARACTER*(*). This is a concatenation of the string arguments to TTQRE.
n	INTEGER. *n* is the order of the Hessenberg matrix *H*.
ilo, *ihi*	INTEGER. It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*.

lwork INTEGER.
The amount of workspace available.

Output Parameters

value INTEGER.
If *value* ≥ 0: the value of the parameter specified by *iparmq*;
If *value* = -k < 0: the k-th argument had an illegal value.

Application Notes

The following conventions have been used when calling ilaenv from the LAPACK routines:

1. *opts* is a concatenation of all of the character options to subroutine *name*, in the same order that they appear in the argument list for *name*, even if they are not used in determining the value of the parameter specified by *ispec*.
2. The problem dimensions *n1*, *n2*, *n3*, *n4* are specified in the order that they appear in the argument list for *name*. *n1* is used first, *n2* second, and so on, and unused problem dimensions are passed a value of -1.
3. The parameter value returned by ilaenv is checked for validity in the calling subroutine. For example, ilaenv is used to retrieve the optimal blocksize for strtri as follows:

```
nb = ilaenv( 1, 'strtri', uplo // diag, n, -1, -1, -1> )
if( nb.le.1 ) nb = max( 1, n )
```

ieeeck

Checks if the infinity and NaN arithmetic is safe. Called by ilaenv.

Syntax

ival = ieeeck(*ispec*, *zero*, *one*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ieeeck is called from ilaenv to verify that infinity and possibly NaN arithmetic is safe, that is, will not trap.

Input Parameters

ispec INTEGER.
Specifies whether to test just for infinity arithmetic or both for infinity and NaN arithmetic:
If *ispec* = 0: Verify infinity arithmetic only.
If *ispec* = 1: Verify infinity and NaN arithmetic.

zero REAL. Must contain the value 0.0
This is passed to prevent the compiler from optimizing away this code.

one REAL. Must contain the value 1.0

This is passed to prevent the compiler from optimizing away this code.

Output Parameters

ival	INTEGER. If *ival* = 0: Arithmetic failed to produce the correct answers. If *ival* = 1: Arithmetic produced the correct answers.

lsamen

Tests two character strings for equality regardless of case.

Syntax

val = lsamen(*n*, *ca*, *cb*)

Description

This function is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

This logical function tests if the first *n* letters of the string *ca* are the same as the first *n* letters of *cb*, regardless of case. The function lsamen returns .TRUE. if *ca* and *cb* are equivalent except for case and .FALSE. otherwise. lsamen also returns .FALSE. if len(*ca*) or len(*cb*) is less than *n*.

Input Parameters

n	INTEGER. The number of characters in *ca* and *cb* to be compared.
ca, *cb*	CHARACTER*(*). Specify two character strings of length at least *n* to be compared. Only the first *n* characters of each string will be accessed.

Output Parameters

val	LOGICAL. Result of the comparison.

?labad

Returns the square root of the underflow and overflow thresholds if the exponent-range is very large.

Syntax

call slabad(*small*, *large*)

call dlabad(*small*, *large*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine takes as input the values computed by slamch/dlamch for underflow and overflow, and returns the square root of each of these values if the log of *large* is sufficiently large. This subroutine is intended to identify machines with a large exponent range, such as the Crays, and redefine the underflow and overflow limits to be the square roots of the values computed by ?lamch. This subroutine is needed because ?lamch does not compensate for poor arithmetic in the upper half of the exponent range, as is found on a Cray.

Input Parameters

small	REAL for slabad DOUBLE PRECISION for dlabad. The underflow threshold as computed by ?lamch.
large	REAL for slabad DOUBLE PRECISION for dlabad. The overflow threshold as computed by ?lamch.

Output Parameters

small	On exit, if log10(*large*) is sufficiently large, the square root of *small*, otherwise unchanged.
large	On exit, if log10(*large*) is sufficiently large, the square root of *large*, otherwise unchanged.

?lamch

Determines machine parameters for floating-point arithmetic.

Syntax

val = slamch(*cmach*)

val = dlamch(*cmach*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The function ?lamch determines single precision and double precision machine parameters.

Input Parameters

cmach	CHARACTER*1. Specifies the value to be returned by ?lamch: = '*E*' or '*e*', *val* = *eps* = '*S*' or '*s* , *val* = *sfmin* = '*B*' or '*b*', *val* = *base* = '*P*' or '*p*', *val* = *eps*base* = '*n*' or '*n*', *val* = *t* = '*R*' or '*r*', *val* = *rnd* = '*m*' or '*m*', *val* = *emin* = '*U*' or '*u*', *val* = *rmin* = 'L' or '*l*', *val* = *emax*

= '*O*' or '*o*', *val* = *rmax*
where
eps = relative machine precision;
sfmin = safe minimum, such that 1/*sfmin* does not overflow;
base = base of the machine;
prec = *eps***base*;
t = number of (base) digits in the mantissa;
rnd = 1.0 when rounding occurs in addition, 0.0 otherwise;
emin = minimum exponent before (gradual) underflow;
rmin = *underflow_threshold* - *base***(*emin*-1);
emax = largest exponent before overflow;
rmax = *overflow_threshold* - (*base****emax*)*(1-*eps*).

Output Parameters

val	REAL for slamch DOUBLE PRECISION for dlamch Value returned by the function.

?lamc1

Called from ?lamc2. *Determines machine parameters given by beta, t, rnd, ieee1.*

Syntax

```
call slamc1( beta, t, rnd, ieee1 )
call dlamc1( beta, t, rnd, ieee1 )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lamc1 determines machine parameters given by *beta, t, rnd, ieee1*.

Output Parameters

beta	INTEGER. The base of the machine.
t	INTEGER. The number of (*beta*) digits in the mantissa.
rnd	LOGICAL. Specifies whether proper rounding (*rnd* = .TRUE.) or chopping (*rnd* = .FALSE.) occurs in addition. This may not be a reliable guide to the way in which the machine performs its arithmetic.
ieee1	LOGICAL. Specifies whether rounding appears to be done in the *ieee* 'round to nearest' style.

?lamc2

Used by ?lamch*. Determines machine parameters specified in its arguments list.*

Syntax

```
call slamc2( beta, t, rnd, eps, emin, rmin, emax, rmax )
call dlamc2( beta, t, rnd, eps, emin, rmin, emax, rmax )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine ?lamc2 determines machine parameters specified in its arguments list.

Output Parameters

beta	INTEGER. The base of the machine.
t	INTEGER. The number of (*beta*) digits in the mantissa.
rnd	LOGICAL. Specifies whether proper rounding (*rnd* = .TRUE.) or chopping (*rnd* = .FALSE.) occurs in addition. This may not be a reliable guide to the way in which the machine performs its arithmetic.
eps	REAL for slamc2 DOUBLE PRECISION for dlamc2 The smallest positive number such that *fl*(1.0 - *eps*) < 1.0, where *fl* denotes the computed value.
emin	INTEGER. The minimum exponent before (gradual) underflow occurs.
rmin	REAL for slamc2 DOUBLE PRECISION for dlamc2 The smallest normalized number for the machine, given by $base^{emin-1}$, where *base* is the floating point value of *beta*.
emax	INTEGER.The maximum exponent before overflow occurs.
rmax	REAL for slamc2 DOUBLE PRECISION for dlamc2 The largest positive number for the machine, given by $base^{emax(1 - eps)}$, where *base* is the floating point value of *beta*.

?lamc3

Called from ?lamc1-?lamc5. *Intended to force* a *and* b *to be stored prior to doing the addition of* a *and* b.

Syntax

val = slamc3(*a*, *b*)

val = dlamc3(*a*, *b*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine is intended to force *A* and *B* to be stored prior to doing the addition of *A* and *B*, for use in situations where optimizers might hold one of these in a register.

Input Parameters

a, *b*	REAL for slamc3 DOUBLE PRECISION for dlamc3 The values *a* and *b*.

Output Parameters

val	REAL for slamc3 DOUBLE PRECISION for dlamc3 The result of adding values *a* and *b*.

?lamc4

This is a service routine for ?lamc2.

Syntax

call slamc4(*emin*, *start*, *base*)

call dlamc4(*emin*, *start*, *base*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

This is a service routine for ?lamc2.

Input Parameters

start	REAL for slamc4 DOUBLE PRECISION for dlamc4 The starting point for determining *emin*.
base	INTEGER. The base of the machine.

Output Parameters

emin	INTEGER. The minimum exponent before (gradual) underflow, computed by setting *a = start* and dividing by *base* until the previous *a* can not be recovered.

?lamc5

Called from ?lamc2*. Attempts to compute the largest machine floating-point number, without overflow.*

Syntax

```
call slamc5( beta, p, emin, ieee, emax, rmax)
call dlamc5( beta, p, emin, ieee, emax, rmax)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine ?lamc5 attempts to compute *rmax*, the largest machine floating-point number, without overflow. It assumes that *emax* + abs(*emin*) sum approximately to a power of 2. It will fail on machines where this assumption does not hold, for example, the Cyber 205 (*emin* = -28625, *emax* = 28718). It will also fail if the value supplied for *emin* is too large (that is, too close to zero), probably with overflow.

Input Parameters

beta	INTEGER. The base of floating-point arithmetic.
p	INTEGER. The number of base *beta* digits in the mantissa of a floating-point value.
emin	INTEGER. The minimum exponent before (gradual) underflow.
ieee	LOGICAL. A logical flag specifying whether or not the arithmetic system is thought to comply with the IEEE standard.

Output Parameters

emax	INTEGER. The largest exponent before overflow.
rmax	REAL for slamc5 DOUBLE PRECISION for dlamc5 The largest machine floating-point number.

second/dsecnd

Return user time for a process.

Syntax

```
val = second()
val = dsecnd()
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The functions `second/dsecnd` return the user time for a process in seconds. These versions get the time from the system function `etime`. The difference is that `dsecnd` returns the result with double precision.

Output Parameters

val	`REAL` for `second`
	`DOUBLE PRECISION` for `dsecnd`
	User time for a process.

chla_transtype

Translates a BLAST-specified integer constant to the character string specifying a transposition operation.

Syntax

val = chla_transtype(*trans*)

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `chla_transtype` translates a BLAST-specified integer constant to the character string specifying a transposition operation.

The function returns a `CHARACTER*1`. If the input is not an integer indicating a transposition operator, then *val* is `'X'`. Otherwise, the function returns the constant value corresponding to *trans*.

Input Parameters

trans	`INTEGER`. Specifies the form of the system of equations: If *trans* = `BLAS_NO_TRANS` = `111`: No transpose. If *trans* = `BLAS_TRANS` = `112`: Transpose. If *trans* = `BLAS_CONJ_TRANS` = `113`: Conjugate Transpose.

Output Parameters

val	`CHARACTER*1` Character that specifies a transposition operation.

iladiag

Translates a character string specifying whether a matrix has a unit diagonal to the relevant BLAST-specified integer constant.

Syntax

val = iladiag(*diag*)

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `iladiag` translates a character string specifying whether a matrix has a unit diagonal or not to the relevant BLAST-specified integer constant.

The function returns an `INTEGER`. If *`val`* < 0, the input is not a character indicating a unit or non-unit diagonal. Otherwise, the function returns the constant value corresponding to *`diag`*.

Input Parameters

`diag`	`CHARACTER*1`. Specifies the form of the system of equations: If *`diag`* = `'N'`: *`A`* is non-unit triangular. If *`diag`* = `'U'`: *`A`* is unit triangular.

Output Parameters

`val`	`INTEGER` Value returned by the function.

ilaprec

Translates a character string specifying an intermediate precision to the relevant BLAST-specified integer constant.

Syntax

`val` = `ilaprec(` *`prec`* `)`

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `ilaprec` translates a character string specifying an intermediate precision to the relevant BLAST-specified integer constant.

The function returns an `INTEGER`. If *`val`* < 0, the input is not a character indicating a supported intermediate precision. Otherwise, the function returns the constant value corresponding to *`prec`*.

Input Parameters

`prec`	`CHARACTER*1`. Specifies the form of the system of equations: If *`prec`* = `'S'`: Single. If *`prec`* = `'D'`: Double. If *`prec`* = `'I'`: Indigenous. If *`prec`* = `'X'`, `'E'`: Extra.

Output Parameters

`val`	`INTEGER`

Value returned by the function.

ilatrans

Translates a character string specifying a transposition operation to the BLAST-specified integer constant.

Syntax

`val = ilatrans( trans )`

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `ilatrans` translates a character string specifying a transposition operation to the BLAST-specified integer constant.

The function returns a `INTEGER`. If *val* < 0, the input is not a character indicating a transposition operator. Otherwise, the function returns the constant value corresponding to *trans*.

Input Parameters

trans — `CHARACTER*1`.
Specifies the form of the system of equations:
If *trans* = `'N'`: No transpose.
If *trans* = `'T'`: Transpose.
If *trans* = `'C'`: Conjugate Transpose.

Output Parameters

val — `INTEGER`
Character that specifies a transposition operation.

ilauplo

Translates a character string specifying an upper- or lower-triangular matrix to the relevant BLAST-specified integer constant.

Syntax

`val = ilauplo( uplo )`

Description

This function is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The function `ilauplo` translates a character string specifying an upper- or lower-triangular matrix to the relevant BLAST-specified integer constant.

The function returns an `INTEGER`. If *val* < 0, the input is not a character indicating an upper- or lower-triangular matrix. Otherwise, the function returns the constant value corresponding to *uplo*.

Input Parameters

diag	CHARACTER. Specifies the form of the system of equations: If *diag* = 'U': *A* is upper triangular. If *diag* = 'L': *A* is lower triangular.

Output Parameters

val	INTEGER Value returned by the function.

xerbla_array

Assists other languages in calling the xerbla *function.*

Syntax

```
call xerbla_array( srname_array, srname_len, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine assists other languages in calling the error handling `xerbla` function. Rather than taking a Fortran string argument as the function name, `xerbla_array` takes an array of single characters along with the array's length. The routine then copies up to 32 characters of that array into a Fortran string and passes that to `xerbla`. If called with a non-positive *srname_len*, the routine will call `xerbla` with a string of all blank characters.

If some macro or other device makes `xerbla_array` available to C99 by a name `lapack_xerbla` and with a common Fortran calling convention, a C99 program could invoke `xerbla` via:

```
{
   int flen = strlen(__func__);
   lapack_xerbla(__func__, &flen, &info);
}
```

Providing `xerbla_array` is not necessary for intercepting LAPACK errors. `xerbla_array` calls `xerbla`.

Output Parameters

srname_array	CHARACTER(1). Array, dimension (*srname_len*). The name of the routine that called `xerbla_array`.
srname_len	INTEGER. The length of the name in *srname_array*.
info	INTEGER. Position of the invalid parameter in the parameter list of the calling routine.

6 ScaLAPACK Routines

This chapter describes the Intel® Math Kernel Library implementation of routines from the ScaLAPACK package for distributed-memory architectures. Routines are supported for both real and complex dense and band matrices to perform the tasks of solving systems of linear equations, solving linear least-squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

Intel MKL ScaLAPACK routines are written in FORTRAN 77 with exception of a few utility routines written in C to exploit the IEEE arithmetic. All routines are available in all precision types: single precision, double precision, complexm, and double complex precision. See the `mkl_scalapack.h` header file for C declarations of ScaLAPACK routines.

NOTE. ScaLAPACK routines are provided only with Intel® MKL versions for Linux* and Windows* OSs.

Sections in this chapter include descriptions of ScaLAPACK computational routines that perform distinct computational tasks, as well as driver routines for solving standard types of problems in one call.

Generally, ScaLAPACK runs on a network of computers using MPI as a message-passing layer and a set of prebuilt communication subprograms (BLACS), as well as a set of BLAS optimized for the target architecture. Intel MKL version of ScaLAPACK is optimized for Intel® processors. For the detailed system and environment requirements, see *Intel® MKL Release Notes* and *Intel® MKL User's Guide*.

For full reference on ScaLAPACK routines and related information, see [SLUG].

Overview

The model of the computing environment for ScaLAPACK is represented as a one-dimensional array of processes (for operations on band or tridiagonal matrices) or also a two-dimensional process grid (for operations on dense matrices). To use ScaLAPACK, all global matrices or vectors should be distributed on this array or grid prior to calling the ScaLAPACK routines.

ScaLAPACK uses the two-dimensional block-cyclic data distribution as a layout for dense matrix computations. This distribution provides good work balance between available processors, as well as gives the opportunity to use BLAS Level 3 routines for optimal local computations. Information about the data distribution that is required to establish the mapping between each global array and its corresponding process and memory location is contained in the so called *array descriptor* associated with each global array. An example of an array descriptor structure is given in Table 6-1.

Table 6-1 Content of the array descriptor for dense matrices

Array Element #	Name	Definition
1	*dtype*	Descriptor type (=1 for dense matrices)
2	*ctxt*	BLACS context handle for the process grid

Array Element #	Name	Definition
3	*m*	Number of rows in the global array
4	*n*	Number of columns in the global array
5	*mb*	Row blocking factor
6	*nb*	Column blocking factor
7	*rsrc*	Process row over which the first row of the global array is distributed
8	*csrc*	Process column over which the first column of the global array is distributed
9	*lld*	Leading dimension of the local array

The number of rows and columns of a global dense matrix that a particular process in a grid receives after data distributing is denoted by $LOC_r()$ and $LOC_c()$, respectively. To compute these numbers, you can use the ScaLAPACK tool routine numroc.

After the block-cyclic distribution of global data is done, you may choose to perform an operation on a submatrix of the global matrix *A*, which is contained in the global subarray sub(*A*), defined by the following 6 values (for dense matrices):

m	The number of rows of sub(*A*)
n	The number of columns of sub(*A*)
a	A pointer to the local array containing the entire global array A
ia	The row index of sub(*A*) in the global array
ja	The column index of sub(*A*) in the global array
desca	The array descriptor for the global array

Routine Naming Conventions

For each routine introduced in this chapter, you can use the ScaLAPACK name. The naming convention for ScaLAPACK routines is similar to that used for LAPACK routines (see Routine Naming Conventions in Chapter 4). A general rule is that each routine name in ScaLAPACK, which has an LAPACK equivalent, is simply the LAPACK name prefixed by initial letter p.

ScaLAPACK names have the structure p?yyzzz or p?yyzz, which is described below.

The initial letter p is a distinctive prefix of ScaLAPACK routines and is present in each such routine.

The second symbol ? indicates the data type:

s	real, single precision
d	real, double precision
c	complex, single precision
z	complex, double precision

The second and third letters yy indicate the matrix type as:

ge	general
gb	general band
gg	a pair of general matrices (for a generalized problem)
dt	general tridiagonal (diagonally dominant-like)
db	general band (diagonally dominant-like)
po	symmetric or Hermitian positive-definite

pb	symmetric or Hermitian positive-definite band
pt	symmetric or Hermitian positive-definite tridiagonal
sy	symmetric
st	symmetric tridiagonal (real)
he	Hermitian
or	orthogonal
tr	triangular (or quasi-triangular)
tz	trapezoidal
un	unitary

For computational routines, the last three letters **zzz** indicate the computation performed and have the same meaning as for LAPACK routines.

For driver routines, the last two letters **zz** or three letters **zzz** have the following meaning:

sv	a *simple* driver for solving a linear system
svx	an *expert* driver for solving a linear system
ls	a driver for solving a linear least squares problem
ev	a simple driver for solving a symmetric eigenvalue problem
evx	an expert driver for solving a symmetric eigenvalue problem
svd	a driver for computing a singular value decomposition
gvx	an expert driver for solving a generalized symmetric definite eigenvalue problem

Simple driver here means that the driver just solves the general problem, whereas an *expert* driver is more versatile and can also optionally perform some related computations (such, for example, as refining the solution and computing error bounds after the linear system is solved).

Computational Routines

In the sections that follow, the descriptions of ScaLAPACK computational routines are given. These routines perform distinct computational tasks that can be used for:

- Solving Systems of Linear Equations
- Orthogonal Factorizations and LLS Problems
- Symmetric Eigenproblems
- Nonsymmetric Eigenproblems
- Singular Value Decomposition
- Generalized Symmetric-Definite Eigenproblems

See also the respective driver routines.

Linear Equations

ScaLAPACK supports routines for the systems of equations with the following types of matrices:

- general
- general banded

- general diagonally dominant-like banded (including general tridiagonal)
- symmetric or Hermitian positive-definite
- symmetric or Hermitian positive-definite banded
- symmetric or Hermitian positive-definite tridiagonal

A *diagonally dominant-like* matrix is defined as a matrix for which it is known in advance that pivoting is not required in the *LU* factorization of this matrix.

For the above matrix types, the library includes routines for performing the following computations: *factoring* the matrix; *equilibrating* the matrix; *solving* a system of linear equations; *estimating the condition number* of a matrix; *refining* the solution of linear equations and computing its error bounds; *inverting* the matrix. Note that for some of the listed matrix types only part of the computational routines are provided (for example, routines that refine the solution are not provided for band or tridiagonal matrices). See Table 6-2 for full list of available routines.

To solve a particular problem, you can either call two or more computational routines or call a corresponding driver routine that combines several tasks in one call. Thus, to solve a system of linear equations with a general matrix, you can first call p?getrf(*LU* factorization) and then p?getrs(computing the solution). Then, you might wish to call p?gerfs to refine the solution and get the error bounds. Alternatively, you can just use the driver routine p?gesvx which performs all these tasks in one call.

Table 6-2 lists the ScaLAPACK computational routines for factorizing, equilibrating, and inverting matrices, estimating their condition numbers, solving systems of equations with real matrices, refining the solution, and estimating its error.

Table 6-2 Computational Routines for Systems of Linear Equations

Matrix type, storage scheme	Factorize matrix	Equilibrate matrix	Solve system	Condition number	Estimate error	Invert matrix
general (partial pivoting)	p?getrf	p?geequ	p?getrs	p?gecon	p?gerfs	p?getri
general band (partial pivoting)	p?gbtrf		p?gbtrs			
general band (no pivoting)	p?dbtrf		p?dbtrs			
general tridiagonal (no pivoting)	p?dttrf		p?dttrs			
symmetric/Hermitian positive-definite	p?potrf	p?poequ	p?potrs	p?pocon	p?porfs	p?potri
symmetric/Hermitian positive-definite, band	p?pbtrf		p?pbtrs			
symmetric/Hermitian positive-definite, tridiagonal	p?pttrf		p?pttrs			
triangular			p?trtrs	p?trcon	p?trrfs	p?trtri

In this table ? stands for s (single precision real), d (double precision real), c (single precision complex), or z (double precision complex).

Routines for Matrix Factorization

This section describes the ScaLAPACK routines for matrix factorization. The following factorizations are supported:

- LU factorization of general matrices
- LU factorization of diagonally dominant-like matrices
- Cholesky factorization of real symmetric or complex Hermitian positive-definite matrices

You can compute the factorizations using full and band storage of matrices.

p?getrf

Computes the LU factorization of a general m-by-n distributed matrix.

Syntax

```
call psgetrf(m, n, a, ia, ja, desca, ipiv, info)
call pdgetrf(m, n, a, ia, ja, desca, ipiv, info)
call pcgetrf(m, n, a, ia, ja, desca, ipiv, info)
call pzgetrf(m, n, a, ia, ja, desca, ipiv, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine forms the *LU* factorization of a general *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) as

A = *P***L***U*

where *P* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m* > *n*) and *U* is upper triangular (upper trapezoidal if *m* < *n*). *L* and *U* are stored in sub(*A*).

The routine uses partial pivoting, with row interchanges.

Input Parameters

m	(global) INTEGER. The number of rows in the distributed submatrix sub(*A*); *m*≥0.
n	(global) INTEGER. The number of columns in the distributed submatrix sub(*A*); *n*≥0.
a	(local) REAL for psgetrf DOUBLE PRECISION for pdgetrf COMPLEX for pcgetrf DOUBLE COMPLEX for pzgetrf. Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub(*A*) to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix *A*(*ia:ia*+*n-1*, *ja:ja*+*n-1*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a	Overwritten by local pieces of the factors *L* and *U* from the factorization *A = P*L*U*. The unit diagonal elements of *L* are not stored.
ipiv	(local) INTEGER array. The dimension of *ipiv* is (*LOCr*(*m_a*)+ *mb_a*). This array contains the pivoting information: local row *i* was interchanged with global row *ipiv*(*i*). This array is tied to the distributed matrix *A*.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but the factor *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

p?gbtrf

Computes the LU factorization of a general n-by-n banded distributed matrix.

Syntax

```
call psgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
call pdgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
call pcgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
call pzgbtrf(n, bwl, bwu, a, ja, desca, ipiv, af, laf, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine computes the *LU* factorization of a general *n*-by-*n* real/complex banded distributed matrix *A*(*1:n*, *ja:ja+n-1*) using partial pivoting with row interchanges.

The resulting factorization is not the same factorization as returned from the LAPACK routine ?gbtrf. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form

A(*1:n*, *ja:ja+n-1*) = *P*L*U*Q*

where *P* and *Q* are permutation matrices, and *L* and *U* are banded lower and upper triangular matrices, respectively. The matrix *Q* represents reordering of columns for the sake of parallelism, while *P* represents reordering of rows for numerical stability using classic partial pivoting.

Input Parameters

n (global) INTEGER. The number of rows and columns in the distributed submatrix *A*(*1:n, ja:ja+n-1*); *n* ≥ 0.

bwl (global) INTEGER. The number of sub-diagonals within the band of *A* (0 ≤ *bwl* ≤ *n-1*).

bwu (global) INTEGER. The number of super-diagonals within the band of *A* (0 ≤ *bwu* ≤ *n-1*).

a (local)
REAL for psgbtrf
DOUBLE PRECISION for pdgbtrf
COMPLEX for pcgbtrf
DOUBLE COMPLEX for pzgbtrf.
Pointer into the local memory to an array of local dimension (*lld_a*, LOC_c(*ja*+*n*-1) where
lld_a ≥ 2**bwl* + 2**bwu* +*1*.
Contains the local pieces of the *n*-by-*n* distributed banded matrix *A*(*1:n, ja:ja+n-1*) to be factored.

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7;
else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

laf (local) INTEGER. The dimension of the array *af*.
Must be *laf* ≥ (NB+*bwu*)*(*bwl*+*bwu*)+6*(*bwl*+*bwu*)*(*bwl*+2**bwu*).
If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local) Same type as *a*. Workspace array of dimension *lwork* .

lwork (local or global) INTEGER. The size of the *work* array (*lwork* ≥ 1). If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned.

Output Parameters

a On exit, this array contains details of the factorization. Note that additional permutations are performed on the matrix, so that the factors returned are different from those returned by LAPACK.

ipiv (local) INTEGER array.
The dimension of *ipiv* must be ≥ *desca*(NB).

	Contains pivot indices for local factorizations. Note that you *should not alter* the contents of this array between factorization and solve.
af	(local) REAL for psgbtrf DOUBLE PRECISION for pdgbtrf COMPLEX for pcgbtrf DOUBLE COMPLEX for pzgbtrf. Array, dimension (*laf*). Auxiliary Fillin space. Fillin is created during the factorization routine p?gbtrf and this is stored in *af*. Note that if a linear system is to be solved using p?gbtrs after the factorization routine, *af* must not be altered after the factorization.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = k ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not nonsingular, and the factorization was not completed. If *info* = k > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?dbtrf

Computes the LU factorization of a n-by-n diagonally dominant-like banded distributed matrix.

Syntax

```
call psdbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
call pddbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
call pcdbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
call pzdbtrf(n, bwl, bwu, a, ja, desca, af, laf, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the LU factorization of a *n*-by-*n* real/complex diagonally dominant-like banded distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1) without pivoting.

Note that the resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

Input Parameters

n (global) INTEGER. The number of rows and columns in the distributed submatrix *A*(1:*n*, *ja*:*ja*+*n*-1); *n* ≥ 0.

bwl (global) INTEGER. The number of sub-diagonals within the band of *A* (0 ≤ *bwl* ≤ *n-1*).

bwu (global) INTEGER. The number of super-diagonals within the band of *A* (0 ≤ *bwu* ≤ *n-1*).

a (local)
REAL for psdbtrf
DOUBLE PRECISION for pddbtrf
COMPLEX for pcdbtrf
DOUBLE COMPLEX for pzdbtrf.
Pointer into the local memory to an array of local dimension (*lld_a*,*LOCc*(*ja*+*n*-1)).
Contains the local pieces of the *n*-by-*n* distributed banded matrix *A*(*1:n*, *ja:ja*+*n-1*) to be factored.

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

laf (local) INTEGER. The dimension of the array *af*.
Must be *laf* ≥ NB*(*bwl*+*bwu*)+6*(max(*bwl*,*bwu*))^2 .
If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local) Same type as *a*. Workspace array of dimension *lwork*.

lwork (local or global) INTEGER. The size of the *work* array, must be *lwork* ≥ (max(*bwl*,*bwu*))^2. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned.

Output Parameters

a On exit, this array contains details of the factorization. Note that additional permutations are performed on the matrix, so that the factors returned are different from those returned by LAPACK.

af (local)
REAL for psdbtrf
DOUBLE PRECISION for pddbtrf
COMPLEX for pcdbtrf
DOUBLE COMPLEX for pzdbtrf.

	Array, dimension (*laf*). Auxiliary Fillin space. Fillin is created during the factorization routine p?dbtrf and this is stored in *af*. Note that if a linear system is to be solved using p?dbtrs after the factorization routine, *af* must not be altered after the factorization.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = k ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not diagonally dominant-like, and the factorization was not completed. If *info* = k > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?dttrf

Computes the LU factorization of a diagonally dominant-like tridiagonal distributed matrix.

Syntax

```
call psdttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
call pddttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
call pcdttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
call pzdttrf(n, dl, d, du, ja, desca, af, laf, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the *LU* factorization of an *n*-by-*n* real/complex diagonally dominant-like tridiagonal distributed matrix *A*(*1:n, ja:ja+n-1*) without pivoting for stability.

The resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form:

$A(1:n, ja:ja+n-1) = P*L*U*P^T$,

where *P* is a permutation matrix, and *L* and *U* are banded lower and upper triangular matrices, respectively.

Input Parameters

n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix *A*(*1:n*, *ja:ja*+*n-1*) (*n* ≥ 0).
dl, *d*, *du*	(local) REAL for pspttrf DOUBLE PRECISON for pdpttrf COMPLEX for pcpttrf DOUBLE COMPLEX for pzpttrf. Pointers to the local arrays of dimension (*desca*(*nb_*)) each. On entry, the array *dl* contains the local part of the global vector storing the subdiagonal elements of the matrix. Globally, *dl*(1) is not referenced, and *dl* must be aligned with *d*. On entry, the array *d* contains the local part of the global vector storing the diagonal elements of the matrix. On entry, the array *du* contains the local part of the global vector storing the super-diagonal elements of the matrix. *du*(*n*) is not referenced, and *du* must be aligned with *d*.
ja	(global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7; else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.
laf	(local) INTEGER. The dimension of the array *af*. Must be *laf* ≥ 2*(NB+2) . If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).
work	(local) Same type as *d*. Workspace array of dimension *lwork*.
lwork	(local or global) INTEGER. The size of the *work* array, must be at least *lwork* ≥ 8*NPCOL.

Output Parameters

dl, *d*, *du*	On exit, overwritten by the information containing the factors of the matrix.
af	(local) REAL for psdttrf DOUBLE PRECISION for pddttrf COMPLEX for pcdttrf DOUBLE COMPLEX for pzdttrf. Array, dimension (*laf*).

	Auxiliary Fillin space. Fillin is created during the factorization routine p?dttrf and this is stored in *af*. Note that if a linear system is to be solved using p?dttrs after the factorization routine, *af* must not be altered.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = k ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not diagonally dominant-like, and the factorization was not completed. If *info* = k > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?potrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite distributed matrix.

Syntax

```
call pspotrf(uplo, n, a, ia, ja, desca, info)
call pdpotrf(uplo, n, a, ia, ja, desca, info)
call pcpotrf(uplo, n, a, ia, ja, desca, info)
call pzpotrf(uplo, n, a, ia, ja, desca, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the Cholesky factorization of a real symmetric or complex Hermitian positive-definite distributed *n*-by-*n* matrix *A*(*ia:ia+n-1, ja:ja+n-1*), denoted below as sub(*A*).

The factorization has the form

sub(*A*) = $U^H * U$ if *uplo*='U', or

sub(*A*) = $L * L^H$ if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

Input Parameters

uplo	(global) CHARACTER*1.

	Indicates whether the upper or lower triangular part of sub(*A*) is stored. Must be 'U' or 'L'. If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix sub(*A*) that is factored as U^H*U. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix sub(*A*) that is factored as $L*L^H$.
n	(global) INTEGER. The order of the distributed submatrix sub(*A*) (*n*≥0).
a	(local) REAL for pspotrf DOUBLE PRECISON for pdpotrf COMPLEX for pcpotrf DOUBLE COMPLEX for pzpotrf. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* symmetric/Hermitian distributed matrix sub(*A*) to be factored. Depending on *uplo*, the array *a* contains either the upper or the lower triangular part of the matrix sub(*A*) (see *uplo*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
info	(global) INTEGER. If *info*=0, the execution is successful; *info* < 0: if the *i*-th argument is an array, and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* = *k* >0, the leading minor of order *k*, *A*(*ia:ia+k-1*, *ja:ja+k-1*), is not positive-definite, and the factorization could not be completed.

p?pbtrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite banded distributed matrix.

Syntax

```
call pspbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
call pdpbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
```

```
call pcpbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
call pzpbtrf(uplo, n, bw, a, ja, desca, af, laf, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the Cholesky factorization of an *n*-by-*n* real symmetric or complex Hermitian positive-definite banded distributed matrix *A*(1:*n*, *ja*:*ja*+*n*-1).

The resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form:

A(1:*n*, *ja*:*ja*+*n*-1) = $P*U^H*U*P^T$, if *uplo*='U', or

A(1:*n*, *ja*:*ja*+*n*-1) = $P*L*L^H*P^T$, if *uplo*='L',

where *P* is a permutation matrix and *U* and *L* are banded upper and lower triangular matrices, respectively.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', upper triangle of *A*(*1:n*, *ja:ja*+*n-1*) is stored; If *uplo* = 'L', lower triangle of *A*(*1:n*, *ja:ja*+*n-1*) is stored.
n	(global) INTEGER. The order of the distributed submatrix *A*(*1:n*, *ja:ja*+*n-1*). (*n*≥0).
bw	(global) INTEGER. The number of superdiagonals of the distributed matrix if *uplo* = 'U', or the number of subdiagonals if *uplo* = 'L' (*bw*≥0).
a	(local) REAL for pspbtrf DOUBLE PRECISON for pdpbtrf COMPLEX for pcpbtrf DOUBLE COMPLEX for pzpbtrf. Pointer into the local memory to an array of dimension (*lld_a*,*LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the upper or lower triangle of the symmetric/Hermitian band distributed matrix *A*(*1:n*, *ja:ja*+*n-1*) to be factored.
ja	(global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7; else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

laf (local) INTEGER. The dimension of the array *af*.

Must be *laf* ≥ (NB+2*bw)*bw.

If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local) Same type as *a*. Workspace array of dimension *lwork* .

lwork (local or global) INTEGER. The size of the *work* array, must be *lwork* ≥ bw^2.

Output Parameters

a On exit, if *info*=0, contains the permuted triangular factor *U* or *L* from the Cholesky factorization of the band matrix *A*(*1:n*, *ja:ja*+*n*-*1*), as specified by *uplo*.

af (local)
REAL for pspbtrf
DOUBLE PRECISON for pdpbtrf
COMPLEX for pcpbtrf
DOUBLE COMPLEX for pzpbtrf.
Array, dimension (*laf*). Auxiliary Fillin space. Fillin is created during the factorization routine p?pbtrf and this is stored in *af*. Note that if a linear system is to be solved using p?pbtrs after the factorization routine, *af* must not be altered.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
If *info*=0, the execution is successful.
info < 0:
If the *i*th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*th argument is a scalar and had an illegal value, then *info* = -*i*.
info>0:

If *info* = k ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed.
If *info* = k > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?pttrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite tridiagonal distributed matrix.

Syntax

```
call pspttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
call pdpttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
call pcpttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
call pzpttrf(n, d, e, ja, desca, af, laf, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the Cholesky factorization of an *n*-by-*n* real symmetric or complex hermitian positive-definite tridiagonal distributed matrix *A*(*1:n*, *ja:ja+n-1*).

The resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.

The factorization has the form:

A(*1:n*, *ja:ja+n-1*) = *P*L*D*L*^{H}**P*^{T}, or

A(*1:n*, *ja:ja+n-1*) = *P*U*^{H}**D*U*P*^{T},

where *P* is a permutation matrix, and *U* and *L* are tridiagonal upper and lower triangular matrices, respectively.

Input Parameters

n	(global) INTEGER. The order of the distributed submatrix *A*(*1:n*, *ja:ja+n-1*) (*n* ≥ 0).
d, *e*	(local) REAL for pspttrf DOUBLE PRECISON for pdpttrf COMPLEX for pcpttrf DOUBLE COMPLEX for pzpttrf. Pointers into the local memory to arrays of dimension (*desca*(*nb_*)) each. On entry, the array *d* contains the local part of the global vector storing the main diagonal of the distributed matrix *A*. On entry, the array *e* contains the local part of the global vector storing the upper diagonal of the distributed matrix *A*.
ja	(global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

laf (local) INTEGER. The dimension of the array *af*.

Must be *laf* ≥ NB+2.
If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local) Same type as *d* and *e*. Workspace array of dimension *lwork* .

lwork (local or global) INTEGER. The size of the *work* array, must be at least

lwork ≥ 8*NPCOL.

Output Parameters

d, *e* On exit, overwritten by the details of the factorization.

af (local)
REAL for pspttrf
DOUBLE PRECISION for pdpttrf
COMPLEX for pcpttrf
DOUBLE COMPLEX for pzpttrf.
Array, dimension (*laf*).
Auxiliary Fillin space. Fillin is created during the factorization routine p?pttrf and this is stored in *af*.
Note that if a linear system is to be solved using p?pttrs after the factorization routine, *af* must not be altered.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
If *info*=0, the execution is successful.
info < 0:
If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
info > 0:

If *info* = k ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed.
If *info* = k > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

Routines for Solving Systems of Linear Equations

This section describes the ScaLAPACK routines for solving systems of linear equations. Before calling most of these routines, you need to factorize the matrix of your system of equations (see Routines for Matrix Factorization in this chapter). However, the factorization is not necessary if your system of equations has a triangular matrix.

p?getrs

Solves a system of distributed linear equations with a general square matrix, using the LU factorization computed by p?getrf.

Syntax

```
call psgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
call pdgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
call pcgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
call pzgetrs(trans, n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine solves a system of distributed linear equations with a general *n*-by-*n* distributed matrix sub(*A*) = *A*(*ia:ia+n-1*, *ja:ja+n-1*) using the *LU* factorization computed by p?getrf.

The system has one of the following forms specified by *trans*:

sub(*A*)**X* = sub(*B*) (no transpose),

sub(*A*)^T**X* = sub(*B*) (transpose),

sub(*A*)^H**X* = sub(*B*) (conjugate transpose),

where sub(*B*) = *B*(*ib:ib+n-1*, *jb:jb+nrhs-1*).

Before calling this routine, you must call p?getrf to compute the *LU* factorization of sub(*A*).

Input Parameters

trans	(global) CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then sub(*A*)**X* = sub(*B*) is solved for *X*. If *trans* = 'T', then sub(*A*)^T**X* = sub(*B*) is solved for *X*. If *trans* = 'C', then sub(*A*)^H **X* = sub(*B*) is solved for *X*.
n	(global) INTEGER. The number of linear equations; the order of the submatrix sub(*A*) (*n*≥0).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(*B*) (*nrhs*≥0).
a, *b*	(global)

REAL for psgetrs
DOUBLE PRECISION for pdgetrs
COMPLEX for pcgetrs
DOUBLE COMPLEX for pzgetrs.
Pointers into the local memory to arrays of local dimension *a*(*lld_a*, *LOCc*(*ja*+*n*-1)) and *b*(*lld_b*, *LOCc*(*jb*+*nrhs*-1)), respectively.
On entry, the array *a* contains the local pieces of the factors *L* and *U* from the factorization sub(*A*) = *P***L***U*; the unit diagonal elements of *L* are not stored. On entry, the array *b* contains the right hand sides sub(*B*).

ia, *ja* — (global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

ipiv — (local) INTEGER array.
The dimension of *ipiv* is (*LOCr*(*m_a*) + *mb_a*). This array contains the pivoting information: local row i of the matrix was interchanged with the global row *ipiv*(i).
This array is tied to the distributed matrix *A*.

ib, *jb* — (global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.

descb — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

Output Parameters

b — On exit, overwritten by the solution distributed matrix *X*.

info — INTEGER. If *info*=0, the execution is successful. *info* < 0:
If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?gbtrs

Solves a system of distributed linear equations with a general band matrix, using the LU factorization computed by p?gbtrf.

Syntax

```
call psgbtrs(trans, n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, af, laf, work, lwork, info)
```

```
call pdgbtrs(trans, n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, af, laf, work, lwork, info)
```

call pcgbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *ipiv*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzgbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *ipiv*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine solves a system of distributed linear equations with a general band distributed matrix sub(*A*) = *A*(*1:n*, *ja:ja+n-1*) using the *LU* factorization computed by p?gbtrf.

The system has one of the following forms specified by *trans*:

sub(*A*)**X* = sub(*B*) (no transpose),

sub(*A*)^T**X* = sub(*B*) (transpose),

sub(*A*)^H**X* = sub(*B*) (conjugate transpose),

where sub(*B*) = *B*(*ib:ib+n-1*, *1:nrhs*) .

Before calling this routine, you must call p?gbtrf to compute the *LU* factorization of sub(*A*).

Input Parameters

trans	(global) CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then sub(*A*)**X* = sub(*B*) is solved for *X*. If *trans* = 'T', then sub(*A*)^T**X* = sub(*B*) is solved for *X*. If *trans* = 'C', then sub(*A*)^H **X* = sub(*B*) is solved for *X*.
n	(global) INTEGER. The number of linear equations; the order of the distributed submatrix sub(*A*) (*n* ≥ 0).
bwl	(global) INTEGER. The number of sub-diagonals within the band of *A* (0 ≤ *bwl* ≤ *n-1*).
bwu	(global) INTEGER. The number of super-diagonals within the band of *A* (0 ≤ *bwu* ≤ *n-1*).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(*B*) (*nrhs* ≥ 0).
a, *b*	(global) REAL for psgbtrs DOUBLE PRECISION for pdgbtrs COMPLEX for pcgbtrs DOUBLE COMPLEX for pzgbtrs. Pointers into the local memory to arrays of local dimension *a*(*lld_a*,LOC_c(*ja*+*n*-1)) and *b*(*lld_b*,LOC_c(*nrhs*)), respectively. The array *a* contains details of the *LU* factorization of the distributed band matrix *A*.

On entry, the array *b* contains the local pieces of the right hand sides *B*(*ib:ib+n-1, 1:nrhs*).

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

ib (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

descb (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 502 , then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

laf (local) INTEGER. The dimension of the array *af*.

Must be *laf* ≥ NB*(*bwl*+*bwu*)+6*(*bwl*+*bwu*)*(*bwl*+2**bwu*).
If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local) Same type as *a*. Workspace array of dimension *lwork*.

lwork (local or global) INTEGER. The size of the *work* array, must be at least

lwork ≥ *nrhs**(NB+2**bwl*+4**bwu*).

Output Parameters

ipiv (local) INTEGER array.

The dimension of *ipiv* must be ≥ *desca*(NB).
Contains pivot indices for local factorizations. Note that you should not alter the contents of this array between factorization and solve.

b On exit, overwritten by the local pieces of the solution distributed matrix *X*.

af (local)
REAL for psgbtrs
DOUBLE PRECISION for pdgbtrs
COMPLEX for pcgbtrs
DOUBLE COMPLEX for pzgbtrs.
Array, dimension (*laf*).
Auxiliary Fillin space. Fillin is created during the factorization routine p?gbtrf and this is stored in *af*.
Note that if a linear system is to be solved using p?gbtrs after the factorization routine, *af* must not be altered after the factorization.

work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?dbtrs

Solves a system of linear equations with a diagonally dominant-like banded distributed matrix using the factorization computed by p?dbtrf.

Syntax

call psdbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pddbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pcdbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzdbtrs(*trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine p?dbtrs solves for *X* one of the systems of equations:

sub(*A*)**X* = sub(*B*),

$(\text{sub}(A))^T * X = \text{sub}(B)$, or

$(\text{sub}(A))^H * X = \text{sub}(B)$,

where sub(*A*) = *A*(*1:n*, *ja:ja*+*n*-*1*) is a diagonally dominant-like banded distributed matrix, and sub(*B*) denotes the distributed matrix *B*(*ib:ib*+*n*-*1*, *1:nrhs*).

This routine uses the *LU* factorization computed by p?dbtrf.

Input Parameters

trans	(global) CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then sub(*A*)**X* = sub(*B*) is solved for *X*. If *trans* = 'T', then $(\text{sub}(A))^T * X = \text{sub}(B)$ is solved for *X*. If *trans* = 'C', then $(\text{sub}(A))^H * X = \text{sub}(B)$ is solved for *X*.

n (global) INTEGER. The order of the distributed submatrix sub(*A*) ($n \geq 0$).

bwl (global) INTEGER. The number of subdiagonals within the band of *A* ($0 \leq bwl \leq n-1$).

bwu (global) INTEGER. The number of superdiagonals within the band of *A* ($0 \leq bwu \leq n-1$).

nrhs (global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(*B*) ($nrhs \geq 0$).

a, *b* (local)
REAL for psdbtrs
DOUBLE PRECISON for pddbtrs
COMPLEX for pcdbtrs
DOUBLE COMPLEX for pzdbtrs.
Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)) and *b*(*lld_b*,*LOCc*(*nrhs*)), respectively.
On entry, the array *a* contains details of the *LU* factorization of the band matrix *A*, as computed by p?dbtrf.
On entry, the array *b* contains the local pieces of the right hand side distributed matrix sub(*B*).

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

ib (global) INTEGER. The row index in the global array *B* that points to the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

If *descb*(*dtype_*) = 502, then *dlen_* ≥ 7;

else if *descb*(*dtype_*) = 1, then *dlen_* ≥ 9.

af, *work* (local)
REAL for psdbtrs
DOUBLE PRECISION for pddbtrs
COMPLEX for pcdbtrs
DOUBLE COMPLEX for pzdbtrs.
Arrays of dimension (*laf*) and (*lwork*), respectively The array *af* contains auxiliary Fillin space. Fillin is created during the factorization routine p?dbtrf and this is stored in *af*.
The array *work* is a workspace array.

laf	(local) INTEGER. The dimension of the array *af*. Must be *laf* ≥ NB*(*bwl*+*bwu*)+6*(max(*bwl*,*bwu*))^2 . If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).
lwork	(local or global) INTEGER. The size of the array *work*, must be at least *lwork* ≥ (max(*bwl*,*bwu*))^2.

Output Parameters

b	On exit, this array contains the local pieces of the solution distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: if the *i*th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?dttrs

Solves a system of linear equations with a diagonally dominant-like tridiagonal distributed matrix using the factorization computed by p?dttrf.

Syntax

call psdttrs(*trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pddttrs(*trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pcdttrs(*trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzdttrs(*trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine p?dttrs solves for *X* one of the systems of equations:

sub(*A*)**X* = sub(*B*),

(sub(*A*))^T**X* = sub(*B*), or

(sub(*A*))^H**X* = sub(*B*),

where sub(*A*) = (1:*n*, *ja*:*ja*+*n*-1); is a diagonally dominant-like tridiagonal distributed matrix, and sub(*B*) denotes the distributed matrix *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

This routine uses the *LU* factorization computed by p?dttrf.

Input Parameters

trans (global) CHARACTER*1. Must be 'N' or 'T' or 'C'.
Indicates the form of the equations:
If *trans* = 'N', then sub(*A*)**X* = sub(*B*) is solved for *X*.
If *trans* = 'T', then $(\text{sub}(A))^T * X = \text{sub}(B)$ is solved for *X*.
If *trans* = 'C', then $(\text{sub}(A))^H * X = \text{sub}(B)$ is solved for *X*.

n (global) INTEGER. The order of the distributed submatrix sub(*A*) (*n* ≥ 0).

nrhs (global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(*B*) (*nrhs* ≥ 0).

dl, *d*, *du* (local)
REAL for psdttrs
DOUBLE PRECISON for pddttrs
COMPLEX for pcdttrs
DOUBLE COMPLEX for pzdttrs.
Pointers to the local arrays of dimension (*desca*(*nb_*)) each.
On entry, these arrays contain details of the factorization. Globally, *dl*(1) and *du*(*n*) are not referenced; *dl* and *du* must be aligned with *d*.

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*dtype_*) = 501 or 502, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

b (local) Same type as *d*.
Pointer into the local memory to an array of local dimension *b*(*lld_b*, *LOCc*(*nrhs*)).
On entry, the array *b* contains the local pieces of the *n*-by-*nrhs* right hand side distributed matrix sub(*B*).

ib (global) INTEGER. The row index in the global array *B* that points to the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

If *descb*(*dtype_*) = 502, then *dlen_* ≥ 7;

else if *descb*(*dtype_*) = 1, then *dlen_* ≥ 9.

af, *work* (local) REAL for psdttrs
DOUBLE PRECISION for pddttrs
COMPLEX for pcdttrs

	DOUBLE COMPLEX for pzdttrs. Arrays of dimension (*laf*) and (*lwork*), respectively. The array *af* contains auxiliary Fillin space. Fillin is created during the factorization routine p?dttrf and this is stored in *af*. If a linear system is to be solved using p?dttrsafter the factorization routine, *af* must not be altered. The array *work* is a workspace array.
laf	(local) INTEGER. The dimension of the array *af*. Must be *laf* ≥ NB*(*bwl*+*bwu*)+6*(*bwl*+*bwu*)*(*bwl*+2**bwu*). If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).
lwork	(local or global) INTEGER. The size of the array *work*, must be at least *lwork* ≥ 10*NPCOL+4**nrhs*.

Output Parameters

b	On exit, this array contains the local pieces of the solution distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: if the *i*th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?potrs

Solves a system of linear equations with a Cholesky-factored symmetric/Hermitian distributed positive-definite matrix.

Syntax

call pspotrs(*uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *info*)

call pdpotrs(*uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *info*)

call pcpotrs(*uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *info*)

call pzpotrs(*uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine p?potrs solves for *X* a system of distributed linear equations in the form:

sub(*A*)*X = sub(*B*) ,

where sub(*A*) = *A*(*ia:ia*+*n-1*, *ja:ja*+*n-1*) is an *n*-by-*n* real symmetric or complex Hermitian positive definite distributed matrix, and sub(*B*) denotes the distributed matrix *B*(*ib:ib*+*n-1*, *jb:jb*+*nrhs-1*).

This routine uses Cholesky factorization

sub(*A*) = U^H*U, or sub(*A*) = *L**L^H

computed by p?potrf.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', upper triangle of sub(*A*) is stored; If *uplo* = 'L', lower triangle of sub(*A*) is stored.
n	(global) INTEGER. The order of the distributed submatrix sub(*A*) (*n*≥0).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(*B*) (*nrhs*≥0).
a, *b*	(local) REAL for pspotrs DOUBLE PRECISION for pdpotrs COMPLEX for pcpotrs DOUBLE COMPLEX for pzpotrs. Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)) and *b*(*lld_b*,*LOCc*(*jb*+*nrhs*-1)), respectively. The array *a* contains the factors *L* or *U* from the Cholesky factorization sub(*A*) = *L**L^H or sub(*A*) = U^H**U*, as computed by p?potrf. On entry, the array *b* contains the local pieces of the right hand sides sub(*B*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

Output Parameters

b	Overwritten by the local pieces of the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?pbtrs

Solves a system of linear equations with a Cholesky-factored symmetric/Hermitian positive-definite band matrix.

Syntax

```
call pspbtrs( uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pdpbtrs( uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pcpbtrs( uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pzpbtrs( uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, af, laf, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine p?pbtrs solves for X a system of distributed linear equations in the form:

sub(A)*X = sub(B) ,

where sub(A) = $A(1:n, ja:ja+n-1)$ is an n-by-n real symmetric or complex Hermitian positive definite distributed band matrix, and sub(B) denotes the distributed matrix $B(ib:ib+n-1, 1:nrhs)$.

This routine uses Cholesky factorization

sub(A) = $P*U^H*U*P^T$, or sub(A) = $P*L*L^H*P^T$

computed by p?pbtrf.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', upper triangle of sub(A) is stored; If *uplo* = 'L', lower triangle of sub(A) is stored.
n	(global) INTEGER. The order of the distributed submatrix sub(A) ($n \geq 0$).
bw	(global) INTEGER. The number of superdiagonals of the distributed matrix if *uplo* = 'U', or the number of subdiagonals if *uplo* = 'L' ($bw \geq 0$).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(B) ($nrhs \geq 0$).
a, *b*	(local) REAL for pspbtrs DOUBLE PRECISION for pdpbtrs COMPLEX for pcpbtrs DOUBLE COMPLEX for pzpbtrs. Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)) and *b*(*lld_b*,*LOCc*(*nrhs*-1)), respectively.

The array *a* contains the permuted triangular factor *U* or *L* from the Cholesky factorization sub(*A*) = $P*U^H*U*P^T$, or sub(*A*) = $P*L*L^H*P^T$ of the band matrix *A*, as returned by p?pbtrf.
On entry, the array *b* contains the local pieces of the *n*-by-*nrhs* right hand side distributed matrix sub(*B*).

ja — (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

ib — (global) INTEGER. The row index in the global array *B* indicating the first row of the submatrix sub(*B*).

descb — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

If *descb*(*dtype_*) = 502, then *dlen_* ≥ 7;

else if *descb*(*dtype_*) = 1, then *dlen_* ≥ 9.

af, *work* — (local) Arrays, same type as *a*.
The array *af* is of dimension (*laf*). It contains auxiliary Fillin space. Fillin is created during the factorization routine p?dbtrf and this is stored in *af*.
The array *work* is a workspace array of dimension *lwork*.

laf — (local) INTEGER. The dimension of the array *af*.

Must be *laf* ≥ *nrhs*bw*.
If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

lwork — (local or global) INTEGER. The size of the array *work*, must be at least

lwork ≥ bw^2.

Output Parameters

b — On exit, if *info*=0, this array contains the local pieces of the *n*-by-*nrhs* solution distributed matrix *X*.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — INTEGER. If *info*=0, the execution is successful.
info < 0:
If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?pttrs

Solves a system of linear equations with a symmetric (Hermitian) positive-definite tridiagonal distributed matrix using the factorization computed by p?pttrf.

Syntax

```
call pspttrs(n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pdpttrs(n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pcpttrs(uplo, n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
call pzpttrs(uplo, n, nrhs, d, e, ja, desca, b, ib, descb, af, laf, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine p?pttrs solves for X a system of distributed linear equations in the form:

sub(A)*X = sub(B) ,

where sub(A) = $A(1:n, ja:ja+n-1)$ is an n-by-n real symmetric or complex Hermitian positive definite tridiagonal distributed matrix, and sub(B) denotes the distributed matrix $B(ib:ib+n-1, 1:nrhs)$.

This routine uses the factorization

sub(A) = $P*L*D*L^H*P^T$, or sub(A) = $P*U^H*D*U*P^T$

computed by p?pttrf.

Input Parameters

uplo	(global, used in complex flavors only) CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', upper triangle of sub(A) is stored; If *uplo* = 'L', lower triangle of sub(A) is stored.
n	(global) INTEGER. The order of the distributed submatrix sub(A) ($n \geq 0$).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(B) ($nrhs \geq 0$).
d, *e*	(local) REAL for pspttrs DOUBLE PRECISON for pdpttrs COMPLEX for pcpttrs DOUBLE COMPLEX for pzpttrs. Pointers into the local memory to arrays of dimension (*desca*(*nb_*)) each. These arrays contain details of the factorization as returned by p?pttrf
ja	(global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 501 or 502, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

b (local) Same type as *d*, *e*.
Pointer into the local memory to an array of local dimension *b*(*lld_b*, *LOCc*(*nrhs*)).
On entry, the array *b* contains the local pieces of the *n*-by-*nrhs* right hand side distributed matrix sub(*B*).

ib (global) INTEGER. The row index in the global array *B* that points to the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

If *descb*(*dtype_*) = 502, then *dlen_* ≥ 7;

else if *descb*(*dtype_*) = 1, then *dlen_* ≥ 9.

af, *work* (local) REAL for pspttrs
DOUBLE PRECISION for pdpttrs
COMPLEX for pcpttrs
DOUBLE COMPLEX for pzpttrs.
Arrays of dimension (*laf*) and (*lwork*), respectively The array *af* contains auxiliary Fillin space. Fillin is created during the factorization routine p?pttrf and this is stored in *af*.
The array *work* is a workspace array.

laf (local) INTEGER. The dimension of the array *af*.

Must be *laf* ≥ NB+2.
If *laf* is not large enough, an error code is returned and the minimum acceptable size will be returned in *af*(1).

lwork (local or global) INTEGER. The size of the array *work*, must be at least
lwork ≥ (10+2*min(100,*nrhs*))*NPCOL+4**nrhs*.

Output Parameters

b On exit, this array contains the local pieces of the solution distributed matrix *X*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info INTEGER. If *info*=0, the execution is successful.
info < 0:
if the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*);
if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?trtrs

Solves a system of linear equations with a triangular distributed matrix.

Syntax

```
call pstrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pdtrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pctrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pztrtrs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine solves for X one of the following systems of linear equations:

$\text{sub}(A)*X = \text{sub}(B)$,

$(\text{sub}(A))^{T}*X = \text{sub}(B)$, or

$(\text{sub}(A))^{H}*X = \text{sub}(B)$,

where sub(A) = A(*ia:ia+n-1, ja:ja+n-1*) is a triangular distributed matrix of order n, and sub(B) denotes the distributed matrix B(*ib:ib+n-1, jb:jb+nrhs-1*).

A check is made to verify that sub(A) is nonsingular.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. Indicates whether sub(A) is upper or lower triangular: If *uplo* = 'U', then sub(A) is upper triangular. If *uplo* = 'L', then sub(A) is lower triangular.
trans	(global) CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then sub(A)*X = sub(B) is solved for X. If *trans* = 'T', then sub(A)^{T}*X = sub(B) is solved for X. If *trans* = 'C', then sub(A)^{H}*X = sub(B) is solved for X.
diag	(global) CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then sub(A) is not a unit triangular matrix. If *diag* = 'U', then sub(A) is unit triangular.
n	(global) INTEGER. The order of the distributed submatrix sub(A) ($n \geq 0$).
nrhs	(global) INTEGER. The number of right-hand sides; i.e., the number of columns of the distributed matrix sub(B) ($nrhs \geq 0$).
a, *b*	(local) REAL for pstrtrs DOUBLE PRECISION for pdtrtrs

	COMPLEX for pctrtrs DOUBLE COMPLEX for pztrtrs. Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)) and *b*(*lld_b*,*LOCc*(*jb*+*nrhs*-1)), respectively. The array *a* contains the local pieces of the distributed triangular matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular matrix, and the strictly lower triangular part of sub(*A*) is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular matrix, and the strictly upper triangular part of sub(*A*) is not referenced. If *diag* = 'U', the diagonal elements of sub(*A*) are also not referenced and are assumed to be 1. On entry, the array *b* contains the local pieces of the right hand side distributed matrix sub(*B*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

Output Parameters

b	On exit, if *info*=0, sub(*B*) is overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: if the *i*th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*th argument is a scalar and had an illegal value, then *info* = -*i*; *info* > 0: if *info* = *i*, the *i*-th diagonal element of sub(*A*) is zero, indicating that the submatrix is singular and the solutions *X* have not been computed.

Routines for Estimating the Condition Number

This section describes the ScaLAPACK routines for estimating the condition number of a matrix. The condition number is used for analyzing the errors in the solution of a system of linear equations. Since the condition number may be arbitrarily large when the matrix is nearly singular, the routines actually compute the *reciprocal* condition number.

p?gecon

Estimates the reciprocal of the condition number of a general distributed matrix in either the 1-norm or the infinity-norm.

Syntax

```
call psgecon( norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
call pdgecon( norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
call pcgecon( norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
call pzgecon( norm, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine estimates the reciprocal of the condition number of a general distributed real/complex matrix sub(*A*) = *A*(*ia:ia+n-1*, *ja:ja+n-1*) in either the 1-norm or infinity-norm, using the *LU* factorization computed by p?getrf.

An estimate is obtained for $||(\text{sub}(A))^{-1}||$, and the reciprocal of the condition number is computed as

$$rcond = \frac{1}{\|sub(A)\| \times \|(sub(A))^{-1}\|}$$

Input Parameters

norm (global) CHARACTER*1. Must be '1' or 'O' or 'I'.
Specifies whether the 1-norm condition number or the infinity-norm condition number is required.
If *norm* = '1' or 'O', then the 1-norm is used;
If *norm* = 'I', then the infinity-norm is used.

n (global) INTEGER. The order of the distributed submatrix sub(*A*) (*n* ≥ 0).

a (local)
REAL for psgecon
DOUBLE PRECISION for pdgecon
COMPLEX for pcgecon
DOUBLE COMPLEX for pzgecon.
Pointer into the local memory to an array of dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)).
The array *a* contains the local pieces of the factors *L* and *U* from the factorization sub(*A*) = *P*L*U*; the unit diagonal elements of *L* are not stored.

ia, *ja* (global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

anorm (global) REAL for single precision flavors, DOUBLE PRECISION for double precision flavors.
If *norm* = '1' or 'O', the 1-norm of the original distributed matrix sub(*A*);
If *norm* = 'I', the infinity-norm of the original distributed matrix sub(*A*).

work (local)
REAL for psgecon
DOUBLE PRECISION for pdgecon
COMPLEX for pcgecon
DOUBLE COMPLEX for pzgecon.
The array *work* of dimension (*lwork*) is a workspace array.

lwork (local or global) INTEGER. The dimension of the array *work*.
For real flavors:
lwork must be at least

lwork ≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+ 2**LOCc*(*n*+mod(*ja*-1,*nb_a*))+ max(2, max(*nb_a**max(1, iceil(NPROW-1, NPCOL)), *LOCc*(*n*+mod(*ja*-1,*nb_a*)) + *nb_a**max(1, iceil(NPCOL-1, NPROW)))).

For complex flavors:
lwork must be at least

lwork ≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+ max(2, max(*nb_a**iceil(NPROW-1, NPCOL), *LOCc*(*n*+mod(*ja*-1,*nb_a*))+ *nb_a**iceil(NPCOL-1, NPROW))).

LOCr and *LOCc* values can be computed using the ScaLAPACK tool function numroc; NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

iwork (local) INTEGER. Workspace array, DIMENSION (*liwork*). Used in real flavors only.

liwork (local or global) INTEGER. The dimension of the array *iwork*; used in real flavors only. Must be at least

liwork ≥ *LOCr*(*n*+mod(*ia*-1,*mb_a*)).

rwork (local) REAL for pcgecon
DOUBLE PRECISION for pzgecon
Workspace array, DIMENSION (*lrwork*). Used in complex flavors only.

lrwork (local or global) INTEGER. The dimension of the array *rwork*; used in complex flavors only. Must be at least

lrwork ≥ 2**LOCc*(*n*+mod(*ja*-1,*nb_a*)).

Output Parameters

rcond	(global) REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The reciprocal of the condition number of the distributed matrix sub(*A*). See Description.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
iwork(1)	On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?pocon

Estimates the reciprocal of the condition number (in the 1 - norm) of a symmetric / Hermitian positive-definite distributed matrix.

Syntax

```
call pspocon( uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
call pdpocon( uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, iwork, liwork, info)
call pcpocon( uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
call pzpocon( uplo, n, a, ia, ja, desca, anorm, rcond, work, lwork, rwork, lrwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine estimates the reciprocal of the condition number (in the 1 - norm) of a real symmetric or complex Hermitian positive definite distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), using the Cholesky factorization sub(*A*) = U^H**U* or sub(*A*) = *L**L^H computed by p?potrf.

An estimate is obtained for $||(sub(A))^{-1}||$, and the reciprocal of the condition number is computed as

$$rcond = \frac{1}{\|sub(A)\| \times \|(sub(A))^{-1}\|}$$

Input Parameters

uplo (global) CHARACTER*1. Must be 'U' or 'L'.
Specifies whether the factor stored in sub(*A*) is upper or lower triangular.
If *uplo* = 'U', sub(*A*) stores the upper triangular factor *U* of the Cholesky factorization sub(*A*) = U^H*U.
If *uplo* = 'L', sub(*A*) stores the lower triangular factor *L* of the Cholesky factorization sub(*A*) = $L*L^H$.

n (global) INTEGER. The order of the distributed submatrix sub(*A*) (*n*≥0).

a (local)
REAL for pspocon
DOUBLE PRECISION for pdpocon
COMPLEX for pcpocon
DOUBLE COMPLEX for pzpocon.
Pointer into the local memory to an array of dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)).
The array *a* contains the local pieces of the factors *L* or *U* from the Cholesky factorization sub(*A*) = U^H*U, or sub(*A*) = $L*L^H$, as computed by p?potrf.

ia, *ja* (global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

anorm (global) REAL for single precision flavors,
DOUBLE PRECISION for double precision flavors.
The 1-norm of the symmetric/Hermitian distributed matrix sub(*A*).

work (local)
REAL for pspocon
DOUBLE PRECISION for pdpocon
COMPLEX for pcpocon
DOUBLE COMPLEX for pzpocon.
The array *work* of dimension (*lwork*) is a workspace array.

lwork (local or global) INTEGER. The dimension of the array *work*.
For real flavors:
lwork must be at least

lwork ≥ 2*LOCr(*n*+mod(*ia*-1,*mb_a*))+ 2*LOCc(*n*+mod(*ja*-1,*nb_a*))+ max(2, max(*nb_a**iceil(NPROW-1, NPCOL),*LOCc*(*n*+mod(*ja*-1,*nb_a*))+ *nb_a**iceil(NPCOL-1, NPROW))).

For complex flavors:
lwork must be at least

	lwork ≥ 2*LOCr(*n*+mod(*ia*-1,*mb_a*))+ max(2, max(*nb_a**max(1,iceil(NPROW-1, NPCOL)), *LOCc*(*n*+mod(*ja*-1,*nb_a*))+ *nb_a**max(1,iceil(NPCOL-1, NPROW)))).
iwork	(local) INTEGER. Workspace array, DIMENSION (*liwork*). Used in real flavors only.
liwork	(local or global) INTEGER. The dimension of the array *iwork*; used in real flavors only. Must be at least *liwork* ≥ *LOCr*(*n*+mod(*ia*-1,*mb_a*)).
rwork	(local) REAL for pcpocon DOUBLE PRECISION for pzpocon Workspace array, DIMENSION (*lrwork*). Used in complex flavors only.
lrwork	(local or global) INTEGER. The dimension of the array *rwork*; used in complex flavors only. Must be at least *lrwork* ≥ 2**LOCc*(*n*+mod(*ja*-1,*nb_a*)).

Output Parameters

rcond	(global) REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The reciprocal of the condition number of the distributed matrix sub(*A*).
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
iwork(1)	On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*th argument is a scalar and had an illegal value, then *info* = -*i*.

p?trcon

Estimates the reciprocal of the condition number of a triangular distributed matrix in either 1-norm or infinity-norm.

Syntax

call pstrcon(*norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, iwork, liwork, info*)

call pdtrcon(*norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, iwork, liwork, info*)

`call pctrcon( norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, rwork, lrwork, info)`

`call pztrcon( norm, uplo, diag, n, a, ia, ja, desca, rcond, work, lwork, rwork, lrwork, info)`

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine estimates the reciprocal of the condition number of a triangular distributed matrix sub(*A*) = *A*(*ia:ia+n-1*, *ja:ja+n-1*), in either the 1-norm or the infinity-norm.

The norm of sub(*A*) is computed and an estimate is obtained for $||(sub(A))^{-1}||$, then the reciprocal of the condition number is computed as

$$rcond = \frac{1}{\|sub(A)\| \times \|(sub(A))^{-1}\|}$$

Input Parameters

norm (global) CHARACTER*1. Must be '1' or 'O' or 'I'.
Specifies whether the 1-norm condition number or the infinity-norm condition number is required.
If *norm* = '1' or 'O', then the 1-norm is used;
If *norm* = 'I', then the infinity-norm is used.

uplo (global) CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', sub(*A*) is upper triangular. If *uplo* = 'L', sub(*A*) is lower triangular.

diag (global) CHARACTER*1. Must be 'N' or 'U'.
If *diag* = 'N', sub(*A*) is non-unit triangular. If *diag* = 'U', sub(*A*) is unit triangular.

n (global) INTEGER. The order of the distributed submatrix sub(*A*), (*n*≥0).

a (local)
REAL for pstrcon
DOUBLE PRECISION for pdtrcon
COMPLEX for pctrcon
DOUBLE COMPLEX for pztrcon.
Pointer into the local memory to an array of dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)).
The array *a* contains the local pieces of the triangular distributed matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of this distributed matrix contains the upper triangular matrix, and its strictly lower triangular part is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of this distributed matrix contains the lower triangular matrix, and its strictly upper triangular part is not referenced.
If *diag* = 'U', the diagonal elements of sub(*A*) are also not referenced and are assumed to be 1.

ia, *ja* — (global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

work — (local)
REAL for pstrcon
DOUBLE PRECISION for pdtrcon
COMPLEX for pctrcon
DOUBLE COMPLEX for pztrcon.
The array *work* of dimension (*lwork*) is a workspace array.

lwork — (local or global) INTEGER. The dimension of the array *work*.
For real flavors:
lwork must be at least

lwork ≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+ *LOCc*(*n*+mod(*ja*-1,*nb_a*))+ max(2, max(*nb_a**max(1,iceil(NPROW-1, NPCOL)), *LOCc*(*n*+mod(*ja*-1,*nb_a*))+ *nb_a**max(1,iceil(NPCOL-1, NPROW)))).

For complex flavors:
lwork must be at least

lwork ≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))+ max(2, max(*nb_a**iceil(NPROW-1, NPCOL), *LOCc*(*n*+mod(*ja*-1,*nb_a*))+ *nb_a**iceil(NPCOL-1, NPROW))).

iwork — (local) INTEGER. Workspace array, DIMENSION (*liwork*). Used in real flavors only.

liwork — (local or global) INTEGER. The dimension of the array *iwork*; used in real flavors only. Must be at least

liwork ≥ *LOCr*(*n*+mod(*ia*-1,*mb_a*)).

rwork — (local) REAL for pcpocon
DOUBLE PRECISION for pzpocon
Workspace array, DIMENSION (*lrwork*). Used in complex flavors only.

lrwork — (local or global) INTEGER. The dimension of the array *rwork*; used in complex flavors only. Must be at least

lrwork ≥ *LOCc*(*n*+mod(*ja*-1,*nb_a*)).

Output Parameters

rcond — (global) REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
The reciprocal of the condition number of the distributed matrix sub(*A*).

work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
iwork(1)	On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Refining the Solution and Estimating Its Error

This section describes the ScaLAPACK routines for refining the computed solution of a system of linear equations and estimating the solution error. You can call these routines after factorizing the matrix of the system of equations and computing the solution (see Routines for Matrix Factorization and Solving Systems of Linear Equations).

p?gerfs

Improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution.

Syntax

call psgerfs(*trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info*)

call pdgerfs(*trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info*)

call pcgerfs(*trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info*)

call pzgerfs(*trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine improves the computed solution to one of the systems of linear equations

sub(*A*)*sub(*X*) = sub(*B*),

sub(*A*)^T*sub(*X*) = sub(*B*), or

sub(*A*)^H*sub(*X*) = sub(*B*) and provides error bounds and backward error estimates for the solution.

Here sub(*A*) = *A*(*ia:ia+n-1, ja:ja+n-1*), sub(*B*) = *B*(*ib:ib+n-1, jb:jb+nrhs-1*), and sub(*X*) = *X*(*ix:ix+n-1, jx:jx+nrhs-1*).

Input Parameters

trans	(global) CHARACTER*1. Must be 'N' or 'T' or 'C'. Specifies the form of the system of equations: If *trans* = 'N', the system has the form sub(*A*)*sub(*X*) = sub(*B*) (No transpose); If *trans* = 'T', the system has the form sub(*A*)^T*sub(*X*) = sub(*B*) (Transpose); If *trans* = 'C', the system has the form sub(*A*)^H*sub(*X*) = sub(*B*) (Conjugate transpose).
n	(global) INTEGER. The order of the distributed submatrix sub(*A*) (*n* ≥ 0).
nrhs	(global) INTEGER. The number of right-hand sides, i.e., the number of columns of the matrices sub(*B*) and sub(*X*) (*nrhs* ≥ 0).
a, *af*, *b*, *x*	(local) REAL for psgerfs DOUBLE PRECISION for pdgerfs COMPLEX for pcgerfs DOUBLE COMPLEX for pzgerfs. Pointers into the local memory to arrays of local dimension *a*(*lld_a*, *LOCc*(*ja*+*n*-1)), *af*(*lld_af*,*LOCc*(*jaf*+*n*-1)), *b*(*lld_b*,*LOCc*(*jb*+*nrhs*-1)), and *x*(*lld_x*,*LOCc*(*jx*+*nrhs*-1)), respectively. The array *a* contains the local pieces of the distributed matrix sub(*A*). The array *af* contains the local pieces of the distributed factors of the matrix sub(*A*) = *P***L***U* as computed by p?getrf. The array *b* contains the local pieces of the distributed matrix of right hand sides sub(*B*). On entry, the array *x* contains the local pieces of the distributed solution matrix sub(*X*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
iaf, *jaf*	(global) INTEGER. The row and column indices in the global array *AF* indicating the first row and the first column of the submatrix sub(*AF*), respectively.
descaf	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *AF*.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

ix, *jx* (global) INTEGER. The row and column indices in the global array *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.

descx (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *X*.

ipiv (local) INTEGER.
Array, dimension *LOCr*(*m_af* + *mb_af*.
This array contains pivoting information as computed by p?getrf. If *ipiv*(i)=j, then the local row i was swapped with the global row j. This array is tied to the distributed matrix *A*.

work (local)
REAL for psgerfs
DOUBLE PRECISION for pdgerfs
COMPLEX for pcgerfs
DOUBLE COMPLEX for pzgerfs.
The array *work* of dimension (*lwork*) is a workspace array.

lwork (local or global) INTEGER. The dimension of the array *work*.
For real flavors:
lwork must be at least

lwork ≥ 3**LOCr*(*n*+mod(*ia*-1,*mb_a*))

For complex flavors:
lwork must be at least

lwork ≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))

iwork (local) INTEGER. Workspace array, DIMENSION (*liwork*). Used in real flavors only.

liwork (local or global) INTEGER. The dimension of the array *iwork*; used in real flavors only. Must be at least

liwork ≥ *LOCr*(*n*+mod(*ib*-1,*mb_b*)).

rwork (local) REAL for pcgerfs
DOUBLE PRECISION for pzgerfs
Workspace array, DIMENSION (*lrwork*). Used in complex flavors only.

lrwork (local or global) INTEGER. The dimension of the array *rwork*; used in complex flavors only. Must be at least *lrwork* ≥ *LOCr*(*n*+mod(*ib*-1,*mb_b*))).

Output Parameters

x On exit, contains the improved solution vectors.

ferr, *berr* REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, dimension *LOCc*(*jb*+*nrhs*-*1*) each.
The array *ferr* contains the estimated forward error bound for each solution vector of sub(*X*).

	If XTRUE is the true solution corresponding to sub(*X*), *ferr* is an estimated upper bound for the magnitude of the largest element in (sub(*X*) - XTRUE) divided by the magnitude of the largest element in sub(*X*). The estimate is as reliable as the estimate for rcond, and is almost always a slight overestimate of the true error. This array is tied to the distributed matrix *X*. The array *berr* contains the component-wise relative backward error of each solution vector (that is, the smallest relative change in any entry of sub(*A*) or sub(*B*) that makes sub(*X*) an exact solution). This array is tied to the distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
iwork(1)	On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?porfs

Improves the computed solution to a system of linear equations with symmetric/Hermitian positive definite distributed matrix and provides error bounds and backward error estimates for the solution.

Syntax

call psporfs(*uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info*)

call pdporfs(*uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, iwork, liwork, info*)

call pcporfs(*uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info*)

call pzporfs(*uplo, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, b, ib, jb, descb, x, ix, jx, descx, ferr, berr, work, lwork, rwork, lrwork, info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine p?porfs improves the computed solution to the system of linear equations

sub(*A*)*sub(*X*) = sub(*B*),

where sub(*A*) = *A*(*ia:ia+n-1, ja:ja+n-1*) is a real symmetric or complex Hermitian positive definite distributed matrix and

sub(*B*) = *B*(*ib:ib+n-1, jb:jb+nrhs-1*),

sub(*X*) = *X*(*ix:ix+n-1, jx:jx+nrhs-1*)

are right-hand side and solution submatrices, respectively. This routine also provides error bounds and backward error estimates for the solution.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix sub(*A*) is stored. If *uplo* = 'U', sub(*A*) is upper triangular. If *uplo* = 'L', sub(*A*) is lower triangular.
n	(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).
nrhs	(global) INTEGER. The number of right-hand sides, i.e., the number of columns of the matrices sub(*B*) and sub(*X*) (*nrhs*≥0).
a, *af*, *b*, *x*	(local) REAL for psporfs DOUBLE PRECISION for pdporfs COMPLEX for pcporfs DOUBLE COMPLEX for pzporfs. Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja+n-1*)), *af*(*lld_af*,*LOCc*(*ja+n-1*)), *b*(*lld_b*,*LOCc*(*jb+nrhs-1*)), and *x*(*lld_x*,*LOCc*(*jx+nrhs-1*)), respectively. The array *a* contains the local pieces of the *n*-by-*n* symmetric/Hermitian distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the distributed matrix, and its strictly upper triangular part is not referenced. The array *af* contains the factors *L* or *U* from the Cholesky factorization sub(*A*) = $L*L^H$ or sub(*A*) = U^H*U, as computed by p?potrf. On entry, the array *b* contains the local pieces of the distributed matrix of right hand sides sub(*B*). On entry, the array *x* contains the local pieces of the solution vectors sub(*X*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

iaf, *jaf*	(global) INTEGER. The row and column indices in the global array *AF* indicating the first row and the first column of the submatrix sub(*AF*), respectively.
descaf	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *AF*.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.
ix, *jx*	(global) INTEGER. The row and column indices in the global array *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *X*.
work	(local) REAL for psporfs DOUBLE PRECISION for pdporfs COMPLEX for pcporfs DOUBLE COMPLEX for pzporfs. The array *work* of dimension (*lwork*) is a workspace array.
lwork	(local) INTEGER. The dimension of the array *work*. *For real flavors:* *lwork* must be at least *lwork* ≥ 3**LOCr*(*n*+mod(*ia*-1,*mb_a*)) *For complex flavors:* *lwork* must be at least *lwork* ≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))
iwork	(local) INTEGER. Workspace array, DIMENSION (*liwork*). Used in real flavors only.
liwork	(local or global) INTEGER. The dimension of the array *iwork*; used in real flavors only. Must be at least *liwork* ≥ *LOCr*(*n*+mod(*ib*-1,*mb_b*)).
rwork	(local) REAL for pcporfs DOUBLE PRECISION for pzporfs Workspace array, DIMENSION (*lrwork*). Used in complex flavors only.
lrwork	(local or global) INTEGER. The dimension of the array *rwork*; used in complex flavors only. Must be at least *lrwork* ≥ *LOCr*(*n*+mod(*ib*-1,*mb_b*))).

Output Parameters

x	On exit, contains the improved solution vectors.
ferr, *berr*	REAL for single precision flavors.

DOUBLE PRECISION for double precision flavors.
Arrays, dimension *LOCc*(*jb*+*nrhs*-*1*) each.
The array *ferr* contains the estimated forward error bound for each solution vector of sub(*X*).
If XTRUE is the true solution corresponding to sub(*X*), *ferr* is an estimated upper bound for the magnitude of the largest element in (sub(*X*) - XTRUE)divided by the magnitude of the largest element in sub(*X*). The estimate is as reliable as the estimate for rcond, and is almost always a slight overestimate of the true error.
This array is tied to the distributed matrix *X*.
The array *berr* contains the component-wise relative backward error of each solution vector (that is, the smallest relative change in any entry of sub(*A*) or sub(*B*) that makes sub(*X*) an exact solution). This array is tied to the distributed matrix *X*.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

iwork(1) — On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).

rwork(1) — On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).

info — (global) INTEGER. If *info*=0, the execution is successful.
info < 0:
If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?trrfs

Provides error bounds and backward error estimates for the solution to a system of linear equations with a distributed triangular coefficient matrix.

Syntax

```
call pstrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx,
descx, ferr, berr, work, lwork, iwork, liwork, info)
```

```
call pdtrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx,
descx, ferr, berr, work, lwork, iwork, liwork, info)
```

```
call pctrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx,
descx, ferr, berr, work, lwork, rwork, lrwork, info)
```

```
call pztrrfs(uplo, trans, diag, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, x, ix, jx,
descx, ferr, berr, work, lwork, rwork, lrwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine p?trrfs provides error bounds and backward error estimates for the solution to one of the systems of linear equations

sub(*A*)*sub(*X*) = sub(*B*),

sub(*A*)^T*sub(*X*) = sub(*B*), or

sub(*A*)^H*sub(*X*) = sub(*B*) ,

where sub(*A*) = *A*(*ia:ia+n-1*, *ja:ja+n-1*) is a triangular matrix,

sub(*B*) = *B*(*ib:ib+n-1*, *jb:jb+nrhs-1*), and

sub(*X*) = *X*(*ix:ix+n-1*, *jx:jx+nrhs-1*).

The solution matrix *X* must be computed by p?trtrs or some other means before entering this routine. The routine p?trrfs does not do iterative refinement because doing so cannot improve the backward error.

Input Parameters

uplo — (global) CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', sub(*A*) is upper triangular. If *uplo* = 'L', sub(*A*) is lower triangular.

trans — (global) CHARACTER*1. Must be 'N' or 'T' or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form sub(*A*)*sub(*X*) = sub(*B*) (No transpose);
If *trans* = 'T', the system has the form sub(*A*)^T*sub(*X*) = sub(*B*) (Transpose);
If *trans* = 'C', the system has the form sub(*A*)^H*sub(*X*) = sub(*B*) (Conjugate transpose).

diag — CHARACTER*1. Must be 'N' or 'U'.
If *diag* = 'N', then sub(*A*) is non-unit triangular.
If *diag* = 'U', then sub(*A*) is unit triangular.

n — (global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).

nrhs — (global) INTEGER. The number of right-hand sides, that is, the number of columns of the matrices sub(*B*) and sub(*X*) (*nrhs*≥0).

a, *b*, *x* — (local)
REAL for pstrrfs
DOUBLE PRECISION for pdtrrfs
COMPLEX for pctrrfs
DOUBLE COMPLEX for pztrrfs.
Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja+n-1*)), *b*(*lld_b*,*LOCc*(*jb+nrhs-1*)), and *x*(*lld_x*,*LOCc*(*jx+nrhs-1*)), respectively.
The array *a* contains the local pieces of the original triangular distributed matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced.

	If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the distributed matrix, and its strictly upper triangular part is not referenced. If *diag* = 'U', the diagonal elements of sub(*A*) are also not referenced and are assumed to be 1. On entry, the array *b* contains the local pieces of the distributed matrix of right hand sides sub(*B*). On entry, the array *x* contains the local pieces of the solution vectors sub(*X*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.
ix, *jx*	(global) INTEGER. The row and column indices in the global array *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *X*.
work	(local) REAL for pstrrfs DOUBLE PRECISION for pdtrrfs COMPLEX for pctrrfs DOUBLE COMPLEX for pztrrfs. The array *work* of dimension (*lwork*) is a workspace array.
lwork	(local) INTEGER. The dimension of the array *work*. *For real flavors:* *lwork* must be at least *lwork* ≥ 3**LOCr*(*n*+mod(*ia*-1,*mb_a*)) *For complex flavors:* *lwork* must be at least *lwork* ≥ 2**LOCr*(*n*+mod(*ia*-1,*mb_a*))
iwork	(local) INTEGER. Workspace array, DIMENSION (*liwork*). Used in real flavors only.
liwork	(local or global) INTEGER. The dimension of the array *iwork*; used in real flavors only. Must be at least *liwork* ≥ *LOCr*(*n*+mod(*ib*-1,*mb_b*)).
rwork	(local) REAL for pctrrfs DOUBLE PRECISION for pztrrfs Workspace array, DIMENSION (*lrwork*). Used in complex flavors only.

lrwork	(local or global) INTEGER. The dimension of the array *rwork*; used in complex flavors only. Must be at least *lrwork* ≥ *LOCr*(*n*+mod(*ib*-1,*mb_b*))).

Output Parameters

ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, dimension *LOCc*(*jb*+*nrhs*-*1*) each. The array *ferr* contains the estimated forward error bound for each solution vector of sub(*X*). If XTRUE is the true solution corresponding to sub(*X*), *ferr* is an estimated upper bound for the magnitude of the largest element in (sub(*X*) - XTRUE) divided by the magnitude of the largest element in sub(*X*). The estimate is as reliable as the estimate for rcond, and is almost always a slight overestimate of the true error. This array is tied to the distributed matrix *X*. The array *berr* contains the component-wise relative backward error of each solution vector (that is, the smallest relative change in any entry of sub(*A*) or sub(*B*) that makes sub(*X*) an exact solution). This array is tied to the distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
iwork(1)	On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance (for real flavors).
rwork(1)	On exit, *rwork*(1) contains the minimum value of *lrwork* required for optimum performance (for complex flavors).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Routines for Matrix Inversion

This sections describes ScaLAPACK routines that compute the inverse of a matrix based on the previously obtained factorization. Note that it is not recommended to solve a system of equations $Ax = b$ by first computing A^{-1} and then forming the matrix-vector product $x = A^{-1}b$. Call a solver routine instead (see Solving Systems of Linear Equations); this is more efficient and more accurate.

p?getri

Computes the inverse of a LU-factored distributed matrix.

Syntax

```
call psgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
```

```
call pdgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
call pcgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
call pzgetri(n, a, ia, ja, desca, ipiv, work, lwork, iwork, liwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the inverse of a general distributed matrix sub(*A*) = *A*(*ia:ia+n-1*, *ja:ja+n-1*) using the *LU* factorization computed by p?getrf. This method inverts *U* and then computes the inverse of sub(*A*) by solving the system

inv(sub(*A*))**L* = inv(*U*)

for inv(sub(*A*)).

Input Parameters

n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*) (*n*≥0).
a	(local) REAL for psgetri DOUBLE PRECISION for pdgetri COMPLEX for pcgetri DOUBLE COMPLEX for pzgetri. Pointer into the local memory to an array of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)). On entry, the array *a* contains the local pieces of the *L* and *U* obtained by the factorization sub(*A*) = *P***L***U* computed by p?getrf.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local) REAL for psgetri DOUBLE PRECISION for pdgetri COMPLEX for pcgetri DOUBLE COMPLEX for pzgetri. The array *work* of dimension (*lwork*) is a workspace array.
lwork	(local) INTEGER. The dimension of the array *work*. *lwork* must be at least *lwork*≥*LOCr*(*n*+mod(*ia*-1,*mb_a*))**nb_a*. The array *work* is used to keep at most an entire column block of sub(*A*).
iwork	(local) INTEGER. Workspace array used for physically transposing the pivots, DIMENSION (*liwork*).

liwork (local or global) INTEGER. The dimension of the array *iwork*.
The minimal value *liwork* of is determined by the following code:

```
if NPROW == NPCOL then
 liwork = LOCc(n_a + mod(ja-1,nb_a))+ nb_a

else

 liwork = LOCc(n_a + mod(ja-1,nb_a)) +

max(ceil(ceil(LOCr(m_a)/mb_a)/(lcm/NPROW)),nb_a)
end if
```

where lcm is the least common multiple of process rows and columns (NPROW and NPCOL).

Output Parameters

ipiv (local) INTEGER.
Array, dimension (*LOCr*(*m_a*)+ *mb_a*).
This array contains the pivoting information.
If *ipiv*(i)=j, then the local row i was swapped with the global row j.
This array is tied to the distributed matrix *A*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

iwork(1) On exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance.

info (global) INTEGER. If *info*=0, the execution is successful.
info < 0:
If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
info > 0:
If *info* = *i*, *U*(*i*,*i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

p?potri

Computes the inverse of a symmetric/Hermitian positive definite distributed matrix.

Syntax

```
call pspotri(uplo, n, a, ia, ja, desca, info)
call pdpotri(uplo, n, a, ia, ja, desca, info)
```

```
call pcpotri(uplo, n, a, ia, ja, desca, info)
call pzpotri(uplo, n, a, ia, ja, desca, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the inverse of a real symmetric or complex Hermitian positive definite distributed matrix sub(*A*) = *A*(*ia:ia+n-1*, *ja:ja+n-1*) using the Cholesky factorization sub(*A*) = U^H*U or sub(*A*) = $L*L^H$ computed by p?potrf.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix sub(*A*) is stored. If *uplo* = 'U', upper triangle of sub(*A*) is stored. If *uplo* = 'L', lower triangle of sub(*A*) is stored.
n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*) (*n*≥0).
a	(local) REAL for pspotri DOUBLE PRECISION for pdpotri COMPLEX for pcpotri DOUBLE COMPLEX for pzpotri. Pointer into the local memory to an array of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)). On entry, the array *a* contains the local pieces of the triangular factor *U* or *L* from the Cholesky factorization sub(*A*) = U^H*U, or sub(*A*) = $L*L^H$, as computed by p?potrf.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a	On exit, overwritten by the local pieces of the upper or lower triangle of the (symmetric/Hermitian) inverse of sub(*A*).
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = *i*, the (*i*, *i*) element of the factor *U* or *L* is zero, and the inverse could not be computed.

p?trtri

Computes the inverse of a triangular distributed matrix.

Syntax

```
call pstrtri(uplo, diag, n, a, ia, ja, desca, info)
call pdtrtri(uplo, diag, n, a, ia, ja, desca, info)
call pctrtri(uplo, diag, n, a, ia, ja, desca, info)
call pztrtri(uplo, diag, n, a, ia, ja, desca, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the inverse of a real or complex upper or lower triangular distributed matrix `sub(A) = A(ia:ia+n-1, ja:ja+n-1)`.

Input Parameters

uplo	(global) CHARACTER*1. Must be 'U' or 'L'. Specifies whether the distributed matrix sub(*A*) is upper or lower triangular. If *uplo* = 'U', sub(*A*) is upper triangular. If *uplo* = 'L', sub(*A*) is lower triangular.
diag	CHARACTER*1. Must be 'N' or 'U'. Specifies whether or not the distributed matrix sub(*A*) is unit triangular. If *diag* = 'N', then sub(*A*) is non-unit triangular. If *diag* = 'U', then sub(*A*) is unit triangular.
n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*) (*n*≥0).
a	(local) REAL for pstrtri DOUBLE PRECISION for pdtrtri COMPLEX for pctrtri DOUBLE COMPLEX for pztrtri. Pointer into the local memory to an array of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)). The array *a* contains the local pieces of the triangular distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular matrix to be inverted, and the strictly lower triangular part of sub(*A*) is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular matrix, and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a	On exit, overwritten by the (triangular) inverse of the original matrix.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = *k*, *A*(*ia*+*k*-1, *ja*+*k*-1) is exactly zero. The triangular matrix sub(*A*) is singular and its inverse can not be computed.

Routines for Matrix Equilibration

ScaLAPACK routines described in this section are used to compute scaling factors needed to equilibrate a matrix. Note that these routines do not actually scale the matrices.

p?geequ

Computes row and column scaling factors intended to equilibrate a general rectangular distributed matrix and reduce its condition number.

Syntax

```
call psgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
call pdgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
call pcgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
call pzgeequ(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia:ia+m-1*, *ja:ja+n-1*) and reduce its condition number. The output array *r* returns the row scale factors and the array *c* the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements b_{ij}=*r*(i)**a*$_{ij}$**c*(*j*) have absolute value 1.

r(i) and *c*(j) are restricted to be between *SMLNUM* = smallest safe number and *BIGNUM* = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of sub(*A*) but works well in practice.

The auxiliary function p?laqge uses scaling factors computed by p?geequ to scale a general rectangular matrix.

Input Parameters

m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*) (*m* ≥ 0).
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*) (*n* ≥ 0).
a	(local) REAL for psgeequ DOUBLE PRECISION for pdgeequ COMPLEX for pcgeequ DOUBLE COMPLEX for pzgeequ . Pointer into the local memory to an array of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)). The array *a* contains the local pieces of the *m*-by-*n* distributed matrix whose equilibration factors are to be computed.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

r, *c*	(local) REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. Arrays, dimension *LOCr*(*m_a)* and *LOCc*(*n_a)*, respectively. If *info* = 0, or *info* > *ia*+*m-1*, the array *r* (*ia:ia*+*m-1*) contains the row scale factors for sub(*A*). *r* is aligned with the distributed matrix *A*, and replicated across every process column. *r* is tied to the distributed matrix *A*. If *info* = 0, the array *c* (*ja:ja*+*n-1*) contains the column scale factors for sub(*A*). *c* is aligned with the distributed matrix *A*, and replicated down every process row. *c* is tied to the distributed matrix *A*.
rowcnd, *colcnd*	(global) REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. If *info* = 0 or *info* > *ia*+*m-1*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i) (*ia* ≤ i ≤ *ia*+*m-1*). If *rowcnd* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r* (*ia:ia*+*m-1*). If *info* = 0, *colcnd* contains the ratio of the smallest *c*(j) to the largest *c*(j) (*ja* ≤ j ≤ *ja*+*n-1*). If *colcnd* ≥ 0.1, it is not worth scaling by *c*(*ja:ja*+*n-1*).
amax	(global) REAL for single precision flavors; DOUBLE PRECISION for double precision flavors.

	Absolute value of the largest matrix element. If *amax* is very close to overflow or very close to underflow, the matrix should be scaled.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = *i* and *i*≤ *m*, the *i*th row of the distributed matrix sub(*A*) is exactly zero; *i* > *m*, the (*i*-*m*)th column of the distributed matrix sub(*A*) is exactly zero.

p?poequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite distributed matrix and reduce its condition number.

Syntax

```
call pspoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
call pdpoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
call pcpoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
call pzpoequ(n, a, ia, ja, desca, sr, sc, scond, amax, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes row and column scalings intended to equilibrate a real symmetric or complex Hermitian positive definite distributed matrix sub(*A*) = *A*(*ia:ia+n-1, ja:ja+n-1*) and reduce its condition number (with respect to the two-norm). The output arrays *sr* and *sc* return the row and column scale factors

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled distributed matrix *B* with elements b_{ij}=s(i)*a_{ij}*s(j) has ones on the diagonal.

This choice of *sr* and *sc* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

The auxiliary function p?laqsy uses scaling factors computed by p?geequ to scale a general rectangular matrix.

Input Parameters

n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*) (*n*≥0).
a	(local) REAL for pspoequ DOUBLE PRECISION for pdpoequ COMPLEX for pcpoequ DOUBLE COMPLEX for pzpoequ. Pointer into the local memory to an array of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)). The array *a* contains the *n*-by-*n* symmetric/Hermitian positive definite distributed matrix sub(*A*) whose scaling factors are to be computed. Only the diagonal elements of sub(*A*) are referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

sr, *sc*	(local) REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. Arrays, dimension *LOCr*(*m_a*) and *LOCc*(*n_a*), respectively. If *info* = 0, the array *sr*(*ia:ia*+*n-1*) contains the row scale factors for sub(*A*). *sr* is aligned with the distributed matrix *A*, and replicated across every process column. *sr* is tied to the distributed matrix *A*. If *info* = 0, the array *sc* (*ja:ja*+*n-1*) contains the column scale factors for sub(*A*). *sc* is aligned with the distributed matrix *A*, and replicated down every process row. *sc* is tied to the distributed matrix *A*.
scond	(global) REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. If *info* = 0, *scond* contains the ratio of the smallest *sr*(i) (or *sc*(j)) to the largest *sr*(i) (or *sc*(j)), with *ia*≤i≤*ia*+*n-1* and *ja*≤j≤*ja*+*n-1*. If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *sr* (or *sc*).
amax	(global) REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. Absolute value of the largest matrix element. If *amax* is very close to overflow or very close to underflow, the matrix should be scaled.

info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = *k*, the *k*-th diagonal entry of sub(*A*) is nonpositive.

Orthogonal Factorizations

This section describes the ScaLAPACK routines for the *QR (RQ)* and *LQ (QL)* factorization of matrices. Routines for the *RZ* factorization as well as for generalized *QR* and *RQ* factorizations are also included. For the mathematical definition of the factorizations, see the respective LAPACK sections or refer to [SLUG].

Table 6-3 lists ScaLAPACK routines that perform orthogonal factorization of matrices.

Table 6-3 Computational Routines for Orthogonal Factorizations

Matrix type, factorization	Factorize without pivoting	Factorize with pivoting	Generate matrix Q	Apply matrix Q
general matrices, QR factorization	p?geqrf	p?geqpf	p?orgqr p?ungqr	p?ormqr p?unmqr

pair of matrices, generalized QR factorization	p?ggqrf			
pair of matrices, generalized RQ factorization	p?ggrqf			

p?geqrf

Computes the QR factorization of a general m-by-n matrix.

Syntax

```
call psgeqrf( m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgeqrf( m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgeqrf( m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgeqrf( m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine forms the *QR* factorization of a general *m*-by-*n* distributed matrix sub(*A*)= *A*(*ia:ia*+*m*-1,*ja:ja*+*n-1*) as

A=*Q***R*

Input Parameters

m	(global) INTEGER. The number of rows in the distributed submatrix sub(*A*); (*m* ≥ 0).
n	(global) INTEGER. The number of columns in the distributed submatrix sub(*A*); (*n* ≥ 0).
a	(local) REAL for psgeqrf DOUBLE PRECISION for pdgeqrf COMPLEX for pcgeqrf DOUBLE COMPLEX for pzgeqrf. Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub(*A*) to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia:ia*+*m-1*,*ja:ja*+*n-1*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*
work	(local). REAL for psgeqrf DOUBLE PRECISION for pdgeqrf. COMPLEX for pcgeqrf. DOUBLE COMPLEX for pzgeqrf Workspace array of dimension *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *nb_a* * (*mp*0+*nq*0+*nb_a*), where
iroff = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),
*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL), and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a The elements on and above the diagonal of sub(*A*) contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m* ≥ *n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau (local)
REAL for psgeqrf
DOUBLE PRECISION for pdgeqrf
COMPLEX for pcgeqrf
DOUBLE COMPLEX for pzgeqrf.
Array, DIMENSION *LOCc*(*ja*+min(*m*,*n*)-1).
Contains the scalar factor *tau* of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0, the execution is successful.
< 0, if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*)*H*(*ja*+1)*...*H*(*ja*+*k*-1),

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau*v*v'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*) = 1; *v*(*i*+1:*m*) is stored on exit in *A*(*ia*+*i*:*ia*+*m*-1, *ja*+*i*-1), and *tau* in *tau*(*ja*+*i*-1).

p?geqpf

Computes the QR factorization of a general m-by-n matrix with pivoting.

Syntax

```
call psgeqpf( m, n, a, ia, ja, desca, ipiv, tau, work, lwork, info)
call pdgeqpf( m, n, a, ia, ja, desca, ipiv, tau, work, lwork, info)
call pcgeqpf( m, n, a, ia, ja, desca, ipiv, tau, work, lwork, info)
call pzgeqpf( m, n, a, ia, ja, desca, ipiv, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine forms the *QR* factorization with column pivoting of a general *m*-by-*n* distributed matrix sub(*A*)= *A*(*ia:ia*+*m*-1,*ja:ja*+*n-1*) as

sub(*A*)**P*=*Q***R*

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*A*) (*m* ≥ 0).
n	(global) INTEGER. The number of columns in the submatrix sub(*A*) (*n* ≥ 0).
a	(local) REAL for psgeqpf DOUBLE PRECISION for pdgeqpf COMPLEX for pcgeqpf DOUBLE COMPLEX for pzgeqpf. Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub(*A*) to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia:ia*+*m*-1,*ja:ja*+*n-1*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local). REAL for psgeqpf DOUBLE PRECISION for pdgeqpf. COMPLEX for pcgeqpf.

DOUBLE COMPLEX for pzgeqpf
Workspace array of dimension *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least
For real flavors:
lwork ≥ max(3,*mp0*+*nq0*) + *LOCc* (*ja*+*n*-1) + *nq0*.
For complex flavors:
lwork ≥ max(3,*mp0*+*nq0*) .
Here
iroff = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
mp0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),
nq0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL),
LOCc (*ja*+*n*-1) = numroc(*ja*+*n*-1, *nb_a*, MYCOL,*csrc_a*, NPCOL),
and numroc, indxg2p are ScaLAPACK tool functions.
You can determine MYROW, MYCOL, NPROW and NPCOL by calling the blacs_gridinfo subroutine.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a The elements on and above the diagonal of sub(*A*)contain the min(*m*, *n*)-by-*n* upper trapezoidal matrix *R* (*R* is upper triangular if *m* ≥ *n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

ipiv (local) INTEGER. Array, DIMENSION *LOCc*(*ja*+*n*-1).
ipiv(*i*) = *k*, the local *i*-th column of sub(*A*)*P* was the global *k*-th column of sub(*A*). *ipiv* is tied to the distributed matrix *A*.

tau (local)
REAL for psgeqpf
DOUBLE PRECISION for pdgeqpf
COMPLEX for pcgeqpf
DOUBLE COMPLEX for pzgeqpf.
Array, DIMENSION *LOCc*(*ja*+min(*m*, *n*)-1).
Contains the scalar factor *tau* of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0, the execution is successful.

< 0, if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*k*)

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*) = 1; *v*(*i*+1:*m*) is stored on exit in *A*(*ia*+*i*:*ia*+*m*-1,*ja*+*i*-1).

The matrix *P* is represented in *ipiv* as follows: if *ipiv*(*j*)= *i* then the *j*-th column of *P* is the *i*-th canonical unit vector.

p?orgqr

Generates the orthogonal matrix Q of the QR factorization formed by p?geqrf.

Syntax

call psorgqr(*m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

call pdorgqr(*m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine generates the whole or part of *m*-by-*n* real distributed matrix *Q* denoting *A*(*ia:ia+m-1, ja:ja+n-1*) with orthonormal columns, which is defined as the first *n* columns of a product of *k* elementary reflectors of order *m*

Q= *H*(1)**H*(2)*...**H*(*k*)

as returned by p?geqrf.

Input Parameters

m (global) INTEGER. The number of rows in the submatrix sub(*Q*) (*m* ≥ 0).

n (global) INTEGER. The number of columns in the submatrix sub(*Q*) (*m* ≥ *n* ≥ 0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n* ≥ *k* ≥ 0).

a (local)

REAL for psorgqr
DOUBLE PRECISION for pdorgqr
Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). The *j*-th column must contain the vector which defines the elementary reflector *H*(*j*), *ja*≤*j*≤*ja* +*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1).

ia, *ja* — (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia:ia*+*m-1*,*ja:ja*+*n-1*), respectively.

desca — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau — (local)
REAL for psorgqr
DOUBLE PRECISION for pdorgqr
Array, DIMENSION *LOCc*(*ja*+*k*-1).
Contains the scalar factor *tau* (*j*) of elementary reflectors *H*(*j*) as returned by p?geqrf. *tau* is tied to the distributed matrix *A*.

work — (local)
REAL for psorgqr
DOUBLE PRECISION for pdorgqr
Workspace array of dimension of *lwork*.

lwork — (local or global) INTEGER, dimension of *work*.

Must be at least *lwork* ≥ *nb_a**(*nqa*0 + *mpa*0 + *nb_a*), where
iroffa = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL);
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — Contains the local pieces of the *m*-by-*n* distributed matrix Q.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ungqr

Generates the complex unitary matrix Q of the QR factorization formed by p?geqrf.

Syntax

```
call pcungqr( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungqr( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine generates the whole or part of *m*-by-*n* complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal columns, which is defined as the first *n* columns of a product of *k* elementary reflectors of order m

Q = *H*(1)**H*(2)*...**H*(*k*)

as returned by p?geqrf.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*Q*); (*m*≥0).
n	(global) INTEGER. The number of columns in the submatrix sub(*Q*) (*m*≥*n*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥0).
a	(local) COMPLEX for pcungqr DOUBLE COMPLEX for pzungqr Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)).The *j*-th column must contain the vector which defines the elementary reflector *H*(*j*), *ja*≤ *j*≤ *ja* +*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcungqr

DOUBLE COMPLEX for pzungqr
Array, DIMENSION *LOCc*(*ja*+*k*-1).
Contains the scalar factor *tau* (*j*) of elementary reflectors *H*(*j*) as returned by p?geqrf. *tau* is tied to the distributed matrix *A*.

work (local)
COMPLEX for pcungqr
DOUBLE COMPLEX for pzungqr
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *nb_a**(*nqa*0 + *mpa*0 + *nb_a*), where
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a Contains the local pieces of the *m*-by-*n* distributed matrix *Q*.

work(1) On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormqr

Multiplies a general matrix by the orthogonal matrix Q of the QR factorization formed by p?geqrf.

Syntax

```
call psormqr( side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

```
call pdormqr( side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*)

as returned by p?geqrf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER
='L': *Q* or Q^T is applied from the left.
='R': *Q* or Q^T is applied from the right.

trans (global) CHARACTER
='N', no transpose, *Q* is applied.
='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)
REAL for psormqr
DOUBLE PRECISION for pdormqr.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*k*-1)). The *j*-th column must contain the vector which defines the elementary reflector *H*(*j*), *ja*≤*j*≤*ja*+*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1). *A*(*ia*:*, *ja*:*ja*+*k*-1) is modified by the routine but restored on exit.

If *side* = 'L', *lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1))

If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1))

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psormqr
DOUBLE PRECISION for pdormqr
Array, DIMENSION *LOCc*(*ja*+*k*-1).
Contains the scalar factor *tau* (*j*) of elementary reflectors *H*(*j*) as returned by p?geqrf. *tau* is tied to the distributed matrix *A*.

c (local)
REAL for psormqr
DOUBLE PRECISION for pdormqr
Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
REAL for psormqr
DOUBLE PRECISION for pdormqr.
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least:
if *side* = 'L',

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0+*mpc*0)**nb_a*) + *nb_a***nb_a*

else if *side* = 'R',

lwork ≥ max((*nb_a**(*nb_a*-1))/2,
(*nqc*0+max(*npa*0+numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*

end if
where
lcmq = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
*npa*0= numroc(*n*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
iroffc = mod(*ic*-1, *mb_c*),
icoffc = mod(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0= numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0= numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),

	ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	Overwritten by the product *Q**sub(*C*), or Q^T*sub(*C*), or sub(*C*)*Q^T, or sub(*C*)**Q*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmqr

Multiplies a complex matrix by the unitary matrix Q of the QR factorization formed by p?geqrf.

Syntax

call pcunmqr(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmqr(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general complex *m*-by-*n* distributed matrix sub (*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*) as returned by p?geqrf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* ='R'.

Input Parameters

side (global) CHARACTER
='L': Q or Q^H is applied from the left.
='R': Q or Q^H is applied from the right.

trans (global) CHARACTER
='N', no transpose, Q is applied.
='C', conjugate transpose, Q^H is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(C) ($m \geq 0$).

n (global) INTEGER. The number of columns in the distributed matrix sub(C) ($n \geq 0$).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:

If *side* = 'L', $m \geq k \geq 0$

If *side* = 'R', $n \geq k \geq 0$.

a (local)
COMPLEX for pcunmqr
DOUBLE COMPLEX for pzunmqr.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*k*-1)). The j-th column must contain the vector which defines the elementary reflector $H(j)$, $ja \leq j \leq ja+k-1$, as returned by p?geqrf in the k columns of its distributed matrix argument A(*ia*:*, *ja*:*ja*+*k*-1). A(*ia*:*, *ja*:*ja*+*k*-1) is modified by the routine but restored on exit.

If *side* = 'L', *lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1))

If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1))

ia, *ja* (global) INTEGER. The row and column indices in the global array a indicating the first row and the first column of the submatrix A, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix A.

tau (local)
COMPLEX for pcunmqr
DOUBLE COMPLEX for pzunmqr
Array, DIMENSION *LOCc*(*ja*+*k*-1).
Contains the scalar factor *tau* (j) of elementary reflectors $H(j)$ as returned by p?geqrf. *tau* is tied to the distributed matrix A.

c (local)
COMPLEX for pcunmqr
DOUBLE COMPLEX for pzunmqr.
Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)).

	Contains the local pieces of the distributed matrix sub(*C*) to be factored.
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.
descc	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local) COMPLEX for pcunmqr DOUBLE COMPLEX for pzunmqr. Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least: If *side* = 'L', *lwork* ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + *mpc*0)**nb_a*) + *nb_a***nb_a* else if *side* = 'R', *lwork* ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + max(*npa*0 + numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a* end if where *lcmq* = *lcm*/NPCOL with *lcm* = ilcm (NPROW, NPCOL), *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW), *npa*0 = numroc(*n*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW), *iroffc* = mod(*ic*-1, *mb_c*), *icoffc* = *mod*(*jc*-1, *nb_c*), *icrow* = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW), *iccol* = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL), *mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW), *nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL), ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	Overwritten by the product *Q**sub(*C*), or Q^H*sub(*C*), or sub(*C*)*Q^H, or sub(*C*)**Q* .
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?gelqf

Computes the LQ factorization of a general rectangular matrix.

Syntax

```
call psgelqf( m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgelqf( m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgelqf( m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgelqf( m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine computes the *LQ* factorization of a real/complex distributed *m*-by-*n* matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1, *ia*:*ia*+*n*-1) = *L***Q*.

Input Parameters

m (global) INTEGER. The number of rows in the submatrix sub(*Q*) (*m* ≥ 0).

n (global) INTEGER. The number of columns in the submatrix sub(*Q*) (*n* ≥ 0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n* ≥ *k* ≥ 0).

a (local)
REAL for psgelqf
DOUBLE PRECISION for pdgelqf
COMPLEX for pcgelqf
DOUBLE COMPLEX for pzgelqf
Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)).
Contains the local pieces of the distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ia*:*ia*+*n*-1), respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

work (local)
REAL for psgelqf
DOUBLE PRECISION for pdgelqf
COMPLEX for pcgelqf
DOUBLE COMPLEX for pzgelqf
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *mb_a**(*mp*0 + *nq*0 + *mb_a*), where
iroff = mod(*ia*-1, *mb_a*),
icoff = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),
*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL)
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a The elements on and below the diagonal of sub(*A*) contain the *m* by min(*m*,*n*) lower trapezoidal matrix *L* (*L* is lower trapezoidal if *m* ≤ *n*); the elements above the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau (local)
REAL for psgelqf
DOUBLE PRECISION for pdgelqf
COMPLEX for pcgelqf
DOUBLE COMPLEX for pzgelqf
Array, DIMENSION *LOCr*(*ia*+min(*m*, *n*)-1).
Contains the scalar factors of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = H(*ia*+*k*-1)**H*(*ia*+*k*-2)*...**H*(*ia*),

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*) = 1; *v*(*i*+1:*n*) is stored on exit in *A*(*ia*+*i*-1, *ja*+*i*:*ja*+*n*-1), and *tau* in *tau* (*ia*+*i*-1).

p?orglq

Generates the real orthogonal matrix Q of the LQ factorization formed by p?gelqf.

Syntax

call psorglq(*m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

call pdorglq(*m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine generates the whole or part of *m*-by-*n* real distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the first *m* rows of a product of *k* elementary reflectors of order *n*

Q = H(*k*)*...* *H*(2)* *H*(1)

as returned by p?gelqf.

Input Parameters

m — (global) INTEGER. The number of rows in the submatrix sub(*Q*); (*m*≥0).

n — (global) INTEGER. The number of columns in the submatrix sub(*Q*) (*n*≥*m*≥0).

k — (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥*k*≥0).

a — (local)
REAL for psorglq
DOUBLE PRECISION for pdorglq
Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc* (*ja*+*n*-1)). On entry, the *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gelqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k* -1, *ja*:*).

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

work (local)
REAL for psorglq
DOUBLE PRECISION for pdorglq
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *mb_a**(*mpa*0+*nqa*0+*mb_a*), where
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.

tau (local)
REAL for psorglq
DOUBLE PRECISION for pdorglq
Array, DIMENSION *LOCr*(*ia*+*k*-1).
Contains the scalar factors *tau* of elementary reflectors *H*(*i*). *tau* is tied to the distributed matrix *A*.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unglq

Generates the unitary matrix Q of the LQ factorization formed by p?gelqf.

Syntax

```
call pcunglq( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzunglq( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine generates the whole or part of *m*-by-*n* complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the first *m* rows of a product of *k* elementary reflectors of order *n*

Q = $(H(k))^H$...*$(H(2))^H$*$(H(1))^H$ as returned by p?gelqf.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*Q*) (*m*≥0).
n	(global) INTEGER. The number of columns in the submatrix sub(*Q*) (*n*≥*m*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥*k*≥0).
a	(local) COMPLEX for pcunglq DOUBLE COMPLEX for pzunglq Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gelqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcunglq DOUBLE COMPLEX for pzunglq Array, DIMENSION *LOCr*(*ia*+k-1). Contains the scalar factors *tau* of elementary reflectors *H*(*i*). *tau* is tied to the distributed matrix *A*.
work	(local)

	COMPLEX for pcunglq DOUBLE COMPLEX for pzunglq Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *mb_a**(*mpa*0+*nqa*0+*mb_a*), where *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW), *iacol* = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL), *mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW), *nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL) indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormlq

Multiplies a general matrix by the orthogonal matrix Q of the LQ factorization formed by p?gelqf.

Syntax

call psormlq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *work*, *lwork*, *info*)

call pdormlq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

side ='L' *side* ='R'

trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)...*H*(2) *H*(1)

as returned by p?gelqf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER
='L': *Q* or Q^T is applied from the left.
='R': *Q* or Q^T is applied from the right.

trans (global) CHARACTER
='N', no transpose, *Q* is applied.
='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)
REAL for psormlq
DOUBLE PRECISION for pdormlq.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)), if *side* = 'L' and (*lld_a*, *LOCc*(*ja*+*n*-1)), if *side* = 'R'.The *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gelqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*). *A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psormlq
DOUBLE PRECISION for pdormlq
Array, DIMENSION *LOCc*(*ja*+*k*-1).
Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?gelqf. *tau* is tied to the distributed matrix *A*.

c (local)
REAL for psormlq
DOUBLE PRECISION for pdormlq
Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
REAL for psormlq
DOUBLE PRECISION for pdormlq.
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of the array *work*; must be at least:
If *side* = 'L',

lwork ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0+max *mqa*0)+ numroc(numroc(*m* + *iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))* *mb_a*) + *mb_a***mb_a*

else if *side* = 'R',

lwork ≥ max((*mb_a** (*mb_a*-1))/2, (*mpc*0+nqc0)**mb_a* + *mb_a***mb_a*

end if
where
lcmp = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	Overwritten by the product *Q**sub(*C*), or *Q'* *sub (*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmlq

Multiplies a general matrix by the unitary matrix Q of the LQ factorization formed by p?gelqf.

Syntax

```
call pcunmlq( side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info )
```

```
call pzunmlq( side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info )
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general complex *m*-by-*n* distributed matrix sub (*C*) = *C* (*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)' ... *H*(2)' *H*(1)'

as returned by p?gelqf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^H is applied from the left. ='R': *Q* or Q^H is applied from the right.
trans	(global) CHARACTER ='N', no transpose, *Q* is applied. ='C', conjugate transpose, Q^H is applied.

m	(global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).
n	(global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: If *side* = 'L', *m*≥*k*≥0 If *side* = 'R', *n*≥*k*≥0.
a	(local) COMPLEX for pcunmlq DOUBLE COMPLEX for pzunmlq. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)), if *side* = 'L', and (*lld_a*, *LOCc*(*ja*+*n*-1)), if *side* = 'R', where *lld_a* ≥ max(1, *LOCr* (*ia*+*k*-1)). The *i*-th column must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gelqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*). *A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcunmlq DOUBLE COMPLEX for pzunmlq Array, DIMENSION *LOCc*(*ia*+*k*-1). Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?gelqf. *tau* is tied to the distributed matrix *A*.
c	(local) COMPLEX for pcunmlq DOUBLE COMPLEX for pzunmlq. Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)). Contains the local pieces of the distributed matrix sub(*C*) to be factored.
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.
descc	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local) COMPLEX for pcunmlq DOUBLE COMPLEX for pzunmlq.

Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of the array *work*; must be at least:
If *side* = 'L',
lwork ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max *mqa*0)+ numroc(numroc(*m* + *iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a*
else if *side* = 'R',
lwork ≥ max((*mb_a** (*mb_a*-1))/2, (*mpc*0 + nqc0)**mb_a* + *mb_a***mb_a*
end if
where
lcmp = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mqa*0 = *numroc*(m + *icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),
iroffc = mod(*ic*-1, *mb_c*),
icoffc = *mod*(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c Overwritten by the product *Q**sub(*C*), or *Q'**sub (*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*

work(1) On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?geqlf

Computes the QL factorization of a general matrix.

Syntax

```
call psgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgeqlf(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine forms the *QL* factorization of a real/complex distributed *m*-by-*n* matrix sub(A) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) = *Q***L*.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*Q*); (*m* ≥ 0).
n	(global) INTEGER. The number of columns in the submatrix sub(*Q*) (*n* ≥ 0).
a	(local) REAL for psgeqlf DOUBLE PRECISION for pdgeqlf COMPLEX for pcgeqlf DOUBLE COMPLEX for pzgeqlf Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub(*A*) to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ia*:*ia*+*n*-1), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local) REAL for psgeqlf DOUBLE PRECISION for pdgeqlf COMPLEX for pcgeqlf DOUBLE COMPLEX for pzgeqlf Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *nb_a**(*mp0* + *nq0* + *nb_a*), where *iroff* = mod(*ia*-1, *mb_a*),

icoff = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),
*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL)
numroc and indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a
On exit, if *m*≥*n*, the lower triangle of the distributed submatrix *A*(*ia*+*m*-*n*:*ia*+*m*-1, *ja*:*ja*+n-1) contains the *n*-by-*n* lower triangular matrix *L*; if *m*≤*n*, the elements on and below the (*n*-*m*)-th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau
(local)
REAL for psgeqlf
DOUBLE PRECISION for pdgeqlf
COMPLEX for pcgeqlf
DOUBLE COMPLEX for pzgeqlf
Array, DIMENSION *LOCc*(*ja*+*n*-1).
Contains the scalar factors of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1)
On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info
(global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*+*k*-1)*...**H*(*ja*+1)**H*(*ja*),

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*m*-*k*+*i*+1:*m*) = 0 and *v*(*m*-*k*+*i*) = 1; *v*(*m*-*k*+*i*-1) is stored on exit in *A*(*ia*:*ia*+*m*-*k*+*i*-2, *ja*+*n*-*k*+*i*-1), and *tau* in *tau* (*ja*+*n*-*k*+*i*-1).

p?orgql

Generates the orthogonal matrix Q of the QL factorization formed by p?geqlf.

Syntax

call psorgql(*m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

call pdorgql(*m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine generates the whole or part of *m*-by-*n* real distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the first *m* rows of a product of *k* elementary reflectors of order *n*

Q = *H*(*k*)*...*H*(2)*H*(1)

as returned by p?geqlf.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*Q*); (*m*≥0).
n	(global) INTEGER. The number of columns in the submatrix sub(*Q*)(*m*≥*n*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥0).
a	(local) REAL for psorgql DOUBLE PRECISION for pdorgql Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc* (*ja*+*n*-1)). On entry, the *j*-th column must contain the vector which defines the elementary reflector *H*(*j*),*ja*+*n*-*k*≤*j*≤*ja*+*n*-1, as returned by p?geqlf in the *k* columns of its distributed matrix argument *A*(*ia*:*,*ja*+*n*-*k*:*ja*+*n*-1).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) REAL for psorgql DOUBLE PRECISION for pdorgql Array, DIMENSION *LOCc*(*ja*+n-1).

Contains the scalar factors *tau*(*j*) of elementary reflectors *H*(*j*). *tau* is tied to the distributed matrix *A*.

work (local)
REAL for psorgql
DOUBLE PRECISION for pdorgql
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *nb_a**(*nqa*0+*mpa*0+*nb_a*), where
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.

work(1) On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ungql

Generates the unitary matrix Q of the QL factorization formed by p?geqlf*.*

Syntax

```
call pcungql( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungql( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine generates the whole or part of *m*-by-*n* complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the first *n* columns of a product of *k* elementary reflectors of order *m*

Q = (*H*(*k*))^H...*(*H*(2))^H*(*H*(1))^H as returned by p?geqlf.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*Q*) (*m*≥0).
n	(global) INTEGER. The number of columns in the submatrix sub(*Q*) (*m*≥*n*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥0).
a	(local) COMPLEX for pcungql DOUBLE COMPLEX for pzungql Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the *j*-th column must contain the vector which defines the elementary reflector *H*(*j*), *ja*+*n*-*k*≤ *j*≤ *ja*+*n*-1, as returned by p?geqlf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*+*n*-*k*: *ja*+*n*-1).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcungql DOUBLE COMPLEX for pzungql Array, DIMENSION *LOCr*(*ia*+n-1). Contains the scalar factors *tau* (*j*) of elementary reflectors *H*(*j*). *tau* is tied to the distributed matrix *A*.
work	(local) COMPLEX for pcungql DOUBLE COMPLEX for pzungql Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *nb_a**(*nqa*0 + *mpa*0 + *nb_a*), where *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW), *iacol* = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL), *mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW), *nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	Contains the local pieces of the *m*-by-*n* distributed matrix *Q* to be factored.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormql

Multiplies a general matrix by the orthogonal matrix Q of the QL factorization formed by p?geqlf.

Syntax

```
call psormql( side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

```
call pdormql( side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C* (*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)' ... *H*(2)' *H*(1)'

as returned by p?geqlf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER
='L': Q or Q^T is applied from the left.
='R': Q or Q^T is applied from the right.

trans (global) CHARACTER
='N', no transpose, Q is applied.
='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(C) ($m \geq 0$).

n (global) INTEGER. The number of columns in the distributed matrix sub(C) ($n \geq 0$).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints:

If *side* = 'L', $m \geq k \geq 0$

If *side* = 'R', $n \geq k \geq 0$.

a (local)
REAL for psormql
DOUBLE PRECISION for pdormql.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*k*-1)). The *j*-th column must contain the vector which defines the elementary reflector *H*(*j*), *ja*≤*j*≤*ja*+*k*-1, as returned by p?gelqf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1).*A*(*ia*:*, *ja*:*ja*+*k*-1) is modified by the routine but restored on exit.

If *side* = 'L', *lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1)),

If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1)).

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psormql
DOUBLE PRECISION for pdormql.
Array, DIMENSION *LOCc*(*ja*+*n*-1).
Contains the scalar factor *tau* (*j*) of elementary reflectors *H*(*j*) as returned by p?geqlf. *tau* is tied to the distributed matrix *A*.

c (local)
REAL for psormql
DOUBLE PRECISION for pdormql.
Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)).

Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
REAL for psormql
DOUBLE PRECISION for pdormql.
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least:
If *side* = 'L',

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0+mpc0)**nb_a* + *nb_a***nb_a*
else if *side* ='R',

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0+max *npa*0)+
numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*
end if
where
lcmp = *lcm*/NPCOL with *lcm* = ilcm (NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
*npa*0= *numroc*(*n* + *iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
iroffc = mod(*ic*-1, *mb_c*),
icoffc = *mod*(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c Overwritten by the product *Q** sub(*C*), or *Q'**sub (*C*), or sub(*C*)* *Q'*, or sub(*C*)* *Q*

work(1) On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmql

Multiplies a general matrix by the unitary matrix Q of the QL factorization formed by p?geqlf.

Syntax

call pcunmql(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmql(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general complex *m*-by-*n* distributed matrix sub(*C*) = *C* (*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)' ... *H*(2)' *H*(1)'

as returned by p?geqlf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^H is applied from the left. ='R': *Q* or Q^H is applied from the right.
trans	(global) CHARACTER ='N', no transpose, *Q* is applied. ='C', conjugate transpose, Q^H is applied.
m	(global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).
n	(global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

	If *side* = 'L', *m*≥*k*≥0
	If *side* = 'R', *n*≥*k*≥0.
a	(local) COMPLEX for pcunmql DOUBLE COMPLEX for pzunmql. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*k*-1)). The *j*-th column must contain the vector which defines the elementary reflector *H*(*j*), *ja*≤*j*≤*ja*+*k*-1, as returned by p?geqlf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1).*A*(*ia*:*, *ja*:*ja*+*k*-1) is modified by the routine but restored on exit. If *side* = 'L',*lld_a* ≥ max(1, *LOCr*(*ia*+*m*-1)), If *side* = 'R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1)).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcunmql DOUBLE COMPLEX for pzunmql Array, DIMENSION *LOCc*(*ia*+*n*-1). Contains the scalar factor *tau* (*j*) of elementary reflectors *H*(*j*) as returned by p?geqlf. *tau* is tied to the distributed matrix *A*.
c	(local) COMPLEX for pcunmql DOUBLE COMPLEX for pzunmql. Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)). Contains the local pieces of the distributed matrix sub(*C*) to be factored.
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.
descc	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local) COMPLEX for pcunmql DOUBLE COMPLEX for pzunmql. Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least: If *side* = 'L', *lwork* ≥ max((*nb_a** (*nb_a*-1))/2, (*nqc*0+mpc0)**nb_a* + *nb_a***nb_a*

else if *side* ='R',

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0+max *npa*0)+ numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*
end if
where
lcmp = *lcm*/NPCOL with *lcm* = ilcm (NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
*npa*0 = *numroc* (*n* + *iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
iroffc = mod(*ic*-1, *mb_c*),
icoffc = *mod*(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q** sub(*C*), or *Q*' sub (*C*), or sub(*C*)* *Q*', or sub(*C*)* *Q*

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?gerqf

Computes the RQ factorization of a general rectangular matrix.

Syntax

call psgerqf(*m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

call pdgerqf(*m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

```
call pcgerqf( m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgerqf( m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine forms the *QR* factorization of a general *m*-by-*n* distributed matrix sub(*A*)= *A*(*ia:ia*+*m*-1,*ja:ja*+*n*-1) as

A= *R***Q*

Input Parameters

m	(global) INTEGER. The number of rows in the distributed submatrix sub(*A*); (*m*≥0).
n	(global) INTEGER. The number of columns in the distributed submatrix sub(*A*); (*n*≥0).
a	(local) REAL for psgeqrf DOUBLE PRECISION for pdgeqrf COMPLEX for pcgeqrf DOUBLE COMPLEX for pzgeqrf. Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub(*A*) to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia:ia*+*m*-1,*ja:ja*+*n*-1), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*
work	(local). REAL for psgeqrf DOUBLE PRECISION for pdgeqrf. COMPLEX for pcgeqrf. DOUBLE COMPLEX for pzgeqrf Workspace array of dimension *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *mb_a**(*mp*0+*nq*0+*mb_a*), where *iroff* = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW), *iacol* = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL), *mp*0 = numroc(*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW),

*nq*0 = numroc(*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL) and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a
On exit, if *m*≤*n*, the upper triangle of *A*(*ia:ia*+*m*-1, *ja:ja*+*n*-1) contains the *m*-by-*m* upper triangular matrix *R*; if *m*≥*n*, the elements on and above the (*m* - *n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau
(local)
REAL for psgeqrf
DOUBLE PRECISION for pdgeqrf
COMPLEX for pcgeqrf
DOUBLE COMPLEX for pzgeqrf.
Array, DIMENSION *LOCr*(*ia*+*m*-1).
Contains the scalar factor *tau* of elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1)
On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info
(global) INTEGER.
= 0, the execution is successful.
< 0, if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ia*)**H*(*ia*+*1*)*...**H*(*ia*+*k*-1),

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*n*-*k*+*i*+1:*n*) = 0 and *v*(*n*-*k*+*i*) = 1; *v*(1:*n*-*k*+*i*-1) is stored on exit in *A*(*ia*+*m*-*k*+*i*-1,*ja*:*ja*+*n*-*k*+*i*-2), and *tau* in *tau*(*ia*+*m*-*k*+*i*-1).

p?orgrq

Generates the orthogonal matrix Q of the RQ factorization formed by p?gerqf.

Syntax

```
call psorgrq( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorgrq( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine generates the whole or part of *m*-by-*n* real distributed matrix *Q* denoting *A*(*ia:ia+m-1, ja:ja+n-1*) with orthonormal columns, which is defined as the last *m* rows of a product of *k* elementary reflectors of order *m*

Q= *H*(1)**H*(2)*...**H*(*k*)

as returned by p?gerqf.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*Q*); (*m*≥0).
n	(global) INTEGER. The number of columns in the submatrix sub(*Q*) (*n*≥*m*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥*k*≥0).
a	(local) REAL for psorgrq DOUBLE PRECISION for pdorgrq Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). The *i*-th column must contain the vector which defines the elementary reflector *H*(*i*), *ja*≤*j*≤*ja*+*k*-1, as returned by p?gerqf in the *k* columns of its distributed matrix argument *A*(*ia*:*, *ja*:*ja*+*k*-1).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*(*ia:ia+m-1*,*ja:ja+n-1*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) REAL for psorgrq DOUBLE PRECISION for pdorgrq Array, DIMENSION *LOCc*(*ja*+*k*-1). Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.

work	(local) REAL for psorgrq DOUBLE PRECISION for pdorgrq Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least *lwork*≥*mb_a**(*mpa*0 + *nqa*0 + *mb_a*), where *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW), *iacol* = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL), *mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW), *nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL) indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	Contains the local pieces of the *m*-by-*n* distributed matrix Q.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ungrq

Generates the unitary matrix Q of the RQ factorization formed by p?gerqf.

Syntax

```
call pcungrq( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungrq( m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine generates the *m*-by-*n* complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors of order n

$Q = (H(1))^H*(H(2))^H*...*(H(k))^H$ as returned by p?gerqf.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*Q*); (*m*≥0).
n	(global) INTEGER. The number of columns in the submatrix sub(*Q*) (*n*≥*m*≥0).
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥*k*≥0).
a	(local) COMPLEX for pcungrq DOUBLE COMPLEX for pzungrqc Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). The *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*+*m*-*k*≤*i*≤*ia*+*m*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*+*m*-*k*:*ia*+*m*-1, *ja*:*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcungrq DOUBLE COMPLEX for pzungrq Array, DIMENSION *LOCr*(*ia*+*m*-1). Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.
work	(local) COMPLEX for pcungrq DOUBLE COMPLEX for pzungrq Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *mb_a**(*mpa*0 +*nqa*0+*mb_a*), where *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW), *iacol* = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL), *mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW), *nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL) indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	Contains the local pieces of the *m*-by-*n* distributed matrix *Q*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ormrq

Multiplies a general matrix by the orthogonal matrix Q of the RQ factorization formed by p?gerqf.

Syntax

call psormrq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdormrq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*)

as returned by p?gerqf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^T is applied from the left. ='R': *Q* or Q^T is applied from the right.

trans (global) CHARACTER
='N', no transpose, Q is applied.
='T', transpose, Q^T is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m*≥*k*≥0

If *side* = 'R', *n*≥*k*≥0.

a (local)
REAL for psormqr
DOUBLE PRECISION for pdormqr.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R'.
The *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*).*A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psormqr
DOUBLE PRECISION for pdormqr
Array, DIMENSION *LOCc*(*ja*+*k*-1).
Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.

c (local)
REAL for psormrq
DOUBLE PRECISION for pdormrq
Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local) REAL for psormrq DOUBLE PRECISION for pdormrq. Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least: If *side* = 'L', *lwork* ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max(*mqa*0 + numroc(numroc(*n*+*iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a* else if *side* ='R', *lwork* ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + *nqc*0)**mb_a*) + *mb_a***mb_a* end if where *lcmp* = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL), *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*), *iacol* = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL), *mqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL), *iroffc* = mod(*ic*-1, *mb_c*), *icoffc* = *mod*(*jc*-1, *nb_c*), *icrow* = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW), *iccol* = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL), *mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW), *nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL), ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	Overwritten by the product *Q** sub(*C*), or *Q'**sub (*C*), or sub(*C*)* *Q'*, or sub(*C*)* *Q*
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmrq

Multiplies a general matrix by the unitary matrix Q of the RQ factorization formed by p?gerqf.

Syntax

call pcunmrq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmrq(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general complex *m*-by-*n* distributed matrix sub (*C*)= *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1)' *H*(2)'... *H*(*k*)'

as returned by p?gerqf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER
='L': *Q* or Q^H is applied from the left.
='R': *Q* or Q^H is applied from the right.

trans (global) CHARACTER
='N', no transpose, *Q* is applied.
='C', conjugate transpose, Q^H is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:
If *side* = 'L', *m*≥*k*≥0

	If *side* = 'R', *n*≥*k*≥0.
a	(local) COMPLEX for pcunmrq DOUBLE COMPLEX for pzunmrq. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R'. The *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia* +*k*-1, *ja**).*A*(*ia*:*ia* +*k*-1, *ja**) is modified by the routine but restored on exit.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcunmrq DOUBLE COMPLEX for pzunmrq Array, DIMENSION *LOCc*(*ja*+*k*-1). Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.
c	(local) COMPLEX for pcunmrq DOUBLE COMPLEX for pzunmrq. Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)). Contains the local pieces of the distributed matrix sub(*C*) to be factored.
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.
descc	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local) COMPLEX for pcunmrq DOUBLE COMPLEX for pzunmrq. Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least: If *side* = 'L', *lwork* ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max(*mqa*0+numroc(numroc(*n*+*iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a* else if *side* = 'R',

lwork ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + *nqc*0)**mb_a*) + *mb_a***mb_a*
end if
where
lcmp = *lcm*/NPROW with *lcm* = ilcm(NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),

*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q** sub(*C*) or *Q'**sub (*C*), or sub(*C*)* *Q'*, or sub(*C*)* *Q*

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?tzrzf

Reduces the upper trapezoidal matrix A to upper triangular form.

Syntax

call pstzrzf(*m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

call pdtzrzf(*m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

call pctzrzf(*m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

```
call pztzrzf( m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces the *m*-by-*n* ($m \le n$) real/complex upper trapezoidal matrix sub(*A*)=(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1) to upper triangular form by means of orthogonal/unitary transformations. The upper trapezoidal matrix *A* is factored as

A = (*R* 0)**Z*,

where *Z* is an *n*-by-*n* orthogonal/unitary matrix and R is an *m*-by-*m* upper triangular matrix.

Input Parameters

m	(global) INTEGER. The number of rows in the submatrix sub(*A*); (*m*≥0).
n	(global) INTEGER. The number of columns in the submatrix sub(*A*); (*n*≥0).
a	(local) REAL for pstzrzf DOUBLE PRECISION for pdtzrzf. COMPLEX for pctzrzf. DOUBLE COMPLEX for pztzrzf. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the *m*-by-*n* distributed matrix sub (*A*) to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local) REAL for pstzrzf DOUBLE PRECISION for pdtzrzf. COMPLEX for pctzrzf. DOUBLE COMPLEX for pztzrzf. Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least *lwork* ≥ *mb_a**(*mp*0+*nq*0+*mb_a*), where *iroff* = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW), *iacol* = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL), *mp*0 = numroc (*m*+*iroff*, *mb_a*, MYROW, *iarow*, NPROW), *nq*0 = numroc (*n*+*icoff*, *nb_a*, MYCOL, *iacol*, NPCOL)

indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a
On exit, the leading *m*-by-m upper triangular part of sub(*A*) contains the upper triangular matrix *R*, and elements *m*+1 to *n* of the first *m* rows of sub (*A*), with the array *tau*, represent the orthogonal/unitary matrix *Z* as a product of *m* elementary reflectors.

work(1)
On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

tau
(local)
REAL for pstzrzf
DOUBLE PRECISION for pdtzrzf.
COMPLEX for pctzrzf.
DOUBLE COMPLEX for pztzrzf.
Array, DIMENSION *LOCr*(*ia*+*m*-1).
Contains the scalar factor of elementary reflectors. *tau* is tied to the distributed matrix *A*.

info
(global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The factorization is obtained by the Householder's method. The *k*-th transformation matrix, *Z*(*k*), which is or whose conjugate transpose is used to introduce zeros into the (*m* - *k* +1)-th row of sub(*A*), is given in the form

$$Z(k) = \begin{bmatrix} i & 0 \\ 0 & \mathrm{T}(k) \end{bmatrix}$$

where

T(*k*) = *i* - *tau***u*(*k*)**u*(*k*)',

$$u(k) = \begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

tau is a scalar and *Z*(*k*) is an (*n* - *m*) element vector. *tau* and *Z*(*k*) are chosen to annihilate the elements of the *k*-th row of sub(*A*). The scalar *tau* is returned in the *k*-th element of *tau* and the vector *u*(*k*) in the *k*-th row of sub(*A*), such that the elements of *Z*(*k*) are in *a*(*k*, *m* + 1),..., *a*(*k*, *n*). The elements of *R* are returned in the upper triangular part of sub(*A*). *Z* is given by

Z = *Z*(1) * *Z*(2) *... * *Z*(*m*).

p?ormrz

Multiplies a general matrix by the orthogonal matrix from a reduction to upper triangular form formed by p?tzrzf.

Syntax

call psormrz(*side*, *trans*, *m*, *n*, *k*, *l*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdormrz(*side*, *trans*, *m*, *n*, *k*, *l*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general real *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1) *H*(2)... *H*(*k*)

as returned by p?tzrzf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^T is applied from the left. ='R': *Q* or Q^T is applied from the right.
trans	(global) CHARACTER ='N', no transpose, *Q* is applied. ='T', transpose, Q^T is applied.
m	(global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

If *side* = 'L', *m* ≥ *k* ≥0

If *side* = 'R', *n* ≥ *k* ≥0.

l (global)
The columns of the distributed submatrix sub(*A*) containing the meaningful part of the Householder reflectors.

If *side* = 'L', *m* ≥ *l* ≥0

If *side* = 'R', *n* ≥ *l* ≥0.

a (local)
REAL for psormrz
DOUBLE PRECISION for pdormrz.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R', where *lld_a* ≥ max(1,*LOCr*(*ia*+*k*-1)).
The *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?tzrzf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*).*A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psormrz
DOUBLE PRECISION for pdormrz
Array, DIMENSION *LOCc*(*ia*+*k*-1).
Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?tzrzf. *tau* is tied to the distributed matrix *A*.

c (local)
REAL for psormrz
DOUBLE PRECISION for pdormrz
Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub(*C*) to be factored.

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
REAL for psormrz
DOUBLE PRECISION for pdormrz.
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least:
If *side* = 'L',

lwork ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + max(*mqa*0 + numroc(numroc(*n*+*iroffc*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nqc*0))**mb_a*) + *mb_a***mb_a*
else if *side* ='R',

lwork ≥ max((*mb_a**(*mb_a*-1))/2, (*mpc*0 + *nqc*0)**mb_a*) + *mb_a***mb_a*
end if
where
lcmp = *lcm*/NPROW with *lcm* = ilcm (NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
*mqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),
iroffc = mod(*ic*-1, *mb_c*),
icoffc = *mod*(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c Overwritten by the product *Q**sub(*C*), or *Q'**sub (*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*

work(1) On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmrz

Multiplies a general matrix by the unitary transformation matrix from a reduction to upper triangular form determined by p?tzrzf*.*

Syntax

call pcunmrz(*side*, *trans*, *m*, *n*, *k*, *l*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmrz(*side*, *trans*, *m*, *n*, *k*, *l*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general complex *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1)' *H*(2)'... *H*(*k*)'

as returned by pctzrzf/pztzrzf. *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER
='L': *Q* or Q^H is applied from the left.
='R': *Q* or Q^H is applied from the right.

trans (global) CHARACTER
='N', no transpose, *Q* is applied.
='C', conjugate transpose, Q^H is applied.

m (global) INTEGER. The number of rows in the distributed matrix sub(*C*), (*m*≥0).

n (global) INTEGER. The number of columns in the distributed matrix sub(*C*), (*n*≥0).

k (global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:
If *side* = 'L', *m*≥*k*≥0
If *side* = 'R', *n*≥*k*≥0.

l (global) INTEGER. The columns of the distributed submatrix sub(*A*) containing the meaningful part of the Householder reflectors.

	If *side* = 'L', *m*≥*l*≥0
	If *side* = 'R', *n*≥*l*≥0.
a	(local) COMPLEX for pcunmrz DOUBLE COMPLEX for pzunmrz. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side* = 'L', and (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R', where *lld_a*≥max(1, *LOCr* (*ja*+*k*-1)). The *i*-th row must contain the vector which defines the elementary reflector *H*(*i*), *ia*≤*i*≤*ia*+*k*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia* +*k*-1, *ja**). *A*(*ia*:*ia* +*k*-1, *ja**) is modified by the routine but restored on exit.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcunmrz DOUBLE COMPLEX for pzunmrz Array, DIMENSION *LOCc*(*ia*+*k*-1). Contains the scalar factor *tau* (*i*) of elementary reflectors *H*(*i*) as returned by p?gerqf. *tau* is tied to the distributed matrix *A*.
c	(local) COMPLEX for pcunmrz DOUBLE COMPLEX for pzunmrz. Pointer into the local memory to an array of local dimension (*lld_c*, *LOCc*(*jc*+*n*-1)). Contains the local pieces of the distributed matrix sub(*C*) to be factored.
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q** sub(*C*), or *Q*'*sub (*C*), or sub(*C*)**Q*', or sub(*C*)**Q*

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?ggqrf

Computes the generalized QR factorization.

Syntax

call psggqrf(*n*, *m*, *p*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

call pdggqrf(*n*, *m*, *p*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

call pcggqrf(*n*, *m*, *p*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

call pzggqrf(*n*, *m*, *p*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine forms the generalized *QR* factorization of an *n*-by-*m* matrix

sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*m*-1)

and an *n*-by-*p* matrix

sub(*B*) = *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*p*-1):

as

sub(A) = *Q***R*, sub(*B*) = *Q***T***Z*,

where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

If $n \geq m$

$$R = \begin{matrix} \begin{pmatrix} R_{11} \\ 0 \end{pmatrix} \\ \begin{matrix} m \\ n - m \end{matrix} \end{matrix} \begin{matrix} m \\ \\ \end{matrix}$$

or if $n < m$

$$R = \begin{matrix} \begin{pmatrix} R_{11} & R_{12} \end{pmatrix} \\ \begin{matrix} n & m - n \end{matrix} \end{matrix} \begin{matrix} n \\ \\ \end{matrix}$$

where R_{11} is upper triangular, and

$$T = \begin{matrix} \begin{pmatrix} 0 & T_{12} \end{pmatrix} \\ \begin{matrix} p - n & n \end{matrix} \end{matrix} \begin{matrix} n, \text{ if } n \leq p, \\ \\ \end{matrix}$$

$$\text{or } T = \begin{matrix} \begin{pmatrix} T_{11} \\ T_{21} \end{pmatrix} \\ p \end{matrix} \begin{matrix} \begin{pmatrix} n - p \\ p \end{pmatrix}, \text{ if } n > p, \\ \\ \end{matrix}$$

where T_{12} or T_{21} is an upper triangular matrix.

In particular, if sub(*B*) is square and nonsingular, the *GQR* factorization of sub(*A*) and sub(*B*) implicitly gives the *QR* factorization of inv (sub(*B*))* sub (*A*):

inv(sub(*B*))*sub(*A*) = Z^H*(inv(*T*)**R*)

Input Parameters

n	(global) INTEGER. The number of rows in the distributed matrices sub(*A*) and sub(*B*) (*n*≥0).
m	(global) INTEGER. The number of columns in the distributed matrix sub(*A*) (*m*≥0).
p	INTEGER. The number of columns in the distributed matrix sub(*B*) (*p*≥0).
a	(local) REAL for psggqrf DOUBLE PRECISION for pdggqrf COMPLEX for pcggqrf DOUBLE COMPLEX for pzggqrf. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)). Contains the local pieces of the *n*-by-*m* matrix sub(*A*) to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
b	(local) REAL for psggqrf DOUBLE PRECISION for pdggqrf COMPLEX for pcggqrf DOUBLE COMPLEX for pzggqrf. Pointer into the local memory to an array of dimension (*lld_b*, *LOCc*(*jb*+*p*-1)). Contains the local pieces of the *n*-by-*p* matrix sub(*B*) to be factored.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix B.
work	(local) REAL for psggqrf DOUBLE PRECISION for pdggqrf COMPLEX for pcggqrf DOUBLE COMPLEX for pzggqrf. Workspace array of dimension of *lwork*.
lwork	(local or global) INTEGER. Dimension of *work*, must be at least *lwork* ≥ max(*nb_a**(*npa*0+*mqa*0+*nb_a*), max((*nb_a**(*nb_a*-1))/2, (*pqb*0+*npb*0)**nb_a*)+*nb_a***nb_a*, *mb_b**(*npb*0+*pqb*0+*mb_b*)), where

iroffa = mod(*ia-1*, *mb_A*),
icoffa = mod(*ja-1*, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
npa0 = numroc (*n*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
mqa0 = numroc (*m*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)
iroffb = mod(*ib-1*, *mb_b*),
icoffb = mod(*jb-1*, *nb_b*),
ibrow = indxg2p(*ib*, *mb_b*, MYROW, *rsrc_b*, NPROW),
ibcol = indxg2p(*jb*, *nb_b*, MYCOL, *csrc_b*, NPCOL),
npb0 = numroc (*n*+*iroffa*, *mb_b*, MYROW, *Ibrow*, NPROW),
pqb0 = numroc(*m*+*icoffb*, *nb_b*, MYCOL, *ibcol*, NPCOL)
and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a
On exit, the elements on and above the diagonal of sub (*A*) contain the min(*n*, *m*)-by-*m* upper trapezoidal matrix *R* (*R* is upper triangular if $n \geq m$); the elements below the diagonal, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors. (See Application Notes below).

taua, *taub*
(local)
REAL for psggqrf
DOUBLE PRECISION for pdggqrf
COMPLEX for pcggqrf
DOUBLE COMPLEX for pzggqrf.
Arrays, DIMENSION *LOCc*(*ja*+min(*n*,*m*)-1)for *taua* and *LOCr*(*ib*+*n*-1) for *taub*.
The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*. *taua* is tied to the distributed matrix *A*. (See Application Notes below).
The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*. *taub* is tied to the distributed matrix *B*. (See Application Notes below).

work(1)
On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info
(global) INTEGER.
= 0: the execution is successful.

< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*)**H*(*ja*+1)*...**H*(*ja*+*k*-1),

where *k* = min(*n*,*m*).

Each *H*(*i*) has the form

H(*i*) = *i* - *taua***v***v*'

where *taua* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*-1) = 0 and *v*(*i*) = 1; v(*i*+1:*n*) is stored on exit in *A*(*ia*+*i*:*ia*+*n*-1,*ja*+*i*-1), and *taua* in *taua*(*ja*+*i*-1).To form *Q* explicitly, use ScaLAPACK subroutine p?orgqr/p?ungqr. To use *Q* to update another matrix, use ScaLAPACK subroutine p?ormqr/p?unmqr.

The matrix *Z* is represented as a product of elementary reflectors

Z = *H*(*ib*)**H*(*ib*+1)*...**H*(*ib*+*k*-1), where *k* = min(*n*,*p*).

Each *H*(*i*) has the form

H(*i*) = *i* - *taub***v***v*'

where *taub* is a real/complex scalar, and *v* is a real/complex vector with *v*(*p*-*k*+*i*+1:*p*) = 0 and *v*(*p*-*k*+*i*) = 1; *v*(1:*p*-*k*+*i*-1) is stored on exit in *B*(*ib*+*n*-*k*+*i*-1,*jb*:*jb*+*p*-*k*+*i*-2), and *taub* in *taub*(*ib*+*n*-*k*+*i*-1). To form *Z* explicitly, use ScaLAPACK subroutine p?orgrq/p?ungrq. To use *Z* to update another matrix, use ScaLAPACK subroutine p?ormrq/p?unmrq.

p?ggrqf

Computes the generalized RQ factorization.

Syntax

call psggrqf(*m*, *p*, *n*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

call pdggrqf(*m*, *p*, *n*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

call pcggrqf(*m*, *p*, *n*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

call pzggrqf(*m*, *p*, *n*, *a*, *ia*, *ja*, *desca*, *taua*, *b*, *ib*, *jb*, *descb*, *taub*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine forms the generalized *RQ* factorization of an *m*-by-*n* matrix sub(*A*)=(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) and a *p*-by-*n* matrix sub(*B*)=(*ib*:*ib*+*p*-1, *ja*:*ja*+*n*-1):

sub(*A*) = *R***Q*, sub(*B*) = *Z***T***Q*,

where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

$$R = \begin{matrix} m \\ \\ n-m \end{matrix} \begin{pmatrix} 0 & R_{12} \end{pmatrix}, \text{ if } m \le n,$$
$$\qquad\qquad\quad m \quad\; m$$

or

$$R = \begin{matrix} \\ m-n \\ n \end{matrix} \begin{pmatrix} R_{11} \\ R_{12} \end{pmatrix}, \text{ if } m > n$$
$$\qquad\quad n$$

where R_{11} or R_{21} is upper triangular, and

$$T = \begin{matrix} \\ n \\ p-n \end{matrix} \begin{pmatrix} T_{11} \\ 0 \end{pmatrix}, \text{ if } p \ge n$$
$$\qquad\quad n$$

or

$$T = \begin{matrix} p \\ \\ p-n \end{matrix} \begin{pmatrix} T_{11} & T_{12} \end{pmatrix} \quad p, \text{ if } p < n,$$
$$\qquad\quad p \quad n-p$$

where T^{11} is upper triangular.

In particular, if sub(*B*) is square and nonsingular, the *GRQ* factorization of sub(*A*) and sub(*B*) implicitly gives the *RQ* factorization of sub (*A*)*inv(sub(*B*)):

sub(*A*)*inv(sub(*B*))= (*R**inv(*T*))**Z'*

where inv(sub(*B*)) denotes the inverse of the matrix sub(*B*), and *Z'* denotes the transpose (conjugate transpose) of matrix *Z*.

Input Parameters

m	(global) INTEGER. The number of rows in the distributed matrices sub (*A*) (*m*≥0).
p	INTEGER. The number of rows in the distributed matrix sub(*B*) (*p*≥0).
n	(global) INTEGER. The number of columns in the distributed matrices sub(*A*) and sub(*B*) (*n*≥0).
a	(local) REAL for psggrqf DOUBLE PRECISION for pdggrqf

COMPLEX for pcggrqf
DOUBLE COMPLEX for pzggrqf.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*) to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

b (local)
REAL for psggrqf
DOUBLE PRECISION for pdggrqf
COMPLEX for pcggrqf
DOUBLE COMPLEX for pzggrqf.
Pointer into the local memory to an array of dimension (*lld_b*, *LOCc*(*jb*+*n*-1)).
Contains the local pieces of the *p*-by-*n* matrix sub(*B*) to be factored.

ib, *jb* (global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.

descb (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

work (local)
REAL for psggrqf
DOUBLE PRECISION for pdggrqf
COMPLEX for pcggrqf
DOUBLE COMPLEX for pzggrqf.
Workspace array of dimension of *lwork*.

lwork (local or global) INTEGER.

Dimension of *work*, must be at least *lwork* ≥
max(*mb_a**(*mpa*0+*nqa*0+*mb_a*), max((*mb_a**(*mb_a*-1))/2, (*ppb*0+*nqb*0)**mb_a*) + *mb_a***mb_a*, *nb_b**(*ppb*0+*nqb*0+*nb_b*)),
where
iroffa = mod(*ia*-1, *mb_A*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p(*ja*, *nb_a*, MYCOL, *csrc_a*, NPCOL),
mpa0 = *numroc* (*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
nqa0 = *numroc* (*m*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL)
iroffb = mod(*ib-1*, *mb_b*),
icoffb = mod(*jb-1*, *nb_b*),
ibrow = indxg2p(*ib*, *mb_b*, MYROW, *rsrc_b*, NPROW),
ibcol = indxg2p(*jb*, *nb_b*, MYCOL, *csrc_b*, NPCOL),
ppb0 = numroc (*p*+*iroffb*, *mb_b*, MYROW, *ibrow,* NPROW),
nqb0 = numroc (*n*+*icoffb*, *nb_b*, MYCOL, *ibcol,* NPCOL)

and numroc, indxg2p are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a
On exit, if $m \le n$, the upper triangle of *A*(*ia*:*ia*+*m*-1, *ja*+*n*-*m*:*ja*+*n*-1) contains the *m*-by-*m* upper triangular matrix *R*; if $m \ge n$, the elements on and above the (*m*-*n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*, *m*) elementary reflectors (see *Application Notes* below).

taua, *taub*
(local)
REAL for psggqrf
DOUBLE PRECISION for pdggqrf
COMPLEX for pcggqrf
DOUBLE COMPLEX for pzggqrf.
Arrays, DIMENSION *LOCr*(*ia*+*m*-1)for *taua* and *LOCc*(*jb*+min(p,*n*)-1) for *taub*.
The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*. *taua* is tied to the distributed matrix *A*.(See *Application Notes* below).
The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*. *taub* is tied to the distributed matrix *B*. (See *Application Notes* below).

work(1)
On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info
(global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ia*)**H*(*ia*+1)*...**H*(*ia*+*k*-1),

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *i* - *taua***v***v*'

where *taua* is a real/complex scalar, and *v* is a real/complex vector with *v*(*n-k+i+1:n*) = 0 and *v*(*n-k+i*) = 1; v(1:*n-k+i-1*) is stored on exit in *A*(*ia+m-k+i-1*, *ja:ja+n-k+i-2*), and *taua* in *taua*(*ia+m-k+i-1*). To form *Q* explicitly, use ScaLAPACK subroutine p?orgrq/p?ungrq. To use *Q* to update another matrix, use ScaLAPACK subroutine p?ormrq/p?unmrq.

The matrix *Z* is represented as a product of elementary reflectors

*Z = H(jb)*H(jb+1)*...*H(jb+k-1), where k = min(p,n).*

Each *H*(*i*) has the form

*H(i) = i - taub*v*v'*

where *taub* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i-1*) = 0 and *v*(*i*)= 1; *v*(*i+1:p*) is stored on exit in *B*(*ib+i:ib+p-1,jb+i-1*), and *taub* in *taub*(*jb+i-1*). To form *Z* explicitly, use ScaLAPACK subroutine p?orgqr/p?ungqr. To use *Z* to update another matrix, use ScaLAPACK subroutine p?ormqr/p?unmqr.

Symmetric Eigenproblems

To solve a symmetric eigenproblem with ScaLAPACK, you usually need to reduce the matrix to real tridiagonal form *T* and then find the eigenvalues and eigenvectors of the tridiagonal matrix *T*. ScaLAPACK includes routines for reducing the matrix to a tridiagonal form by an orthogonal (or unitary) similarity transformation $A = QTQ^H$ as well as for solving tridiagonal symmetric eigenvalue problems. These routines are listed in Table 6-4 .

There are different routines for symmetric eigenproblems, depending on whether you need eigenvalues only or eigenvectors as well, and on the algorithm used (either the *QTQ* algorithm, or bisection followed by inverse iteration).

Table 6-4 Computational Routines for Solving Symmetric Eigenproblems

Operation	Dense symmetric/Hermitian matrix	Orthogonal/unitary matrix	Symmetric tridiagonal matrix
Reduce to tridiagonal form $A = QTQ^H$	p?sytrd/p?hetrd		
Multiply matrix after reduction		p?ormtr/p?unmtr	
Find all eigenvalues and eigenvectors of a tridiagonal matrix *T* by a *QTQ* method			steqr2*)
Find selected eigenvalues of a tridiagonal matrix *T* via bisection			p?stebz
Find selected eigenvectors of a tridiagonal matrix *T* by inverse iteration			p?stein

*) This routine is described as part of auxiliary ScaLAPACK routines.

p?sytrd

Reduces a symmetric matrix to real symmetric tridiagonal form by an orthogonal similarity transformation.

Syntax

```
call pssytrd( uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
call pdsytrd( uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces a real symmetric matrix sub(*A*) to symmetric tridiagonal form *T* by an orthogonal similarity transformation:

Q'*sub(*A*)**Q* = *T*,

where sub(*A*) = *A*(*ia*:*ia*+*n*-1,*ja*:*ja*+*n*-1).

Input Parameters

uplo	(global) CHARACTER. Specifies whether the upper or lower triangular part of the symmetric matrix sub(*A*) is stored: If *uplo* = 'U', upper triangular If *uplo* = 'L', lower triangular
n	(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).
a	(local) REAL for pssytrd DOUBLE PRECISION for pdsytrd. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the symmetric distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced. See *Application Notes* below.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local) REAL for pssytrd DOUBLE PRECISION for pdsytrd. Workspace array of dimension *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least: *lwork* ≥ max(NB*(*np* +1), 3*NB), where NB = *mb_a* = *nb_a*, *np* = numroc(*n*, NB, MYROW, *iarow*, NPROW), *iarow* = indxg2p(*ia*, NB, MYROW, *rsrc_a*, NPROW). indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — On exit, if *uplo* = 'U', the diagonal and first superdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors; if *uplo* = 'L', the diagonal and first subdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors. See *Application Notes* below.

d — (local)
REAL for pssytrd
DOUBLE PRECISION for pdsytrd.
Arrays, DIMENSION *LOCc*(*ja*+*n*-1) .The diagonal elements of the tridiagonal matrix *T*:
d(*i*)= *A*(*i*,*i*).
d is tied to the distributed matrix *A*.

e — (local)
REAL for pssytrd
DOUBLE PRECISION for pdsytrd.
Arrays, DIMENSION *LOCc*(*ja*+*n*-1) if *uplo* = 'U', *LOCc*(*ja*+*n*-2) otherwise.
The off-diagonal elements of the tridiagonal matrix *T*:
e(*i*)= *A*(*i*,*i*+1) if *uplo* = 'U',
e(*i*) = *A*(*i*+1,*i*) if *uplo* = 'L'.
e is tied to the distributed matrix *A*.

tau — (local)
REAL for pssytrd
DOUBLE PRECISION for pdsytrd.
Arrays, DIMENSION *LOCc*(*ja*+*n*-1). This array contains the scalar factors *tau* of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*n*-1)... *H*(2) *H*(1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau* * *v* * *v'*,

where *tau* is a real scalar, and *v* is a real vector with *v*(*i*+1:*n*) = 0 and *v*(*i*) = 1; *v*(1:*i*-1) is stored on exit in *A*(*ia*:*ia*+*i*-2, *ja*+*i*), and *tau* in *tau* (*ja*+*i*-1).

If *uplo* = 'L', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1) *H*(2)... *H*(*n*-1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau* * *v* * *v'*,

where *tau* is a real scalar, and *v* is a real vector with *v*(1:*i*) = 0 and *v*(*i*+1) = 1; *v*(*i*+2:*n*) is stored on exit in *A*(*ia*+*i*+1:*ia*+*n*-1,*ja*+*i*-1), and *tau* in *tau*(*ja*+*i*-1).

The contents of sub(*A*) on exit are illustrated by the following examples with *n* = 5:

If *uplo* = 'U':

$$\begin{bmatrix} d & e & v2 & v3 & v4 \\ & d & e & v3 & v4 \\ & & d & e & v4 \\ & & & d & e \\ & & & & d \end{bmatrix}$$

If *uplo* = 'L':

$$\begin{bmatrix} d & & & & \\ e & d & & & \\ v1 & e & d & & \\ v1 & v2 & e & d & \\ v1 & v2 & v3 & e & d \end{bmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *T*, and *v i* denotes an element of the vector defining *H*(*i*).

p?ormtr

Multiplies a general matrix by the orthogonal transformation matrix from a reduction to tridiagonal form determined by p?sytrd.

Syntax

call psormtr(*side*, *uplo*, *trans*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdormtr(*side*, *uplo*, *trans*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general real distributed *m*-by-*n* matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix of order *nq*, with *nq* = *m* if *side* = 'L' and *nq* = *n* if *side* = 'R'.

Q is defined as the product of *nq* elementary reflectors, as returned by p?sytrd.

If *uplo* = 'U', *Q* = *H*(*nq*-1)... *H*(2) *H*(1);

If *uplo* = 'L', *Q* = *H*(1) *H*(2)... *H*(*nq*-1).

Input Parameters

side — (global) CHARACTER
='L': *Q* or Q^T is applied from the left.
='R': *Q* or Q^T is applied from the right.

trans — (global) CHARACTER
='N', no transpose, *Q* is applied.
='T', transpose, Q^T is applied.

uplo — (global) CHARACTER.
= 'U': Upper triangle of *A*(*ia*:*, *ja*:*) contains elementary reflectors from p?sytrd;
= 'L': Lower triangle of *A*(*ia*:*,*ja*:*) contains elementary reflectors from p?sytrd

m — (global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).

n — (global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).

a	(local) REAL for psormtr DOUBLE PRECISION for pdormtr. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side*='L', or (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R'. Contains the vectors which define the elementary reflectors, as returned by p?sytrd. If *side*='L', *lld_a* ≥ max(1,*LOCr*(*ia*+*m*-1)); If *side* ='R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1)).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) REAL for psormtr DOUBLE PRECISION for pdormtr. Array, DIMENSION of *ltau* where if *side* = 'L' and *uplo* = 'U', *ltau* = *LOCc*(*m_a*), if *side* = 'L' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*m*-2), if *side* = 'R' and *uplo* = 'U', *ltau* = *LOCc*(*n_a*), if *side* = 'R' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*n*-2). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by p?sytrd. *tau* is tied to the distributed matrix *A*.
c	(local) REAL for psormtr DOUBLE PRECISION for pdormtr. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub (*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.
descc	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local) REAL for psormtr DOUBLE PRECISION for pdormtr. Workspace array of dimension *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least: if *uplo* = 'U', *iaa*= *ia*; *jaa*= *ja*+1, *icc*= *ic*; *jcc*= *jc*; else *uplo* = 'L', *iaa*= *ia*+1, *jaa*= *ja*; If *side* = 'L', *icc*= *ic*+1; *jcc*= *jc*;

else *icc*= *ic*; *jcc*= *jc*+1;
end if
end if
If *side* = 'L',
mi= *m*-1; *ni*= *n*
lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + *mpc*0)**nb_a*) + *nb_a***nb_a*
else
If *side* = 'R',
mi= *m*; *mi* = *n*-1;
lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + max(*npa*0+numroc(numroc(*ni*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*)+ *nb_a***nb_a*
end if
where *lcmq* = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),
iroffa = mod(*iaa*-1, *mb_a*),
icoffa = mod(*jaa*-1, *nb_a*),
iarow = indxg2p(*iaa*, *mb_a*, MYROW, *rsrc_a*, NPROW),
*npa*0 = numroc(*ni*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
iroffc = mod(*icc*-1, *mb_c*),
icoffc = mod(*jcc*-1, *nb_c*),
icrow = indxg2p(*icc*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jcc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0 = numroc(*mi*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — Overwritten by the product *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q',* or sub(*C*)**Q*.

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?hetrd

Reduces a Hermitian matrix to Hermitian tridiagonal form by a unitary similarity transformation.

Syntax

```
call pchetrd( uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
call pzhetrd( uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine reduces a complex Hermitian matrix sub(*A*) to Hermitian tridiagonal form *T* by a unitary similarity transformation:

*Q'*sub(*A*)*Q* = *T*

where sub(*A*) = *A*(*ia*:*ia*+*n*-1,*ja*:*ja*+*n*-1).

Input Parameters

uplo	(global) CHARACTER. Specifies whether the upper or lower triangular part of the Hermitian matrix sub(*A*) is stored: If *uplo* = 'U', upper triangular If *uplo* = 'L', lower triangular
n	(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).
a	(local) COMPLEX for pchetrd DOUBLE COMPLEX for pzhetrd. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the Hermitian distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced. (see *Application Notes* below).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local) COMPLEX for pchetrd DOUBLE COMPLEX for pzhetrd.

Workspace array of dimension *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least:

lwork≥max(NB*(*np* +1), 3*NB)
where NB = *mb_a* = *nb_a*,
np = numroc(*n*, NB, MYROW, *iarow*, NPROW),
iarow = indxg2p(*ia*, NB, MYROW, *rsrc_a*, NPROW).
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit,
If *uplo* = 'U', the diagonal and first superdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the unitary matrix *Q* as a product of elementary reflectors;if *uplo* = 'L', the diagonal and first subdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

d (local)
REAL for pchetrd
DOUBLE PRECISION for pzhetrd.
Arrays, DIMENSION *LOCc*(*ja*+*n*-1). The diagonal elements of the tridiagonal matrix *T*:
d(*i*)= *A*(*i*,*i*).
d is tied to the distributed matrix *A*.

e (local)
REAL for pchetrd
DOUBLE PRECISION for pzhetrd.
Arrays, DIMENSION *LOCc*(*ja*+*n*-1) if *uplo* = 'U'; *LOCc*(*ja*+*n*-2) - otherwise.
The off-diagonal elements of the tridiagonal matrix *T*:
e(*i*)= *A*(*i*,*i*+1) if *uplo* = 'U',
e(*i*)= *A*(*i*+1,*i*) if *uplo* = 'L'.
e is tied to the distributed matrix *A*.

tau (local) COMPLEX for pchetrd
DOUBLE COMPLEX for pzhetrd.

	Arrays, DIMENSION *LOCc*(*ja*+*n*-1). This array contains the scalar factors *tau* of the elementary reflectors. *tau* is tied to the distributed matrix *A*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*n*-1)*...**H*(2)**H*(1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau***v***v*',

where *tau* is a complex scalar, and *v* is a complex vector with *v*(*i*+1:*n*) = 0 and *v*(*i*) = 1; *v*(1:*i*-1) is stored on exit in *A*(*ia*:*ia*+*i*-2, *ja*+*i*), and *tau* in *tau* (*ja*+*i*-1).

If *uplo* = 'L', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*n*-1).

Each *H*(*i*) has the form

H(*i*) = *i* - *tau***v***v*',

where *tau* is a complex scalar, and *v* is a complex vector with *v*(1:*i*) = 0 and *v*(*i*+1) = 1; *v*(*i*+2:*n*) is stored on exit in *A*(*ia*+*i*+1:*ia*+*n*-1,*ja*+*i*-1), and *tau* in *tau*(*ja*+*i*-1).

The contents of sub(*A*) on exit are illustrated by the following examples with *n* = 5:

If *uplo* = 'U':

$$\begin{bmatrix} d & e & v2 & v3 & v4 \\ & d & e & v3 & v4 \\ & & d & e & v4 \\ & & & d & e \\ & & & & d \end{bmatrix}$$

If *uplo* = 'L':

$$\begin{bmatrix} d & & & & \\ e & d & & & \\ v1 & e & d & & \\ v1 & v2 & e & d & \\ v1 & v2 & v3 & e & d \end{bmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *T*, and *v i* denotes an element of the vector defining *H*(*i*).

p?unmtr

Multiplies a general matrix by the unitary transformation matrix from a reduction to tridiagonal form determined by p?hetrd*.*

Syntax

call pcunmtr(*side*, *uplo*, *trans*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmtr(*side*, *uplo*, *trans*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general complex distributed *m*-by-*n* matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix of order *nq*, with *nq* = *m* if *side* = 'L' and *nq* = *n* if *side* = 'R'.

Q is defined as the product of *nq*-1 elementary reflectors, as returned by p?hetrd.

If *uplo* = 'U', *Q* = *H*(*nq*-1)... *H*(2) *H*(1);

If *uplo* = 'L', *Q* = *H*(1) *H*(2)... *H*(*nq*-1).

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^H is applied from the left. ='R': *Q* or Q^H is applied from the right.
trans	(global) CHARACTER ='N', no transpose, *Q* is applied.

	='C', conjugate transpose, Q^H is applied.
uplo	(global) CHARACTER. = 'U': Upper triangle of *A*(*ia*:*, *ja*:*) contains elementary reflectors from p?hetrd; = 'L': Lower triangle of *A*(*ia*:*,*ja*:*) contains elementary reflectors from p?hetrd
m	(global) INTEGER. The number of rows in the distributed matrix sub(*C*) (*m*≥0).
n	(global) INTEGER. The number of columns in the distributed matrix sub(*C*) (*n*≥0).
a	(local) REAL for pcunmtr DOUBLE PRECISION for pzunmtr. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side*='L', or (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R'. Contains the vectors which define the elementary reflectors, as returned by p?hetrd. If *side*='L', *lld_a* ≥ max(1,*LOCr*(*ia*+*m*-1)); If *side* ='R', *lld_a* ≥ max(1, *LOCr*(*ia*+*n*-1)).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) COMPLEX for pcunmtr DOUBLE COMPLEX for pzunmtr. Array, DIMENSION of *ltau* where If *side* = 'L' and *uplo* = 'U', *ltau* = *LOCc*(*m_a*), if *side* = 'L' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*m*-2), if *side* = 'R' and *uplo* = 'U', *ltau* = *LOCc*(*n_a*), if *side* = 'R' and *uplo* = 'L', *ltau* = *LOCc*(*ja*+*n*-2). *tau*(*i*) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by p?hetrd. *tau* is tied to the distributed matrix *A*.
c	(local) COMPLEX for pcunmtr DOUBLE COMPLEX for pzunmtr. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). Contains the local pieces of the distributed matrix sub (*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.
descc	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
COMPLEX for pcunmtr
DOUBLE COMPLEX for pzunmtr.
Workspace array of dimension *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least:
If *uplo* = 'U',
iaa= *ia*; *jaa*= *ja*+1, *icc*= *ic*; *jcc*= *jc*;
else *uplo* = 'L',
iaa= *ia*+1, *jaa*= *ja*;
If *side* = 'L',
icc= *ic*+1; *jcc*= *jc*;
else *icc*= *ic*; *jcc*= *jc*+1;
end if
end if
If *side* = 'L',
mi= *m*-1; *ni*= *n*

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + *mpc*0)**nb_a*) + *nb_a***nb_a*
else
If *side* = 'R',
mi= *m*; *mi* = *n*-1;

lwork ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + max(*npa*0+numroc(numroc(*ni*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*
end if
where *lcmq* = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),
iroffa = mod(*iaa*-1, *mb_a*),
icoffa = mod(*jaa*-1, *nb_a*),
iarow = indxg2p(*iaa*, *mb_a*, MYROW, *rsrc_a*, NPROW),
*npa*0 = numroc(*ni*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
iroffc = mod(*icc*-1, *mb_c*),
icoffc = mod(*jcc*-1, *nb_c*),
icrow = indxg2p(*icc*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jcc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0 = numroc(*mi*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	Overwritten by the product *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q',* or sub(*C*)**Q*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - *i*

p?stebz

Computes the eigenvalues of a symmetric tridiagonal matrix by bisection.

Syntax

call psstebz(*ictxt*, *range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *abstol*, *d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit*, *work*, *iwork*, *liwork*, *info*)

call pdstebz(*ictxt*, *range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *abstol*, *d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit*, *work*, *iwork*, *liwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the eigenvalues of a symmetric tridiagonal matrix in parallel. These may be all eigenvalues, all eigenvalues in the interval [*v1 vu*], or the eigenvalues indexed *il* through *iu*. A static partitioning of work is done at the beginning of p?stebz which results in all processes finding an (almost) equal number of eigenvalues.

Input Parameters

ictxt	(global) INTEGER. The BLACS context handle.
range	(global) CHARACTER. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues in the interval [*v1*, *vu*]. If *range* ='I', the routine computes eigenvalues with indices *il* to *iu*.
order	(global) CHARACTER. Must be 'B' or 'E'. If *order* = 'B', the eigenvalues are to be ordered from smallest to largest within each split-off block. If *order* = 'E', the eigenvalues for the entire matrix are to be ordered from smallest to largest.
n	(global) INTEGER. The order of the tridiagonal matrix *T* (*n*≥0).
vl, *vu*	(global) REAL for psstebz

DOUBLE PRECISION for pdstebz.
If *range* = 'V', the routine computes the lower and the upper bounds for the eigenvalues on the interval [*1*, *vu*].
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* (global)

INTEGER. Constraint: 1≤*il*≤*iu*≤*n*.
If *range* = 'I', the index of the smallest eigenvalue is returned for *il* and of the largest eigenvalue for *iu* (assuming that the eigenvalues are in ascending order) must be returned. *il* must be at least 1. *iu* must be at least *il* and no greater than *n*.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol (global)
REAL for psstebz
DOUBLE PRECISION for pdstebz.
The absolute tolerance to which each eigenvalue is required. An eigenvalue (or cluster) is considered to have converged if it lies in an interval of width *abstol*. If *abstol*≤0, then the tolerance is taken as *ulp*||*T*||, where *ulp* is the machine precision, and ||*T*|| means the 1-norm of *T*
Eigenvalues will be computed most accurately when *abstol* is set to the underflow threshold slamch('U'), not 0. Note that if eigenvectors are desired later by inverse iteration (p?stein), *abstol* should be set to 2*p?lamch('S').

d (global)
REAL for psstebz
DOUBLE PRECISION for pdstebz.
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*. To avoid overflow, the matrix must be scaled so that its largest entry is no greater than the $overflow^{(1/2)}$ * $underflow^{(1/4)}$ in absolute value, and for greatest accuracy, it should not be much smaller than that.

e (global)
REAL for psstebz
DOUBLE PRECISION for pdstebz.
Array, DIMENSION (*n* - 1).
Contains (*n*-1) off-diagonal elements of the tridiagonal matrix *T*. To avoid overflow, the matrix must be scaled so that its largest entry is no greater than $overflow^{(1/2)}$ * $underflow^{(1/4)}$ in absolute value, and for greatest accuracy, it should not be much smaller than that.

work (local)
REAL for psstebz
DOUBLE PRECISION for pdstebz.
Array, DIMENSION max(5*n*, 7). This is a workspace array.

lwork (local) INTEGER. The size of the *work* array must be ≥ max(5*n*, 7).

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

iwork (local) INTEGER. Array, DIMENSION max(4*n*, 14). This is a workspace array.

liwork (local) INTEGER. the size of the *iwork* array must ≥ max(4*n*, 14, NPROCS).
If *liwork* = -1, then *liwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

m (global) INTEGER. The actual number of eigenvalues found. 0≤*m*≤*n*

nsplit (global) INTEGER. The number of diagonal blocks detected in *T*.
1≤*nsplit*≤*n*

w (global)
REAL for psstebz
DOUBLE PRECISION for pdstebz.
Array, DIMENSION (*n*). On exit, the first *m* elements of *w* contain the eigenvalues on all processes.

iblock (global) INTEGER.
Array, DIMENSION (*n*). At each row/column *j* where *e*(*j*) is zero or small, the matrix *T* is considered to split into a block diagonal matrix. On exit *iblock*(*i*) specifies which block (from 1 to the number of blocks) the eigenvalue *w*(*i*) belongs to.

NOTE. In the (theoretically impossible) event that bisection does not converge for some or all eigenvalues, *info* is set to 1 and the ones for which it did not are identified by a negative block number.

isplit (global) INTEGER.
Array, DIMENSION (*n*).
Contains the splitting points, at which *T* breaks up into submatrices. The first submatrix consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc., and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n*. (Only the first *nsplit* elements are used, but since the *nsplit* values are not known, *n* words must be reserved for *isplit*.)

info (global) INTEGER.
If *info* = 0, the execution is successful.
If *info* < 0, if *info* = -*i*, the *i*-th argument has an illegal value.
If *info* > 0, some or all of the eigenvalues fail to converge or not computed.
If *info* = 1, bisection fails to converge for some eigenvalues; these eigenvalues are flagged by a negative block number. The effect is that the eigenvalues may not be as accurate as the absolute and relative tolerances.
If *info* = 2, mismatch between the number of eigenvalues output and the number desired.
If *info* = 3: *range*='*i*', and the Gershgorin interval initially used is incorrect. No eigenvalues are computed. Probable cause: the machine has a sloppy floating point arithmetic. Increase the *fudge* parameter, recompile, and try again.

p?stein

Computes the eigenvectors of a tridiagonal matrix using inverse iteration.

Syntax

call psstein(*n*, *d*, *e*, *m*, *w*, *iblock*, *isplit*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

call pdstein(*n*, *d*, *e*, *m*, *w*, *iblock*, *isplit*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

call pcstein(*n*, *d*, *e*, *m*, *w*, *iblock*, *isplit*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

call pzstein(*n*, *d*, *e*, *m*, *w*, *iblock*, *isplit*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the eigenvectors of a symmetric tridiagonal matrix *T* corresponding to specified eigenvalues, by inverse iteration. p?stein does not orthogonalize vectors that are on different processes. The extent of orthogonalization is controlled by the input parameter *lwork*. Eigenvectors that are to be orthogonalized are computed by the same process. p?stein decides on the allocation of work among the processes and then calls ?stein2 (modified LAPACK routine) on each individual process. If insufficient workspace is allocated, the expected orthogonalization may not be done.

NOTE. If the eigenvectors obtained are not orthogonal, increase *lwork* and run the code again.

p = NPROW*NPCOL is the total number of processes.

Input Parameters

n	(global) INTEGER. The order of the matrix *T* (*n* ≥ 0).
m	(global) INTEGER. The number of eigenvectors to be returned.
d, *e*, *w*	(global) REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d*(*) contains the diagonal elements of *T*. DIMENSION (*n*). *e*(*) contains the off-diagonal elements of *T*. DIMENSION (*n*-1). *w*(*) contains all the eigenvalues grouped by split-off block.The eigenvalues are supplied from smallest to largest within the block. (Here the output array *w* from p?stebz with order = 'B' is expected. The array should be replicated in all processes.) DIMENSION(*m*)
iblock	(global) INTEGER. Array, DIMENSION (*n*). The submatrix indices associated with the corresponding eigenvalues in *w*--1 for eigenvalues belonging to the first submatrix from the top, 2 for those belonging to the second submatrix, etc. (The output array *iblock* from p?stebz is expected here).
isplit	(global) INTEGER. Array, DIMENSION (*n*). The splitting points, at which *T* breaks up into submatrices. The first submatrix consists of rows/columns 1 to *isplit*(1), the second of rows/columns *isplit*(1)+1 through *isplit*(2), etc., and the *nsplit*-th consists of rows/columns *isplit*(*nsplit*-1)+1 through *isplit*(*nsplit*)=*n* . (The output array *isplit* from p?stebz is expected here.)
orfac	(global) REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *orfac* specifies which eigenvectors should be orthogonalized. Eigenvectors that correspond to eigenvalues within *orfac**||T|| of each other are to be orthogonalized. However, if the workspace is insufficient (see *lwork*), this tolerance may be decreased until all eigenvectors can be stored in one process. No orthogonalization is done if *orfac* is equal to zero. A default value of 1000 is used if *orfac* is negative. *orfac* should be identical on all processes
iz, *jz*	(global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.
descz	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *Z*.
work	(local). REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors.

Workspace array, DIMENSION (*lwork*).

lwork (local) INTEGER.
lwork controls the extent of orthogonalization which can be done. The number of eigenvectors for which storage is allocated on each process is *nvec* = floor((*lwork*-max(5**n*,*np*00**mq*00))/*n*). Eigenvectors corresponding to eigenvalue clusters of size *nvec* - ceil(*m*/*p*) + 1 are guaranteed to be orthogonal (the orthogonality is similar to that obtained from ?stein2).

NOTE. *lwork* must be no smaller than max(5**n*,*np*00**mq*00) + ceil(*m*/*p*)**n* and should have the same input value on all processes.

It is the minimum value of *lwork* input on different processes that is significant.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

iwork (local) INTEGER.
Workspace array, DIMENSION (3*n*+*p*+1).

liwork (local) INTEGER. The size of the array *iwork*. It must be greater than (3**n*+*p*+1).
If *liwork* = -1, then *liwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

z (local)
REAL for psstein
DOUBLE PRECISION for pdstein
COMPLEX for pcstein
DOUBLE COMPLEX for pzstein.
Array, DIMENSION (*descz*(*dlen_*), *n*/NPCOL + NB). *z* contains the computed eigenvectors associated with the specified eigenvalues. Any vector which fails to converge is set to its current iterate after MAXIT iterations (See ?stein2). On output, *z* is distributed across the *p* processes in block cyclic format.

work(1) On exit, *work*(1) gives a lower bound on the workspace (*lwork*) that guarantees the user desired orthogonalization (see *orfac*). Note that this may overestimate the minimum workspace needed.

iwork On exit, *iwork*(1) contains the amount of integer workspace required.

	On exit, the *iwork*(2) through *iwork*(*p*+2) indicate the eigenvectors computed by each process. Process *i* computes eigenvectors indexed *iwork*(*i*+2)+1 through *iwork*(*i*+3).
ifail	(global). INTEGER. Array, DIMENSION (*m*). On normal exit, all elements of *ifail* are zero. If one or more eigenvectors fail to converge after MAXIT iterations (as in ?stein), then *info* > 0 is returned. If mod(*info*, *m*+1)>0, then for *i*=1 to mod(*info*,*m*+1), the eigenvector corresponding to the eigenvalue *w*(*ifail*(*i*)) failed to converge (*w* refers to the array of eigenvalues on output).
iclustr	(global) INTEGER. Array, DIMENSION (2**p*) This output array contains indices of eigenvectors corresponding to a cluster of eigenvalues that could not be orthogonalized due to insufficient workspace (see *lwork*, *orfac* and *info*). Eigenvectors corresponding to clusters of eigenvalues indexed *iclustr*(2*I-1) to *iclustr*(2*I), *i* = 1 to *info*/(*m*+1), could not be orthogonalized due to lack of workspace. Hence the eigenvectors corresponding to these clusters may not be orthogonal. *iclustr* is a zero terminated array ---(*iclustr*(2**k*).*ne*.0.*and*.*iclustr*(2**k*+1).*eq*.*0*) if and only if *k* is the number of clusters.
gap	(global) REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. This output array contains the gap between eigenvalues whose eigenvectors could not be orthogonalized. The *info*/*m* output values in this array correspond to the *info*/(*m*+1) clusters indicated by the array *iclustr*. As a result, the dot product between eigenvectors corresponding to the *i-th* cluster may be as high as (*O*(*n*)**macheps*)/*gap*(*i*).
info	(global) INTEGER. If *info* = 0, the execution is successful. If *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), If the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* < 0: if *info* = -*i*, the *i*-th argument had an illegal value. If *info* > 0: if mod(*info*, *m*+1) = *i*, then *i* eigenvectors failed to converge in MAXIT iterations. Their indices are stored in the array *ifail*. If *info*/(*m*+1) = *i*, then eigenvectors corresponding to *i* clusters of eigenvalues could not be orthogonalized due to insufficient workspace. The indices of the clusters are stored in the array *iclustr*.

Nonsymmetric Eigenvalue Problems

This section describes ScaLAPACK routines for solving nonsymmetric eigenvalue problems, computing the Schur factorization of general matrices, as well as performing a number of related computational tasks.

To solve a nonsymmetric eigenvalue problem with ScaLAPACK, you usually need to reduce the matrix to the upper Hessenberg form and then solve the eigenvalue problem with the Hessenberg matrix obtained.

Table 6-5 lists ScaLAPACK routines for reducing the matrix to the upper Hessenberg form by an orthogonal (or unitary) similarity transformation $A = QHQ^H$, as well as routines for solving eigenproblems with Hessenberg matrices, and multiplying the matrix after reduction.

Table 6-5 Computational Routines for Solving Nonsymmetric Eigenproblems

Operation performed	General matrix	Orthogonal/Unitary matrix	Hessenberg matrix
Reduce to Hessenberg form $A = QHQ^H$	p?gehrd		
Multiply the matrix after reduction		p?ormhr/p?unmhr	
Find eigenvalues and Schur factorization			p?lahqr

p?gehrd

Reduces a general matrix to upper Hessenberg form.

Syntax

```
call psgehrd( n, ilo, ihi, a, ia, ja, desca, tau, work, lwork, info)
call pdgehrd( n, ilo, ihi, a, ia, ja, desca, tau, work, lwork, info)
call pcgehrd( n, ilo, ihi, a, ia, ja, desca, tau, work, lwork, info)
call pzgehrd( n, ilo, ihi, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine reduces a real/complex general distributed matrix sub(*A*) to upper Hessenberg form *H* by an orthogonal or unitary similarity transformation

Q'*sub(*A*)**Q* = *H*,

where sub(*A*) = *A*(*ia*+*n*-1:*ia*+*n*-1, *ja*+*n*-1:*ja*+*n*-1).

Input Parameters

n	(global) INTEGER. The order of the distributed matrix sub(*A*) (*n*≥0).
ilo, *ihi*	(global) INTEGER. It is assumed that sub(*A*) is already upper triangular in rows *ia*:*ia*+*ilo*-2 and *ia*+*ihi*:*ia*+*n*-1 and columns *ja*:*ja*+*ilo*-2 and *ja*+*ihi*:*ja*+*n*-1. (See *Application Notes* below). If *n* > 0, 1≤*ilo*≤*ihi*≤*n*; otherwise set *ilo* = 1, *ihi* = *n*.
a	(local) REAL for psgehrd DOUBLE PRECISION for pdgehrd COMPLEX for pcgehrd DOUBLE COMPLEX for pzgehrd.

	Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* general distributed matrix sub(*A*) to be reduced.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local) REAL for psgehrd DOUBLE PRECISION for pdgehrd COMPLEX for pcgehrd DOUBLE COMPLEX for pzgehrd. Workspace array of dimension *lwork*.
lwork	(local or global) INTEGER, dimension of the array *work*. *lwork* is local input and must be at least *lwork*≥NB*NB + NB*max(*ihip*+1, *ihlp*+*inlq*) where NB = *mb_a* = *nb_a*, *iroffa* = mod(*ia*-1, NB), *icoffa* = mod(*ja*-1, NB), *ioff* = mod(*ia*+*ilo*-2, NB), *iarow* = indxg2p(*ia*, NB, MYROW, *rsrc_a*, NPROW), *ihip* = numroc(*ihi*+*iroffa*, NB, MYROW, *iarow*, NPROW), *ilrow* = indxg2p(*ia*+*ilo*-1, NB, MYROW, *rsrc_a*, NPROW), *ihlp* = numroc(*ihi*-*ilo*+*ioff*+1, NB, MYROW, *ilrow*, NPROW), *ilcol* = indxg2p(*ja*+*ilo*-1, NB, MYCOL, *csrc_a*, NPCOL), *inlq* = numroc(*n*-*ilo*+*ioff*+1, NB, MYCOL, *ilcol*, NPCOL), indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	On exit, the upper triangle and the first subdiagonal of sub(*A*)are overwritten with the upper Hessenberg matrix *H*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).
tau	(local). REAL for psgehrd DOUBLE PRECISION for pdgehrd COMPLEX for pcgehrd DOUBLE COMPLEX for pzgehrd.

	Array, DIMENSION at least max(*ja*+*n*-2). The scalar factors of the elementary reflectors (see *Application Notes* below). Elements *ja*:*ja*+*ilo*-2 and *ja*+*ihi*:*ja*+*n*-2 of *tau* are set to zero. *tau* is tied to the distributed matrix *A*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of (*ihi*-*ilo*) elementary reflectors

Q = *H*(*ilo*)**H*(*ilo*+1)*...**H*(*ihi*-1).

Each *H*(*i*) has the form

H(*i*)= *i* - *tau***v***v'*

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*)= 0, *v*(*i*+1)= 1 and *v*(*ihi*+1:*n*)= 0; *v*(*i*+2:*ihi*) is stored on exit in *a*(*ia*+*ilo*+*i*:*ia*+*ihi*-1,*ja*+*ilo*+*i*-2), and *tau* in *tau*(*ja*+*ilo*+*i*-2). The contents of *a*(*ia*:*ia*+*n*-1,*ja*:*ja*+*n*-1) are illustrated by the following example, with *n* = 7, *ilo* = 2 and *ihi* = 6:

on entry

$$\begin{bmatrix} a & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & a & a & a & a & a & a \\ & & & & & & a \end{bmatrix}$$

on exit

$$\begin{bmatrix} a & a & a & h & h & h & a \\ & a & h & h & h & h & a \\ & h & h & h & h & h & h \\ & v2 & h & h & h & h & h \\ & v2 & v3 & h & h & h & h \\ & v2 & v3 & v4 & h & h & h \\ & & & & & & a \end{bmatrix}$$

where *a* denotes an element of the original matrix sub(*A*), *H* denotes a modified element of the upper Hessenberg matrix *H*, and *vi* denotes an element of the vector defining *H*(*ja*+*ilo*+*i*-2).

p?ormhr

Multiplies a general matrix by the orthogonal transformation matrix from a reduction to Hessenberg form determined by p?gehrd.

Syntax

call psormhr(*side*, *trans*, *m*, *n*, *ilo*, *ihi*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdormhr(*side*, *trans*, *m*, *n*, *ilo*, *ihi*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general real distributed *m*-by-*n* matrix sub(*C*)= *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'T':	Q^T*sub(*C*)	sub(*C*)*Q^T

where *Q* is a real orthogonal distributed matrix of order *nq*, with *nq* = *m* if *side* = 'L' and *nq* = *n* if *side* = 'R'.

Q is defined as the product of *ihi*-*ilo* elementary reflectors, as returned by p?gehrd.

Q = *H*(*ilo*) *H*(*ilo*+1)... *H*(*ihi*-1).

Input Parameters

side	(global) CHARACTER ='L': *Q* or Q^T is applied from the left. ='R': *Q* or Q^T is applied from the right.
trans	(global) CHARACTER ='N', no transpose, *Q* is applied. ='T', transpose, Q^T is applied.
m	(global) INTEGER. The number of rows in the distributed matrix sub (*C*) (*m*≥0).
n	(global) INTEGER. The number of columns in he distributed matrix sub (*C*) (*n*≥0).
ilo, *ihi*	(global) INTEGER. *ilo* and *ihi* must have the same values as in the previous call of p?gehrd. *Q* is equal to the unit matrix except for the distributed submatrix *Q*(*ia*+*ilo*:*ia*+*ihi*-1,*ia*+*ilo*:*ja*+*ihi*-1).

If *side* = 'L', 1≤*ilo*≤*ihi*≤max(1,*m*);

If *side* = 'R', 1≤*ilo*≤*ihi*≤max(1,*n*);

ilo and *ihi* are relative indexes.

a (local)
REAL for psormhr
DOUBLE PRECISION for pdormhr
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*m*-1)) if *side*='L', and (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R'.
Contains the vectors which define the elementary reflectors, as returned by p?gehrd.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psormhr
DOUBLE PRECISION for pdormhr
Array, DIMENSION *LOCc*(*ja*+*m*-2), if *side* = 'L', and *LOCc*(*ja*+*n*-2) if *side* = 'R'.
This array contains the scalar factors *tau*(*j*) of the elementary reflectors *H*(*j*) as returned by p?gehrd. *tau* is tied to the distributed matrix *A*.

c (local)
REAL for psormhr
DOUBLE PRECISION for pdormhr
Pointer into the local memory to an array of dimension (*lld_c*,*LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub(*C*).

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
REAL for psormhr
DOUBLE PRECISION for pdormhr
Workspace array with dimension *lwork*.

lwork (local or global) INTEGER.
The dimension of the array *work*.
lwork must be at least *iaa* = *ia* + *ilo*; *jaa* = *ja*+*ilo*-1;
If *side* = 'L',

mi = *ihi*-*ilo*; *ni* = *n*; *icc* = *ic* + *ilo*; *jcc* = *jc*; *lwork* ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0+*mpc*0)**nb_a*) + *nb_a***nb_a*

else if *side* = 'R',
mi = *m*; *ni* = *ihi*-*ilo*; *icc* = *ic*; *jcc* = *jc* + *ilo*; *lwork* ≥
max((*nb_a**(*nb_a*-1))/2,
(*nqc*0+max(*npa*0+numroc(numroc(*ni*+*icoffc*, *nb_a*, 0, 0,
NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*
end if
where *lcmq* = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),
iroffa = mod(*iaa*-1, *mb_a*),
icoffa = mod(*jaa*-1, *nb_a*),
iarow = indxg2p(*iaa*, *mb_a*, MYROW, *rsrc_a*, NPROW),
*npa*0 = numroc(*ni*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
iroffc = mod(*icc*-1, *mb_c*), *icoffc* = mod(*jcc*-1, *nb_c*),
icrow = indxg2p(*icc*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jcc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
*mpc*0 = numroc(*mi*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — sub(*C*) is overwritten by *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*.

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmhr

Multiplies a general matrix by the unitary transformation matrix from a reduction to Hessenberg form determined by p?gehrd.

Syntax

call pcunmhr(*side*, *trans*, *m*, *n*, *ilo*, *ihi*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmhr(*side*, *trans*, *m*, *n*, *ilo*, *ihi*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This routine overwrites the general complex distributed *m*-by-*n* matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'H':	Q^H*sub(*C*)	sub(*C*)*Q^H

where *Q* is a complex unitary distributed matrix of order *nq*, with *nq* = *m* if *side* = 'L' and *nq* = *n* if *side* = 'R'.

Q is defined as the product of *ihi*-*ilo* elementary reflectors, as returned by p?gehrd.

Q = *H*(*ilo*) *H*(*ilo*+1)... *H*(*ihi*-1).

Input Parameters

side — (global) CHARACTER
='L': *Q* or Q^H is applied from the left.
='R': *Q* or Q^H is applied from the right.

trans — (global) CHARACTER
='N', no transpose, *Q* is applied.
='C', conjugate transpose, Q^H is applied.

m — (global) INTEGER. The number of rows in the distributed submatrix sub (*C*) (*m*≥0).

n — (global) INTEGER. The number of columns in the distributed submatrix sub (*C*) (*n*≥0).

ilo, *ihi* — (global) INTEGER
These must be the same parameters *ilo* and *ihi*, respectively, as supplied to p?gehrd. *Q* is equal to the unit matrix except in the distributed submatrix *Q* (*ia*+*ilo*:*ia*+*ihi*-1,*ia*+*ilo*:*ja*+*ihi*-1).
If *side* ='L', then 1≤*ilo*≤*ihi*≤max(1,*m*).
If *side* = 'R', then 1≤*ilo*≤*ihi*≤max(1,*n*)
ilo and *ihi* are relative indexes.

a — (local)
COMPLEX for pcunmhr
DOUBLE COMPLEX for pzunmhr.
Pointer into the local memory to an array of dimension (*lld_a*, *LOC c*(*ja*+*m*-1)) if *side*='L', and (*lld_a*, *LOCc*(*ja*+*n*-1)) if *side* = 'R'.
Contains the vectors which define the elementary reflectors, as returned by p?gehrd.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
COMPLEX for pcunmhr
DOUBLE COMPLEX for pzunmhr.
Array, DIMENSION *LOCc*(*ja*+*m*-2), if *side* = 'L', and *LOCc*(*ja*+*n*-2) if *side* = 'R'.
This array contains the scalar factors *tau*(*j*) of the elementary reflectors *H*(*j*) as returned by p?gehrd. *tau* is tied to the distributed matrix *A*.

c (local)
COMPLEX for pcunmhr
DOUBLE COMPLEX for pzunmhr.
Pointer into the local memory to an array of dimension (*lld_c*, *LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub(*C*).

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
COMPLEX for pcunmhr
DOUBLE COMPLEX for pzunmhr.
Workspace array with dimension *lwork*.

lwork (local or global)
The dimension of the array *work*.
lwork must be at least *iaa* = *ia* + *ilo*; *jaa* = *ja*+*ilo*-1;
If *side* = 'L', *mi* = *ihi*-*ilo*; *ni* = *n*; *icc* = *ic* + *ilo*; *jcc* = *jc*; *lwork* ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0+*mpc*0)**nb_a*) + *nb_a***nb_a*
else if *side* = 'R',
mi = *m*; *ni* = *ihi*-*ilo*; *icc* = *ic*; *jcc* = *jc* + *ilo*; *lwork* ≥ max((*nb_a**(*nb_a*-1))/2, (*nqc*0 + max(*npa*0+numroc(numroc(*ni*+*icoffc*, *nb_a*, 0, 0, NPCOL), *nb_a*, 0, 0, *lcmq*), *mpc*0))**nb_a*) + *nb_a***nb_a*
end if
where *lcmq* = *lcm*/NPCOL with *lcm* = ilcm(NPROW, NPCOL),
iroffa = mod(*iaa*-1, *mb_a*),
icoffa = mod(*jaa*-1, *nb_a*),
iarow = indxg2p(*iaa*, *mb_a*, MYROW, *rsrc_a*, NPROW),
*npa*0 = numroc(*ni*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
iroffc = mod(*icc*-1, *mb_c*),

icoffc = mod(*jcc*-1, *nb_c*),
icrow = indxg2p(*icc*, *mb_c*, MYROW, *rsrc_c*, NPROW),
iccol = indxg2p(*jcc*, *nb_c*, MYCOL, *csrc_c*, NPCOL),
mpc0 = numroc(*mi*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
nqc0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c — *C* is overwritten by *Q** sub(*C*) or *Q'**sub(*C*) or sub(*C*)**Q'* or sub(*C*)**Q*.

work(1) — On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?lahqr

Computes the Schur decomposition and/or eigenvalues of a matrix already in Hessenberg form.

Syntax

call pslahqr(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *a*, *desca*, *wr*, *wi*, *iloz*, *ihiz*, *z*, *descz*, *work*, *lwork*, *iwork*, *ilwork*, *info*)

call pdlahqr(*wantt*, *wantz*, *n*, *ilo*, *ihi*, *a*, *desca*, *wr*, *wi*, *iloz*, *ihiz*, *z*, *descz*, *work*, *lwork*, *iwork*, *ilwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This is an auxiliary routine used to find the Schur decomposition and/or eigenvalues of a matrix already in Hessenberg form from columns *ilo* to *ihi*.

Input Parameters

wantt — (global) LOGICAL
If *wantt* = .TRUE., the full Schur form T is required;
If *wantt* = .FALSE., only eigenvalues are required.

wantz	(global) LOGICAL. If *wantz* = .TRUE., the matrix of Schur vectors *z* is required; If *wantz* = .FALSE., Schur vectors are not required.
n	(global) INTEGER. The order of the Hessenberg matrix *A* (and *z* if *wantz*). (*n*≥0).
ilo, *ihi*	(global) INTEGER. It is assumed that *A* is already upper quasi-triangular in rows and columns *ihi*+1:*n*, and that *A*(*ilo*, *ilo*-1) = 0 (unless *ilo* = 1). p?lahqr works primarily with the Hessenberg submatrix in rows and columns *ilo* to *ihi*, but applies transformations to all of *h* if *wantt* is .TRUE.. 1≤*ilo*≤max(1,*ihi*); *ihi* ≤ *n*.
a	(global) REAL for pslahqr DOUBLE PRECISION for pdlahqr Array, DIMENSION (*desca*(*lld_*),*). On entry, the upper Hessenberg matrix *A*.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
iloz, *ihiz*	(global) INTEGER. Specify the rows of *z* to which transformations must be applied if *wantz* is .TRUE.. 1≤*iloz*≤*ilo*; *ihi*≤*ihiz*≤*n*.
z	(global) REAL for pslahqr DOUBLE PRECISION for pdlahqr Array. If *wantz* is .TRUE., on entry *z* must contain the current matrix *Z* of transformations accumulated by pdhseqr. If *wantz* is .FALSE., *z* is not referenced.
descz	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix Z.
work	(local) REAL for pslahqr DOUBLE PRECISION for pdlahqr Workspace array with dimension *lwork*.
lwork	(local) INTEGER. The dimension of *work*. *lwork* is assumed big enough so that *lwork*≥3**n* + max(2*max(*descz*(*lld_*),*desca*(*lld_*)) + 2**LOCq*(*n*), 7*ceil(*n*/*hbl*)/*lcm*(NPROW,NPCOL))). If *lwork* = -1, then *work*(1)gets set to the above number and the code returns immediately.
iwork	(global and local) INTEGER array of size *ilwork*.
ilwork	(local) INTEGER This holds some of the *iblk* integer arrays.

Output Parameters

a	On exit, if *wantt* is .TRUE., *A* is upper quasi-triangular in rows and columns *ilo*:*ihi*, with any 2-by-2 or larger diagonal blocks not yet in standard form. If *wantt* is .FALSE., the contents of *A* are unspecified on exit.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
wr, *wi*	(global replicated output) REAL for pslahqr DOUBLE PRECISION for pdlahqr Arrays, DIMENSION(*n*) each. The real and imaginary parts, respectively, of the computed eigenvalues *ilo* to *ihi* are stored in the corresponding elements of *wr* and *wi*. If two eigenvalues are computed as a complex conjugate pair, they are stored in consecutive elements of *wr* and *wi*, say the *i*-th and (*i*+1)-th, with *wi*(*i*)> 0 and *wi*(*i*+1) < 0. If *wantt* is .TRUE. , the eigenvalues are stored in the same order as on the diagonal of the Schur form returned in *A*. *A* may be returned with larger diagonal blocks until the next release.
z	On exit *z* has been updated; transformations are applied only to the submatrix *z*(*iloz*:*ihiz*, *ilo*:*ihi*).
info	(global) INTEGER. = 0: the execution is successful. < 0: parameter number -*info* incorrect or inconsistent > 0: p?lahqr failed to compute all the eigenvalues *ilo* to *ihi* in a total of 30*(*ihi*-*ilo*+1) iterations; if *info* = *i*, elements *i*+1:*ihi* of *wr* and *wi* contain those eigenvalues which have been successfully computed.

Singular Value Decomposition

This section describes ScaLAPACK routines for computing the singular value decomposition (SVD) of a general *m*-by-*n* matrix *A* (see "Singular Value Decomposition" in LAPACK chapter).

To find the SVD of a general matrix *A*, this matrix is first reduced to a bidiagonal matrix *B* by a unitary (orthogonal) transformation, and then SVD of the bidiagonal matrix is computed. Note that the SVD of *B* is computed using the LAPACK routine ?bdsqr .

Table 6-6 lists ScaLAPACK computational routines for performing this decomposition.

Table 6-6 Computational Routines for Singular Value Decomposition (SVD)

Operation	General matrix	Orthogonal/unitary matrix
Reduce *A* to a bidiagonal matrix	p?gebrd	
Multiply matrix after reduction		p?ormbr/p?unmbr

p?gebrd

Reduces a general matrix to bidiagonal form.

Syntax

```
call psgebrd(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
call pdgebrd(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
call pcgebrd(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
call pzgebrd(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine reduces a real/complex general *m*-by-*n* distributed matrix sub(*A*)= *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1) to upper or lower bidiagonal form *B* by an orthogonal/unitary transformation:

*Q'*sub(*A*)*P* = *B*.

If *m*≥ *n*, *B* is upper bidiagonal; if *m* < *n*, *B* is lower bidiagonal.

Input Parameters

m	(global) INTEGER. The number of rows in the distributed matrix sub(*A*) (*m*≥0).
n	(global) INTEGER. The number of columns in the distributed matrix sub(*A*) (*n*≥0).
a	(local) REAL for psgebrd DOUBLE PRECISION for pdgebrd COMPLEX for pcgebrd DOUBLE COMPLEX for pzgebrd. Real pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the distributed matrix sub (*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local) REAL for psgebrd DOUBLE PRECISION for pdgebrd COMPLEX for pcgebrd DOUBLE COMPLEX for pzgebrd. Workspace array of dimension *lwork*.
lwork	(local or global) INTEGER, dimension of *work*, must be at least:

lwork ≥ *nb**(*mpa*0 + nqa0+1)+ *nqa*0
where *nb* = *mb_a* = *nb_a*,
iroffa = mod(*ia*-1, *nb*),
icoffa = mod(*ja*-1, nb),
iarow = indxg2p(*ia*, *nb*, MYROW, *rsrc_a*, NPROW),
iacol = indxg2p (*ja*, nb, MYCOL, *csrc_a*, NPCOL),
*mpa*0 = numroc(*m* +*iroffa*, nb, MYROW, iarow, NPROW),
*nqa*0 = numroc(*n* +*icoffa*, nb, MYCOL, *iacol*, NPCOL),
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a

On exit, if *m*≥*n*, the diagonal and the first superdiagonal of sub(*A*) are overwritten with the upper bidiagonal matrix *B*; the elements below the diagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and the elements above the first superdiagonal, with the array *taup*, represent the orthogonal matrix *P* as a product of elementary reflectors. If *m* < *n*, the diagonal and the first subdiagonal are overwritten with the lower bidiagonal matrix *B*; the elements below the first subdiagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and the elements above the diagonal, with the array *taup*, represent the orthogonal matrix *P* as a product of elementary reflectors. See *Application Notes* below.

d

(local)
REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors. Array, DIMENSION *LOCc*(*ja*+min(*m*,*n*)-1) if *m*≥*n*; *LOCr*(*ia*+min(*m*,*n*)-1) otherwise. The distributed diagonal elements of the bidiagonal matrix *B*: *d*(*i*) = *a*(*i*,*i*).
d is tied to the distributed matrix *A*.

e

(local)
REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors. Array, DIMENSION *LOCr*(*ia*+min(*m*,*n*)-1) if *m*≥*n*; *LOCc*(*ja*+min(*m*,*n*)-2) otherwise. The distributed off-diagonal elements of the bidiagonal distributed matrix *B*:

	If $m \geq n$, $e(i) = a(i,i+1)$ for $i = 1,2,\ldots, n-1$; if $m < n$, $e(i) = a(i+1, i)$ for $i = 1,2,\ldots,m-1$. e is tied to the distributed matrix A.
tauq, *taup*	(local) REAL for psgebrd DOUBLE PRECISION for pdgebrd COMPLEX for pcgebrd DOUBLE COMPLEX for pzgebrd. Arrays, DIMENSION *LOCc*(*ja*+min(*m*,*n*)-1) for *tauq* and *LOCr*(*ia*+min(*m*,*n*)-1) for *taup*. Contain the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrices Q and P, respectively. *tauq* and *taup* are tied to the distributed matrix A. See *Application Notes* below.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the i-th argument is an array and the j-entry had an illegal value, then *info* = - (*i**100+*j*), if the i-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrices Q and P are represented as products of elementary reflectors:

If $m \geq n$,

$Q = H(1)*H(2)*...*H(n)$, and $P = G(1)*G(2)*...*G(n-1)$.

Each $H(i)$ and $G(i)$ has the form:

$H(i)= i - tauq * v * v'$ and $G(i) = i - taup*u*u'$

where *tauq* and *taup* are real/complex scalars, and v and u are real/complex vectors;

$v(1:i-1) = 0$, $v(i) = 1$, and $v(i+1:m)$ is stored on exit in $A(ia+i:ia+m-1,ja+i-1)$;

$u(1:i) = 0$, $u(i+1) = 1$, and $u(i+2:n)$ is stored on exit in A $(ia+i-1,ja+i+1:ja+n-1)$;

tauq is stored in *tauq*(*ja*+*i*-1) and *taup* in *taup*(*ia*+*i*-1).

If $m < n$,

$Q = H(1)*H(2)*...*H(m-1)$, and $P = G(1)*$ $G(2)*...*$ $G(m)$

Each H (i) and $G(i)$ has the form:

$H(i)= i-tauq*v*v'$ and $G(i)= i-taup*u*u'$

here *tauq* and *taup* are real/complex scalars, and v and u are real/complex vectors;

$v(1:i) = 0$, $v(i+1) = 1$, and $v(i+2:m)$ is stored on exit in A $(ia+i:ia+m-1,ja+i-1)$; $u(1:i-1) = 0$, $u(i) = 1$, and $u(i+1:n)$ is stored on exit in $A(ia+i-1,ja+i+1:ja+n-1)$;

tauq is stored in *tauq*(*ja*+*i*-1) and *taup* in *taup*(*ia*+*i*-1).

The contents of sub(*A*) on exit are illustrated by the following examples:

m = 6 and *n* = 5 (*m* > *n*):

$$\begin{bmatrix} d & e & u1 & u1 & u1 \\ v1 & d & e & u2 & u2 \\ v1 & v2 & d & e & u3 \\ v1 & v2 & v3 & d & e \\ v1 & v2 & v3 & v4 & d \\ v1 & v2 & v3 & v4 & v5 \end{bmatrix}$$

m = 5 and *n* = 6 (*m* < *n*):

$$\begin{bmatrix} d & u1 & u1 & u1 & u1 & u1 \\ e & d & u2 & u2 & u2 & u2 \\ v1 & e & d & u3 & u3 & u3 \\ v1 & v2 & e & d & u4 & u4 \\ v1 & v2 & v3 & e & d & u5 \end{bmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *B*, *vi* denotes an element of the vector defining *H*(*i*), and *ui* an element of the vector defining *G*(*i*).

p?ormbr

Multiplies a general matrix by one of the orthogonal matrices from a reduction to bidiagonal form determined by p?gebrd.

Syntax

```
call psormbr(vect, side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

```
call pdormbr(vect, side, trans, m, n, k, a, ia, ja, desca, tau, c, ic, jc, descc, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

If *vect* = '*Q*', the routine overwrites the general real distributed *m*-by-*n* matrix sub(*C*) = *C*(*c*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q* sub(*C*)	sub(*C*) *Q*
trans = 'T':	Q^T sub(*C*)	sub(*C*) Q^T

If *vect* = 'P', the routine overwrites sub(*C*) with

	side ='L'	*side* ='R'
trans = 'N':	*P* sub(*C*)	sub(*C*) *P*
trans = 'T':	P^T sub(*C*)	sub(*C*) P^T

Here *Q* and P^T are the orthogonal distributed matrices determined by p?gebrd when reducing a real distributed matrix *A*(*ia*:*, *ja*:*) to bidiagonal form: *A*(*ia*:*,*ja*:*) = *Q***B***P*^{T}. *Q* and P^T are defined as products of elementary reflectors *H*(*i*) and *G*(*i*) respectively.

Let *nq* = *m* if *side* = 'L' and *nq* = *n* if *side* = 'R'. Thus *nq* is the order of the orthogonal matrix *Q* or P^T that is applied.

If *vect* = 'Q', *A*(*ia*:*, *ja*:*) is assumed to have been an *nq*-by-*k* matrix:

If *nq* ≥ *k*, *Q* = *H*(1) *H*(2)...*H*(*k*);

If *nq* < *k*, *Q* = *H*(1) *H*(2)...*H*(*nq*-1).

If *vect* = 'P', *A*(*ia*:*, *ja*:*) is assumed to have been a *k*-by-*nq* matrix:

If *k* < *nq*, *P* = *G*(1) *G*(2)...*G*(*k*);

If *k* ≥ *nq*, *P* = *G*(1) *G*(2)...*G*(*nq*-1).

Input Parameters

vect — (global) CHARACTER.
If *vect* ='Q', then *Q* or Q^T is applied.
If *vect* ='P', then *P* or P^T is applied.

side — (global) CHARACTER.
If *side* ='L', then *Q* or Q^T, *P* or P^T is applied from the left.
If *side* ='R', then *Q* or Q^T, *P* or P^T is applied from the right.

trans — (global) CHARACTER.
If *trans* = 'N', no transpose, *Q* or *P* is applied.
If *trans* = 'T', then Q^T or P^T is applied.

m — (global) INTEGER. The number of rows in the distributed matrix sub (*C*).

n — (global) INTEGER. The number of columns in the distributed matrix sub (*C*).

k — (global) INTEGER.
If *vect* = 'Q', the number of columns in the original distributed matrix reduced by p?gebrd;
If *vect* = 'P', the number of rows in the original distributed matrix reduced by p?gebrd.
Constraints: *k* ≥ 0.

a — (local)
REAL for psormbr
DOUBLE PRECISION for pdormbr.

Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+min(*nq*,*k*)-1))
If *vect*='Q', and (*lld_a*, *LOCc*(*ja*+*nq*-1))
If *vect* = 'P'.
nq = *m* if *side* = 'L', and *nq* = *n* otherwise.
The vectors which define the elementary reflectors *H*(*i*) and *G*(*i*), whose products determine the matrices *Q* and *P*, as returned by p?gebrd.

If *vect* = 'Q', *lld_a*≥max(1, *LOCr*(*ia*+*nq*-1));

If *vect* = 'P', *lld_a*≥max(1, *LOCr*(*ia*+min(*nq*, *k*)-1)).

ia, *ja* — (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau — (local)
REAL for psormbr
DOUBLE PRECISION for pdormbr.
Array, DIMENSION *LOCc*(*ja*+min(*nq*, *k*)-1), if *vect* = 'Q', and *LOCr*(*ia*+min(*nq*, *k*)-1), if *vect* = 'P'.
tau(*i*) must contain the scalar factor of the elementary reflector *H*(*i*) or *G*(*i*), which determines *Q* or *P*, as returned by pdgebrd in its array argument *tauq* or *taup*. *tau* is tied to the distributed matrix *A*.

c — (local) REAL for psormbr
DOUBLE PRECISION for pdormbr
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub (*C*).

ic, *jc* — (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work — (local)
REAL for psormbr
DOUBLE PRECISION for pdormbr.
Workspace array of dimension *lwork*.

lwork — (local or global) INTEGER, dimension of *work*, must be at least:
If *side* = 'L'
nq = *m*;

if ((*vect* = 'Q' and *nq*≥*k*) or (*vect* is not equal to 'Q' and *nq*>*k*)),

*mpc*0 = numroc(*mi*+*iroffc*, *mb_c*, MYROW, *icrow*, NPROW),
*nqc*0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	On exit, if *vect*='Q', sub(*C*) is overwritten by *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*; if *vect*='P', sub(*C*) is overwritten by *P**sub(*C*), or *P'**sub(*C*), or sub(*C*)**P*, or sub(*C*)**P'*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?unmbr

Multiplies a general matrix by one of the unitary transformation matrices from a reduction to bidiagonal form determined by p?gebrd.

Syntax

call pcunmbr(*vect*, *side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmbr(*vect*, *side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

If *vect* = 'Q', the routine overwrites the general complex distributed *m*-by-*n* matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) with

	side ='L'	*side* ='R'
trans = 'N':	*Q**sub(*C*)	sub(*C*)**Q*
trans = 'C':	Q^H*sub(*C*)	sub(*C*)*Q^H

If *vect* = 'P', the routine overwrites sub(*C*) with

	side ='L'	*side* ='R'
trans = 'N':	*P**sub(*C*)	sub(*C*)**P*
trans = 'C':	P^H*sub(*C*)	sub(*C*)*P^H

Here Q and P^H are the unitary distributed matrices determined by p?gebrd when reducing a complex distributed matrix $A(ia:*, ja:*)$ to bidiagonal form: $A(ia:*,ja:*) = Q*B*P^H$.

Q and P^H are defined as products of elementary reflectors $H(i)$ and $G(i)$ respectively.

Let $nq = m$ if $side = 'L'$ and $nq = n$ if $side = 'R'$. Thus nq is the order of the unitary matrix Q or P^H that is applied.

If $vect = 'Q'$, $A(ia:*, ja:*)$ is assumed to have been an nq-by-k matrix:

If $nq \geq k$, $Q = H(1)\ H(2)...\ H(k)$;

If $nq < k$, $Q = H(1)\ H(2)...\ H(nq-1)$.

If $vect = 'P'$, $A(ia:*, ja:*)$ is assumed to have been a k-by-nq matrix:

If $k < nq$, $P = G(1)\ G(2)...\ G(k)$;

If $k \geq nq$, $P = G(1)\ G(2)...\ G(nq-1)$.

Input Parameters

vect	(global) CHARACTER. If *vect* ='Q', then Q or Q^H is applied. If *vect* ='P', then P or P^H is applied.
side	(global) CHARACTER. If *side* ='L', then Q or Q^H, P or P^H is applied from the left. If *side* ='R', then Q or Q^H, P or P^H is applied from the right.
trans	(global) CHARACTER. If *trans* = 'N', no transpose, Q or P is applied. If *trans* = 'C', conjugate transpose, Q^H or P^H is applied.
m	(global) INTEGER. The number of rows in the distributed matrix sub (C) $m \geq 0$.
n	(global) INTEGER. The number of columns in the distributed matrix sub (C) $n \geq 0$.
k	(global) INTEGER. If *vect* = 'Q', the number of columns in the original distributed matrix reduced by p?gebrd; If *vect* = 'P', the number of rows in the original distributed matrix reduced by p?gebrd. Constraints: $k \geq 0$.
a	(local) COMPLEX for psormbr DOUBLE COMPLEX for pdormbr. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+min(*nq*,*k*)-1)) if *vect*='Q', and (*lld_a*, *LOCc*(*ja*+*nq*-1)) if *vect* = 'P'. *nq* = *m* if *side* = 'L', and *nq* = *n* otherwise.

The vectors which define the elementary reflectors *H*(*i*) and *G*(*i*), whose products determine the matrices *Q* and *P*, as returned by p?gebrd.

If *vect* = 'Q', *lld_a* ≥ max(1, *LOCr*(*ia*+*nq*-1));

If *vect* = 'P', *lld_a* ≥ max(1, *LOCr*(*ia*+min(*nq*, *k*)-1)).

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
COMPLEX for pcunmbr
DOUBLE COMPLEX for pzunmbr.
Array, DIMENSION *LOCc*(*ja*+min(*nq*, *k*)-1), if *vect* = 'Q', and *LOCr*(*ia*+min(*nq*, *k*)-1), if *vect* = 'P'.
tau(*i*) must contain the scalar factor of the elementary reflector *H*(*i*) or *G*(*i*), which determines *Q* or *P*, as returned by p?gebrd in its array argument *tauq* or *taup*. *tau* is tied to the distributed matrix *A*.

c (local) COMPLEX for pcunmbr
DOUBLE COMPLEX for pzunmbr
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*jc*+*n*-1)).
Contains the local pieces of the distributed matrix sub (*C*).

ic, *jc* (global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix *C*, respectively.

descc (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
COMPLEX for pcunmbr
DOUBLE COMPLEX for pzunmbr.
Workspace array of dimension *lwork*.

lwork (local or global) INTEGER, dimension of *work*, must be at least:
If *side* = 'L'
nq = *m*;
if ((*vect* = 'Q' and *nq* ≥ *k*) or (*vect* is not equal to 'Q' and *nq* > *k*)), *iaa*= *ia*; *jaa*= *ja*; *mi*= *m*; *ni*= *n*; *icc*= *ic*; *jcc*= *jc*;

*nqc*0 = numroc(*ni*+*icoffc*, *nb_c*, MYCOL, *iccol*, NPCOL),
indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL,
NPROW and NPCOL can be determined by calling the subroutine
blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	On exit, if *vect*='Q', sub(*C*) is overwritten by *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q'*, or sub(*C*)**Q*; if *vect*='P', sub(*C*) is overwritten by *P**sub(*C*), or *P'**sub(*C*), or sub(*C*)**P*, or sub(*C*)**P'*.
work(1)	On exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	(global) INTEGER. = 0: the execution is successful. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Generalized Symmetric-Definite Eigen Problems

This section describes ScaLAPACK routines that allow you to reduce the *generalized symmetric-definite eigenvalue problems* (see Generalized Symmetric-Definite Eigenvalue Problems in LAPACK chapters) to standard symmetric eigenvalue problem $Cy = \lambda y$, which you can solve by calling ScaLAPACK routines described earlier in this chapter (see Symmetric Eigenproblems).

Table 6-7 lists these routines.

Table 6-7 Computational Routines for Reducing Generalized Eigenproblems to Standard Problems

Operation	Real symmetric matrices	Complex Hermitian matrices
Reduce to standard problems	p?sygst	p?hegst

p?sygst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form.

Syntax

```
call pssygst( ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, info )
call pdsygst( ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, info )
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces real symmetric-definite generalized eigenproblems to the standard form.

In the following sub(*A*) denotes *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) and sub(*B*) denotes *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*n*-1).

If *ibtype* = 1, the problem is

sub(*A*)**x* = λ*sub(*B*)**x*,

and sub(*A*) is overwritten by inv(U^T)*sub(*A*)*inv(*U*), or inv(*L*)*sub(*A*)*inv(L^T).

If *ibtype* = 2 or 3, the problem is

sub(*A*)*sub(*B*)*x = λ*x*, or sub(*B*)*sub(*A*)*x = λ*x*,

and sub(*A*) is overwritten by *U**sub(*A*)**U*^{T}, or *L*^{T}*sub(*A*)**L*.

sub(*B*) must have been previously factorized as *U*^{T}**U* or *L***L*^{T} by p?potrf.

Input Parameters

ibtype	(global) INTEGER. Must be 1 or 2 or 3. If *itype* = 1, compute inv(*U*^{T})*sub(*A*)*inv(*U*), or inv(*L*)*sub(*A*)*inv(*L*^{T}); If *itype* = 2 or 3, compute *U**sub(*A*)**U*^{T}, or *L*^{T}*sub(*A*)**L*.
uplo	(global) CHARACTER. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of sub(*A*) is stored and sub (*B*) is factored as *U*^{T}**U*. If *uplo* = 'L', the lower triangle of sub(*A*) is stored and sub (*B*) is factored as *L***L*^{T}.
n	(global) INTEGER. The order of the matrices sub (*A*) and sub (*B*) (*n* ≥ 0).
a	(local) REAL for pssygst DOUBLE PRECISION for pdsygst. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the array contains the local pieces of the *n*-by-*n* symmetric distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
b	(local) REAL for pssygst DOUBLE PRECISION for pdsygst. Pointer into the local memory to an array of dimension (*lld_b*, *LOCc*(*jb*+*n*-1)). On entry, the array contains the local pieces of the triangular factor from the Cholesky factorization of sub (*B*) as returned by p?potrf.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.

descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix B.

Output Parameters

a	On exit, if *info* = 0, the transformed matrix, stored in the same format as sub(*A*).
scale	(global) REAL for pssygst DOUBLE PRECISION for pdsygst. Amount by which the eigenvalues should be scaled to compensate for the scaling performed in this routine. At present, *scale* is always returned as 1.0, it is returned here to allow for future enhancement.
info	(global) INTEGER. If *info* = 0, the execution is successful. If *info* < 0, if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?hegst

Reduces a Hermitian-definite generalized eigenvalue problem to the standard form.

Syntax

```
call pchegst( ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, info)
call pzhegst( ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, scale, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces complex Hermitian-definite generalized eigenproblems to the standard form.

In the following sub(*A*) denotes *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) and sub(*B*) denotes *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*n*-1).

If *ibtype* = 1, the problem is

sub(*A*)**x* = λ*sub(*B*)**x*,

and sub(*A*) is overwritten by inv(U^H)*sub(*A*)*inv(*U*), or inv(*L*)*sub(*A*)*inv(L^H).

If *ibtype* = 2 or 3, the problem is

sub(*A*)*sub(*B*)**x* = λ**x*, or sub(*B*)*sub(*A*)**x* = λ**x*,

and sub(*A*) is overwritten by *U**sub(*A*)*U^H, or L^H*sub(*A*)**L*.

sub(*B*) must have been previously factorized as U^H**U* or *L**L^H by p?potrf.

Input Parameters

ibtype	(global) INTEGER. Must be 1 or 2 or 3. If *itype* = 1, compute inv(U^H)*sub(A)*inv(U), or inv(L)*sub(A)*inv(L^H); If *itype* = 2 or 3, compute U*sub(A)*U^H, or L^H*sub(A)*L.
uplo	(global) CHARACTER. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of sub(A) is stored and sub (B) is factored as U^H*U. If *uplo* = 'L', the lower triangle of sub(A) is stored and sub (B) is factored as L*L^H.
n	(global) INTEGER. The order of the matrices sub (A) and sub (B) ($n \geq 0$).
a	(local) COMPLEX for pchegst DOUBLE COMPLEX for pzhegst. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the array contains the local pieces of the n-by-n Hermitian distributed matrix sub(A). If *uplo* = 'U', the leading n-by-n upper triangular part of sub(A) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced. If *uplo* = 'L', the leading n-by-n lower triangular part of sub(A) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
b	(local) COMPLEX for pchegst DOUBLE COMPLEX for pzhegst. Pointer into the local memory to an array of dimension (*lld_b*, *LOCc*(*jb*+*n*-1)). On entry, the array contains the local pieces of the triangular factor from the Cholesky factorization of sub (B) as returned by p?potrf.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix B.

Output Parameters

a	On exit, if *info* = 0, the transformed matrix, stored in the same format as sub(A).
scale	(global)

	REAL for pchegst DOUBLE PRECISION for pzhegst. Amount by which the eigenvalues should be scaled to compensate for the scaling performed in this routine. At present, *scale* is always returned as 1.0, it is returned here to allow for future enhancement.
info	(global) INTEGER. If *info* = 0, the execution is successful. If *info* <0, if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i*100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Driver Routines

Table 6-8 lists ScaLAPACK driver routines available for solving systems of linear equations, linear least-squares problems, standard eigenvalue and singular value problems, and generalized symmetric definite eigenproblems.

Table 6-8 ScaLAPACK Driver Routines

Type of Problem	Matrix type, storage scheme	Driver
Linear equations	general (partial pivoting)	p?gesv (simple driver)p?gesvx (expert driver)
	general band (partial pivoting)	p?gbsv (simple driver)
	general band (no pivoting)	p?dbsv (simple driver)
	general tridiagonal (no pivoting)	p?dtsv (simple driver)
	symmetric/Hermitian positive-definite	p?posv (simple driver)p?posvx (expert driver)
	symmetric/Hermitian positive-definite, band	p?pbsv (simple driver)
	symmetric/Hermitian positive-definite, tridiagonal	p?ptsv (simple driver)
Linear least squares problem	general *m*-by-*n*	p?gels
Symmetric eigenvalue problem	symmetric/Hermitian	p?syev / p?heev (simple driver); p?syevd / p?heevd (simple driver with a divide and conquer algorithm); p?syevx / p?heevx (expert driver)
Singular value decomposition	general *m*-by-*n*	p?gesvd
Generalized symmetric definite eigenvalue problem	symmetric/Hermitian, one matrix also positive-definite	p?sygvx / p?hegvx (expert driver)

p?gesv

Computes the solution to the system of linear equations with a square distributed matrix and multiple right-hand sides.

Syntax

```
call psgesv(n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
call pdgesv(n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
```

```
call pcgesv(n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
call pzgesv(n, nrhs, a, ia, ja, desca, ipiv, b, ib, jb, descb, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine p?gesv computes the solution to a real or complex system of linear equations sub(*A*)**X* = sub(*B*), where sub(*A*) = *A*(*ia:ia+n-1*, *ja:ja+n-1*) is an *n*-by-*n* distributed matrix and *X* and sub(*B*) = *B*(*ib:ib+n-1*, *jb:jb+nrhs-1*) are *n*-by-*nrhs* distributed matrices.

The *LU* decomposition with partial pivoting and row interchanges is used to factor sub(*A*) as sub(*A*) = *P*L*U*, where *P* is a permutation matrix, *L* is unit lower triangular, and *U* is upper triangular. *L* and *U* are stored in sub(*A*). The factored form of sub(*A*) is then used to solve the system of equations sub(*A*)**X* = sub(*B*).

Input Parameters

n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*) (*n* ≥ 0).
nrhs	(global) INTEGER. The number of right hand sides, that is, the number of columns of the distributed submatrices *B* and *X* (*nrhs* ≥ 0).
a, *b*	(local) REAL for psgesv DOUBLE PRECISION for pdgesv COMPLEX for pcgesv DOUBLE COMPLEX for pzgesv. Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)) and *b*(*lld_b*,*LOCc*(*jb*+*nrhs-1*)), respectively. On entry, the array *a* contains the local pieces of the *n*-by-*n* distributed matrix sub(*A*) to be factored. On entry, the array *b* contains the right hand side distributed matrix sub(*B*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of sub(*A*), respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of sub(*B*), respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

Output Parameters

a	Overwritten by the factors *L* and *U* from the factorization sub(*A*) = *P*L*U*; the unit diagonal elements of *L* are not stored .
b	Overwritten by the solution distributed matrix *X*.

ipiv	(local) INTEGER array. The dimension of *ipiv* is (*LOCr*(*m_a*)+*mb_a*). This array contains the pivoting information. The (local) row i of the matrix was interchanged with the (global) row *ipiv*(i). This array is tied to the distributed matrix *A*.
info	(global) INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*-th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = *k*, *U*(*ia*+*k*-1,*ja*+*k*-1) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

p?gesvx

Uses the LU factorization to compute the solution to the system of linear equations with a square matrix A and multiple right-hand sides, and provides error bounds on the solution.

Syntax

```
call psgesvx(fact, trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, equed,
r, c, b, ib, jb, descb, x, ix, jx, descx, rcond, ferr, berr, work, lwork, iwork, liwork,
info)
```

```
call pdgesvx(fact, trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, equed,
r, c, b, ib, jb, descb, x, ix, jx, descx, rcond, ferr, berr, work, lwork, iwork, liwork,
info)
```

```
call pcgesvx(fact, trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, equed,
r, c, b, ib, jb, descb, x, ix, jx, descx, rcond, ferr, berr, work, lwork, rwork, lrwork,
info)
```

```
call pzgesvx(fact, trans, n, nrhs, a, ia, ja, desca, af, iaf, jaf, descaf, ipiv, equed,
r, c, b, ib, jb, descb, x, ix, jx, descx, rcond, ferr, berr, work, lwork, rwork, lrwork,
info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *AX* = *B*, where *A* denotes the *n*-by-*n* submatrix *A*(*ia:ia*+*n*-1, *ja:ja*+*n*-1), *B* denotes the *n*-by-*nrhs* submatrix *B*(*ib:ib*+*n*-1, *jb:jb*+*nrhs*-1) and *X* denotes the *n*-by-*nrhs* submatrix *X*(*ix:ix*+*n*-1, *jx:jx*+*nrhs*-1).

Error bounds on the solution and a condition estimate are also provided.

In the following description, *af* stands for the subarray *af*(*iaf:iaf*+*n*-1, *jaf:jaf*+*n*-1).

The routine p?gesvx performs the following steps:

1. If *fact* = 'E', real scaling factors *R* and *C* are computed to equilibrate the system:

trans = 'N': diag(*R*)*A*diag(*C*) *diag(*C*)-1*X* = diag(*R*)*B

trans = 'T': (diag(*R*)*A*diag(*C*))*T* *diag(*R*)-1*X* = diag(*C*)*B

trans = 'C': (diag(*R*)*A*diag(*C*))*H* *diag(*R*)-1*X* = diag(*C*)*B

Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by diag(*R*)*A*diag(*C*) and *B* by diag(*R*)*B* (if *trans*='N') or diag(*c*)*B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *P* *L* *U*, where *P* is a permutation matrix, *L* is a unit lower triangular matrix, and *U* is upper triangular.

3. The factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than relative machine precision, steps 4 - 6 are skipped.

4. The system of equations is solved for *X* using the factored form of *A*.

5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

6. If equilibration was used, the matrix *X* is premultiplied by diag(*C*) (if *trans* = 'N') or diag(*R*) (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact	(global) CHARACTER*1. Must be 'F', 'N', or 'E'. Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored. If *fact* = 'F' then, on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*. Arrays *a*, *af*, and *ipiv* are not modified. If *fact* = 'N', the matrix *A* is copied to *af* and factored. If *fact* = 'E', the matrix *A* is equilibrated if necessary, then copied to *af* and factored.
trans	(global) CHARACTER*1. Must be 'N', 'T', or 'C'. Specifies the form of the system of equations: If *trans* = 'N', the system has the form *A*X* = *B* (No transpose); If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose); If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate transpose);
n	(global) INTEGER. The number of linear equations; the order of the submatrix *A* (*n* ≥ 0).
nrhs	(global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrices *B* and *X* (*nrhs* ≥ 0).
a, *af*, *b*, *work*	(local) REAL for psgesvx DOUBLE PRECISION for pdgesvx COMPLEX for pcgesvx

DOUBLE COMPLEX for pzgesvx.
Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)), *af*(*lld_af*,*LOCc*(*ja*+*n*-1)), *b*(*lld_b*,*LOCc*(*jb*+*nrhs*-1)), *work(lwork)*, respectively.
The array *a* contains the matrix *A*. If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*.
The array *af* is an input argument if *fact* = 'F'. In this case it contains on entry the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P*L*U* as computed by p?getrf. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*.
The array *b* contains on entry the matrix *B* whose columns are the right-hand sides for the systems of equations.
work(*) is a workspace array. The dimension of *work* is (*lwork*).

ia, *ja* — (global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix *A*(*ia:ia*+*n*-1, *ja:ja*+*n*-1), respectively.

desca — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

iaf, *jaf* — (global) INTEGER. The row and column indices in the global array *af* indicating the first row and the first column of the subarray *af*(*iaf:iaf*+*n*-1, *jaf:jaf*+*n*-1), respectively.

descaf — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *AF*.

ib, *jb* — (global) INTEGER. The row and column indices in the global array B indicating the first row and the first column of the submatrix *B*(*ib:ib*+*n*-1, *jb:jb*+*nrhs*-1), respectively.

descb — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

ipiv — (local) INTEGER array.
The dimension of *ipiv* is (*LOCr*(*m_a*)+*mb_a*).
The array *ipiv* is an input argument if *fact* = 'F' .
On entry, it contains the pivot indices from the factorization *A* = *P*L*U* as computed by p?getrf; (local) row i of the matrix was interchanged with the (global) row *ipiv*(i).
This array must be aligned with *A*(*ia:ia*+*n*-1, *).

equed — (global) CHARACTER*1. Must be 'N', 'R', 'C', or 'B'. *equed* is an input argument if *fact* = 'F' . It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N');
If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by diag(*r*);
If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by diag(*c*);

	If *equed* = 'B', both row and column equilibration was done; *A* has been replaced by diag(*r*)*A*diag(*c*).
r, *c*	(local) REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. Arrays, dimension *LOCr*(m_a) and *LOCc*(n_a), respectively. The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments. If *equed* = 'R' or 'B', *A* is multiplied on the left by diag(*r*); if *equed* = 'N' or 'C', *r* is not accessed. If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive. If *equed* = 'C' or 'B', *A* is multiplied on the right by diag(*c*); if *equed* = 'N' or 'R', *c* is not accessed. If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive. Array *r* is replicated in every process column, and is aligned with the distributed matrix *A*. Array *c* is replicated in every process row, and is aligned with the distributed matrix *A*.
ix, *jx*	(global) INTEGER. The row and column indices in the global array *X* indicating the first row and the first column of the submatrix *X*(*ix:ix+n-1, jx:jx+nrhs-1*), respectively.
descx	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *X*.
lwork	(local or global) INTEGER. The dimension of the array *work* ; must be at least max(p?gecon(*lwork*), p?gerfs(*lwork*))+*LOCr*(n_a) .
iwork	(local, psgesvx/pdgesvx only) INTEGER. Workspace array. The dimension of *iwork* is (*liwork*).
liwork	(local, psgesvx/pdgesvx only) INTEGER. The dimension of the array *iwork* , must be at least *LOCr*(n_a) .
rwork	(local) REAL for pcgesvx DOUBLE PRECISION for pzgesvx. Workspace array, used in complex flavors only. The dimension of *rwork* is (*lrwork*).
lrwork	(local or global, pcgesvx/pzgesvx only) INTEGER. The dimension of the array *rwork*;must be at least 2**LOCc*(n_a) .

Output Parameters

x	(local) REAL for psgesvx DOUBLE PRECISION for pdgesvx COMPLEX for pcgesvx DOUBLE COMPLEX for pzgesvx. Pointer into the local memory to an array of local dimension *x*(lld_x,*LOCc*(*jx+nrhs-1*)).

	If *info* = 0, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is: diag(*C*)-1**X*, if *trans* = 'N' and *equed* = 'C' or 'B'; and diag(*R*)-1**X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'.
a	Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'. If *equed* ≠ 'N', *A* is scaled on exit as follows: *equed* = 'R': *A* = diag(*R*)**A* *equed* = 'C': *A* = *A**diag(*c*) *equed* = 'B': *A* = diag(*R*)**A**diag(*c*)
af	If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.
b	Overwritten by diag(*R*)**B* if *trans* = 'N' and *equed* = 'R' or 'B'; overwritten by diag(*c*)**B* if *trans* = 'T' and *equed* = 'C' or 'B'; not changed if *equed* = 'N'.
r, *c*	These arrays are output arguments if *fact* ≠ 'F'. See the description of *r*, *c* in *Input Arguments* section.
rcond	(global) REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
ferr, *berr*	(local) REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION *LOCc*(n_b) each. Contain the component-wise forward and relative backward errors, respectively, for each solution vector. Arrays *ferr* and *berr* are both replicated in every process row, and are aligned with the matrices *B* and *X*.
ipiv	If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).
work(1)	If *info*=0, on exit *work*(1) returns the minimum value of *lwork* required for optimum performance.

iwork(1)	If *info*=0, on exit *iwork*(1) returns the minimum value of *liwork* required for optimum performance.
rwork(1)	If *info*=0, on exit *rwork*(1) returns the minimum value of *lrwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: if the *i*th argument is an array and the *j*th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* = *i*, and *i* ≤ *n*, then *U*(*i*,*i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed. If *info* = *i*, and *i* = *n* +1, then *U* is nonsingular, but *rcond* is less than machine precision. The factorization has been completed, but the matrix is singular to working precision and the solution and error bounds have not been computed.

p?gbsv

Computes the solution to the system of linear equations with a general banded distributed matrix and multiple right-hand sides.

Syntax

```
call psgbsv(n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, work, lwork, info)
call pdgbsv(n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, work, lwork, info)
call pcgbsv(n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, work, lwork, info)
call pzgbsv(n, bwl, bwu, nrhs, a, ja, desca, ipiv, b, ib, descb, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine p?gbsv computes the solution to a real or complex system of linear equations

sub(*A*)**X* = sub(*B*),

where sub(*A*) = *A*(*1:n*, *ja:ja*+*n*-*1*) is an *n*-by-*n* real/complex general banded distributed matrix with *bwl* subdiagonals and *bwu* superdiagonals, and *X* and sub(*B*)= *B*(*ib:ib*+*n*-*1*, *1:rhs*) are *n*-by-*nrhs* distributed matrices.

The *LU* decomposition with partial pivoting and row interchanges is used to factor sub(*A*) as sub(*A*) = *P***L***U***Q*, where *P* and *Q* are permutation matrices, and *L* and *U* are banded lower and upper triangular matrices, respectively. The matrix *Q* represents reordering of columns for the sake of parallelism, while *P* represents reordering of rows for numerical stability using classic partial pivoting.

Input Parameters

n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*) (*n* ≥ 0).

bwl (global) INTEGER. The number of subdiagonals within the band of *A* (0≤ *bwl* ≤ *n-1*).

bwu (global) INTEGER. The number of superdiagonals within the band of *A* (0≤ *bwu* ≤ *n-1*).

nrhs (global) INTEGER. The number of right hand sides; the number of columns of the distributed submatrix sub(*B*) (*nrhs* ≥ 0).

a, *b* (local)
REAL for psgbsv
DOUBLE PRECISON for pdgbsv
COMPLEX for pcgbsv
DOUBLE COMPLEX for pzgbsv.
Pointers into the local memory to arrays of local dimension *a*(*lld_a*,*LOCc*(*ja*+*n*-1)) and *b*(*lld_b*,*LOCc*(*nrhs*)), respectively.
On entry, the array *a* contains the local pieces of the global array *A*.
On entry, the array *b* contains the right hand side distributed matrix sub(*B*).

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

If *desca*(*dtype_*) = 501, then *dlen_* ≥ 7;

else if *desca*(*dtype_*) = 1, then *dlen_* ≥ 9.

ib (global) INTEGER. The row index in the global array *B* that points to the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

If *descb*(*dtype_*) = 502, then *dlen_* ≥ 7;

else if *descb*(*dtype_*) = 1, then *dlen_* ≥ 9.

work (local)
REAL for psgbsv
DOUBLE PRECISON for pdgbsv
COMPLEX for pcgbsv
DOUBLE COMPLEX for pzgbsv.
Workspace array of dimension (*lwork*).

lwork (local or global) INTEGER. The size of the array *work*, must be at least

lwork ≥ (NB+*bwu*)*(*bwl*+*bwu*)+6*(*bwl*+*bwu*)*(*bwl*+2*bwu*) +
+ max(*nrhs* *(NB+2*bwl*+4*bwu*), 1).

Output Parameters

a	On exit, contains details of the factorization. Note that the resulting factorization is not the same factorization as returned from LAPACK. Additional permutations are performed on the matrix for the sake of parallelism.
b	On exit, this array contains the local pieces of the solution distributed matrix *X*.
ipiv	(local) INTEGER array. The dimension of *ipiv* must be at least *desca*(NB). This array contains pivot indices for local factorizations. You should not alter the contents between factorization and solve.
work(1)	On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info*=0, the execution is successful. *info* < 0: If the *i*th argument is an array and the *j*-th entry had an illegal value, then *info* = -(*i**100+*j*); if the *i*th argument is a scalar and had an illegal value, then *info* = -*i*. *info* > 0: If *info* = k ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not nonsingular, and the factorization was not completed. If *info* = k > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not nonsingular, and the factorization was not completed.

p?dbsv

Solves a general band system of linear equations.

Syntax

```
call psdbsv(n, bwl, bwu, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
call pddbsv(n, bwl, bwu, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
call pcdbsv(n, bwl, bwu, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
call pzdbsv(n, bwl, bwu, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves the system of linear equations

A(1:*n*, *ja*:*ja*+*n*-1)* *X* = *B*(*ib*:*ib*+*n*-1, 1:*nrhs*),

where *A*(1:*n*, *ja*:*ja*+*n*-1) is an *n*-by-*n* real/complex banded diagonally dominant-like distributed matrix with bandwidth *bwl*, *bwu*.

Gaussian elimination without pivoting is used to factor a reordering of the matrix into *LU*.

Input Parameters

n	(global) INTEGER. The order of the distributed submatrix *A*, (*n* ≥ 0).
bwl	(global) INTEGER. Number of subdiagonals. 0 ≤ *bwl* ≤ *n*-1.
bwu	(global) INTEGER. Number of subdiagonals. 0 ≤ *bwu* ≤ *n*-1.
nrhs	(global) INTEGER. The number of right-hand sides; the number of columns of the distributed submatrix *B*, (*nrhs* ≥ 0).
a	(local). REAL for psdbsv DOUBLE PRECISION for pddbsv COMPLEX for pcdbsv DOUBLE COMPLEX for pzdbsv. Pointer into the local memory to an array with first dimension *lld_a* ≥ (*bwl*+*bwu*+1) (stored in *desca*). On entry, this array contains the local pieces of the distributed matrix.
ja	(global) INTEGER. The index in the global array *a* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).
desca	(global and local) INTEGER array of dimension *dlen*. If 1*d* type (*dtype_a*=501 or 502), *dlen* ≥ 7; If 2*d* type (*dtype_a*=1), *dlen* ≥ 9. The array descriptor for the distributed matrix *A*. Contains information of mapping of *A* to memory.
b	(local) REAL for psdbsv DOUBLE PRECISON for pddbsv COMPLEX for pcdbsv DOUBLE COMPLEX for pzdbsv. Pointer into the local memory to an array of local lead dimension *lld_b* ≥ *nb*. On entry, this array contains the local pieces of the right hand sides *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).
ib	(global) INTEGER. The row index in the global array *b* that points to the first row of the matrix to be operated on (which may be either all of *b* or a submatrix of *B*).
descb	(global and local) INTEGER array of dimension *dlen*. If 1*d* type (*dtype_b* =502), *dlen* ≥ 7; If 2*d* type (*dtype_b* =1), *dlen* ≥ 9. The array descriptor for the distributed matrix *B*. Contains information of mapping of *B* to memory.
work	(local). REAL for psdbsv DOUBLE PRECISON for pddbsv COMPLEX for pcdbsv

	DOUBLE COMPLEX for pzdbsv. Temporary workspace. This space may be overwritten in between calls to routines. *work* must be the size given in *lwork*.
lwork	(local or global) INTEGER. Size of user-input workspace *work*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned. *lwork* ≥ *nb*(*bwl*+*bwu*)+6max(*bwl*,*bwu*)*max(*bwl*,*bwu*)+max((max(*bwl*,*bwu*)*nrhs*), max(*bwl*,*bwu*)*max(*bwl*,*bwu*))

Output Parameters

a	On exit, this array contains information containing details of the factorization. Note that permutations are performed on the matrix, so that the factors returned are different from those returned by LAPACK.
b	On exit, this contains the local piece of the solutions distributed matrix *X*.
work	On exit, *work*(1) contains the minimal *lwork*.
info	(local) INTEGER. If *info*=0, the execution is successful. < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. > 0: If *info* = *k* < NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed. If *info* = *k* > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not positive definite, and the factorization was not completed.

p?dtsv

Solves a general tridiagonal system of linear equations.

Syntax

```
call psdtsv(n, nrhs, dl, d, du, ja, desca, b, ib, descb, work, lwork, info)
call pddtsv(n, nrhs, dl, d, du, ja, desca, b, ib, descb, work, lwork, info)
call pcdtsv(n, nrhs, dl, d, du, ja, desca, b, ib, descb, work, lwork, info)
call pzdtsv(n, nrhs, dl, d, du, ja, desca, b, ib, descb, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves a system of linear equations

A(1:*n*, *ja*:*ja*+*n*-1) * *X* = *B*(*ib*:*ib*+*n*-1, 1:*nrhs*),

where *A*(1:*n*, *ja*:*ja*+*n*-1) is an *n*-by-*n* complex tridiagonal diagonally dominant-like distributed matrix.

Gaussian elimination without pivoting is used to factor a reordering of the matrix into *L U*.

Input Parameters

n	(global) INTEGER. The order of the distributed submatrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right hand sides; the number of columns of the distributed matrix *B* (*nrhs* ≥ 0).
dl	(local). REAL for psdtsv DOUBLE PRECISION for pddtsv COMPLEX for pcdtsv DOUBLE COMPLEX for pzdtsv. Pointer to local part of global vector storing the lower diagonal of the matrix. Globally, *dl*(1)is not referenced, and *dl* must be aligned with *d*. Must be of size > *desca*(*nb_*).
d	(local). REAL for psdtsv DOUBLE PRECISION for pddtsv COMPLEX for pcdtsv DOUBLE COMPLEX for pzdtsv. Pointer to local part of global vector storing the main diagonal of the matrix.
du	(local). REAL for psdtsv DOUBLE PRECISION for pddtsv COMPLEX for pcdtsv DOUBLE COMPLEX for pzdtsv. Pointer to local part of global vector storing the upper diagonal of the matrix. Globally, *du*(*n*) is not referenced, and *du* must be aligned with *d*.
ja	(global) INTEGER. The index in the global array *a* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).
desca	(global and local) INTEGER array of dimension *dlen*. If 1*d* type (*dtype_a*=501 or 502), *dlen* ≥ 7; If 2*d* type (*dtype_a*=1), *dlen* ≥ 9. The array descriptor for the distributed matrix *A*. Contains information of mapping of *A* to memory.
b	(local) REAL for psdtsv DOUBLE PRECISONfor pddtsv COMPLEX for pcdtsv DOUBLE COMPLEX for pzdtsv. Pointer into the local memory to an array of local lead dimension *lld_b* > *nb*. On entry, this array contains the local pieces of the right hand sides *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

ib	(global) INTEGER. The row index in the global array *b* that points to the first row of the matrix to be operated on (which may be either all of *b* or a submatrix of *B*).
descb	(global and local) INTEGER array of dimension *dlen*. If 1*d* type (*dtype_b* =502), *dlen* ≥ 7; If 2*d* type (*dtype_b* =1), *dlen* ≥ 9. The array descriptor for the distributed matrix *B*. Contains information of mapping of *B* to memory.
work	(local). REAL for psdtsv DOUBLE PRECISON for pddtsv COMPLEX for pcdtsv DOUBLE COMPLEX for pzdtsv. Temporary workspace. This space may be overwritten in between calls to routines. *work* must be the size given in *lwork*.
lwork	(local or global) INTEGER. Size of user-input workspace *work*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned. *lwork* > (12*NPCOL+3**nb*)+max((10+2*min(100, *nrhs*))*NPCOL+4**nrhs*, 8*NPCOL)

Output Parameters

dl	On exit, this array contains information containing the * factors of the matrix.
d	On exit, this array contains information containing the * factors of the matrix. Must be of size > *desca*(*nb_*).
du	On exit, this array contains information containing the * factors of the matrix. Must be of size > *desca*(*nb_*).
b	On exit, this contains the local piece of the solutions distributed matrix *X*.
work	On exit, *work*(1) contains the minimal *lwork*.
info	(local) INTEGER. If *info*=0, the execution is successful. < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. > 0: If *info* = *k* < NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed. If *info* = *k* > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not positive definite, and the factorization was not completed.

p?posv

Solves a symmetric positive definite system of linear equations.

Syntax

```
call psposv(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pdposv(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pcposv(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
call pzposv(uplo, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the solution to a real/complex system of linear equations

sub(*A*)**X* = sub(*B*),

where sub(*A*) denotes *A*(*ia*:*ia*+*n*-1,*ja*:*ja*+*n*-1) and is an *n*-by-*n* symmetric/Hermitian distributed positive definite matrix and *X* and sub(*B*) denoting *B*(*ib*:*ib*+*n*-1,*jb*:*jb*+*nrhs*-1) are *n*-by-*nrhs* distributed matrices. The Cholesky decomposition is used to factor sub(*A*) as

sub(*A*) = U^T**U*, if *uplo* = 'U', or

sub(*A*) = *L**L^T, if *uplo* = 'L',

where *U* is an upper triangular matrix and *L* is a lower triangular matrix. The factored form of sub(*A*) is then used to solve the system of equations.

Input Parameters

uplo	(global). CHARACTER. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of sub(*A*) is stored.
n	(global) INTEGER. The order of the distributed submatrix sub(*A*) (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns of the distributed submatrix sub(*B*) (*nrhs* ≥ 0).
a	(local) REAL for psposv DOUBLE PRECISION for pdposv COMPLEX for pcposv COMPLEX*16 for pzposv. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* symmetric distributed matrix sub(*A*) to be factored. If *uplo* = '*U*', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced.

	If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the distributed matrix, and its strictly upper triangular part is not referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
b	(local) REAL for psposv DOUBLE PRECISON for pdposv COMPLEX for pcposv COMPLEX*16 for pzposv. Pointer into the local memory to an array of dimension (*lld_b*,*LOC*(*jb*+*nrhs*-1)). On entry, the local pieces of the right hand sides distributed matrix sub(*B*).
ib, *jb*	(global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.
descb	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

Output Parameters

a	On exit, if *info* = 0, this array contains the local pieces of the factor *U* or *L* from the Cholesky factorization sub(*A*) = U^H*U, or $L*L^H$.
b	On exit, if *info* = 0, sub(*B*) is overwritten by the solution distributed matrix *X*.
info	(global) INTEGER. If *info* =0, the execution is successful. If *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* > 0: If *info* = *k*, the leading minor of order *k*, *A*(*ia*:*ia*+*k*-1, *ja*:*ja*+*k*-1) is not positive definite, and the factorization could not be completed, and the solution has not been computed.

p?posvx

Solves a symmetric or Hermitian positive definite system of linear equations.

Syntax

call psposvx(*fact*, *uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *af*, *iaf*, *jaf*, *descaf*, *equed*, *sr*, *sc*, *b*, *ib*, *jb*, *descb*, *x*, *ix*, *jx*, *descx*, *rcond*, *ferr*, *berr*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call pdposvx(*fact*, *uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *af*, *iaf*, *jaf*, *descaf*, *equed*, *sr*, *sc*, *b*, *ib*, *jb*, *descb*, *x*, *ix*, *jx*, *descx*, *rcond*, *ferr*, *berr*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call pcposvx(*fact*, *uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *af*, *iaf*, *jaf*, *descaf*, *equed*, *sr*, *sc*, *b*, *ib*, *jb*, *descb*, *x*, *ix*, *jx*, *descx*, *rcond*, *ferr*, *berr*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call pzposvx(*fact*, *uplo*, *n*, *nrhs*, *a*, *ia*, *ja*, *desca*, *af*, *iaf*, *jaf*, *descaf*, *equed*, *sr*, *sc*, *b*, *ib*, *jb*, *descb*, *x*, *ix*, *jx*, *descx*, *rcond*, *ferr*, *berr*, *work*, *lwork*, *iwork*, *liwork*, *info*)

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine uses the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ to compute the solution to a real or complex system of linear equations

A(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1)*X = *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*nrhs*-1),

where *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) is a *n*-by-*n* matrix and *X* and *B*(*ib*:*ib*+*n*-1,*jb*:*jb*+*nrhs*-1) are *n*-by-*nrhs* matrices.

Error bounds on the solution and a condition estimate are also provided.

In the following comments *y* denotes *Y*(*iy*:*iy*+*m*-1, *jy*:*jy*+*k*-1) a *m*-by-*k* matrix where *y* can be *a*, *af*, *b* and *x*.

The routine p?posvx performs the following steps:

1. If *fact* = 'E', real scaling factors *s* are computed to equilibrate the system:

   diag(*sr*)*A*diag(*sc*)*inv(diag(*sc*))*X = diag(*sr*)*B

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by diag(*sr*)*A*diag(*sc*) and *B* by diag(*sr*)*B .
2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   $A = U^T*U$, if *uplo* = 'U', or

   $A = L*L^T$, if *uplo* = 'L',

   where *U* is an upper triangular matrix and *L* is a lower triangular matrix.
3. The factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, steps 4-6 are skipped
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by diag(*sr*) so that it solves the original system before equilibration.

Input Parameters

fact (global) CHARACTER. Must be 'F', 'N', or 'E'.

	Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored. If *fact* = 'F': on entry, *af* contains the factored form of *A*. If *equed* = 'Y', the matrix *A* has been equilibrated with scaling factors given by *s*. *a* and *af* will not be modified. If *fact* = 'N', the matrix *A* will be copied to *af* and factored. If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *af* and factored.
uplo	(global) CHARACTER. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored.
n	(global) INTEGER. The order of the distributed submatrix sub(*A*) (*n* ≥ 0).
nrhs	(global) INTEGER. The number of right-hand sides; the number of columns of the distributed submatrices *B* and *X*. (*nrhs* ≥ 0).
a	(local) REAL for psposvx DOUBLE PRECISION for pdposvx COMPLEX for pcposvx DOUBLE COMPLEX for pzposvx. Pointer into the local memory to an array of local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the symmetric/Hermitian matrix *A*, except if *fact* = 'F' and *equed* = 'Y', then *A* must contain the equilibrated matrix diag(*sr*)*A*diag(*sc*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *A* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *A* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced. *A* is not modified if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N' on exit.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
af	(local) REAL for psposvx DOUBLE PRECISION for pdposvx COMPLEX for pcposvx DOUBLE COMPLEX for pzposvx. Pointer into the local memory to an array of local dimension (*lld_af*, *LOCc*(*ja*+*n*-1)).

If *fact* = 'F', then *af* is an input argument and on entry contains the triangular factor *U* or *L* from the Cholesky factorization $A = U^T*U$ or $A = L*L^T$, in the same storage format as *A*. If *equed* ≠ 'N', then *af* is the factored form of the equilibrated matrix diag(*sr*)*A*diag(*sc*).

iaf, *jaf* — (global) INTEGER. The row and column indices in the global array *af* indicating the first row and the first column of the submatrix *AF*, respectively.

descaf — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *AF*.

equed — (global). CHARACTER. Must be 'N' or 'Y'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N');
If *equed* = 'Y', equilibration was done and *A* has been replaced by diag(*sr*)*A*diag(*sc*).

sr — (local)
REAL for psposvx
DOUBLE PRECISION for pdposvx
COMPLEX for pcposvx
DOUBLE COMPLEX for pzposvx.
Array, DIMENSION (*lld_a*).
The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

b — (local)
REAL for psposvx
DOUBLE PRECISION for pdposvx
COMPLEX for pcposvx
DOUBLE COMPLEX for pzposvx.
Pointer into the local memory to an array of local dimension (*lld_b*, *LOCc*(*jb*+*nrhs*-1)). On entry, the *n*-by-*nrhs* right-hand side matrix *B*.

ib, *jb* — (global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.

descb — (global and local) INTEGER. Array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

x — (local)
REAL for psposvx
DOUBLE PRECISION for pdposvx
COMPLEX for pcposvx
DOUBLE COMPLEX for pzposvx.

	Pointer into the local memory to an array of local dimension (*lld_x*, *LOCc*(*jx*+*nrhs*-1)).
ix, *jx*	(global) INTEGER. The row and column indices in the global array *x* indicating the first row and the first column of the submatrix *X*, respectively.
descx	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *X*.
work	(local) REAL for psposvx DOUBLE PRECISION for pdposvx COMPLEX for pcposvx DOUBLE COMPLEX for pzposvx. Workspace array, DIMENSION (*lwork*).
lwork	(local or global) INTEGER. The dimension of the array *work*. *lwork* is local input and must be at least *lwork* = max(p?pocon(*lwork*), p?porfs(*lwork*)) + *LOCr*(*n_a*). *lwork* = 3**desca*(*lld_*). If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.
iwork	(local) INTEGER. Workspace array, dimension (*liwork*).
liwork	(local or global) INTEGER. The dimension of the array *iwork*. *liwork* is local input and must be at least *liwork* = *desca*(*lld_*) *liwork* = *LOCr*(*n_a*). If *liwork* = -1, then *liwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a	On exit, if *fact* = 'E' and *equed* = 'Y', *a* is overwritten by diag(*sr*)**a**diag(*sc*).
af	If *fact* = 'N', then *af* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization *A* = U^T**U* or *A* = *L***L*^{T} of the original matrix *A*. If *fact* = 'E', then *af* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization *A* = U^T**U* or *A* = *L***L*^{T} of the equilibrated matrix *A* (see the description of *A* for the form of the equilibrated matrix).

equed
If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

sr
This array is an output argument if *fact* ≠ 'F'.
See the description of *sr* in *Input Arguments* section.

sc
This array is an output argument if *fact* ≠ 'F'.
See the description of *sc* in *Input Arguments* section.

b
On exit, if *equed* = 'N', *b* is not modified; if *trans* = 'N' and *equed* = 'R' or 'B', *b* is overwritten by diag(*r*)**b*; if *trans* = 'T' or 'C' and *equed* = 'C' or 'B', *b* is overwritten by diag(*c*)**b*.

x
(local)
REAL for psposvx
DOUBLE PRECISION for pdposvx
COMPLEX for pcposvx
DOUBLE COMPLEX for pzposvx.
If *info* = 0 the *n*-by-*nrhs* solution matrix *X* to the original system of equations.
Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is
inv(diag(*sc*))**X* if *trans* = 'N' and *equed* = 'C' or 'B', or
inv(diag(*sr*))**X* if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'.

rcond
(global)
REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond*=0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr
REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(*LOC*,*n_b*). The estimated forward error bounds for each solution vector *X*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution, *ferr*(*j*) bounds the magnitude of the largest entry in (*X*(*j*) - *xtrue*) divided by the magnitude of the largest entry in *X*(*j*). The quality of the error bound depends on the quality of the estimate of norm(inv(*A*)) computed in the code; if the estimate of norm(inv(*A*)) is accurate, the error bound is guaranteed.

berr
(local)
REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(*LOC*,*n_b*). The componentwise relative backward error of each solution vector *X*(*j*) (the smallest relative change in any entry of *A* or *B* that makes *X*(*j*) an exact solution).

work(1)	(local) On exit, *work*(1) returns the minimal and optimal *liwork*.
info	(global) INTEGER. If *info*=0, the execution is successful. < 0: if *info* = -*i*, the *i*-th argument had an illegal value > 0: if *info* = *i*, and *i* is ≤ *n*: if *info* = *i*, the leading minor of order *i* of *a* is not positive definite, so the factorization could not be completed, and the solution and error bounds could not be computed. = *n*+1: *rcond* is less than machine precision. The factorization has been completed, but the matrix is singular to working precision, and the solution and error bounds have not been computed.

p?pbsv

Solves a symmetric/Hermitian positive definite banded system of linear equations.

Syntax

```
call pspbsv(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
call pdpbsv(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
call pcpbsv(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
call pzpbsv(uplo, n, bw, nrhs, a, ja, desca, b, ib, descb, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves a system of linear equations

A(1:*n*, *ja*:*ja*+*n*-1)***X* = *B*(*ib*:*ib*+*n*-1, 1:*nrhs*),

where *A*(1:*n*, *ja*:*ja*+*n*-1) is an *n*-by-*n* real/complex banded symmetric positive definite distributed matrix with bandwidth *bw*.

Cholesky factorization is used to factor a reordering of the matrix into *L*L'*.

Input Parameters

uplo	(global) CHARACTER. Must be 'U' or 'L'. Indicates whether the upper or lower triangular of *A* is stored. If *uplo* = 'U', the upper triangular *A* is stored If *uplo* = 'L', the lower triangular of *A* is stored.
n	(global) INTEGER. The order of the distributed matrix *A* (*n* ≥ 0).
bw	(global) INTEGER. The number of subdiagonals in *L* or *U*. 0 ≤ *bw* ≤ *n*-1.
nrhs	(global) INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a	(local). REAL for pspbsv

DOUBLE PRECISON for pdpbsv
COMPLEX for pcpbsv
DOUBLE COMPLEX for pzpbsv.
Pointer into the local memory to an array with first dimension *lld_a* ≥ (*bw*+1) (stored in *desca*). On entry, this array contains the local pieces of the distributed matrix sub(*A*) to be factored.

ja (global) INTEGER. The index in the global array *a* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.

b (local)
REAL for pspbsv
DOUBLE PRECISON for pdpbsv
COMPLEX for pcpbsv
DOUBLE COMPLEX for pzpbsv.
Pointer into the local memory to an array of local lead dimension *lld_b* ≥ *nb*. On entry, this array contains the local pieces of the right hand sides *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

ib (global) INTEGER. The row index in the global array *b* that points to the first row of the matrix to be operated on (which may be either all of *b* or a submatrix of *B*).

descb (global and local) INTEGER array of dimension *dlen*.

If 1D type (*dtype_b* =502), *dlen* ≥ 7;

If 2D type (*dtype_b* =1), *dlen* ≥ 9.
The array descriptor for the distributed matrix *B*.
Contains information of mapping of *B* to memory.

work (local).
REAL for pspbsv
DOUBLE PRECISON for pdpbsv
COMPLEX for pcpbsv
DOUBLE COMPLEX for pzpbsv.
Temporary workspace. This space may be overwritten in between calls to routines. *work* must be the size given in *lwork*.

lwork (local or global) INTEGER. Size of user-input workspace *work*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1)and an error code is returned. *lwork* ≥ (*nb*+2***bw*)***bw* +max((*bw***nrhs*), *bw***bw*)

Output Parameters

a On exit, this array contains information containing details of the factorization. Note that permutations are performed on the matrix, so that the factors returned are different from those returned by LAPACK.

b	On exit, contains the local piece of the solutions distributed matrix *X*.
work	On exit, *work*(1) contains the minimal *lwork*.
info	(global). INTEGER. If *info*=0, the execution is successful. < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. > 0: If *info* = *k* ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed. If *info* = *k* > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not positive definite, and the factorization was not completed.

p?ptsv

Solves a symmetric or Hermitian positive definite tridiagonal system of linear equations.

Syntax

```
call psptsv(n, nrhs, d, e, ja, desca, b, ib, descb, work, lwork, info)
call pdptsv(n, nrhs, d, e, ja, desca, b, ib, descb, work, lwork, info)
call pcptsv(n, nrhs, d, e, ja, desca, b, ib, descb, work, lwork, info)
call pzptsv(n, nrhs, d, e, ja, desca, b, ib, descb, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves a system of linear equations

A(1:*n*, *ja*:*ja*+*n*-1)**X* = *B*(*ib*:*ib*+*n*-1, 1:*nrhs*),

where *A*(1:*n*, *ja*:*ja*+*n*-1) is an *n*-by-*n* real tridiagonal symmetric positive definite distributed matrix.

Cholesky factorization is used to factor a reordering of the matrix into *L***L*'.

Input Parameters

n	(global) INTEGER. The order of matrix *A* (*n* ≥ 0).
nrhs	(global) INTEGER. The number of right-hand sides; the number of columns of the distributed submatrix *B* (*nrhs* ≥ 0).
d	(local) REAL for psptsv DOUBLE PRECISON for pdptsv COMPLEX for pcptsv DOUBLE COMPLEX for pzptsv.

Pointer to local part of global vector storing the main diagonal of the matrix.

e (local)
REAL for psptsv
DOUBLE PRECISON for pdptsv
COMPLEX for pcptsv
DOUBLE COMPLEX for pzptsv.
Pointer to local part of global vector storing the upper diagonal of the matrix. Globally, *du*(n) is not referenced, and *du* must be aligned with *d*.

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array of dimension *dlen*.

If 1*d* type (*dtype_a*=501 or 502), *dlen* ≥ 7;

If 2*d* type (*dtype_a*=1), *dlen* ≥ 9.
The array descriptor for the distributed matrix *A*.
Contains information of mapping of *A* to memory.

b (local)
REAL for psptsv
DOUBLE PRECISON for pdptsv
COMPLEX for pcptsv
DOUBLE COMPLEX for pzptsv.
Pointer into the local memory to an array of local lead dimension *lld_b* ≥ *nb*.
On entry, this array contains the local pieces of the right hand sides *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

ib (global) INTEGER. The row index in the global array *b* that points to the first row of the matrix to be operated on (which may be either all of *b* or a submatrix of *B*).

descb (global and local) INTEGER array of dimension *dlen*.

If 1*d* type (*dtype_b* = 502), *dlen* ≥ 7;

If 2*d* type (*dtype_b* = 1), *dlen* ≥ 9.
The array descriptor for the distributed matrix *B*.
Contains information of mapping of *B* to memory.

work (local).
REAL for psptsv
DOUBLE PRECISON for pdptsv
COMPLEX for pcptsv
DOUBLE COMPLEX for pzptsv.
Temporary workspace. This space may be overwritten in between calls to routines. *work* must be the size given in *lwork*.

lwork	(local or global) INTEGER. Size of user-input workspace *work*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned. *lwork* > (12*NPCOL+3**nb*)+max((10+2*min(100, *nrhs*))*NPCOL+4**nrhs*, 8*NPCOL).

Output Parameters

d	On exit, this array contains information containing the factors of the matrix. Must be of size greater than or equal to *desca*(*nb_*).
e	On exit, this array contains information containing the factors of the matrix. Must be of size greater than or equal to *desca*(*nb_*).
b	On exit, this contains the local piece of the solutions distributed matrix *X*.
work	On exit, *work*(1) contains the minimal *lwork*.
info	(local) INTEGER. If *info*=0, the execution is successful. < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. > 0: If *info* = *k* ≤ NPROCS, the submatrix stored on processor *info* and factored locally was not positive definite, and the factorization was not completed. If *info* = *k* > NPROCS, the submatrix stored on processor *info*-NPROCS representing interactions with other processors was not positive definite, and the factorization was not completed.

p?gels

Solves overdetermined or underdetermined linear systems involving a matrix of full rank.

Syntax

```
call psgels(trans, m, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, work, lwork, info)
call pdgels(trans, m, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, work, lwork, info)
call pcgels(trans, m, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, work, lwork, info)
call pzgels(trans, m, n, nrhs, a, ia, ja, desca, b, ib, jb, descb, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves overdetermined or underdetermined real/ complex linear systems involving an *m*-by-*n* matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1), or its transpose/ conjugate-transpose, using a *QTQ* or *LQ* factorization of sub(*A*). It is assumed that sub(*A*) has full rank.

The following options are provided:

1. If *trans* = 'N' and *m* ≥ *n*: find the least squares solution of an overdetermined system, that is, solve the least squares problem

   minimize ||sub(*B*) - sub(*A*)*X||

2. If *trans* = 'N' and *m* < *n*: find the minimum norm solution of an underdetermined system sub(*A*)*X = sub(*B*).

3. If *trans* = 'T' and *m* ≥ *n*: find the minimum norm solution of an undetermined system $\text{sub}(A)^T*X = \text{sub}(B)$.

4. If *trans* = 'T' and *m* < *n*: find the least squares solution of an overdetermined system, that is, solve the least squares problem

   minimize $||\text{sub}(B) - \text{sub}(A)^T*X||$,

   where sub(*B*) denotes *B*(*ib*:*ib*+*m*-1, *jb*:*jb*+*nrhs*-1) when *trans* = 'N' and *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*nrhs*-1) otherwise. Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; when *trans* = 'N', the solution vectors are stored as the columns of the *n*-by-*nrhs* right hand side matrix sub(*B*) and the *m*-by-*nrhs* right hand side matrix sub(*B*) otherwise.

Input Parameters

trans	(global) CHARACTER. Must be 'N', or 'T'. If *trans* = 'N', the linear system involves matrix sub(*A*); If *trans* = 'T', the linear system involves the transposed matrix A^T (for real flavors only).
m	(global) INTEGER. The number of rows in the distributed submatrix sub (*A*) (*m* ≥ 0).
n	(global) INTEGER. The number of columns in the distributed submatrix sub (*A*) (*n* ≥ 0).
nrhs	(global) INTEGER. The number of right-hand sides; the number of columns in the distributed submatrices sub(*B*) and *X*. (*nrhs* ≥ 0).
a	(local) REAL for psgels DOUBLE PRECISION for pdgels COMPLEX for pcgels DOUBLE COMPLEX for pzgels. Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, contains the *m*-by-*n* matrix *A*.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
b	(local) REAL for psgels DOUBLE PRECISION for pdgels

COMPLEX for pcgels
DOUBLE COMPLEX for pzgels.
Pointer into the local memory to an array of local dimension (*lld_b*, *LOCc*(*jb*+*nrhs*-1)). On entry, this array contains the local pieces of the distributed matrix *B* of right-hand side vectors, stored columnwise; sub(*B*) is *m*-by-*nrhs* if *trans*='N', and *n*-by-*nrhs* otherwise.

ib, *jb* — (global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.

descb — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*.

work — (local)
REAL for psgels
DOUBLE PRECISION for pdgels
COMPLEX for pcgels
DOUBLE COMPLEX for pzgels.
Workspace array with dimension *lwork*.

lwork — (local or global) INTEGER.
The dimension of the array *work* *lwork* is local input and must be at least *lwork* ≥ *ltau* + max(*lwf*, *lws*), where if *m* > *n*, then
ltau = numroc(*ja*+min(*m*,*n*)-1, *nb_a*, MYCOL, *csrc_a*, NPCOL),
lwf = *nb_a**(*mpa*0 + *nqa*0 + *nb_a*)
lws = max((*nb_a**(*nb_a*-1))/2, (*nrhsqb*0 + *mpb*0)**nb_a*) + *nb_a***nb_a*
else
ltau = numroc(*ia*+min(*m*,*n*)-1, *mb_a*, MYROW, *rsrc_a*, NPROW),
lwf = *mb_a* * (*mpa*0 + *nqa*0 + *mb_a*)
lws = max((*mb_a**(*mb_a*-1))/2, (*npb*0 + max(*nqa*0 + numroc(numroc(*n*+*iroffb*, *mb_a*, 0, 0, NPROW), *mb_a*, 0, 0, *lcmp*), *nrhsqb*0))**mb_a*) + *mb_a***mb_a*
end if,
where *lcmp* = *lcm*/NPROW with *lcm* = ilcm(NPROW, NPCOL),
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, MYROW, *rsrc_a*, NPROW),
iacol= indxg2p(*ja*, *nb_a*, MYROW, *rsrc_a*, NPROW)
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, MYROW, *iarow*, NPROW),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, MYCOL, *iacol*, NPCOL),
iroffb = mod(*ib*-1, *mb_b*),
icoffb = mod(*jb*-1, *nb_b*),
ibrow = indxg2p(*ib*, *mb_b*, MYROW, *rsrc_b*, NPROW),
ibcol = indxg2p(*jb*, *nb_b*, MYCOL, *csrc_b*, NPCOL),
*mpb*0 = numroc(*m*+*iroffb*, *mb_b*, MYROW, *icrow*, NPROW),
*nqb*0 = numroc(*n*+*icoffb*, *nb_b*, MYCOL, *ibcol*, NPCOL),

ilcm, indxg2p and numroc are ScaLAPACK tool functions; MYROW, MYCOL, NPROW, and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — On exit, If $m \geq n$, sub(*A*) is overwritten by the details of its *QR* factorization as returned by p?geqrf; if $m < n$, sub(*A*) is overwritten by details of its *LQ* factorization as returned by p?gelqf.

b — On exit, sub(*B*) is overwritten by the solution vectors, stored columnwise: if *trans* = 'N' and $m \geq n$, rows 1 to *n* of sub(*B*) contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements *n*+1 to *m* in that column;
If *trans* = 'N' and $m < n$, rows 1 to *n* of sub(*B*) contain the minimum norm solution vectors;
If *trans* = 'T' and $m \geq n$, rows 1 to *m* of sub(*B*) contain the minimum norm solution vectors; if *trans* = 'T' and $m < n$, rows 1 to *m* of sub(*B*) contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements *m*+1 to *n* in that column.

work(1) — On exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — (global) INTEGER.
= 0: the execution is successful.
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i** 100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?syev

Computes selected eigenvalues and eigenvectors of a symmetric matrix.

Syntax

```
call pssyev( jobz, uplo, n, a, ia, ja, desca, w, z, iz, jz, descz, work, lwork, info )
call pdsyev( jobz, uplo, n, a, ia, ja, desca, w, z, iz, jz, descz, work, lwork, info )
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* by calling the recommended sequence of ScaLAPACK routines.

In its present form, the routine assumes a homogeneous system and makes no checks for consistency of the eigenvalues or eigenvectors across the different processes. Because of this, it is possible that a heterogeneous system may return incorrect results without any error messages.

Input Parameters

np = the number of rows local to a given process.

nq = the number of columns local to a given process.

jobz	(global). CHARACTER. Must be 'N' or 'V'. Specifies if it is necessary to compute the eigenvectors: If *jobz* ='N', then only eigenvalues are computed. If *jobz* ='V', then eigenvalues and eigenvectors are computed.
uplo	(global). CHARACTER. Must be 'U' or 'L'. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored: If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	(global) INTEGER. The number of rows and columns of the matrix *A* (*n* ≥ 0).
a	(local) REAL for pssyev. DOUBLE PRECISION for pdsyev. Block cyclic array of global dimension (*n*, *n*) and local dimension (*lld_a*, *LOC c*(*ja*+*n*-1)). On entry, the symmetric matrix *A*. If *uplo* = 'U', only the upper triangular part of *A* is used to define the elements of the symmetric matrix. If *uplo* = 'L', only the lower triangular part of *A* is used to define the elements of the symmetric matrix.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
iz, *jz*	(global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.
descz	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *Z*.
work	(local) REAL for pssyev. DOUBLE PRECISION for pdsyev. Array, DIMENSION (*lwork*).
lwork	(local) INTEGER. See below for definitions of variables used to define *lwork*.

If no eigenvectors are requested (*jobz* = 'N'), then *lwork* ≥ 5*n + *sizesytrd* + 1,
where *sizesytrd* is the workspace for p?sytrd and is max(NB*(*np* +1), 3*NB).
If eigenvectors are requested (*jobz* = 'V') then the amount of workspace required to guarantee that all eigenvectors are computed is:
qrmem = 2*n-2
lwmin = 5*n + n*ldc + max(*sizemqrleft*, *qrmem*) + 1
Variable definitions:
nb = *desca*(*mb_*) = *desca*(*nb_*) = *descz*(*mb_*) = *descz*(*nb_*);
nn = max(*n*, *nb*, 2);
desca(*rsrc_*) = *desca*(*rsrc_*) = *descz*(*rsrc_*) = *descz*(*csrc_*) = 0
np = numroc(*nn*, *nb*, 0, 0, NPROW)
nq = numroc(max(*n*, *nb*, 2), *nb*, 0, 0, NPCOL)
nrc = numroc(*n*, *nb*, *myprowc*, 0, NPROCS)
ldc = max(1, *nrc*)
sizemqrleft is the workspace for p?ormtr when its *side* argument is 'L'.
myprowc is defined when a new context is created as follows:
call blacs_get(*desca*(*ctxt_*), 0, *contextc*)
call blacs_gridinit(*contextc*, 'R', NPROCS, 1)
call blacs_gridinfo(*contextc*, *nprowc*, *npcolc*, *myprowc*, *mypcolc*)
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — On exit, the lower triangle (if *uplo*='L') or the upper triangle (if *uplo*='U') of *A*, including the diagonal, is destroyed.

w — (global). REAL for pssyev
DOUBLE PRECISION for pdsyev
Array, DIMENSION (*n*).
On normal exit, the first *m* entries contain the selected eigenvalues in ascending order.

z — (local). REAL for pssyev
DOUBLE PRECISION for pdsyev
Array, global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)). If *jobz* = 'V', then on normal exit the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix corresponding to the selected eigenvalues.
If *jobz* = 'N', then *z* is not referenced.

work(1)	On output, *work*(1) returns the workspace needed to guarantee completion. If the input parameters are incorrect, *work*(1) may also be incorrect. If *jobz* = 'N' *work*(1) = minimal (optimal) amount of workspace If *jobz* = 'V' *work*(1) = minimal workspace required to generate all the eigenvectors.
info	(global) INTEGER. If *info* = 0, the execution is successful. If *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* > 0: If *info*= 1 through *n*, the *i*-th eigenvalue did not converge in ?steqr2 after a total of 30*n* iterations. If *info*= *n*+1, then p?syev has detected heterogeneity by finding that eigenvalues were not identical across the process grid. In this case, the accuracy of the results from p?syev cannot be guaranteed.

p?syevd

Computes all eigenvalues and eigenvectors of a real symmetric matrix by using a divide and conquer algorithm.

Syntax

```
call pssyevd(jobz, uplo, n, a, ia, ja, desca, w, z, iz, jz, descz, work, lwork, iwork, liwork, info)
```

```
call pdsyevd(jobz, uplo, n, a, ia, ja, desca, w, z, iz, jz, descz, work, lwork, iwork, liwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h.

The p?syevd routine computes all eigenvalues and eigenvectors of a real symmetric matrix *A* by using a divide and conquer algorithm.

Input Parameters

np = the number of rows local to a given process.

nq = the number of columns local to a given process.

jobz	(global). CHARACTER*1. Must be 'N' or 'V'. Specifies if it is necessary to compute the eigenvectors: If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	(global). CHARACTER*1. Must be 'U' or 'L'.

	Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored: If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	(global) INTEGER. The number of rows and columns of the matrix *A* (*n* ≥ 0).
a	(local). REAL for pssyevd DOUBLE PRECISION for pdsyevd. Block cyclic array of global dimension (*n*, *n*) and local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the symmetric matrix *A*. If *uplo* = 'U', only the upper triangular part of *A* is used to define the elements of the symmetric matrix. If *uplo* = 'L', only the lower triangular part of *A* is used to define the elements of the symmetric matrix.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*ctxt_*) is incorrect, p?syevd cannot guarantee correct error reporting.
iz, *jz*	(global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.
descz	(global and local) INTEGER array, dimension *dlen_*. The array descriptor for the distributed matrix *Z*. *descz*(*ctxt_*) must equal *desca*(*ctxt_*).
work	(local). REAL for pssyevd DOUBLE PRECISION for pdsyevd. Array, DIMENSION *lwork*.
lwork	(local). INTEGER. The dimension of the array *work*. If eigenvalues are requested: *lwork* ≥ max(1+6*n* + 2*np***nq*, *trilwmin*) + 2*n* with *trilwmin* = 3*n* + max(*nb**(*np* + 1), 3**nb*) *np* = numroc(*n*, *nb*, *myrow*, *iarow*, NPROW) *nq* = numroc(*n*, *nb*, *mycol*, *iacol*, NPCOL) If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. The required workspace is returned as the first element of the corresponding work arrays, and no error message is issued by pxerbla.
iwork	(local) INTEGER. Workspace array, dimension *liwork*.
liwork	(local) INTEGER, dimension of *iwork*. *liwork* = 7**n* + 8**npcol* + 2.

Output Parameters

a	On exit, the lower triangle (if *uplo* = 'L'), or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
w	(global). REAL for pssyevd DOUBLE PRECISION for pdsyevd. Array, DIMENSION *n*. If *info* = 0, *w* contains the eigenvalues in the ascending order.
z	(local). REAL for pssyevd DOUBLE PRECISION for pdsyevd. Array, global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)). The *z* parameter contains the orthonormal eigenvectors of the matrix *A*.
work(1)	On exit, returns adequate workspace to allow optimal performance.
iwork(1)	(local). On exit, if *liwork* > 0, *iwork*(1) returns the optimal *liwork*.
info	(global) INTEGER. If *info* = 0, the execution is successful. If *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*). If the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* > 0: The algorithm failed to compute the *info*/(*n*+1)-th eigenvalue while working on the submatrix lying in global rows and columns mod(*info*,*n*+1).

p?syevx

Computes selected eigenvalues and, optionally, eigenvectors of a symmetric matrix.

Syntax

call pssyevx(*jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

call pdsyevx(*jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* by calling the recommended sequence of ScaLAPACK routines. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

np = the number of rows local to a given process.

nq = the number of columns local to a given process.

jobz	(global). CHARACTER*1. Must be 'N' or 'V'. Specifies if it is necessary to compute the eigenvectors: If *jobz* ='N', then only eigenvalues are computed. If *jobz* ='V', then eigenvalues and eigenvectors are computed.
range	(global). CHARACTER*1. Must be 'A', 'V', or 'I'. If *range* = 'A', all eigenvalues will be found. If *range* = 'V', all eigenvalues in the half-open interval [*vl*, *vu*] will be found. If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.
uplo	(global). CHARACTER*1. Must be 'U' or 'L'. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is stored: If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	(global) INTEGER. The number of rows and columns of the matrix *A* (*n* ≥ 0).
a	(local). REAL for pssyevx DOUBLE PRECISION for pdsyevx. Block cyclic array of global dimension (*n*, *n*) and local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the symmetric matrix *A*. If *uplo* = 'U', only the upper triangular part of *A* is used to define the elements of the symmetric matrix. If *uplo* = 'L', only the lower triangular part of *A* is used to define the elements of the symmetric matrix.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*.
vl, *vu*	(global) REAL for pssyevx DOUBLE PRECISION for pdsyevx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues; *vl* ≤ *vu*. Not referenced if *range* = 'A' or 'I'.
il, *iu*	(global) INTEGER.

If *range* ='I', the indices of the smallest and largest eigenvalues to be returned.

Constraints: *il* ≥ 1

min(*il*,*n*) ≤ *iu* ≤ *n*

Not referenced if *range* = 'A' or 'V'.

abstol (global). REAL for pssyevx
DOUBLE PRECISION for pdsyevx.
If *jobz*='V', setting *abstol* to p?lamch(*context*, 'U') yields the most orthogonal eigenvectors.
The absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [*a*, *b*] of width less than or equal to
abstol + *eps* * max(|*a*|,|*b*|),
where *eps* is the machine precision. If *abstol* is less than or equal to zero, then *eps**norm(T) will be used in its place, where norm(T) is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form.
Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*p?lamch('S') not zero. If this routine returns with ((mod(*info*,2).*ne*.0).*or*. * (mod(*info*/8,2).*ne*.0)), indicating that some eigenvalues or eigenvectors did not converge, try setting *abstol* to 2*p?lamch('S').

orfac (global). REAL for pssyevx
DOUBLE PRECISION for pdsyevx.
Specifies which eigenvectors should be reorthogonalized. Eigenvectors that correspond to eigenvalues which are within *tol*=*orfac**norm(*A*)of each other are to be reorthogonalized. However, if the workspace is insufficient (see *lwork*), *tol* may be decreased until all eigenvectors to be reorthogonalized can be stored in one process. No reorthogonalization will be done if *orfac* equals zero. A default value of 1.0e-3 is used if *orfac* is negative. *orfac* should be identical on all processes.

iz, *jz* (global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.

descz (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *Z*.*descz*(*ctxt_*) must equal *desca*(*ctxt_*).

work (local)
REAL for pssyevx.
DOUBLE PRECISION for pdsyevx.
Array, DIMENSION (*lwork*).

lwork (local) INTEGER. The dimension of the array *work*.
See below for definitions of variables used to define *lwork*.

If no eigenvectors are requested (*jobz* = 'N'), then *lwork* ≥ 5*n + max(5*nn, NB*(np0 + 1)).
If eigenvectors are requested (*jobz* = 'V'), then the amount of workspace required to guarantee that all eigenvectors are computed is:

lwork ≥ 5*n + max(5*nn, np0*mq0 + 2*NB*NB) + iceil(neig, NPROW*NPCOL)*nn

The computed eigenvectors may not be orthogonal if the minimal workspace is supplied and *orfac* is too small. If you want to guarantee orthogonality (at the cost of potentially poor performance) you should add the following to *lwork*:
(*clustersize*-1)*n,
where *clustersize* is the number of eigenvalues in the largest cluster, where a cluster is defined as a set of close eigenvalues:

{w(k),..., w(k+clustersize-1)| w(j+1) ≤ w(j)) + orfac*2*norm(A)},

where
neig = number of eigenvectors requested
nb = *desca*(*mb_*) = *desca*(*nb_*) = *descz*(*mb_*) = *descz*(*nb_*);
nn = max(*n*, *nb*, 2);
desca(*rsrc_*) = *desca*(*nb_*) = *descz*(*rsrc_*) = *descz*(*csrc_*) = 0;
*np*0 = numroc(*nn*, *nb*, 0, 0, NPROW);
*mq*0 = numroc(max(*neig*, *nb*, 2), *nb*, 0, 0, NPCOL)
iceil(*x*, *y*) is a ScaLAPACK function returning ceiling(*x*/*y*)
If *lwork* is too small to guarantee orthogonality, p?syevx attempts to maintain orthogonality in the clusters with the smallest spacing between the eigenvalues.
If *lwork* is too small to compute all the eigenvectors requested, no computation is performed and *info*= -23 is returned.
Note that when *range*='V', number of requested eigenvectors are not known until the eigenvalues are computed. In this case and if *lwork* is large enough to compute the eigenvalues, p?sygvx computes the eigenvalues and as many eigenvectors as possible.
Relationship between workspace, orthogonality & performance:
Greater performance can be achieved if adequate workspace is provided. In some situations, performance can decrease as the provided workspace increases above the workspace amount shown below:

lwork ≥ max(*lwork*, 5*n + *nsytrd_lwopt*),

where *lwork*, as defined previously, depends upon the number of eigenvectors requested, and
nsytrd_lwopt = *n* + 2*(*anb*+1)*(4**nps*+2) + (*nps* + 3)**nps;*
anb = pjlaenv(*desca*(*ctxt_*), 3, 'p?syttrd', 'L', 0, 0, 0, 0);
sqnpc = int(*sqrt*(*dble*(NPROW * NPCOL)));
nps = max(numroc(*n*, 1, 0, 0, *sqnpc*), 2**anb*);

numroc is a ScaLAPACK tool functions;
pjlaenv is a ScaLAPACK environmental inquiry function
MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
For large n, no extra workspace is needed, however the biggest boost in performance comes for small n, so it is wise to provide the extra workspace (typically less than a megabyte per process).
If *clustersize* > *n*/*sqrt*(NPROW*NPCOL), then providing enough space to compute all the eigenvectors orthogonally will cause serious degradation in performance. At the limit (that is, *clustersize* = *n*-1) p?stein will perform no better than ?stein on single processor.
For *clustersize* = *n*/*sqrt*(NPROW*NPCOL) reorthogonalizing all eigenvectors will increase the total execution time by a factor of 2 or more.
For *clustersize* > *n*/*sqrt*(NPROW*NPCOL) execution time will grow as the square of the cluster size, all other factors remaining equal and assuming enough workspace. Less workspace means less reorthogonalization but faster execution.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. Each of these values is returned in the first entry of the corresponding work arrays, and no error message is issued by pxerbla.

iwork (local) INTEGER. Workspace array.

liwork (local) INTEGER, dimension of *iwork*. *liwork* ≥ 6**nnp*
Where: *nnp* = max(*n*, NPROW*NPCOL + 1, 4)
If *liwork* = -1, then *liwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U')of *A*, including the diagonal, is overwritten.

m (global) INTEGER. The total number of eigenvalues found; 0 ≤ *m* ≤ *n*.

nz (global) INTEGER. Total number of eigenvectors computed. 0 ≤ *nz* ≤ *m*.
The number of columns of *z* that are filled.
If *jobz* ≠ 'V', *nz* is not referenced.
If *jobz* = 'V', *nz* = *m* unless the user supplies insufficient space and p?syevx is not able to detect this before beginning computation. To get all the eigenvectors requested, the user must supply both sufficient

space to hold the eigenvectors in *z* (*m*.*le*.*descz*(*n_*)) and sufficient workspace to compute them. (See *lwork*). p?syevx is always able to detect insufficient space without computation unless *range*.*eq*.'V'.

w (global). REAL for pssyevx
DOUBLE PRECISION for pdsyevx.
Array, DIMENSION (*n*). The first *m* elements contain the selected eigenvalues in ascending order.

z (local). REAL for pssyevx
DOUBLE PRECISION for pdsyevx.
Array, global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)).
If *jobz* = 'V', then on normal exit the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix corresponding to the selected eigenvalues. If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
If *jobz* = 'N', then *z* is not referenced.

work(1) On exit, returns workspace adequate workspace to allow optimal performance.

iwork(1) On return, *iwork*(1) contains the amount of integer workspace required.

ifail (global) INTEGER.
Array, DIMENSION (*n*).
If *jobz* = 'V', then on normal exit, the first *m* elements of *ifail* are zero. If (mod(*info*,2). *ne*.0) on exit, then *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

iclustr (global) INTEGER. Array, DIMENSION (2*NPROW*NPCOL)
This array contains indices of eigenvectors corresponding to a cluster of eigenvalues that could not be reorthogonalized due to insufficient workspace (see *lwork*, *orfac* and *info*). Eigenvectors corresponding to clusters of eigenvalues indexed *iclustr*(2**i*-1) to *iclustr*(2**i*), could not be reorthogonalized due to lack of workspace. Hence the eigenvectors corresponding to these clusters may not be orthogonal. *iclustr*() is a zero terminated array.
(*iclustr*(2**k*).*ne*.0. *and*. *iclustr*(2**k*+1).*eq*.0) if and only if *k* is the number of clusters.
iclustr is not referenced if *jobz* = 'N'.

gap (global)
REAL for pssyevx
DOUBLE PRECISION for pdsyevx.
Array, DIMENSION (NPROW*NPCOL)

	This array contains the gap between eigenvalues whose eigenvectors could not be reorthogonalized. The output values in this array correspond to the clusters indicated by the array *iclustr*. As a result, the dot product between eigenvectors corresponding to the *i*th cluster may be as high as (*C***n*)/*gap*(*i*) where *C* is a small constant.

info	(global) INTEGER.
	If *info* = 0, the execution is successful.
	If *info* < 0:
	If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
	If *info* > 0: if (mod(*info*,2).*ne*.0), then one or more eigenvectors failed to converge. Their indices are stored in *ifail*. Ensure *abstol*=2.0*p?lamch('U').
	If (mod(*info*/2,2).*ne*.0), then eigenvectors corresponding to one or more clusters of eigenvalues could not be reorthogonalized because of insufficient workspace.The indices of the clusters are stored in the array *iclustr*.
	If (mod(*info*/4,2).*ne*.0), then space limit prevented p?syevxf rom computing all of the eigenvectors between *vl* and *vu*. The number of eigenvectors computed is returned in *nz*.
	If (mod(*info*/8,2).*ne*.0), then p?stebz failed to compute eigenvalues. Ensure *abstol*=2.0*p?lamch('U').

p?heev

Computes all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix.

Syntax

call pcheev(*jobz*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *w*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *rwork*, *lrwork*, *info*)

call pzheev(*jobz*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *w*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *rwork*, *lrwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h.

The p?heev routine computes all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* by calling the recommended sequence of ScaLAPACK routines. The routine assumes a homogeneous system and makes spot checks of the consistency of the eigenvalues across the different processes. A heterogeneous system may return incorrect results without any error messages.

Input Parameters

np = the number of rows local to a given process.

nq = the number of columns local to a given process.

jobz (global). CHARACTER*1. Must be 'N' or 'V'.
Specifies if it is necessary to compute the eigenvectors:
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo (global). CHARACTER*1. Must be 'U' or 'L'.
Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored:
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n (global) INTEGER. The number of rows and columns of the matrix *A* (*n* ≥ 0).

a (local).
COMPLEX for pcheev
DOUBLE COMPLEX for pzheev.
Block cyclic array of global dimension (*n*, *n*) and local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the Hermitian matrix *A*.
If *uplo* = 'U', only the upper triangular part of *A* is used to define the elements of the Hermitian matrix.
If *uplo* = 'L', only the lower triangular part of *A* is used to define the elements of the Hermitian matrix.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*ctxt_*) is incorrect, p?heev cannot guarantee correct error reporting.

iz, *jz* (global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.

descz (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *Z*. *descz*(*ctxt_*) must equal *desca*(*ctxt_*).

work (local).
COMPLEX for pcheev
DOUBLE COMPLEX for pzheev.
Array, DIMENSION *lwork*.

lwork (local). INTEGER. The dimension of the array *work*.
If only eigenvalues are requested (*jobz* = 'N'):

lwork ≥ max(*nb**(*np*0 + 1), 3) + 3**n*

If eigenvectors are requested (*jobz* = 'V'), then the amount of workspace required:

lwork ≥ (*np*0+*nq*0+*nb*)**nb* + 3**n* + n^2

with *nb* = *desca*(*mb_*) = *desca*(*nb_*) = *nb* = *descz*(*mb_*) = *descz*(*nb_*)

	*np*0 = numroc(*nn*, *nb*, 0, 0, NPROW). *nq*0 = numroc(max(*n*, *nb*, 2), *nb*, 0, 0, NPCOL). If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. The required workspace is returned as the first element of the corresponding work arrays, and no error message is issued by pxerbla.
rwork	(local). REAL for pcheev DOUBLE PRECISION for pzheev. Workspace array, DIMENSION *lrwork*.
lrwork	(local) INTEGER. The dimension of the array *rwork*. See below for definitions of variables used to define *lrwork*. If no eigenvectors are requested (*jobz* = 'N'), then *lrwork* ≥ 2*n. If eigenvectors are requested (*jobz* = 'V'), then *lrwork* ≥ 2*n + 2*n-2. If *lrwork* = -1, then *lrwork* is global input and a workspace query is assumed; the routine only calculates the minimum size required for the *rwork* array. The required workspace is returned as the first element of *rwork*, and no error message is issued by pxerbla.

Output Parameters

a	On exit, the lower triangle (if *uplo* = 'L'), or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
w	(global). REAL for pcheev DOUBLE PRECISION for pzheev. Array, DIMENSION *n*. The first *m* elements contain the selected eigenvalues in ascending order.
z	(local). COMPLEX for pcheev DOUBLE COMPLEX for pzheev. Array, global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)). If *jobz* ='V', then on normal exit the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix corresponding to the selected eigenvalues. If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced.
work(1)	On exit, returns adequate workspace to allow optimal performance. If *jobz* ='N', then *work*(1) = minimal workspace only for eigenvalues. If *jobz* ='V', then *work*(1) = minimal workspace required to generate all the eigenvectors.
rwork(1)	(local)

COMPLEX for pcheev
DOUBLE COMPLEX for pzheev.
On output, *rwork*(1) returns workspace required to guarantee completion.

info (global) INTEGER.
If *info* = 0, the execution is successful.
If *info* < 0:
If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*). If the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
If *info* > 0:
If *info* = 1 through *n*, the *i*-th eigenvalue did not converge in ?steqr2 after a total of 30**n* iterations.
If *info* = *n*+1, then p?heev detected heterogeneity, and the accuracy of the results cannot be guaranteed.

p?heevd

Computes all eigenvalues and eigenvectors of a complex Hermitian matrix by using a divide and conquer algorithm.

Syntax

```
call pcheevd(jobz, uplo, n, a, ia, ja, desca, w, z, iz, jz, descz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

```
call pzheevd(jobz, uplo, n, a, ia, ja, desca, w, z, iz, jz, descz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h.

The p?heevd routine computes all eigenvalues and eigenvectors of a complex Hermitian matrix *A* by using a divide and conquer algorithm.

Input Parameters

np = the number of rows local to a given process.

nq = the number of columns local to a given process.

jobz (global). CHARACTER*1. Must be 'N' or 'V'.
Specifies if it is necessary to compute the eigenvectors:
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo (global). CHARACTER*1. Must be 'U' or 'L'.
Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored:
If *uplo* = 'U', *a* stores the upper triangular part of *A*.

	If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	(global) INTEGER. The number of rows and columns of the matrix *A* (*n* ≥ 0).
a	(local). COMPLEX for pcheevd DOUBLE COMPLEX for pzheevd. Block cyclic array of global dimension (*n*, *n*) and local dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the Hermitian matrix *A*. If *uplo* = 'U', only the upper triangular part of *A* is used to define the elements of the Hermitian matrix. If *uplo* = 'L', only the lower triangular part of *A* is used to define the elements of the Hermitian matrix.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*ctxt_*) is incorrect, p?heevd cannot guarantee correct error reporting.
iz, *jz*	(global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.
descz	(global and local) INTEGER array, dimension *dlen_*. The array descriptor for the distributed matrix *Z*. *descz*(*ctxt_*) must equal *desca*(*ctxt_*).
work	(local). COMPLEX for pcheevd DOUBLE COMPLEX for pzheevd. Array, DIMENSION *lwork*.
lwork	(local). INTEGER. The dimension of the array *work*. If eigenvalues are requested: *lwork* = *n* + (*nb*0 + *mq*0 + *nb*)**nb* with *np*0 = numroc(max(*n*, *nb*, 2), *nb*, 0, 0, NPROW) *mq*0 = numroc(max(*n*, *nb*, 2), *nb*, 0, 0, NPCOL) If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. The required workspace is returned as the first element of the corresponding work arrays, and no error message is issued by pxerbla.
rwork	(local). REAL for pcheevd DOUBLE PRECISION for pzheevd. Workspace array, DIMENSION *lrwork*.
lrwork	(local) INTEGER. The dimension of the array *rwork*. *lrwork* ≥ 1 + 9**n* + 3**np*nq*, with *np* = numroc(*n*, *nb*, *myrow*, *iarow*, NPROW) *nq* = numroc(*n*, *nb*, *mycol*, *iacol*, NPCOL)

iwork	(local) INTEGER. Workspace array, dimension *liwork*.
liwork	(local) INTEGER, dimension of *iwork*. *liwork* = 7*n + 8*npcol + 2.

Output Parameters

a	On exit, the lower triangle (if *uplo* = 'L'), or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
w	(global). REAL for pcheevd DOUBLE PRECISION for pzheevd. Array, DIMENSION *n*. If *info* = 0, *w* contains the eigenvalues in the ascending order.
z	(local). COMPLEX for pcheevd DOUBLE COMPLEX for pzheevd. Array, global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)). The *z* parameter contains the orthonormal eigenvectors of the matrix *A*.
work(1)	On exit, returns adequate workspace to allow optimal performance.
rwork(1)	(local) COMPLEX for pcheevd DOUBLE COMPLEX for pzheevd. On output, *rwork*(1) returns workspace required to guarantee completion.
iwork(1)	(local). On return, *iwork*(1) contains the amount of integer workspace required.
info	(global) INTEGER. If *info* = 0, the execution is successful. If *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*). If the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. If *info* > 0: If *info* = 1 through *n*, the *i*-th eigenvalue did not converge.

p?heevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix.

Syntax

call pcheevx(*jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

call pzheevx(*jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* by calling the recommended sequence of ScaLAPACK routines. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

np = the number of rows local to a given process.

nq = the number of columns local to a given process.

jobz (global). CHARACTER*1. Must be 'N' or 'V'.
Specifies if it is necessary to compute the eigenvectors:
If *jobz* ='N', then only eigenvalues are computed.
If *jobz* ='V', then eigenvalues and eigenvectors are computed.

range (global). CHARACTER*1. Must be 'A', 'V', or 'I'.
If *range* = 'A', all eigenvalues will be found.
If *range* = 'V', all eigenvalues in the half-open interval [*vl*, *vu*] will be found.
If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.

uplo (global). CHARACTER*1. Must be 'U' or 'L'.
Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is stored:
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n (global) INTEGER. The number of rows and columns of the matrix *A* (*n* ≥ 0).

a (local).
COMPLEX for pcheevx
DOUBLE COMPLEX for pzheevx.
Block cyclic array of global dimension (*n*, *n*) and local dimension (*lld_a*, *LOC c*(*ja*+*n*-1)). On entry, the Hermitian matrix *A*.

If *uplo* = 'U', only the upper triangular part of *A* is used to define the elements of the symmetric matrix.
If *uplo* = 'L', only the lower triangular part of *A* is used to define the elements of the Hermitian matrix.

ia, *ja* — (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*ctxt_*) is incorrect, p?heevx cannot guarantee correct error reporting

vl, *vu* — (global)
REAL for pcheevx
DOUBLE PRECISION for pzheevx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues; not referenced if *range* = 'A' or 'I'.

il, *iu* — (global)
INTEGER. If *range* ='I', the indices of the smallest and largest eigenvalues to be returned.
Constraints:

$il \geq 1;\ \min(il,n) \leq iu \leq n$.

Not referenced if *range* = 'A' or 'V'.

abstol — (global).
REAL for pcheevx
DOUBLE PRECISION for pzheevx.
If *jobz*='V', setting *abstol* to p?lamch(*context*, 'U') yields the most orthogonal eigenvectors.
The absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [*a*, *b*] of width less than or equal to *abstol*+*eps**max(|*a*|,|*b*|), where *eps* is the machine precision. If *abstol* is less than or equal to zero, then *eps**norm(T) will be used in its place, where norm(T) is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form.
Eigenvalues are computed most accurately when *abstol* is set to twice the underflow threshold 2*p?lamch('S'), not zero. If this routine returns with ((mod(*info*,2).*ne*.0).*or*.(mod(*info*/8,2).*ne*.0)), indicating that some eigenvalues or eigenvectors did not converge, try setting *abstol* to 2*p?lamch('S').

orfac — (global). REAL for pcheevx
DOUBLE PRECISION for pzheevx.
Specifies which eigenvectors should be reorthogonalized. Eigenvectors that correspond to eigenvalues which are within *tol*=*orfac**norm(*A*) of each other are to be reorthogonalized. However, if the workspace is insufficient (see *lwork*), *tol* may be decreased until all eigenvectors

to be reorthogonalized can be stored in one process. No reorthogonalization will be done if *orfac* equals zero. A default value of 1.0e-3 is used if *orfac* is negative.
orfac should be identical on all processes.

iz, *jz* — (global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.

descz — (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *Z*.*descz*(*ctxt_*) must equal *desca*(*ctxt_*).

work — (local)
COMPLEX for pcheevx
DOUBLE COMPLEX for pzheevx.
Array, DIMENSION (*lwork*).

lwork — (local). INTEGER. The dimension of the array *work*.
If only eigenvalues are requested:

lwork ≥ *n* + max(*nb**(*np*0 + 1), 3)

If eigenvectors are requested:

lwork ≥ *n* + (*np*0+*mq*0+*nb*)**nb*

with *nq*0 = numroc(*nn*, *nb*, 0, 0, NPCOL).

lwork ≥ 5**n* + max(5**nn*, *np*0**mq*0+2**nb***nb*) + iceil(*neig*, NPROW*NPCOL)**nn*

For optimal performance, greater workspace is needed, that is

lwork ≥ max(*lwork*, *nhetrd_lwork*)

where *lwork* is as defined above, and *nhetrd_lwork* = *n* + 2*(*anb*+1)*(4**nps*+2) + (*nps*+1)**nps*
ictxt = *desca*(*ctxt_*)
anb = pjlaenv(*ictxt*, 3, 'pchettrd', 'L', 0, 0, 0, 0)
sqnpc = *sqrt*(*dble*(NPROW * NPCOL))
nps = max(numroc(*n*, 1, 0, 0, *sqnpc*), 2**anb*)
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. Each of these values is returned in the first entry of the corresponding work arrays, and no error message is issued by pxerbla.

rwork — (local)
REAL for pcheevx
DOUBLE PRECISION for pzheevx.
Workspace array, DIMENSION (*lrwork*).

lrwork — (local) INTEGER. The dimension of the array *work*.
See below for definitions of variables used to define *lwork*.

If no eigenvectors are requested (*jobz* = 'N'), then *lrwork* ≥ 5**nn*+4**n*.

If eigenvectors are requested (*jobz* = 'V'), then the amount of workspace required to guarantee that all eigenvectors are computed is:

lrwork ≥ 4*n + max(5*nn, np0*mq0+2*nb*nb) + iceil(neig, NPROW*NPCOL)*nn

The computed eigenvectors may not be orthogonal if the minimal workspace is supplied and *orfac* is too small. If you want to guarantee orthogonality (at the cost of potentially poor performance) you should add the following values to *lrwork*:

(*clustersize*-1)*n,

where *clustersize* is the number of eigenvalues in the largest cluster, where a cluster is defined as a set of close eigenvalues:

{w(k),..., w(k+clustersize-1)|w(j+1) ≤ w(j)+orfac*2*norm(A)}.

Variable definitions:

neig = number of eigenvectors requested;

nb = *desca*(*mb_*) = *desca*(*nb_*) = *descz*(*mb_*) = *descz*(*nb_*);

nn = max(*n*, NB, 2);

desca(*rsrc_*) = *desca*(*nb_*) = *descz*(*rsrc_*) = *descz*(*csrc_*) = 0;

np0 = numroc(*nn*, *nb*, 0, 0, NPROW);

mq0 = numroc(max(*neig*, *nb*, 2), *nb*, 0, 0, NPCOL);

iceil(*x*, *y*) is a ScaLAPACK function returning ceiling(*x*/*y*)

When *lrwork* is too small:

If *lwork* is too small to guarantee orthogonality, p?heevx attempts to maintain orthogonality in the clusters with the smallest spacing between the eigenvalues. If *lwork* is too small to compute all the eigenvectors requested, no computation is performed and *info*= -23 is returned. Note that when *range*='V', p?heevx does not know how many eigenvectors are requested until the eigenvalues are computed. Therefore, when *range*='V' and as long as *lwork* is large enough to allow p?heevx to compute the eigenvalues, p?heevx will compute the eigenvalues and as many eigenvectors as it can.

Relationship between workspace, orthogonality and performance:

If *clustersize* ≥ *n*/*sqrt*(NPROW*NPCOL), then providing enough space to compute all the eigenvectors orthogonally will cause serious degradation in performance. In the limit (that is, *clustersize* = *n*-1) p?stein will perform no better than ?stein on 1 processor.

For *clustersize* = *n*/*sqrt*(NPROW*NPCOL) reorthogonalizing all eigenvectors will increase the total execution time by a factor of 2 or more.

For *clustersize* > *n*/*sqrt*(NPROW*NPCOL) execution time will grow as the square of the cluster size, all other factors remaining equal and assuming enough workspace. Less workspace means less reorthogonalization but faster execution.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. Each of these values is returned in the first entry of the corresponding work arrays, and no error message is issued by pxerbla.

iwork (local) INTEGER. Workspace array.

liwork (local) INTEGER, dimension of *iwork*.

liwork ≥ 6**nnp*
Where: *nnp* = max(*n*, NPROW*NPCOL+1, 4)
If *liwork* = -1, then *liwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, the lower triangle (if *uplo* = 'L'), or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m (global) INTEGER. The total number of eigenvalues found; 0 ≤ *m* ≤ *n*.

nz (global) INTEGER. Total number of eigenvectors computed. 0 ≤ *nz* ≤ *m*.
The number of columns of *z* that are filled.

If *jobz* ≠ 'V', *nz* is not referenced.
If *jobz* = 'V', *nz* = *m* unless the user supplies insufficient space and p?heevx is not able to detect this before beginning computation. To get all the eigenvectors requested, the user must supply both sufficient space to hold the eigenvectors in *z* (*m*.*le*.*descz*(*n*_)) and sufficient workspace to compute them. (See *lwork*). p?heevx is always able to detect insufficient space without computation unless *range*.*eq*.'V'.

w (global).
REAL for pcheevx
DOUBLE PRECISION for pzheevx.
Array, DIMENSION (*n*). The first *m* elements contain the selected eigenvalues in ascending order.

z (local).
COMPLEX for pcheevx
DOUBLE COMPLEX for pzheevx.
Array, global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)).

	If *jobz* ='V', then on normal exit the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix corresponding to the selected eigenvalues. If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced.
work(1)	On exit, returns workspace adequate workspace to allow optimal performance.
rwork	(local). REAL for pcheevx DOUBLE PRECISION for pzheevx. Array, DIMENSION (*lrwork*). On return, *rwork(1)* contains the optimal amount of workspace required for efficient execution. If *jobz*='N' *rwork(1)* = optimal amount of workspace required to compute eigenvalues efficiently. If *jobz*='V' *rwork(1)* = optimal amount of workspace required to compute eigenvalues and eigenvectors efficiently with no guarantee on orthogonality. If *range*='V', it is assumed that all eigenvectors may be required.
iwork(1)	(local) On return, *iwork*(1) contains the amount of integer workspace required.
ifail	(global) INTEGER. Array, DIMENSION (*n*). If *jobz* ='V', then on normal exit, the first *m* elements of *ifail* are zero. If (mod(*info*,2).*ne*.0) on exit, then *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
iclustr	(global) INTEGER. Array, DIMENSION (2*NPROW*NPCOL). This array contains indices of eigenvectors corresponding to a cluster of eigenvalues that could not be reorthogonalized due to insufficient workspace (see *lwork*, *orfac* and *info*). Eigenvectors corresponding to clusters of eigenvalues indexed *iclustr*(2*i*-1) to *iclustr*(2*i*), could not be reorthogonalized due to lack of workspace. Hence the eigenvectors corresponding to these clusters may not be orthogonal. *iclustr*() is a zero terminated array. (*iclustr*(2*k*).*ne*.0. *and*. *iclustr*(2*k*+1).*eq*.0) if and only if *k* is the number of clusters. *iclustr* is not referenced if *jobz* = 'N'.
gap	(global) REAL for pcheevx DOUBLE PRECISION for pzheevx. Array, DIMENSION (NPROW*NPCOL)

	This array contains the gap between eigenvalues whose eigenvectors could not be reorthogonalized. The output values in this array correspond to the clusters indicated by the array *iclustr*. As a result, the dot product between eigenvectors corresponding to the *i*-th cluster may be as high as (*C***n*)/*gap*(*i*) where *C* is a small constant.

info	(global) INTEGER.
	If *info* = 0, the execution is successful.
	If *info* < 0:
	If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
	If *info* > 0:
	If (mod(*info*,2).*ne*.0), then one or more eigenvectors failed to converge. Their indices are stored in *ifail*. Ensure *abstol*=2.0*p?lamch('U')
	If (mod(*info*/2,2).*ne*.0), then eigenvectors corresponding to one or more clusters of eigenvalues could not be reorthogonalized because of insufficient workspace.The indices of the clusters are stored in the array *iclustr*.
	If (mod(*info*/4,2).*ne*.0), then space limit prevented p?syevx from computing all of the eigenvectors between *vl* and *vu*. The number of eigenvectors computed is returned in *nz*.
	If (mod(*info*/8,2).*ne*.0), then p?stebz failed to compute eigenvalues. Ensure *abstol*=2.0*p?lamch('U').

p?gesvd

Computes the singular value decomposition of a general matrix, optionally computing the left and/or right singular vectors.

Syntax

call psgesvd(*jobu*, *jobvt*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *s*, *u*, *iu*, *ju*, *descu*, *vt*, *ivt*, *jvt*, *descvt*, *work*, *lwork*, *info*)

call pdgesvd(*jobu*, *jobvt*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *s*, *u*, *iu*, *ju*, *descu*, *vt*, *ivt*, *jvt*, *descvt*, *work*, *lwork*, *info*)

call pcgesvd(*jobu*, *jobvt*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *s*, *u*, *iu*, *ju*, *descu*, *vt*, *ivt*, *jvt*, *descvt*, *work*, *lwork*, *rwork*, *info*)

call pzgesvd(*jobu*, *jobvt*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *s*, *u*, *iu*, *ju*, *descu*, *vt*, *ivt*, *jvt*, *descvt*, *work*, *lwork*, *rwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the singular value decomposition (SVD) of an *m*-by-*n* matrix *A*, optionally computing the left and/or right singular vectors. The SVD is written

$A = U*\Sigma*V^T$,

where Σ is an m-by-n matrix that is zero except for its min(m, n) diagonal elements, U is an m-by-m orthogonal matrix, and V is an n-by-n orthogonal matrix. The diagonal elements of Σ are the singular values of A and the columns of U and V are the corresponding right and left singular vectors, respectively. The singular values are returned in array s in decreasing order and only the first min(m,n) columns of U and rows of $vt = V^T$ are computed.

Input Parameters

mp = number of local rows in A and U

nq = number of local columns in A and VT

$size$ = min(m, n)

$sizeq$ = number of local columns in U

$sizep$ = number of local rows in VT

jobu	(global). CHARACTER*1. Specifies options for computing all or part of the matrix U. If *jobu* = 'V', the first *size* columns of U (the left singular vectors) are returned in the array u; If *jobu* ='N', no columns of U (no left singular vectors)are computed.
jobvt	(global) CHARACTER*1. Specifies options for computing all or part of the matrix V^T. If *jobvt* = 'V', the first *size* rows of V^T (the right singular vectors) are returned in the array *vt*; If *jobvt* = 'N', no rows of V^T(no right singular vectors) are computed.
m	(global) INTEGER. The number of rows of the matrix A ($m \geq 0$).
n	(global) INTEGER. The number of columns in A ($n \geq 0$).
a	(local). REAL for psgesvd DOUBLE PRECISION for pdgesvd COMPLEX for pcgesvd COMPLEX*16 for pzgesvd Block cyclic array, global dimension (m, n), local dimension (mp, nq). *work*(*lwork*) is a workspace array.
ia, *ja*	(global) INTEGER. The row and column indices in the global array a indicating the first row and the first column of the submatrix A, respectively.
desca	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix A.
iu, *ju*	(global) INTEGER. The row and column indices in the global array a indicating the first row and the first column of the submatrix U, respectively.
descu	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix U.

ivt, *jvt* (global) INTEGER. The row and column indices in the global array *vt* indicating the first row and the first column of the submatrix *VT*, respectively.

descvt (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *VT*.

work (local). REAL for psgesvd
DOUBLE PRECISION for pdgesvd
COMPLEX for pcgesvd
COMPLEX*16 for pzgesvd
Workspace array, dimension (*lwork*)

lwork (local) INTEGER. The dimension of the array *work*;
lwork > 2 + 6**sizeb* + max(*watobd*, *wbdtosvd*),
where *sizeb* = max(*m*, *n*), and *watobd* and *wbdtosvd* refer, respectively, to the workspace required to bidiagonalize the matrix *A* and to go from the bidiagonal matrix to the singular value decomposition *U S VT*.
For *watobd*, the following holds:
watobd = max(max(*wp?lange*,*wp?gebrd*), max(*wp?lared2d*, *wp?lared1d*)),
where *wp?lange*, *wp?lared1d*, *wp?lared2d*, *wp?gebrd* are the workspaces required respectively for the subprograms p?lange, p?lared1d, p?lared2d, p?gebrd. Using the standard notation
mp = numroc(*m*, *mb*, MYROW, *desca*(*ctxt_*), NPROW),
nq = numroc(*n*, *nb*, MYCOL, *desca*(*lld_*), NPCOL),
the workspaces required for the above subprograms are
wp?lange = *mp*,
wp?lared1d = *nq*0,
wp?lared2d = *mp*0,
wp?gebrd = *nb**(*mp* + *nq* + 1) + *nq*,
where *nq*0 and *mp*0 refer, respectively, to the values obtained at MYCOL = 0 and MYROW = 0. In general, the upper limit for the workspace is given by a workspace required on processor (0,0):
watobd ≤ *nb**(*mp*0 + *nq*0 + 1) + *nq*0.
In case of a homogeneous process grid this upper limit can be used as an estimate of the minimum workspace for every processor.
For *wbdtosvd*, the following holds:
wbdtosvd = *size**(*wantu**nru* + *wantvt**ncvt*) + max(*w?bdsqr*, max(*wantu**wp?ormbrqln*, *wantvt**wp?ormbrprt*)),
where
wantu(*wantvt*) = 1, if left/right singular vectors are wanted, and *wantu*(*wantvt*) = 0, otherwise. *w?bdsqr*, *wp?ormbrqln*, and *wp?ormbrprt* refer respectively to the workspace required for the subprograms ?bdsqr, p?ormbr(*qln*), and p?ormbr(*prt*), where *qln* and *prt* are the values of the arguments *vect*, *side*, and *trans* in the call to p?ormbr. *nru* is equal to the local number of rows of the matrix *U* when distributed 1-dimensional "column" of processes. Analogously,

ncvt is equal to the local number of columns of the matrix *VT* when distributed across 1-dimensional "row" of processes. Calling the LAPACK procedure ?bdsqr requires
w?bdsqr = max(1, 2**size* + (2**size* - 4)* max(*wantu*, *wantvt*))
on every processor. Finally,
wp?ormbrqln = max((*nb**(*nb*-1))/2, (*sizeq*+*mp*)**nb*)+*nb***nb*,
wp?ormbrprt = max((*mb**(*mb*-1))/2, (*sizep*+*nq*)**mb*)+*mb***mb*,
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum size for the work array. The required workspace is returned as the first element of *work* and no error message is issued by pxerbla.

rwork
REAL for psgesvd
DOUBLE PRECISION for pdgesvd
COMPLEX for pcgesvd
COMPLEX*16 for pzgesvd
Workspace array, dimension (1 + 4**sizeb*)

Output Parameters

a
On exit, the contents of *a* are destroyed.

s
(global). REAL for psgesvd
DOUBLE PRECISION for pdgesvd
COMPLEX for pcgesvd
COMPLEX*16 for pzgesvd
Array, DIMENSION (*size*).
Contains the singular values of *A* sorted so that *s*(i) ≥ *s*(i+1).

u
(local). REAL for psgesvd
DOUBLE PRECISION for pdgesvd
COMPLEX for pcgesvd
COMPLEX*16 for pzgesvd
local dimension (*mp*, *sizeq*), global dimension (*m*, *size*)
If *jobu* = 'V', *u* contains the first min(*m*, *n*) columns of *U*.
If *jobu* = 'N' or 'O', *u* is not referenced.

vt
(local). REAL for psgesvd
DOUBLE PRECISION for pdgesvd
COMPLEX for pcgesvd
COMPLEX*16 for pzgesvd
local dimension (*sizep*, *nq*), global dimension (*size*, *n*)
If *jobvt* = 'V', *vt* contains the first *size* rows of V^T if *jobu* = 'N', *vt* is not referenced.

work
On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.

rwork
On exit, if *info* = 0, then *rwork*(1) returns the required size of *rwork*.

info
(global) INTEGER.
If *info* = 0, the execution is successful.

If *info* < 0, If *info* = -*i*, the *i*th parameter had an illegal value.
If *info* > 0 *i*, then if ?bdsqr did not converge,
If *info* = min(*m*,*n*) + 1, then p?gesvd has detected heterogeneity by finding that eigenvalues were not identical across the process grid. In this case, the accuracy of the results from p?gesvd cannot be guaranteed.

p?sygvx

Computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric definite eigenproblem.

Syntax

call pssygvx(*ibtype*, *jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

call pdsygvx(*ibtype*, *jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

sub(*A*)*x = λ*sub(*B*)*x, sub(*A*) sub(*B*)*x = λ*x, or sub(*B*)*sub(*A*)*x = λ*x.

Here *x* denotes eigen vectors, λ (*lambda*) denotes eigenvalues, sub(*A*) denoting A(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) is assumed to symmetric, and sub(*B*) denoting *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*n*-1) is also positive definite.

Input Parameters

ibtype (global) INTEGER. Must be 1 or 2 or 3.
Specifies the problem type to be solved:
If *ibtype* = 1, the problem type is sub(*A*)*x = *lambda**sub(*B*)*x;
If *ibtype* = 2, the problem type is sub(*A*)*sub(*B*)*x = *lambda**x;
If *ibtype* = 3, the problem type is sub(*B*)*sub(*A*)*x = *lambda**x.

jobz (global). CHARACTER*1. Must be 'N' or 'V'.
If *jobz* ='N', then compute eigenvalues only.
If *jobz* ='V', then compute eigenvalues and eigenvectors.

range (global). CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues in the interval: [*vl*, *vu*]
If *range* = 'I', the routine computes eigenvalues with indices *il* through *iu*.

uplo (global). CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', arrays *a* and *b* store the upper triangles of sub(*A*) and sub (*B*);
If *uplo* = 'L', arrays *a* and *b* store the lower triangles of sub(*A*) and sub (*B*).

n (global). INTEGER. The order of the matrices sub(*A*) and sub (*B*), $n \geq 0$.

a (local)
REAL for pssygvx
DOUBLE PRECISION for pdsygvx.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* symmetric distributed matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *A*. If *desca*(*ctxt_*) is incorrect, p?sygvx cannot guarantee correct error reporting.

b (local). REAL for pssygvx
DOUBLE PRECISION for pdsygvx.
Pointer into the local memory to an array of dimension (*lld_b*, *LOCc*(*jb*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* symmetric distributed matrix sub(*B*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*B*) contains the upper triangular part of the matrix.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix.

ib, *jb* (global) INTEGER. The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.

descb (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *B*. *descb*(*ctxt_*) must be equal to *desca*(*ctxt_*).

vl, *vu* (global)

	REAL for pssygvx DOUBLE PRECISION for pdsygvx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	(global) INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: $1 \le il \le iu \le n$, $\min(il, n)$ If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	(global) REAL for pssygvx DOUBLE PRECISION for pdsygvx. If *jobz*='V', setting *abstol* to p?lamch(*context*, 'U') yields the most orthogonal eigenvectors. The absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [*a*,*b*] of width less than or equal to *abstol* + *eps**max(|*a*|,|*b*|), where *eps* is the machine precision. If *abstol* is less than or equal to zero, then *eps**norm(T) will be used in its place, where norm(T) is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*p?lamch('S') not zero. If this routine returns with ((mod(*info*,2).*ne*.0).*or*.*(*mod*(*info*/8,2).*ne*.0)), indicating that some eigenvalues or eigenvectors did not converge, try setting *abstol* to 2*p?lamch('S').
orfac	(global). REAL for pssygvx DOUBLE PRECISION for pdsygvx. Specifies which eigenvectors should be reorthogonalized. Eigenvectors that correspond to eigenvalues which are within *tol*=*orfac**norm(*A*) of each other are to be reorthogonalized. However, if the workspace is insufficient (see *lwork*), *tol* may be decreased until all eigenvectors to be reorthogonalized can be stored in one process. No reorthogonalization will be done if *orfac* equals zero. A default value of 1.0e-3 is used if *orfac* is negative. *orfac* should be identical on all processes.
iz, *jz*	(global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.
descz	(global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *Z*.*descz*(*ctxt_*) must equal *desca*(*ctxt_*).

work (local)
REAL for pssygvx
DOUBLE PRECISION for pdsygvx.
Workspace array, dimension (*lwork*)

lwork (local) INTEGER.
Dimension of the array *work*. See below for definitions of variables used to define *lwork*.

If no eigenvectors are requested (*jobz* = 'N'), then *lwork* ≥ 5*n + max(5*nn, NB*(np0 + 1)).
If eigenvectors are requested (*jobz* = 'V'), then the amount of workspace required to guarantee that all eigenvectors are computed is:

lwork ≥ 5*n + max(5*nn, np0*mq0 + 2*nb*nb) + iceil(neig, NPROW*NPCOL)*nn.
The computed eigenvectors may not be orthogonal if the minimal workspace is supplied and *orfac* is too small. If you want to guarantee orthogonality at the cost of potentially poor performance you should add the following to *lwork*:
(*clustersize*-1)*n,
where *clustersize* is the number of eigenvalues in the largest cluster, where a cluster is defined as a set of close eigenvalues:

{w(k),..., w(k+clustersize-1)|w(j+1) ≤ w(j) + orfac*2*norm(A)}
Variable definitions:
neig = number of eigenvectors requested,
nb = *desca*(*mb_*) = *desca*(*nb_*) = *descz*(*mb_*) = *descz*(*nb_*),
nn = max(*n*, *nb*, 2),
desca(*rsrc_*) = *desca*(*nb_*) = *descz*(*rsrc_*) = *descz*(*csrc_*) = 0,
*np*0 = numroc(*nn*, *nb*, 0, 0, NPROW),
*mq*0 = numroc(max(*neig*, *nb*, 2), *nb*, 0, 0, NPCOL)
iceil(*x*, *y*) is a ScaLAPACK function returning ceiling(*x*/*y*)
If *lwork* is too small to guarantee orthogonality, p?syevx attempts to maintain orthogonality in the clusters with the smallest spacing between the eigenvalues.
If *lwork* is too small to compute all the eigenvectors requested, no computation is performed and *info*= -23 is returned.
Note that when *range*='V', number of requested eigenvectors are not known until the eigenvalues are computed. In this case and if *lwork* is large enough to compute the eigenvalues, p?sygvx computes the eigenvalues and as many eigenvectors as possible.
Greater performance can be achieved if adequate workspace is provided. In some situations, performance can decrease as the provided workspace increases above the workspace amount shown below:

lwork ≥ max(*lwork*, 5*n + *nsytrd_lwopt*, *nsygst_lwopt*),
where

lwork, as defined previously, depends upon the number of eigenvectors requested, and
nsytrd_lwopt = *n* + 2*(*anb*+1)*(4**nps*+2) + (*nps*+3)**nps*
nsygst_lwopt = 2**np*0**nb* + *nq*0**nb* + *nb***nb*
anb = pjlaenv(*desca*(*ctxt_*), 3, p?syttrd ', 'L', 0, 0, 0, 0)
sqnpc = int(*sqrt*(*dble*(NPROW * NPCOL)))
nps = max(numroc(*n*, 1, 0, 0, *sqnpc*), 2**anb*)
NB = *desca*(*mb_*)
*np*0 = numroc(*n*, *nb*, 0, 0, NPROW)
*nq*0 = numroc(*n*, *nb*, 0, 0, NPCOL)
numroc is a ScaLAPACK tool functions;
pjlaenv is a ScaLAPACK environmental inquiry function
MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
For large n, no extra workspace is needed, however the biggest boost in performance comes for small n, so it is wise to provide the extra workspace (typically less than a Megabyte per process).

If *clustersize* ≥ *n*/*sqrt*(NPROW*NPCOL), then providing enough space to compute all the eigenvectors orthogonally will cause serious degradation in performance. At the limit (that is, *clustersize* = *n*-1) p?stein will perform no better than ?stein on a single processor.
For *clustersize* = *n*/*sqrt*(NPROW*NPCOL) reorthogonalizing all eigenvectors will increase the total execution time by a factor of 2 or more.
For *clustersize* > *n*/*sqrt*(NPROW*NPCOL) execution time will grow as the square of the cluster size, all other factors remaining equal and assuming enough workspace. Less workspace means less reorthogonalization but faster execution.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. Each of these values is returned in the first entry of the corresponding work arrays, and no error message is issued by pxerbla.

iwork (local) INTEGER. Workspace array.

liwork (local) INTEGER, dimension of *iwork*.

liwork ≥ 6**nnp*
Where:
nnp = max(*n*, NPROW*NPCOL + 1, 4)
If *liwork* = -1, then *liwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a
On exit,
If *jobz* = 'V', and if *info* = 0, sub(*A*) contains the distributed matrix *Z* of eigenvectors. The eigenvectors are normalized as follows:
for *ibtype* = 1 or 2, Z^T*sub(*B*)*Z* = *i*;
for *ibtype* = 3, Z^T*inv(sub(*B*))*Z* = *i*.
If *jobz* = 'N', then on exit the upper triangle (if *uplo*='U') or the lower triangle (if *uplo*='L') of sub(*A*), including the diagonal, is destroyed.

b
On exit, if *info* ≤ *n*, the part of sub(*B*) containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization sub(*B*) = U^T*U or sub(*B*) = *L*L^T.

m
(global) INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.

nz
(global) INTEGER.
Total number of eigenvectors computed. 0 ≤ *nz* ≤ *m*. The number of columns of *z* that are filled.
If *jobz* ≠ 'V', *nz* is not referenced.
If *jobz* = 'V', *nz* = *m* unless the user supplies insufficient space and p?sygvx is not able to detect this before beginning computation. To get all the eigenvectors requested, the user must supply both sufficient space to hold the eigenvectors in *z* (*m*.*le*.*descz*(*n*_)) and sufficient workspace to compute them. (See *lwork* below.) p?sygvx is always able to detect insufficient space without computation unless *range*.*eq*.'V'.

w
(global)
REAL for pssygvx
DOUBLE PRECISION for pdsygvx.
Array, DIMENSION (*n*). On normal exit, the first *m* entries contain the selected eigenvalues in ascending order.

z
(local).
REAL for pssygvx
DOUBLE PRECISION for pdsygvx.
global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)).
If *jobz* = 'V', then on normal exit the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix corresponding to the selected eigenvalues. If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
If *jobz* = 'N', then *z* is not referenced.

work
If *jobz*='N' *work*(1) = optimal amount of workspace required to compute eigenvalues efficiently
If *jobz* = 'V' *work*(1) = optimal amount of workspace required to compute eigenvalues and eigenvectors efficiently with no guarantee on orthogonality.

If *range*='V', it is assumed that all eigenvectors may be required.

ifail (global) INTEGER.
Array, DIMENSION (*n*).
ifail provides additional information when *info*.*ne*.0
If (*mod*(*info*/16,2).*ne*.0) then *ifail*(1) indicates the order of the smallest minor which is not positive definite. If (*mod*(*info*,2).*ne*.0) on exit, then *ifail* contains the indices of the eigenvectors that failed to converge.
If neither of the above error conditions hold and *jobz* = 'V', then the first *m* elements of *ifail* are set to zero.

iclustr (global) INTEGER.
Array, DIMENSION (2*NPROW*NPCOL). This array contains indices of eigenvectors corresponding to a cluster of eigenvalues that could not be reorthogonalized due to insufficient workspace (see *lwork*, *orfac* and *info*). Eigenvectors corresponding to clusters of eigenvalues indexed *iclustr*(2**i*-1) to *iclustr*(2**i*), could not be reorthogonalized due to lack of workspace. Hence the eigenvectors corresponding to these clusters may not be orthogonal. *iclustr*( ) is a zero terminated array.
(*iclustr*(2**k*).*ne*.0.*and*. *iclustr*(2**k*+1).*eq*.0) if and only if *k* is the number of clusters *iclustr* is not referenced if *jobz* = 'N'.

gap (global)
REAL for pssygvx
DOUBLE PRECISION for pdsygvx.
Array, DIMENSION (NPROW*NPCOL). This array contains the gap between eigenvalues whose eigenvectors could not be reorthogonalized. The output values in this array correspond to the clusters indicated by the array *iclustr*. As a result, the dot product between eigenvectors corresponding to the *i*-th cluster may be as high as (*C***n*)/*gap*(*i*), where *C* is a small constant.

info (global) INTEGER.
If *info* = 0, the execution is successful.
If *info* <0: the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
If *info* > 0:
If (mod(*info*,2).*ne*.0), then one or more eigenvectors failed to converge. Their indices are stored in *ifail*.
If (mod(*info*,2,2).*ne*.0), then eigenvectors corresponding to one or more clusters of eigenvalues could not be reorthogonalized because of insufficient workspace. The indices of the clusters are stored in the array *iclustr*.
If (mod(*info*/4,2).*ne*.0), then space limit prevented p?sygvx from computing all of the eigenvectors between *vl* and *vu*. The number of eigenvectors computed is returned in *nz*.
If (mod(*info*/8,2).*ne*.0), then p?stebz failed to compute eigenvalues.

If (mod(*info*/16,2).*ne*.0), then *B* was not positive definite. *ifail(1)* indicates the order of the smallest minor which is not positive definite.

p?hegvx

Computes selected eigenvalues and, optionally, eigenvectors of a complex generalized Hermitian definite eigenproblem.

Syntax

call pchegvx(*ibtype*, *jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

call pzhegvx(*ibtype*, *jobz*, *range*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *nz*, *w*, *orfac*, *z*, *iz*, *jz*, *descz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *ifail*, *iclustr*, *gap*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes all the eigenvalues, and optionally, the eigenvectors of a complex generalized Hermitian-definite eigenproblem, of the form

sub(*A*)*x = λ*sub(*B*)*x, sub(*A*)*sub(*B*)*x = λ*x, or sub(*B*)*sub(*A*)*x = λ*x.

Here sub (*A*) denoting *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) and sub(*B*) denoting *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*n*-1) is also positive definite.

Input Parameters

ibtype (global) INTEGER. Must be 1 or 2 or 3.
Specifies the problem type to be solved:
If *ibtype* = 1, the problem type is sub(*A*)*x = *lambda**sub(*B*)*x;
If *ibtype* = 2, the problem type is sub(*A*)*sub(*B*)*x = *lambda***x*;
If *ibtype* = 3, the problem type is sub(*B*)*sub(*A*)*x = *lambda***x*.

jobz (global). CHARACTER*1. Must be 'N' or 'V'.
If *jobz* ='N', then compute eigenvalues only.
If *jobz* ='V', then compute eigenvalues and eigenvectors.

range (global). CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues in the interval: [*vl*, *vu*]
If *range* = 'I', the routine computes eigenvalues with indices *il* through *iu*.

uplo (global). CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', arrays *a* and *b* store the upper triangles of sub(*A*) and sub (*B*);
If *uplo* = 'L', arrays *a* and *b* store the lower triangles of sub(*A*) and sub (*B*).

n (global). INTEGER.
The order of the matrices sub(*A*) and sub (*B*) ($n \geq 0$).

a (local)
COMPLEX for pchegvx
DOUBLE COMPLEX for pzhegvx.
Pointer into the local memory to an array of dimension (*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* Hermitian distributed matrix sub(*A*). If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix.

ia, *ja* (global) INTEGER.
The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, dimension (*dlen_*).
The array descriptor for the distributed matrix *A*. If *desca*(*ctxt_*) is incorrect, p?hegvx cannot guarantee correct error reporting.

b (local).
COMPLEX for pchegvx
DOUBLE COMPLEX for pzhegvx.
Pointer into the local memory to an array of dimension (*lld_b*, *LOCc*(*jb*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* Hermitian distributed matrix sub(*B*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*B*) contains the upper triangular part of the matrix.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*B*) contains the lower triangular part of the matrix.

ib, *jb* (global) INTEGER.
The row and column indices in the global array *b* indicating the first row and the first column of the submatrix *B*, respectively.

descb (global and local) INTEGER array, dimension (*dlen_*).
The array descriptor for the distributed matrix *B*. *descb*(*ctxt_*) must be equal to *desca*(*ctxt_*).

vl, *vu* (global)
REAL for pchegvx
DOUBLE PRECISION for pzhegvx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* (global)
INTEGER.

If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: *il* ≥ 1, min(*il*, *n*) ≤ *iu* ≤ *n*
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol (global)
REAL for pchegvx
DOUBLE PRECISION for pzhegvx.
If *jobz*='V', setting *abstol* to p?lamch(*context*, 'U') yields the most orthogonal eigenvectors.
The absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [*a*,*b*] of width less than or equal to
abstol + *eps**max(|*a*|,|*b*|),
where *eps* is the machine precision. If *abstol* is less than or equal to zero, then *eps**norm(T) will be used in its place, where norm(T) is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form.
Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*p?lamch('S') not zero. If this routine returns with ((mod(*info*,2).*ne*.0).*or*. * (*mod*(*info*/8,2).*ne*.0)), indicating that some eigenvalues or eigenvectors did not converge, try setting *abstol* to 2*p?lamch('S').

orfac (global).
REAL for pchegvx
DOUBLE PRECISION for pzhegvx.
Specifies which eigenvectors should be reorthogonalized. Eigenvectors that correspond to eigenvalues which are within *tol*=*orfac**norm(*A*) of each other are to be reorthogonalized. However, if the workspace is insufficient (see *lwork*), *tol* may be decreased until all eigenvectors to be reorthogonalized can be stored in one process. No reorthogonalization will be done if *orfac* equals zero. A default value of 1.0E-3 is used if *orfac* is negative. *orfac* should be identical on all processes.

iz, *jz* (global) INTEGER. The row and column indices in the global array *z* indicating the first row and the first column of the submatrix *Z*, respectively.

descz (global and local) INTEGER array, dimension (*dlen_*). The array descriptor for the distributed matrix *Z*.*descz*(*ctxt_*) must equal *desca*(*ctxt_*).

work (local)
COMPLEX for pchegvx
DOUBLE COMPLEX for pzhegvx.
Workspace array, dimension (*lwork*)

lwork (local).
INTEGER. The dimension of the array *work*.
If only eigenvalues are requested:

lwork ≥ *n*+ max(NB*(*np*0 + 1), 3)
If eigenvectors are requested:
lwork ≥ *n* + (*np*0+ *mq*0 + NB)*NB
with *nq*0 = numroc(*nn*, NB, 0, 0, NPCOL).
For optimal performance, greater workspace is needed, that is
lwork ≥ max(*lwork*, *n*, *nhetrd_lwopt*, *nhegst_lwopt*)
where *lwork* is as defined above, and
nhetrd_lwork = 2*(*anb*+1)*(4**nps*+2) + (*nps* + 1)**nps*;
nhegst_lwopt = 2**np*0**nb* + *nq*0**nb* + *nb***nb*
nb = *desca*(*mb_*)
*np*0 = numroc(*n*, *nb*, 0, 0, NPROW)
*nq*0 = numroc(*n*, *nb*, 0, 0, NPCOL)
ictxt = *desca*(*ctxt_*)
anb = pjlaenv(*ictxt*, 3, 'p?hettrd', 'L', 0, 0, 0, 0)
sqnpc = *sqrt*(*dble*(NPROW * NPCOL))
nps = max(numroc(*n*, 1, 0, 0, *sqnpc*), 2**anb*)
numroc is a ScaLAPACK tool functions;
pjlaenv is a ScaLAPACK environmental inquiry function MYROW, MYCOL, NPROW and NPCOL can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. Each of these values is returned in the first entry of the corresponding work arrays, and no error message is issued by pxerbla.

rwork (local)
REAL for pchegvx
DOUBLE PRECISION for pzhegvx.
Workspace array, DIMENSION (*lrwork*).

lrwork (local) INTEGER. The dimension of the array *rwork*.
See below for definitions of variables used to define *lrwork*.
If no eigenvectors are requested (*jobz* = 'N'), then *lrwork* ≥ 5**nn*+4**n*
If eigenvectors are requested (*jobz* = 'V'), then the amount of workspace required to guarantee that all eigenvectors are computed is:
lrwork ≥ 4**n* + max(5**nn*, *np*0**mq*0)+ iceil(*neig*, NPROW*NPCOL)**nn*
The computed eigenvectors may not be orthogonal if the minimal workspace is supplied and *orfac* is too small. If you want to guarantee orthogonality (at the cost of potentially poor performance) you should add the following value to *lrwork*:
(*clustersize*-1)**n*,
where *clustersize* is the number of eigenvalues in the largest cluster, where a cluster is defined as a set of close eigenvalues:

{*w*(*k*),..., *w*(*k*+*clustersize*-1)| *w*(*j*+1) ≤ *w*(*j*)+*orfac**2*norm(*A*)}
Variable definitions:
neig = number of eigenvectors requested;
nb = *desca*(*mb_*) = *desca*(*nb_*) = *descz*(*mb_*) = *descz*(*nb_*);
nn = max(*n*, *nb*, 2);
desca(*rsrc_*) = *desca*(*nb_*) = *descz*(*rsrc_*) = *descz*(*csrc_*) = 0 ;
*np*0 = numroc(*nn*, *nb*, 0, 0, NPROW);
*mq*0 = numroc(max(*neig*, *nb*, 2), *nb*, 0, 0, NPCOL);
iceil(*x*, *y*) is a ScaLAPACK function returning ceiling(*x*/*y*).
When *lrwork* is too small:
If *lwork* is too small to guarantee orthogonality, p?hegvx attempts to maintain orthogonality in the clusters with the smallest spacing between the eigenvalues.
If *lwork* is too small to compute all the eigenvectors requested, no computation is performed and *info*= -25 is returned. Note that when *range*='V', p?hegvx does not know how many eigenvectors are requested until the eigenvalues are computed. Therefore, when *range*='V' and as long as *lwork* is large enough to allow p?hegvx to compute the eigenvalues, p?hegvx will compute the eigenvalues and as many eigenvectors as it can.
Relationship between workspace, orthogonality & performance:
If *clustersize* > *n*/*sqrt*(NPROW*NPCOL), then providing enough space to compute all the eigenvectors orthogonally will cause serious degradation in performance. In the limit (that is, *clustersize* = *n*-1) p?stein will perform no better than ?stein on 1 processor.
For *clustersize* = *n*/*sqrt*(NPROW*NPCOL) reorthogonalizing all eigenvectors will increase the total execution time by a factor of 2 or more.
For *clustersize* > *n*/*sqrt*(NPROW*NPCOL) execution time will grow as the square of the cluster size, all other factors remaining equal and assuming enough workspace. Less workspace means less reorthogonalization but faster execution.
If *lwork* = -1, then *lrwork* is global input and a workspace query is assumed; the routine only calculates the size required for optimal performance for all work arrays. Each of these values is returned in the first entry of the corresponding work arrays, and no error message is issued by pxerbla.

iwork (local) INTEGER. Workspace array.

liwork (local) INTEGER, dimension of *iwork*.

liwork ≥ 6**nnp*

Where: *nnp* = max(*n*, NPROW*NPCOL + 1, 4)

If *liwork* = -1, then *liwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — On exit, if *jobz* = 'V', then if *info* = 0, sub(*A*) contains the distributed matrix *Z* of eigenvectors.
The eigenvectors are normalized as follows:
If *ibtype* = 1 or 2, then Z^H*sub(*B*)*Z = *i*;
If *ibtype* = 3, then Z^H*inv(sub(*B*))*Z = *i*.
If *jobz* = 'N', then on exit the upper triangle (if *uplo*='U') or the lower triangle (if *uplo*='L') of sub(*A*), including the diagonal, is destroyed.

b — On exit, if *info* ≤ *n*, the part of sub(*B*) containing the matrix is overwritten by the triangular factor *U* or *L* from the Cholesky factorization sub(*B*) = U^H*U, or sub(*B*) = *L*L^H.

m — (global) INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.

nz — (global) INTEGER. Total number of eigenvectors computed. 0 < *nz* < *m*. The number of columns of *z* that are filled.

If *jobz* ≠ 'V', *nz* is not referenced.
If *jobz* = 'V', *nz* = *m* unless the user supplies insufficient space and p?hegvx is not able to detect this before beginning computation. To get all the eigenvectors requested, the user must supply both sufficient space to hold the eigenvectors in *z* (*m*. *le*. *descz*(*n_*)) and sufficient workspace to compute them. (See *lwork* below.) The routine p?hegvx is always able to detect insufficient space without computation unless *range* = 'V'.

w — (global)
REAL for pchegvx
DOUBLE PRECISION for pzhegvx.
Array, DIMENSION (*n*). On normal exit, the first *m* entries contain the selected eigenvalues in ascending order.

z — (local).
COMPLEX for pchegvx
DOUBLE COMPLEX for pzhegvx.
global dimension (*n*, *n*), local dimension (*lld_z*, *LOCc*(*jz*+*n*-1)).
If *jobz* = 'V', then on normal exit the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix corresponding to the selected eigenvalues. If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
If *jobz* = 'N', then *z* is not referenced.

work On exit, *work*(1) returns the optimal amount of workspace.

rwork On exit, *rwork*(1) contains the amount of workspace required for optimal efficiency
If *jobz*='N' *rwork*(1) = optimal amount of workspace required to compute eigenvalues efficiently
If *jobz*='V' *rwork*(1) = optimal amount of workspace required to compute eigenvalues and eigenvectors efficiently with no guarantee on orthogonality.
If *range*='V', it is assumed that all eigenvectors may be required when computing optimal workspace.

ifail (global) INTEGER.
Array, DIMENSION (*n*).
ifail provides additional information when *info*.*ne*.0
If (*mod*(*info*/16,2).*ne*.0), then *ifail*(1) indicates the order of the smallest minor which is not positive definite.
If (*mod*(*info*,2).*ne*.0) on exit, then *ifail*(1) contains the indices of the eigenvectors that failed to converge.
If neither of the above error conditions are held, and *jobz* = 'V', then the first *m* elements of *ifail* are set to zero.

iclustr (global) INTEGER.
Array, DIMENSION (2*NPROW*NPCOL). This array contains indices of eigenvectors corresponding to a cluster of eigenvalues that could not be reorthogonalized due to insufficient workspace (see *lwork*, *orfac* and *info*). Eigenvectors corresponding to clusters of eigenvalues indexed *iclustr*(2**i*-1) to *iclustr*(2**i*), could not be reorthogonalized due to lack of workspace. Hence the eigenvectors corresponding to these clusters may not be orthogonal.
iclustr() is a zero terminated array.
(*iclustr*(2**k*).*ne*.0.*and*.*clustr*(2**k*+1).*eq*.0) if and only if *k* is the number of clusters.
iclustr is not referenced if *jobz* = 'N'.

gap (global)
REAL for pchegvx
DOUBLE PRECISION for pzhegvx.
Array, DIMENSION (NPROW*NPCOL).
This array contains the gap between eigenvalues whose eigenvectors could not be reorthogonalized. The output values in this array correspond to the clusters indicated by the array *iclustr*. As a result, the dot product between eigenvectors corresponding to the *i*-th cluster may be as high as (*C**n*)/*gap*(*i*), where *C* is a small constant.

info (global) INTEGER.
If *info* = 0, the execution is successful.
If *info* <0: the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.
If *info* > 0:

If (mod(*info*,2).*ne*.0), then one or more eigenvectors failed to converge. Their indices are stored in *ifail*.
If (mod(*info*,2,2).*ne*.0), then eigenvectors corresponding to one or more clusters of eigenvalues could not be reorthogonalized because of insufficient workspace. The indices of the clusters are stored in the array *iclustr*.
If (mod(*info*/4,2).*ne*.0), then space limit prevented p?sygvx from computing all of the eigenvectors between *vl* and *vu*. The number of eigenvectors computed is returned in *nz*.
If (mod(*info*/8,2).*ne*.0), then p?stebz failed to compute eigenvalues.
If (mod(*info*/16,2).*ne*.0), then *B* was not positive definite. *ifail(1)* indicates the order of the smallest minor which is not positive definite.

ScaLAPACK Auxiliary and Utility Routines

7

This chapter describes the Intel® Math Kernel Library implementation of ScaLAPACK Auxiliary Routines and Utility Functions and Routines. The library includes routines for both real and complex data.

NOTE. ScaLAPACK routines are provided only with Intel® MKL versions for Linux* and Windows* OSs.

Routine naming conventions, mathematical notation, and matrix storage schemes used for ScaLAPACK auxiliary and utility routines are the same as described in previous chapters. Some routines and functions may have combined character codes, such as `sc` or `dz`. For example, the routine `pscsum1` uses a complex input array and returns a real value.

Auxiliary Routines

Table 7-1 ScaLAPACK Auxiliary Routines

Routine Name	Data Types	Description
`p?lacgv`	`c,z`	Conjugates a complex vector.
`p?max1`	`c,z`	Finds the index of the element whose real part has maximum absolute value (similar to the Level 1 PBLAS `p?amax`, but using the absolute value to the real part).
`?combamax1`	`c,z`	Finds the element with maximum real part absolute value and its corresponding global index.
`p?sum1`	`sc,dz`	Forms the 1-norm of a complex vector similar to Level 1 PBLAS `p?asum`, but using the true absolute value.
`p?dbtrsv`	`s,d,c,z`	Computes an *LU* factorization of a general tridiagonal matrix with no pivoting. The routine is called by `p?dbtrs`.
`p?dttrsv`	`s,d,c,z`	Computes an *LU* factorization of a general band matrix, using partial pivoting with row interchanges. The routine is called by `p?dttrs`.
`p?gebd2`	`s,d,c,z`	Reduces a general rectangular matrix to real bidiagonal form by an orthogonal/unitary transformation (unblocked algorithm).

Routine Name	Data Types	Description
p?gehd2	s,d,c,z	Reduces a general matrix to upper Hessenberg form by an orthogonal/unitary similarity transformation (unblocked algorithm).
p?gelq2	s,d,c,z	Computes an *LQ* factorization of a general rectangular matrix (unblocked algorithm).
p?geql2	s,d,c,z	Computes a *QL* factorization of a general rectangular matrix (unblocked algorithm).
p?geqr2	s,d,c,z	Computes a *QR* factorization of a general rectangular matrix (unblocked algorithm).
p?gerq2	s,d,c,z	Computes an *RQ* factorization of a general rectangular matrix (unblocked algorithm).
p?getf2	s,d,c,z	Computes an *LU* factorization of a general matrix, using partial pivoting with row interchanges (local blocked algorithm).
p?labrd	s,d,c,z	Reduces the first *nb* rows and columns of a general rectangular matrix A to real bidiagonal form by an orthogonal/unitary transformation, and returns auxiliary matrices that are needed to apply the transformation to the unreduced part of A.
p?lacon	s,d,c,z	Estimates the 1-norm of a square matrix, using the reverse communication for evaluating matrix-vector products.
p?laconsb	s,d	Looks for two consecutive small subdiagonal elements.
p?lacp2	s,d,c,z	Copies all or part of a distributed matrix to another distributed matrix.
p?lacp3	s,d	Copies from a global parallel array into a local replicated array or vice versa.
p?lacpy	s,d,c,z	Copies all or part of one two-dimensional array to another.
p?laevswp	s,d,c,z	Moves the eigenvectors from where they are computed to ScaLAPACK standard block cyclic array.
p?lahrd	s,d,c,z	Reduces the first *nb* columns of a general rectangular matrix A so that elements below the k^{th} subdiagonal are zero, by an orthogonal/unitary transformation, and returns auxiliary matrices that are needed to apply the transformation to the unreduced part of A.
p?laiect	s,d,c,z	Exploits IEEE arithmetic to accelerate the computations of eigenvalues. (C interface function).
p?lange	s,d,c,z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element, of a general rectangular matrix.

Routine Name	Data Types	Description
p?lanhs	s,d,c,z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element, of an upper Hessenberg matrix.
p?lansy, p?lanhe	s,d,c,z/c,z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element of a real symmetric or complex Hermitian matrix.
p?lantr	s,d,c,z	Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element, of a triangular matrix.
p?lapiv	s,d,c,z	Applies a permutation matrix to a general distributed matrix, resulting in row or column pivoting.
p?laqge	s,d,c,z	Scales a general rectangular matrix, using row and column scaling factors computed by p?geequ.
p?laqsy	s,d,c,z	Scales a symmetric/Hermitian matrix, using scaling factors computed by p?poequ.
p?lared1d	s,d	Redistributes an array assuming that the input array *bycol* is distributed across rows and that all process columns contain the same copy of *bycol*.
p?lared2d	s,d	Redistributes an array assuming that the input array *byrow* is distributed across columns and that all process rows contain the same copy of *byrow* .
p?larf	s,d,c,z	Applies an elementary reflector to a general rectangular matrix.
p?larfb	s,d,c,z	Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.
p?larfc	c,z	Applies the conjugate transpose of an elementary reflector to a general matrix.
p?larfg	s,d,c,z	Generates an elementary reflector (Householder matrix).
p?larft	s,d,c,z	Forms the triangular vector *T* of a block reflector $H=I-VTV^H$
p?larz	s,d,c,z	Applies an elementary reflector as returned by p?tzrzf to a general matrix.
p?larzb	s,d,c,z	Applies a block reflector or its transpose/conjugate-transpose as returned by p?tzrzf to a general matrix.
p?larzc	c,z	Applies (multiplies by) the conjugate transpose of an elementary reflector as returned by p?tzrzf to a general matrix.
p?larzt	s,d,c,z	Forms the triangular factor *T* of a block reflector $H=I-VTV^H$ as returned by p?tzrzf.

Routine Name	Data Types	Description
p?lascl	s,d,c,z	Multiplies a general rectangular matrix by a real scalar defined as C_{to}/C_{from}.
p?laset	s,d,c,z	Initializes the off-diagonal elements of a matrix to α and the diagonal elements to β.
p?lasmsub	s,d	Looks for a small subdiagonal element from the bottom of the matrix that it can safely set to zero.
p?lassq	s,d,c,z	Updates a sum of squares represented in scaled form.
p?laswp	s,d,c,z	Performs a series of row interchanges on a general rectangular matrix.
p?latra	s,d,c,z	Computes the trace of a general square distributed matrix.
p?latrd	s,d,c,z	Reduces the first *nb* rows and columns of a symmetric/Hermitian matrix A to real tridiagonal form by an orthogonal/unitary similarity transformation.
p?latrz	s,d,c,z	Reduces an upper trapezoidal matrix to upper triangular form by means of orthogonal/unitary transformations.
p?lauu2	s,d,c,z	Computes the product UU^H or L^HL, where U and L are upper or lower triangular matrices (local unblocked algorithm).
p?lauum	s,d,c,z	Computes the product UU^H or L^HL, where U and L are upper or lower triangular matrices.
p?lawil	s,d	Forms the Wilkinson transform.
p?org2l/p?ung2l	s,d,c,z	Generates all or part of the orthogonal/unitary matrix Q from a QL factorization determined by p?geqlf (unblocked algorithm).
p?org2r/p?ung2r	s,d,c,z	Generates all or part of the orthogonal/unitary matrix Q from a QR factorization determined by p?geqrf (unblocked algorithm).
p?orgl2/p?ungl2	s,d,c,z	Generates all or part of the orthogonal/unitary matrix Q from an LQ factorization determined by p?gelqf (unblocked algorithm).
p?orgr2/p?ungr2	s,d,c,z	Generates all or part of the orthogonal/unitary matrix Q from an RQ factorization determined by p?gerqf (unblocked algorithm).
p?orm2l/p?unm2l	s,d,c,z	Multiplies a general matrix by the orthogonal/unitary matrix from a QL factorization determined by p?geqlf (unblocked algorithm).
p?orm2r/p?unm2r	s,d,c,z	Multiplies a general matrix by the orthogonal/unitary matrix from a QR factorization determined by p?geqrf (unblocked algorithm).
p?orml2/p?unml2	s,d,c,z	Multiplies a general matrix by the orthogonal/unitary matrix from an LQ factorization determined by p?gelqf (unblocked algorithm).

Routine Name	Data Types	Description
p?ormr2/p?unmr2	s,d,c,z	Multiplies a general matrix by the orthogonal/unitary matrix from an *RQ* factorization determined by p?gerqf (unblocked algorithm).
p?pbtrsv	s,d,c,z	Solves a single triangular linear system via frontsolve or backsolve where the triangular matrix is a factor of a banded matrix computed by p?pbtrf.
p?pttrsv	s,d,c,z	Solves a single triangular linear system via frontsolve or backsolve where the triangular matrix is a factor of a tridiagonal matrix computed by p?pttrf.
p?potf2	s,d,c,z	Computes the Cholesky factorization of a symmetric/Hermitian positive definite matrix (local unblocked algorithm).
p?rscl	s,d,cs,zd	Multiplies a vector by the reciprocal of a real scalar.
p?sygs2/p?hegs2	s,d,c,z	Reduces a symmetric/Hermitian definite generalized eigenproblem to standard form, using the factorization results obtained from p?potrf (local unblocked algorithm).
p?sytd2/p?hetd2	s,d,c,z	Reduces a symmetric/Hermitian matrix to real symmetric tridiagonal form by an orthogonal/unitary similarity transformation (local unblocked algorithm).
p?trti2	s,d,c,z	Computes the inverse of a triangular matrix (local unblocked algorithm).
?lamsh	s,d	Sends multiple shifts through a small (single node) matrix to maximize the number of bulges that can be sent through.
?laref	s,d	Applies Householder reflectors to matrices on either their rows or columns.
?lasorte	s,d	Sorts eigenpairs by real and complex data types.
?lasrt2	s,d	Sorts numbers in increasing or decreasing order.
?stein2	s,d	Computes the eigenvectors corresponding to specified eigenvalues of a real symmetric tridiagonal matrix, using inverse iteration.
?dbtf2	s,d,c,z	Computes an *LU* factorization of a general band matrix with no pivoting (local unblocked algorithm).
?dbtrf	s,d,c,z	Computes an *LU* factorization of a general band matrix with no pivoting (local blocked algorithm).
?dttrf	s,d,c,z	Computes an *LU* factorization of a general tridiagonal matrix with no pivoting (local blocked algorithm).
?dttrsv	s,d,c,z	Solves a general tridiagonal system of linear equations using the *LU* factorization computed by ?dttrf.

Routine Name	Data Types	Description
?pttrsv	s,d,c,z	Solves a symmetric (Hermitian) positive-definite tridiagonal system of linear equations, using the LDL^H factorization computed by ?pttrf.
?steqr2	s,d	Computes all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the implicit *QL* or *QR* method.

p?lacgv

Conjugates a complex vector.

Syntax

```
call pclacgv(n, x, ix, jx, descx, incx)
call pzlacgv(n, x, ix, jx, descx, incx)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine conjugates a complex vector sub(*x*) of length *n*, where sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*:*ix*+*n*-1, *jx*) if *incx* = 1.

Input Parameters

n	(global) INTEGER. The length of the distributed vector sub(*x*).
x	(local). COMPLEX for pclacgv COMPLEX*16 for pzlacgv.Pointer into the local memory to an array of DIMENSION (*lld_x*, *). On entry the vector to be conjugated *x*(i) = *X*(*ix*+(*jx*-1)*m_x+(*i*-1)*incx), 1 ≤ *i* ≤ *n*.
ix	(global) INTEGER.The row index in the global array *x* indicating the first row of sub(*x*).
jx	(global) INTEGER. The column index in the global array *x* indicating the first column of sub(*x*).
descx	(global and local) INTEGER. Array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *X*.
incx	(global) INTEGER.The global increment for the elements of *X*. Only two values of *incx* are supported in this version, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

x	(local). On exit, the conjugated vector.

p?max1

Finds the index of the element whose real part has maximum absolute value (similar to the Level 1 PBLAS p?amax*, but using the absolute value to the real part).*

Syntax

```
call pcmax1(n, amax, indx, x, ix, jx, descx, incx)
call pzmax1(n, amax, indx, x, ix, jx, descx, incx)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the global index of the maximum element in absolute value of a distributed vector sub(*x*). The global index is returned in *indx* and the value is returned in *amax*, where sub(*x*) denotes *X*(*ix*:*ix*+*n*-1, *jx*) if *incx* = 1, *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*.

Input Parameters

n	(global) pointer to INTEGER. The number of components of the distributed vector sub(*x*). *n* ≥ 0.
x	(local) COMPLEX for pcmax1. COMPLEX*16 for pzmax1 Array containing the local pieces of a distributed matrix of dimension of at least ((*jx*-1)*m_x+*ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub (*x*).
ix	(global) INTEGER.The row index in the global array *X* indicating the first row of sub(*x*).
jx	(global) INTEGER. The column index in the global array *X* indicating the first column of sub(*x*)
descx	(global and local) INTEGER. Array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *X*.
incx	(global) INTEGER.The global increment for the elements of *X*. Only two values of *incx* are supported in this version, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

amax	(global output) pointer to REAL.The absolute value of the largest entry of the distributed vector sub(*x*) only in the scope of sub(*x*).
indx	(global output) pointer to INTEGER.The global index of the element of the distributed vector sub(*x*) whose real part has maximum absolute value.

?combamax1

Finds the element with maximum real part absolute value and its corresponding global index.

Syntax

```
call ccombamax1(v1, v2)
call zcombamax1(v1, v2)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine finds the element having maximum real part absolute value as well as its corresponding global index.

Input Parameters

v1	(local) `COMPLEX` for `ccombamax1` `COMPLEX*16` for `zcombamax1` Array, `DIMENSION` 2. The first maximum absolute value element and its global index. *v1*`(1)=amax`, *v1*`(2)=indx`.

v2	(local)
	`COMPLEX` for `ccombamax1`
	`COMPLEX*16` for `zcombamax1`
	Array, `DIMENSION` 2. The second maximum absolute value element and its global index. *v2*`(1)=amax`, *v2*`(2)=indx`.

Output Parameters

v1	(local). The first maximum absolute value element and its global index. *v1*`(1)=amax`, *v1*`(2)=indx`.

p?sum1

Forms the 1-norm of a complex vector similar to Level 1 PBLAS `p?asum`*, but using the true absolute value.*

Syntax

```
call pscsum1(n, asum, x, ix, jx, descx, incx)
call pdzsum1(n, asum, x, ix, jx, descx, incx)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine returns the sum of absolute values of a complex distributed vector sub(*x*) in *asum*, where sub(*x*) denotes *X*(*ix*:*ix*+*n*-1, *jx*:*jx*), if *incx* = 1, *X*(*ix*:*ix*, *jx*:*jx*+*n*-1), if *incx* = *m_x*.

Based on p?asum from the Level 1 PBLAS. The change is to use the 'genuine' absolute value.

Input Parameters

n	(global) pointer to INTEGER. The number of components of the distributed vector sub(*x*). *n* ≥ 0.
x	(local) COMPLEX for pscsum1 COMPLEX*16 for pdzsum1. Array containing the local pieces of a distributed matrix of dimension of at least ((*jx*-1)*m_x+*ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub (*x*).
ix	(global) INTEGER.The row index in the global array *X* indicating the first row of sub(*x*).
jx	(global) INTEGER. The column index in the global array *X* indicating the first column of sub(*x*)
descx	(global and local) INTEGER. Array, DIMENSION 8. The array descriptor for the distributed matrix *X*.
incx	(global) INTEGER.The global increment for the elements of *X*. Only two values of *incx* are supported in this version, namely 1 and *m_x*.

Output Parameters

asum	(local) Pointer to REAL. The sum of absolute values of the distributed vector sub(*x*) only in its scope.

p?dbtrsv

Computes an LU factorization of a general triangular matrix with no pivoting. The routine is called by p?dbtrs.

Syntax

call psdbtrsv(*uplo*, *trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pddbtrsv(*uplo*, *trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pcdbtrsv(*uplo*, *trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzdbtrsv(*uplo*, *trans*, *n*, *bwl*, *bwu*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routines solves a banded triangular system of linear equations

A(1 :*n*, *ja*:*ja*+*n*-1) * *X* = *B*(*ib*:*ib*+*n*-1, 1 :*nrhs*) or

A(1 :*n*, *ja*:*ja*+*n*-1)^T * *X* = *B*(*ib*:*ib*+*n*-1, 1 :*nrhs*) (for real flavors); *A*(1 :*n*, *ja*:*ja*+*n*-1)^H * *X* = *B*(*ib*:*ib*+*n*-1, 1 :*nrhs*) (for complex flavors),

where *A*(1 :*n*, *ja*:*ja*+*n*-1) is a banded triangular matrix factor produced by the Gaussian elimination code PD@(dom_pre)BTRF and is stored in *A*(1 :*n*, *ja*:*ja*+*n*-1) and *af*. The matrix stored in *A*(1 :*n*, *ja*:*ja*+*n*-1) is either upper or lower triangular according to *uplo*, and the choice of solving *A*(1 :*n*, *ja*:*ja*+*n*-1) or *A*(1 :*n*, *ja*:*ja*+*n*-1)^T is dictated by the user by the parameter *trans*.

Routine p?dbtrf must be called first.

Input Parameters

uplo (global) CHARACTER.
If *uplo*='U', the upper triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored,
if *uplo* = 'L', the lower triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored.

trans (global) CHARACTER.
If *trans* = 'N', solve with *A*(1:*n*, *ja*:*ja*+*n*-1),
if *trans* = 'C', solve with conjugate transpose *A*(1:*n*, *ja*:*ja*+*n*-1).

n (global) INTEGER. The order of the distributed submatrix *A*;(*n*≥ 0).

bwl (global) INTEGER. Number of subdiagonals. 0 ≤ *bwl* ≤ *n*-1.

bwu (global) INTEGER. Number of subdiagonals. 0 ≤ *bwu* ≤ *n*-1.

nrhs (global) INTEGER. The number of right-hand sides; the number of columns of the distributed submatrix *B* (*nrhs*≥ 0).

a (local).
REAL for psdbtrsv
DOUBLE PRECISION for pddbtrsv
COMPLEX for pcdbtrsv
COMPLEX*16 for pzdbtrsv.
Pointer into the local memory to an array with first DIMENSION *lld_a*≥(*bwl*+*bwu*+1)(stored in *desca*). On entry, this array contains the local pieces of the *n*-by-*n* unsymmetric banded distributed Cholesky factor *L* or *L*^{T}*A*(1 :*n*, *ja*:*ja*+*n*-1). This local portion is stored in the packed banded format used in LAPACK. See the *Application Notes* below and the ScaLAPACK manual for more detail on the format of distributed matrices.

ja (global) INTEGER. The index in the global array *a* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*).
if 1*d* type (*dtype_a* = 501 or 502), *dlen*≥ 7;
if 2*d* type (*dtype_a* = 1), *dlen*≥ 9. The array descriptor for the distributed matrix *A*. Contains information of mapping of *A* to memory.

b (local)
REAL for psdbtrsv

DOUBLE PRECISION for pddbtrsv
COMPLEX for pcdbtrsv
COMPLEX*16 for pzdbtrsv.
Pointer into the local memory to an array of local lead DIMENSION *lld_b*≥*nb*. On entry, this array contains the local pieces of the right-hand sides *B*(*ib*:*ib*+*n*-1, 1:*nrhs*).

ib (global) INTEGER. The row index in the global array *b* that points to the first row of the matrix to be operated on (which may be either all of *b* or a submatrix of *B*).

descb (global and local) INTEGER array of DIMENSION (*dlen_*).

if 1*d* type (*dtype_b* =502), *dlen*≥7;

if 2*d* type (*dtype_b* =1), *dlen*≥9. The array descriptor for the distributed matrix *B*. Contains information of mapping *B* to memory.

laf (local)
INTEGER. Size of user-input Auxiliary Filling space *af*.

laf must be ≥*nb**(*bwl*+*bwu*)+6*max(*bwl*, *bwu*)*max(*bwl*, *bwu*). If *laf* is not large enough, an error code is returned and the minimum acceptable size will be returned in *af*(1).

work (local).
REAL for psdbtrsv
DOUBLE PRECISION for pddbtrsv
COMPLEX for pcdbtrsv
COMPLEX*16 for pzdbtrsv.
Temporary workspace. This space may be overwritten in between calls to routines.
work must be the size given in *lwork*.

lwork (local or global) INTEGER.
Size of user-input workspace *work*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned.

lwork≥ max(*bwl*, *bwu*)**nrhs*.

Output Parameters

a (local).
This local portion is stored in the packed banded format used in LAPACK. Please see the ScaLAPACK manual for more detail on the format of distributed matrices.

b On exit, this contains the local piece of the solutions distributed matrix *X*.

af (local).
REAL for psdbtrsv
DOUBLE PRECISION for pddbtrsv
COMPLEX for pcdbtrsv
COMPLEX*16 for pzdbtrsv.

	Auxiliary Filling Space. Filling is created during the factorization routine p?dbtrf and this is stored in *af*. If a linear system is to be solved using p?dbtrf after the factorization routine, *af* must not be altered after the factorization.
work	On exit, *work*(1) contains the minimal *lwork*.
info	(local). INTEGER. If *info* = 0, the execution is successful. < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?dttrsv

Computes an LU factorization of a general band matrix, using partial pivoting with row interchanges. The routine is called by p?dttrs.

Syntax

call psdttrsv(*uplo*, *trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pddttrsv(*uplo*, *trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pcdttrsv(*uplo*, *trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzdttrsv(*uplo*, *trans*, *n*, *nrhs*, *dl*, *d*, *du*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves a tridiagonal triangular system of linear equations

A(1 :*n*, *ja*:*ja*+*n*-1)**X* = *B*(*ib*:*ib*+*n*-1, 1 :*nrhs*) or

A(1 :*n*, *ja*:*ja*+*n*-1)^T * *X* = *B*(*ib*:*ib*+*n*-1, 1 :*nrhs*) for real flavors; *A*(1 :*n*, *ja*:*ja*+*n*-1)^H * *X* = *B*(*ib*:*ib*+*n*-1, 1 :*nrhs*) for complex flavors,

where *A*(1 :*n*, *ja*:*ja*+*n*-1) is a tridiagonal matrix factor produced by the Gaussian elimination code PS@(dom_pre)TTRF and is stored in *A*(1 :*n*, *ja*:*ja*+*n*-1) and *af*.

The matrix stored in *A*(1 :*n*, *ja*:*ja*+*n*-1) is either upper or lower triangular according to *uplo*, and the choice of solving *A*(1 :*n*, *ja*:*ja*+*n*-1) or *A*(1 :*n*, *ja*:*ja*+*n*-1)^T is dictated by the user by the parameter *trans*.

Routine p?dttrf must be called first.

Input Parameters

uplo	(global) CHARACTER. If *uplo*='U', the upper triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored,

if *uplo* = 'L', the lower triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored.

trans (global) CHARACTER.
If *trans* = 'N', solve with *A*(1:*n*, *ja*:*ja*+*n*-1),
if *trans* = 'C', solve with conjugate transpose *A*(1:*n*, *ja*:*ja*+*n*-1).

n (global) INTEGER. The order of the distributed submatrix *A*; (*n*≥ 0).

nrhs (global) INTEGER. The number of right-hand sides; the number of columns of the distributed submatrix *B*(*ib*:*ib*+*n*-1, 1:*nrhs*). (*nrhs*≥ 0).

dl (local).
REAL for psdttrsv
DOUBLE PRECISION for pddttrsv
COMPLEX for pcdttrsv
COMPLEX*16 for pzdttrsv.
Pointer to local part of global vector storing the lower diagonal of the matrix.
Globally, *dl*(1) is not referenced, and *dl* must be aligned with *d*.
Must be of size ≥*desca*(*nb_*).

d (local).
REAL for psdttrsv
DOUBLE PRECISION for pddttrsv
COMPLEX for pcdttrsv
COMPLEX*16 for pzdttrsv.
Pointer to local part of global vector storing the main diagonal of the matrix.

du (local).
REAL for psdttrsv
DOUBLE PRECISION for pddttrsv
COMPLEX for pcdttrsv
COMPLEX*16 for pzdttrsv.
Pointer to local part of global vector storing the upper diagonal of the matrix.
Globally, *du*(*n*) is not referenced, and *du* must be aligned with *d*.

ja (global) INTEGER. The index in the global array *a* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local). INTEGER array of DIMENSION (*dlen_*).
if 1*d* type (*dtype_a* = 501 or 502), *dlen*≥ 7;
if 2*d* type (*dtype_a* = 1), *dlen*≥ 9.
The array descriptor for the distributed matrix *A*. Contains information of mapping of *A* to memory.

b (local)
REAL for psdttrsv
DOUBLE PRECISION for pddttrsv
COMPLEX for pcdttrsv

	COMPLEX*16 for pzdttrsv. Pointer into the local memory to an array of local lead DIMENSION *lld_b*≥*nb*. On entry, this array contains the local pieces of the right-hand sides *B*(*ib*:*ib*+*n*-1, 1 :*nrhs*).
ib	(global). INTEGER. The row index in the global array *b* that points to the first row of the matrix to be operated on (which may be either all of *b* or a submatrix of *B*).
descb	(global and local).INTEGER array of DIMENSION (*dlen_*). if 1*d* type (*dtype_b* = 502), *dlen*≥7; if 2*d* type (*dtype_b* = 1), *dlen*≥ 9. The array descriptor for the distributed matrix *B*. Contains information of mapping *B* to memory.
laf	(local). INTEGER. Size of user-input Auxiliary Filling space *af*. *laf* must be ≥ 2*(*nb*+2). If *laf* is not large enough, an error code is returned and the minimum acceptable size will be returned in *af*(1).
work	(local). REAL for psdttrsv DOUBLE PRECISION for pddttrsv COMPLEX for pcdttrsv COMPLEX*16 for pzdttrsv. Temporary workspace. This space may be overwritten in between calls to routines. *work* must be the size given in *lwork*.
lwork	(local or global).INTEGER. Size of user-input workspace *work*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned. *lwork*≥ 10**npcol*+4**nrhs*.

Output Parameters

dl	(local). On exit, this array contains information containing the factors of the matrix.
d	On exit, this array contains information containing the factors of the matrix. Must be of size ≥*desca* (*nb_*).
b	On exit, this contains the local piece of the solutions distributed matrix X.
af	(local). REAL for psdttrsv DOUBLE PRECISION for pddttrsv COMPLEX for pcdttrsv

	COMPLEX*16 for pzdttrsv. Auxiliary Filling Space. Filling is created during the factorization routine p?dttrf and this is stored in *af*. If a linear system is to be solved using p?dttrs after the factorization routine, *af* must not be altered after the factorization.
work	On exit, *work*(1) contains the minimal *lwork*.
info	(local). INTEGER. If *info*=0, the execution is successful. if *info*< 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?gebd2

Reduces a general rectangular matrix to real bidiagonal form by an orthogonal/unitary transformation (unblocked algorithm).

Syntax

```
call psgebd2(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
call pdgebd2(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
call pcgebd2(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
call pzgebd2(m, n, a, ia, ja, desca, d, e, tauq, taup, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces a real/complex general *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) to upper or lower bidiagonal form *B* by an orthogonal/unitary transformation:

Q'*sub(*A*)**P* = *B*.

If *m* ≥ *n*, *B* is the upper bidiagonal; if *m*<*n*, *B* is the lower bidiagonal.

Input Parameters

m	(global) INTEGER. The number of rows of the distributed submatrix sub(*A*). (*m*≥0).
n	(global) INTEGER. The order of the distributed submatrix sub(*A*). (*n*≥0).
a	(local). REAL for psgebd2 DOUBLE PRECISION for pdgebd2 COMPLEX for pcgebd2 COMPLEX*16 for pzgebd2.

Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the general distributed matrix sub(*A*).

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

work (local).
REAL for psgebd2
DOUBLE PRECISION for pdgebd2
COMPLEX for pcgebd2
COMPLEX*16 for pzgebd2.
This is a workspace array of DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork* ≥ max(*mpa*0, *nqa*0), where *nb* = *mb_a* = *nb_a*, *iroffa* = mod(*ia*-1, *nb*),
iarow = indxg2p(*ia*, *nb*, *myrow*, *rsrc_a*, *nprow*),
iacol = indxg2p(*ja*, *nb*, *mycol*, *csrc_a*, *npcol*),
*mpa*0 = numroc(*m*+*iroffa*, *nb*, *myrow*, *iarow*, *nprow*),
*nqa*0 = numroc(*n*+*icoffa*, *nb*, *mycol*, *iacol*, *npcol*).
indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a (local).

On exit, if *m* ≥ *n*, the diagonal and the first superdiagonal of sub(*A*) are overwritten with the upper bidiagonal matrix *B*; the elements below the diagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and the elements above the first superdiagonal, with the array *taup*, represent the orthogonal matrix *P* as a product of elementary reflectors. If *m* < *n*, the diagonal and the first subdiagonal are overwritten with the lower bidiagonal matrix *B*; the elements below the first subdiagonal, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary

reflectors, and the elements above the diagonal, with the array *taup*, represent the orthogonal matrix *P* as a product of elementary reflectors. See *Applications Notes* below.

d (local)
REAL for psgebd2
DOUBLE PRECISION for pdgebd2
COMPLEX for pcgebd2
COMPLEX*16 for pzgebd2.
Array, DIMENSION *LOCc*(*ja*+min(*m*,*n*)-1) if $m \geq n$; *LOCr*(*ia*+min(*m*,*n*)-1) otherwise. The distributed diagonal elements of the bidiagonal matrix *B*: *d*(*i*) = *a*(*i*,*i*). *d* is tied to the distributed matrix *A*.

e (local)
REAL for psgebd2
DOUBLE PRECISION for pdgebd2
COMPLEX for pcgebd2
COMPLEX*16 for pzgebd2.
Array, DIMENSION *LOCc*(*ja*+min(*m*,*n*)-1) if $m \geq n$; *LOCr*(*ia*+min(*m*,*n*)-2) otherwise. The distributed diagonal elements of the bidiagonal matrix *B*:
if $m \geq n$, *e*(*i*) = *a*(*i*, *i*+1) for *i* = 1, 2, ... , *n*-1;
if $m < n$, *e*(*i*) = *a*(*i*+1, *i*) for *i* = 1, 2, ..., *m*-1. *e* is tied to the distributed matrix *A*.

tauq (local).
REAL for psgebd2
DOUBLE PRECISION for pdgebd2
COMPLEX for pcgebd2
COMPLEX*16 for pzgebd2.
Array, DIMENSION*LOCc*(*ja*+min(*m*,*n*)-1). The scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*. *tauq* is tied to the distributed matrix *A*.

taup (local).
REAL for psgebd2
DOUBLE PRECISION for pdgebd2
COMPLEX for pcgebd2
COMPLEX*16 for pzgebd2.
Array, DIMENSION *LOCr*(*ia*+min(*m*,*n*)-1). The scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *P*. *taup* is tied to the distributed matrix *A*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local)
INTEGER.
If *info* = 0, the execution is successful.

if *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrices *Q* and *P* are represented as products of elementary reflectors:

If *m*≥*n*,

Q = *H*(1)**H*(2)*...**H*(*n*), and *P* = *G*(1)**G*(2)*...**G*(*n*-1)

Each *H*(i) and *G*(i) has the form:

H(i) = *I* - *tauq***v***v'*, and *G*(i) = *I* - *taup***u***u'*,

where *tauq* and *taup* are real/complex scalars, and *v* and *u* are real/complex vectors. *v*(1: *i*-1) = 0, *v*(*i*) = 1, and *v*(*i*+*i*:*m*) is stored on exit in

A(*ia*+*i*-*ia*+*m*-1, *a*+*i*-1);

u(1:*i*) = 0, *u*(*i*+1) = 1, and *u*(*i*+2:*n*) is stored on exit in *A*(*ia*+*i*-1, *ja*+*i*+1:*ja*+*n*-1);

tauq is stored in *TAUQ*(*ja*+*i*-1) and *taup* in *TAUP*(*ia*+*i*-1).

If *m* < *n*,

v(1: *i*) = 0, *v*(*i*+1) = 1, and *v*(*i*+2:*m*) is stored on exit in *A*(*ia*+*i*+1: *ia*+*m*-1, *ja*+*i*-1);

u(1: *i*-1) = 0, *u*(*i*) = 1, and *u*(*i*+1 :*n*) is stored on exit in *A*(*ia*+*i*-1,*ja*+*i*:*ja*+*n*-1);

tauq is stored in *TAUQ*(*ja*+*i*-1) and *taup* in *TAUP*(*ia*+*i*-1).

The contents of sub(*A*) on exit are illustrated by the following examples:

m = 6 and *n* = 5(*m* > *n*):

$$\begin{bmatrix} d & e & u1 & u1 & u1 \\ v1 & d & e & u2 & u2 \\ v1 & v2 & d & e & u3 \\ v1 & v2 & v3 & d & e \\ v1 & v2 & v3 & v4 & d \\ v1 & v2 & v3 & v4 & v5 \end{bmatrix}$$

m = 5 and *n* = 6(*m* < *n*):

$$\begin{bmatrix} d & u1 & u1 & u1 & u1 & u1 \\ e & d & u2 & u2 & u2 & u2 \\ v1 & e & d & u3 & u3 & u3 \\ v1 & v2 & e & d & u4 & u4 \\ v1 & v2 & v3 & e & d & u5 \end{bmatrix}$$

where *d* and *e* denote diagonal and off-diagonal elements of *B*, *vi* denotes an element of the vector defining *H*(*i*), and *ui* an element of the vector defining *G*(*i*).

p?gehd2

Reduces a general matrix to upper Hessenberg form by an orthogonal/unitary similarity transformation (unblocked algorithm).

Syntax

call psgehd2(*n*, *ilo*, *ihi*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

```
call pdgehd2(n, ilo, ihi, a, ia, ja, desca, tau, work, lwork, info)
call pcgehd2(n, ilo, ihi, a, ia, ja, desca, tau, work, lwork, info)
call pzgehd2(n, ilo, ihi, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine reduces a real/complex general distributed matrix sub(*A*) to upper Hessenberg form *H* by an orthogonal/unitary similarity transformation: *Q*'*sub(*A*)**Q* = *H*, where sub(*A*) = *A*(*ia*+*n*-1 :*ia*+*n*-1, *ja*+*n*-1 :*ja*+*n*-1).

Input Parameters

n	(global) INTEGER. The order of the distributed submatrix *A*. (*n*≥ 0).
ilo, *ihi*	(global) INTEGER. It is assumed that sub(*A*) is already upper triangular in rows *ia*:*ia*+*ilo*-2 and *ia*+*ihi*:*ia*+*n*-1 and columns *ja*:*ja*+*jlo*-2 and *ja*+*jhi*:*ja*+*n*-1. See *Application Notes* for further information. If *n*≥ 0, 1 ≤ *ilo* ≤ *ihi* ≤ *n*; otherwise set *ilo* = 1, *ihi* = *n*.
a	(local). REAL for psgehd2 DOUBLE PRECISION for pdgehd2 COMPLEX for pcgehd2 COMPLEX*16 for pzgehd2. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *n*-by-*n* general distributed matrix sub(*A*) to be reduced.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
work	(local). REAL for psgehd2 DOUBLE PRECISION for pdgehd2 COMPLEX for pcgehd2 COMPLEX*16 for pzgehd2. This is a workspace array of DIMENSION (*lwork*).
lwork	(local or global). INTEGER. The dimension of the array *work*. *lwork* is local input and must be at least *lwork*≥*nb* + max(*npa*0, *nb*), where *nb* = *mb_a* = *nb_a*, *iroffa* = mod(*ia*-1, *nb*), *iarow* = indxg2p (*ia*, *nb*, *myrow*, *rsrc_a*, *nprow*),*npa*0 = numroc(*ihi*+*iroffa*, *nb*, *myrow*, *iarow*, *nprow*).

indxg2p and numroc are ScaLAPACK tool functions;*myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a (local). On exit, the upper triangle and the first subdiagonal of sub(*A*) are overwritten with the upper Hessenberg matrix *H*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors. (see *Application Notes* below).

tau (local).
REAL for psgehd2
DOUBLE PRECISION for pdgehd2
COMPLEX for pcgehd2
COMPLEX*16 for pzgehd2.
Array, DIMENSION *LOCc*(*ja*+*n*-2) The scalar factors of the elementary reflectors (see *Application Notes* below). Elements *ja*:*ja*+*ilo*-2 and *ja*+*ihi*:*ja*+*n*-2 of *tau* are set to zero. *tau* is tied to the distributed matrix *A*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local).INTEGER.
If *info* = 0, the execution is successful.
if *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

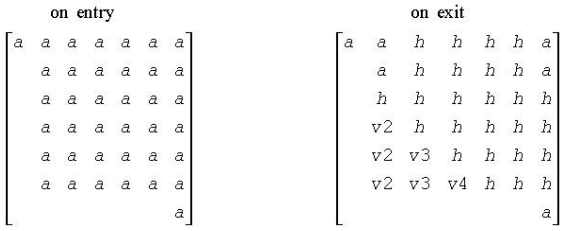
Application Notes

The matrix *Q* is represented as a product of (*ihi*-*ilo*) elementary reflectors
Q = *H*(*ilo*)**H*(*ilo*+1)*...**H*(*ihi*-1).

Each *H*(*i*) has the form
H(*i*) = *I* - *tau***v***v*',

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1: *i*)=0, *v*(*i*+1)=1 and *v*(*ihi*+1:*n*)=0; *v*(*i*+2:*ihi*) is stored on exit in *A*(*ia*+*ilo*+*i*:*ia*+*ihi*-1, *ia*+*ilo*+*i*-2), and *tau* in *tau*(*ja*+*ilo*+*i*-2).

The contents of *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) are illustrated by the following example, with *n* = 7, *ilo* = 2 and *ihi* = 6:



where *a* denotes an element of the original matrix sub(*A*), *h* denotes a modified element of the upper Hessenberg matrix *H*, and *vi* denotes an element of the vector defining *H*(*ja*+*ilo*+*i*-2).

p?gelq2

Computes an LQ factorization of a general rectangular matrix (unblocked algorithm).

Syntax

```
call psgelq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgelq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgelq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgelq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes an *LQ* factorization of a real/complex distributed *m*-by-*n* matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) = *L***Q*.

Input Parameters

m — (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥0).

n — (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n*≥0).

a — (local).
REAL for psgelq2
DOUBLE PRECISION for pdgelq2
COMPLEX for pcgelq2
COMPLEX*16 for pzgelq2.
Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*) which is to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

work (local).
REAL for psgelq2
DOUBLE PRECISION for pdgelq2
COMPLEX for pcgelq2
COMPLEX*16 for pzgelq2.
This is a workspace array of DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork*≥*nq*0 + max(1, *mp*0), where *iroff* = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*), *iacol* = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*), *mp*0 = numroc(*m*+*iroff*, *mb_a*, *myrow*, *iarow*, *nprow*), *nq*0 = numroc(*n*+*icoff*, *nb_a*, *mycol*, *iacol*, *npcol*), indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a (local).
On exit, the elements on and below the diagonal of sub(*A*) contain the *m* by min(*m*, *n*) lower trapezoidal matrix *L* (*L* is lower triangular if *m* ≤ *n*); the elements above the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau (local).
REAL for psgelq2
DOUBLE PRECISION for pdgelq2
COMPLEX for pcgelq2
COMPLEX*16 for pzgelq2.
Array, DIMENSION *LOCr*(*ia*+min(*m*, *n*)-1). This array contains the scalar factors of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info	(local).INTEGER. If *info* = 0, the execution is successful. if *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q =*H*(*ia*+*k*-1)**H*(*ia*+*k*-2)*. . . **H*(*ia*) for real flavors, *Q* =$(H(ia+k-1))^H$*$(H(ia+k-2))^H$...*$(H(ia))^H$ for complex flavors,

where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1: *i*-1) = 0 and *v*(*i*) = 1; *v*(*i*+1: *n*) (for real flavors) or conjg(*v*(*i*+1: *n*)) (for complex flavors) is stored on exit in *A*(*ia*+*i*-1,*ja*+*i*:*ja*+*n*-1), and *tau* in *TAU*(*ia*+*i*-1).

p?geql2

Computes a QL factorization of a general rectangular matrix (unblocked algorithm).

Syntax

```
call psgeql2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgeql2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgeql2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgeql2(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes a *QL* factorization of a real/complex distributed *m*-by-*n* matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1)= *Q* **L*.

Input Parameters

m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥ 0).
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n*≥ 0).
a	(local). REAL for psgeql2

DOUBLE PRECISION for pdgeql2
COMPLEX for pcgeql2
COMPLEX*16 for pzgeql2.
Pointer into the local memory to an array of DIMENSION (*lld_a*,*LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*) which is to be factored.

ia, *ja* — (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca — (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

work — (local).
REAL for psgeql2
DOUBLE PRECISION for pdgeql2
COMPLEX for pcgeql2
COMPLEX*16 for pzgeql2.
This is a workspace array of DIMENSION (*lwork*).

lwork — (local or global) INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork*≥*mp*0 + max(1, *nq*0), where *iroff* = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*), *iacol* = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*), *mp*0 = numroc(*m*+*iroff*, *mb_a*, *myrow*, *iarow*, *nprow*), *nq*0 = numroc(*n*+*icoff*, *nb_a*, *mycol*, *iacol*, *npcol*), indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a — (local).
On exit,

if *m* ≥ *n*, the lower triangle of the distributed submatrix *A*(*ia*+*m*-*n*:*ia*+*m*-1, *ja*:*ja*+*n*-1) contains the *n*-by-*n* lower triangular matrix *L*;

if *m* ≤ *n*, the elements on and below the (*n*-*m*)-th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; the remaining elements, with the array *tau*, represent the orthogonal/ unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau	(local). REAL for psgeql2 DOUBLE PRECISION for pdgeql2 COMPLEX for pcgeql2 COMPLEX*16 for pzgeql2. Array, DIMENSION *LOCc*(*ja*+*n*-1). This array contains the scalar factors of the elementary reflectors. *tau* is tied to the distributed matrix *A*.
work	On exit, *work*(1) returns the minimal and optimal *lwork*.
info	(local). INTEGER. If *info* = 0, the execution is successful. if *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*+*k*-1)*...**H*(*ja*+1)**H*(*ja*), where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*i*) = *I*- *tau* **v***v*'

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*m*-*k*+*i*+1: *m*) = 0 and *v*(*m*-*k*+*i*) = 1; *v*(1: *m*-*k*+*i*-1) is stored on exit in *A*(*ia*:*ia*+*m*-*k*+*i*-2, *ja*+*n*-*k*+*i*-1), and *tau* in *TAU*(*ja*+*n*-*k*+*i*-1).

p?geqr2

Computes a QR factorization of a general rectangular matrix (unblocked algorithm).

Syntax

```
call psgeqr2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgeqr2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgeqr2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgeqr2(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes a *QR* factorization of a real/complex distributed *m*-by-*n* matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1)= *Q***R*.

Input Parameters

m	(global). INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥0).

n (global).INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n*≥0).

a (local).
REAL for psgeqr2
DOUBLE PRECISION for pdgeqr2
COMPLEX for pcgeqr2
COMPLEX*16 for pzgeqr2.
Pointer into the local memory to an array of DIMENSION (*lld_a*, *LOCc* (*ja*+*n*-1)).
On entry, this array contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*) which is to be factored.

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

work (local).
REAL for psgeqr2
DOUBLE PRECISION for pdgeqr2
COMPLEX for pcgeqr2
COMPLEX*16 for pzgeqr2.
This is a workspace array of DIMENSION (*lwork*).

lwork (local or global). INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork*≥*mp*0+max(1, *nq*0), where *iroff* = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*), *iacol* = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*), *mp*0 = numroc(*m*+*iroff*, *mb_a*, *myrow*, *iarow*, *nprow*), *nq*0 = numroc(*n*+*icoff*, *nb_a*, *mycol*, *iacol*, *npcol*). indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a (local).

	On exit, the elements on and above the diagonal of sub(*A*) contain the min(*m*, *n*) by *n* upper trapezoidal matrix *R* (*R* is upper triangular if *m*≥*n*); the elements below the diagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).
tau	(local). REAL for psgeqr2 DOUBLE PRECISION for pdgeqr2 COMPLEX for pcgeqr2 COMPLEX*16 for pzgeqr2. Array, DIMENSION *LOCc*(*ja*+min(*m*, *n*)-1). This array contains the scalar factors of the elementary reflectors. *tau* is tied to the distributed matrix *A*.
work	On exit, *work*(1) returns the minimal and optimal *lwork*.
info	(local). INTEGER. If *info* = 0, the execution is successful. if *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ja*)**H*(*ja*+1)*. . .* *H*(*ja*+*k*-1), where *k* = min(*m*,*n*).

Each *H*(*i*) has the form

H(*j*)= *I* - *tau***v***v*',

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1: *i*-1) = 0 and *v*(*i*) = 1; *v*(*i*+1: *m*) is stored on exit in *A*(*ia*+*i*:*ia*+*m*-1, *ja*+*i*-1), and *tau* in *TAU*(*ja*+*i*-1).

p?gerq2

Computes an RQ factorization of a general rectangular matrix (unblocked algorithm).

Syntax

```
call psgerq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pdgerq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pcgerq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
call pzgerq2(m, n, a, ia, ja, desca, tau, work, lwork, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes an *RQ* factorization of a real/complex distributed *m*-by-*n* matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) = *R***Q*.

Input Parameters

m	(global). INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥0).
n	(global).INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n*≥0).
a	(local). REAL for psgerq2 DOUBLE PRECISION for pdgerq2 COMPLEX for pcgerq2 COMPLEX*16 for pzgerq2. Pointer into the local memory to an array of DIMENSION (*lld_a*,*LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*) which is to be factored.
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.
work	(local). REAL for psgerq2 DOUBLE PRECISION for pdgerq2 COMPLEX for pcgerq2 COMPLEX*16 for pzgerq2. This is a workspace array of DIMENSION (*lwork*).
lwork	(local or global). INTEGER. The dimension of the array *work*. *lwork* is local input and must be at least *lwork*≥*nq*0 + max(1, *mp*0), where *iroff* = mod(*ia*-1, *mb_a*), *icoff* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*), *iacol* = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*), *mp*0 = numroc(*m*+*iroff*, *mb_a*, *myrow*, *iarow*, *nprow*), *nq*0 = numroc(*n*+*icoff*, *nb_a*, *mycol*, *iacol*, *npcol*), indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a (local).
On exit,

if $m \leq n$, the upper triangle of *A*(*ia*+*m*-*n*:*ia*+*m*-1, *ja*:*ja*+*n*-1) contains the *m*-by-*m* upper triangular matrix *R*;

if $m \geq n$, the elements on and above the (*m*-*n*)-th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *tau*, represent the orthogonal/ unitary matrix *Q* as a product of elementary reflectors (see *Application Notes* below).

tau (local).
REAL for psgerq2
DOUBLE PRECISION for pdgerq2
COMPLEX for pcgerq2
COMPLEX*16 for pzgerq2.
Array, DIMENSION *LOCr*(*ia*+*m*-1). This array contains the scalar factors of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local). INTEGER.
If *info* = 0, the execution is successful.
if *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

The matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*ia*)**H*(*ia*+1)*...**H*(*ia*+*k*-1) for real flavors,

$Q = (H(ia))^H * (H(ia+1))^H ... * (H(ia+k-1))^H$ for complex flavors,

where *k* = min(*m*, *n*).

Each *H*(*i*) has the form

H(*i*) = *I* - *tau***v***v*',

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*n*-*k*+*i*+1:*n*) = 0 and *v*(*n*-*k*+*i*) = 1; *v*(1:*n*-*k*+*i*-1) for real flavors or conjg(*v*(1:*n*-*k*+*i*-1)) for complex flavors is stored on exit in *A*(*ia*+*m*-*k*+*i*-1, *ja*:*ja*+*n*-*k*+*i*-2), and *tau* in *TAU*(*ia*+*m*-*k*+*i*-1).

p?getf2

Computes an LU factorization of a general matrix, using partial pivoting with row interchanges (local blocked algorithm).

Syntax

```
call psgetf2(m, n, a, ia, ja, desca, ipiv, info)
call pdgetf2(m, n, a, ia, ja, desca, ipiv, info)
call pcgetf2(m, n, a, ia, ja, desca, ipiv, info)
call pzgetf2(m, n, a, ia, ja, desca, ipiv, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes an *LU* factorization of a general *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) using partial pivoting with row interchanges.

The factorization has the form sub(*A*) = *P* * *L** *U*, where *P* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if *m*>*n*), and *U* is upper triangular (upper trapezoidal if *m* < *n*). This is the right-looking Parallel Level 2 BLAS version of the algorithm.

Input Parameters

m	(global). INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥0).
n	(global).INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*nb_a* - mod(*ja*-1, *nb_a*)≥*n*≥0).
a	(local). REAL for psgetf2 DOUBLE PRECISION for pdgetf2 COMPLEX for pcgetf2 COMPLEX*16 for pzgetf2. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

Output Parameters

ipiv (local). INTEGER.
Array, DIMENSION(*LOCr*(*m_a*) + *mb_a*). This array contains the pivoting information. *ipiv*(*i*) -> The global row that local row *i* was swapped with. This array is tied to the distributed matrix *A*.

info (local). INTEGER.
If *info* = 0: successful exit.
If *info* < 0:

- if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*),
- if the *i*-th argument is a scalar and had an illegal value, then *info* = - *i*.

If *info* > 0: If *info* = *k*, *u*(*ia*+*k*-1, *ja*+*k*-1) is exactly zero. The factorization has been completed, but the factor *u* is exactly singular, and division by zero will occur if it is used to solve a system of equations.

p?labrd

Reduces the first nb rows and columns of a general rectangular matrix A to real bidiagonal form by an orthogonal/unitary transformation, and returns auxiliary matrices that are needed to apply the transformation to the unreduced part of A.

Syntax

```
call pslabrd(m, n, nb, a, ia, ja, desca, d, e, tauq, taup, x, ix, jx, descx, y, iy, jy, descy, work)
call pdlabrd(m, n, nb, a, ia, ja, desca, d, e, tauq, taup, x, ix, jx, descx, y, iy, jy, descy, work)
call pclabrd(m, n, nb, a, ia, ja, desca, d, e, tauq, taup, x, ix, jx, descx, y, iy, jy, descy, work)
call pzlabrd(m, n, nb, a, ia, ja, desca, d, e, tauq, taup, x, ix, jx, descx, y, iy, jy, descy, work)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces the first *nb* rows and columns of a real/complex general *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) to upper or lower bidiagonal form by an orthogonal/unitary transformation *Q'* A * P*, and returns the matrices *X* and *Y* necessary to apply the transformation to the unreduced part of sub(*A*).

If *m* ≥*n*, sub(*A*) is reduced to upper bidiagonal form; if *m* < *n*, sub(*A*) is reduced to lower bidiagonal form.

This is an auxiliary routine called by p?gebrd.

Input Parameters

m	(global). INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m* ≥ 0).
n	(global).INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n* ≥ 0).
nb	(global) INTEGER. The number of leading rows and columns of sub(*A*) to be reduced.
a	(local). REAL for pslabrd DOUBLE PRECISION for pdlabrd COMPLEX for pclabrd COMPLEX*16 for pzlabrd. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the general distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.
ix, *jx*	(global) INTEGER. The row and column indices in the global array *x* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix X.
iy, *jy*	(global) INTEGER. The row and column indices in the global array *y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.
descy	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix Y.
work	(local). REAL for pslabrd DOUBLE PRECISION for pdlabrd COMPLEX for pclabrd COMPLEX*16 for pzlabrd Workspace array, DIMENSION(*lwork*) *lwork* ≥ *nb_a* + *nq*, with *nq* = numroc(*n*+mod(*ia*-1, *nb_y*), *nb_y*, *mycol*, *iacol*, *npcol*) *iacol* = indxg2p (*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*)

indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

a (local)
On exit, the first *nb* rows and columns of the matrix are overwritten; the rest of the distributed matrix sub(*A*) is unchanged.

If $m \geq n$, elements on and below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors;and elements above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *P* as a product of elementary reflectors.
If $m < n$, elements below the diagonal in the first *nb* columns, with the array *tauq*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors, and elements on and above the diagonal in the first *nb* rows, with the array *taup*, represent the orthogonal/unitary matrix *P* as a product of elementary reflectors. See *Application Notes* below.

d (local).
REAL for pslabrd
DOUBLE PRECISION for pdlabrd
COMPLEX for pclabrd
COMPLEX*16 for pzlabrd

Array, DIMENSION *LOCr*(*ia*+min(*m,n*)-1) if $m \geq n$; *LOCc*(*ja*+min(*m,n*)-1) otherwise. The distributed diagonal elements of the bidiagonal distributed matrix *B*:
d(*i*) = *A*(*ia*+*i*-1, *ja*+*i*-1).
d is tied to the distributed matrix *A*.

e (local).
REAL for pslabrd
DOUBLE PRECISION for pdlabrd
COMPLEX for pclabrd
COMPLEX*16 for pzlabrd

Array, DIMENSION *LOCr*(*ia*+min(*m,n*)-1) if $m \geq n$; *LOCc*(*ja*+min(*m,n*)-2) otherwise. The distributed off-diagonal elements of the bidiagonal distributed matrix *B*:

if $m \geq n$, *E*(*i*) = *A*(*ia*+*i*-1, *ja*+*i*) for *i* = 1, 2, ..., *n*-1;
if $m<n$, *E*(*i*) = *A*(*ia*+*i*, *ja*+*i*-1) for *i* = 1, 2, ..., *m*-1.
e is tied to the distributed matrix *A*.

tauq, *taup* (local).
REAL for pslabrd
DOUBLE PRECISION for pdlabrd
COMPLEX for pclabrd
COMPLEX*16 for pzlabrd

	Array DIMENSION *LOCc*(*ja*+min(*m*, *n*)-1) for *tauq*, DIMENSION *LOCr*(*ia*+min(*m*, *n*)-1) for *taup*. The scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q* for *tauq*, *P* for *taup*. *tauq* and *taup* are tied to the distributed matrix *A*. See *Application Notes* below.
x	(local) REAL for pslabrd DOUBLE PRECISION for pdlabrd COMPLEX for pclabrd COMPLEX*16 for pzlabrd Pointer into the local memory to an array of DIMENSION (*lld_x*, *nb*). On exit, the local pieces of the distributed *m*-by-*nb* matrix *X*(*ix*:*ix*+*m*-1, *jx*:*jx*+*nb*-1) required to update the unreduced part of sub(*A*).
y	(local). REAL for pslabrd DOUBLE PRECISION for pdlabrd COMPLEX for pclabrd COMPLEX*16 for pzlabrd Pointer into the local memory to an array of DIMENSION (*lld_y*, *nb*). On exit, the local pieces of the distributed *n*-by-*nb* matrix *Y*(*iy*:*iy*+*n*-1, *jy*:*jy*+*nb*-1) required to update the unreduced part of sub(*A*).

Application Notes

The matrices *Q* and *P* are represented as products of elementary reflectors:

Q = *H*(1)**H*(2)*...**H*(*nb*), and *P* = *G*(1)**G*(2)*...**G*(*nb*)

Each *H*(i) and *G*(i) has the form:

H(i) = *I* - *tauq***v***v'* , and *G*(i) = *I* - *taup***u***u'*,

where *tauq* and *taup* are real/complex scalars, and *v* and *u* are real/complex vectors.

If *m* ≥ *n*, *v*(1: *i*-1) = 0, *v*(*i*) = 1, and *v*(*i*:*m*) is stored on exit in

A(*ia*+*i*-1:*ia*+*m*-1, *ja*+*i*-1); *u*(1:*i*) = 0, *u*(*i*+1) = 1, and *u*(*i*+1:*n*) is stored on exit in *A*(*ia*+*i*-1, *ja*+*i*:*ja*+*n*-1); *tauq* is stored in *TAUQ*(*ja*+*i*-1) and *taup* in *TAUP*(*ia*+*i*-1).

If *m* < *n*, *v*(1: *i*) = 0, *v*(*i*+1) = 1, and *v*(*i*+1:*m*) is stored on exit in

A(*ia*+*i*+1:*ia*+*m*-1, *ja*+*i*-1); *u*(1:*i*-1) = 0, *u*(*i*) = 1, and *u*(*i*:*n*) is stored on exit in *A*(*ia*+*i*-1, *ja*+*i*:*ja*+*n*-1); *tauq* is stored in *TAUQ*(*ja*+*i*-1) and *taup* in *TAUP*(*ia*+*i*-1). The elements of the vectors *v* and *u* together form the *m*-by-*nb* matrix *V* and the *nb*-by-*n* matrix *U'* which are necessary, with *X* and *Y*, to apply the transformation to the unreduced part of the matrix, using a block update of the form: sub(*A*):= sub(*A*) - *V***Y'* - *X***U'*. The contents of sub(*A*) on exit are illustrated by the following examples with *nb* = 2:

$m = 6$ and $n = 5 (m > n)$:

$$\begin{bmatrix} 1 & 1 & u1 & u1 & u1 \\ v1 & 1 & 1 & u2 & u2 \\ v1 & v2 & a & a & a \\ v1 & v2 & a & a & a \\ v1 & v2 & a & a & a \\ v1 & v2 & a & a & a \end{bmatrix}$$

$m = 5$ and $n = 6 (m < n)$:

$$\begin{bmatrix} 1 & u1 & u1 & u1 & u1 & u1 \\ 1 & 1 & u2 & u2 & u2 & u2 \\ v1 & 1 & a & a & a & a \\ v1 & v2 & a & a & a & a \\ v1 & v2 & a & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix which is unchanged, *vi* denotes an element of the vector defining *H*(*i*), and *ui* an element of the vector defining *G*(*i*).

p?lacon

Estimates the 1-norm of a square matrix, using the reverse communication for evaluating matrix-vector products.

Syntax

```
call pslacon(n, v, iv, jv, descv, x, ix, jx, descx, isgn, est, kase)
call pdlacon(n, v, iv, jv, descv, x, ix, jx, descx, isgn, est, kase)
call pclacon(n, v, iv, jv, descv, x, ix, jx, descx, isgn, est, kase)
call pzlacon(n, v, iv, jv, descv, x, ix, jx, descx, isgn, est, kase)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine estimates the 1-norm of a square, real/unitary distributed matrix *A*. Reverse communication is used for evaluating matrix-vector products. *x* and *v* are aligned with the distributed matrix *A*, this information is implicitly contained within *iv*, *ix*, *descv*, and *descx*.

Input Parameters

n	(global).INTEGER. The length of the distributed vectors *v* and *x*. $n \geq 0$.
v	(local). REAL for pslacon DOUBLE PRECISION for pdlacon COMPLEX for pclacon COMPLEX*16 for pzlacon. Pointer into the local memory to an array of DIMENSION *LOCr*(*n*+mod(*iv*-1, *mb_v*)). On the final return, *v* = *a***w*, where *est* = norm(*v*)/norm(*w*) (*w* is not returned).
iv, *jv*	(global) INTEGER. The row and column indices in the global array *v* indicating the first row and the first column of the submatrix *V*, respectively.

descv	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix V.
x	(local). REAL for pslacon DOUBLE PRECISION for pdlacon COMPLEX for pclacon COMPLEX*16 for pzlacon. Pointer into the local memory to an array of DIMENSION *LOCr*(*n*+mod(*ix*-1, *mb_x*)).
ix, *jx*	(global) INTEGER. The row and column indices in the global array *x* indicating the first row and the first column of the submatrix *X*, respectively.
descx	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix X.
isgn	(local). INTEGER. Array, DIMENSION *LOCr*(*n*+mod(*ix*-1, *mb_x*)). *isgn* is aligned with *x* and *v*.
kase	(local). INTEGER. On the initial call to p?lacon, *kase* should be 0.

Output Parameters

x	(local). On an intermediate return, X should be overwritten by *A***X*, if *kase*=1, *A'* **X*, if *kase*=2, p?lacon must be re-called with all the other parameters unchanged.
est	(global). REAL for single precision flavors DOUBLE PRECISION for double precision flavors
kase	(local) INTEGER. On an intermediate return, *kase* is 1 or 2, indicating whether *X* should be overwritten by *A***X*, or *A'***X*. On the final return from p?lacon, *kase* is again 0.

p?laconsb

Looks for two consecutive small subdiagonal elements.

Syntax

```
call pslaconsb(a, desca, i, l, m, h44, h33, h43h34, buf, lwork)
call pdlaconsb(a, desca, i, l, m, h44, h33, h43h34, buf, lwork)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine looks for two consecutive small subdiagonal elements by analyzing the effect of starting a double shift *QR* iteration given by *h44*, *h33*, and *h43h34* to see if this process makes a subdiagonal negligible.

Input Parameters

a	(global). REAL for pslaconsb DOUBLE PRECISION for pdlaconsb Array, DIMENSION (*desca* (*lld_*),*). On entry, the Hessenberg matrix whose tridiagonal part is being scanned. Unchanged on exit.
desca	(global and local) INTEGER. Array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
i	(global) INTEGER. The global location of the bottom of the unreduced submatrix of *A*. Unchanged on exit.
l	(global) INTEGER. The global location of the top of the unreduced submatrix of *A*. Unchanged on exit.
h44, *h33*, *h43h34*	(global). REAL for pslaconsb DOUBLE PRECISION for pdlaconsb These three values are for the double shift QR iteration.
lwork	(global) INTEGER. This must be at least 7*ceil(ceil((*i*-l)/*hbl*)/lcm(*nprow*, *npcol*)). Here lcm is least common multiple and *nprow***npcol* is the logical grid size.

Output Parameters

m	(global). On exit, this yields the starting location of the *QR* double shift. This will satisfy: $l \le m \le i$-2.
buf	(local). REAL for pslaconsb DOUBLE PRECISION for pdlaconsb Array of size *lwork*.
lwork	(global). On exit, *lwork* is the size of the work buffer.

p?lacp2

Copies all or part of a distributed matrix to another distributed matrix.

Syntax

```
call pslacp2(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
call pdlacp2(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
call pclacp2(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
call pzlacp2(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine copies all or part of a distributed matrix *A* to another distributed matrix *B*. No communication is performed, p?lacp2 performs a local copy sub(*A*):= sub(*B*), where sub(*A*) denotes *A*(*ia*:*ia*+*m*-1, *a*:*ja*+*n*-1) and sub(*B*) denotes *B*(*ib*:*ib*+*m*-1, *jb*:*jb*+*n*-1).

p?lacp2 requires that only dimension of the matrix operands is distributed.

Input Parameters

uplo	(global) CHARACTER. Specifies the part of the distributed matrix sub(*A*) to be copied: = 'U': Upper triangular part is copied; the strictly lower triangular part of sub(*A*) is not referenced; = 'L': Lower triangular part is copied; the strictly upper triangular part of sub(*A*) is not referenced. Otherwise: all of the matrix sub(*A*) is copied.
m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m* ≥ 0).
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n* ≥ 0).
a	(local). REAL for pslacp2 DOUBLE PRECISION for pdlacp2 COMPLEX for pclacp2 COMPLEX*16 for pzlacp2. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the local pieces of the *m*-by-*n* distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of sub(*B*), respectively.
descb	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix B.

Output Parameters

b	(local). REAL for pslacp2 DOUBLE PRECISION for pdlacp2

COMPLEX for pclacp2
COMPLEX*16 for pzlacp2.
Pointer into the local memory to an array of DIMENSION (*lld_b*, *LOCc*(*jb*+*n*-1)). This array contains on exit the local pieces of the distributed matrix sub(B) set as follows:
if *uplo* = 'U', *B*(*ib*+*i*-1, *jb*+*j*-1) = *A*(*ia*+*i*-1, *ja*+*j*-1), $1 \le i \le j$, $1 \le j \le n$;
if *uplo* = 'L', *B*(*ib*+*i*-1, *jb*+*j*-1) = *A*(*ia*+*i*-1, *ja*+*j*-1), $j \le i \le m$, $1 \le j \le n$;
otherwise, *B*(*ib*+*i*-1, *jb*+*j*-1) = *A*(*ia*+*i*-1, *ja*+*j*-1), $1 \le i \le m$, $1 \le j \le n$.

p?lacp3

Copies from a global parallel array into a local replicated array or vice versa.

Syntax

call pslacp3(*m*, *i*, *a*, *desca*, *b*, *ldb*, *ii*, *jj*, *rev*)

call pdlacp3(*m*, *i*, *a*, *desca*, *b*, *ldb*, *ii*, *jj*, *rev*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This is an auxiliary routine that copies from a global parallel array into a local replicated array or vise versa. Note that the entire submatrix that is copied gets placed on one node or more. The receiving node can be specified precisely, or all nodes can receive, or just one row or column of nodes.

Input Parameters

m — (global) INTEGER.
m is the order of the square submatrix that is copied.
$m \ge 0$. Unchanged on exit.

i — (global) INTEGER. *A*(*i*, *i*) is the global location that the copying starts from. Unchanged on exit.

a — (global). REAL for pslacp3
DOUBLE PRECISION for pdlacp3
Array, DIMENSION (*desca*(*lld_*),*). On entry, the parallel matrix to be copied into or from.

desca — (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

b — (local).
REAL for pslacp3
DOUBLE PRECISION for pdlacp3

	Array, DIMENSION (*ldb*, *m*). If *rev* = 0, this is the global portion of the array *A*(*i*:*i*+*m*-1, *i*:*i*+*m*-1). If *rev* = 1, this is the unchanged on exit.
ldb	(local) INTEGER. The leading dimension of *B*.
ii	(global) INTEGER. By using *rev* 0 and 1, data can be sent out and returned again. If *rev* = 0, then *ii* is destination row index for the node(s) receiving the replicated *B*. If *ii* ≥ 0, *jj* ≥ 0, then node (*ii*, *jj*) receives the data. If *ii* = -1, *jj* ≥ 0, then all rows in column *jj* receive the data. If *ii* ≥ 0, *jj* = -1, then all cols in row *ii* receive the data. f *ii* = -1, *jj* = -1, then all nodes receive the data. If *rev* !=0, then *ii* is the source row index for the node(s) sending the replicated *B*.
jj	(global) INTEGER. Similar description as *ii* above.
rev	(global) INTEGER. Use *rev* = 0 to send global *A* into locally replicated *B* (on node (*ii*, *jj*)). Use *rev* != 0 to send locally replicated *B* from node (*ii*, *jj*) to its owner (which changes depending on its location in *A*) into the global *A*.

Output Parameters

a	(global). On exit, if *rev* = 1, the copied data. Unchanged on exit if *rev* = 0.
b	(local). If *rev* = 1, this is unchanged on exit.

p?lacpy

Copies all or part of one two-dimensional array to another.

Syntax

```
call pslacpy(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
call pdlacpy(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
call pclacpy(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
call pzlacpy(uplo, m, n, a, ia, ja, desca, b, ib, jb, descb)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine copies all or part of a distributed matrix *A* to another distributed matrix *B*. No communication is performed, p?lacpy performs a local copy sub(*B*):= sub(*A*), where sub(*A*) denotes *A*(*ia*:*ia*+*m*-1,*ja*:*ja*+*n*-1) and sub(*B*) denotes *B*(*ib*:*ib*+*m*-1,*jb*:*jb*+*n*-1).

Input Parameters

uplo (global). CHARACTER. Specifies the part of the distributed matrix sub(*A*) to be copied:
= 'U': Upper triangular part; the strictly lower triangular part of sub(*A*) is not referenced;
= 'L': Lower triangular part; the strictly upper triangular part of sub(*A*) is not referenced.
Otherwise: all of the matrix sub(*A*) is copied.

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥0).

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n*≥0).

a (local).
REAL for pslacpy
DOUBLE PRECISION for pdlacpy
COMPLEX for pclacpy
COMPLEX*16 for pzlacpy.
Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the distributed matrix sub(*A*).

ia, *ja* (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

ib, *jb* (global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of sub(*B*) respectively.

descb (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

Output Parameters

b (local).
REAL for pslacpy
DOUBLE PRECISION for pdlacpy
COMPLEX for pclacpy
COMPLEX*16 for pzlacpy.
Pointer into the local memory to an array of DIMENSION (*lld_b*, *LOCc*(*jb*+*n*-1)). This array contains on exit the local pieces of the distributed matrix sub(B) set as follows:
if *uplo* = 'U', *B*(*ib*+*i*-1, *jb*+*j*-1) = *A*(*ia*+*i*-1, *ja*+*j*-1), 1≤*i*≤*j*, 1≤*j*≤*n*;
if *uplo* = 'L', *B*(*ib*+*i*-1, *jb*+*j*-1) = *A*(*ia*+*i*-1, *ja*+*j*-1), *j*≤*i*≤*m*, 1≤*j*≤*n*;

otherwise, $B(ib+i-1, jb+j-1) = A(ia+i-1, ja+j-1)$, $1 \le i \le m$, $1 \le j \le n$.

p?laevswp

Moves the eigenvectors from where they are computed to ScaLAPACK standard block cyclic array.

Syntax

```
call pslaevswp(n, zin, ldzi, z, iz, jz, descz, nvs, key, rwork, lrwork)
call pdlaevswp(n, zin, ldzi, z, iz, jz, descz, nvs, key, rwork, lrwork)
call pclaevswp(n, zin, ldzi, z, iz, jz, descz, nvs, key, rwork, lrwork)
call pzlaevswp(n, zin, ldzi, z, iz, jz, descz, nvs, key, rwork, lrwork)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine moves the eigenvectors (potentially unsorted) from where they are computed, to a ScaLAPACK standard block cyclic array, sorted so that the corresponding eigenvalues are sorted.

Input Parameters

np = the number of rows local to a given process.

nq = the number of columns local to a given process.

n	(global). INTEGER. The order of the matrix *A*. $n \ge 0$.
zin	(local). REAL for pslaevswp DOUBLE PRECISION for pdlaevswp COMPLEX for pclaevswp COMPLEX*16 for pzlaevswp. Array, DIMENSION (*ldzi*, *nvs*(*iam*)). The eigenvectors on input. Each eigenvector resides entirely in one process. Each process holds a contiguous set of *nvs*(*iam*) eigenvectors. The first eigenvector which the process holds is: sum for *i*=[0, *iam*-1) of *nvs*(*i*).
ldzi	(local) INTEGER.The leading dimension of the *zin* array.
iz, *jz*	(global) INTEGER.The row and column indices in the global array *Z* indicating the first row and the first column of the submatrix *Z*, respectively.
descz	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix Z.
nvs	(global) INTEGER. Array, DIMENSION(*nprocs*+1) *nvs*(*i*) = number of processes number of eigenvectors held by processes [0, *i*-1)

	nvs(1) = number of eigen vectors held by[0, 1 -1) = 0 *nvs*(*nprocs*+1)= number of eigen vectors held by [0, *nprocs*)= total number of eigenvectors.
key	(global) INTEGER. Array, DIMENSION (*n*). Indicates the actual index (after sorting) for each of the eigenvectors.
rwork	(local). REAL for pslaevswp DOUBLE PRECISIONfor pdlaevswp COMPLEX for pclaevswp COMPLEX*16 for pzlaevswp. Array, DIMENSION (*lrwork*).
lrwork	(local) INTEGER. Dimension of *work*.

Output Parameters

z	(local). REAL for pslaevswp DOUBLE PRECISION for pdlaevswp COMPLEX for pclaevswp COMPLEX*16 for pzlaevswp. Array, global DIMENSION (*n*, *n*), local DIMENSION (*descz*(*dlen_*), *nq*). The eigenvectors on output. The eigenvectors are distributed in a block cyclic manner in both dimensions, with a block size of *nb*.

p?lahrd

Reduces the first nb columns of a general rectangular matrix A so that elements below the k-th subdiagonal are zero, by an orthogonal/unitary transformation, and returns auxiliary matrices that are needed to apply the transformation to the unreduced part of A.

Syntax

```
call pslahrd(n, k, nb, a, ia, ja, desca, tau, t, y, iy, jy, descy, work)
call pdlahrd(n, k, nb, a, ia, ja, desca, tau, t, y, iy, jy, descy, work)
call pclahrd(n, k, nb, a, ia, ja, desca, tau, t, y, iy, jy, descy, work)
call pzlahrd(n, k, nb, a, ia, ja, desca, tau, t, y, iy, jy, descy, work)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces the first *nb* columns of a real general *n*-by-(*n*-*k*+1) distributed matrix *A*(*ia*:*ia*+*n*-1 , *ja*:*ja*+*n*-*k*) so that elements below the *k*-th subdiagonal are zero. The reduction is performed by an orthogonal/unitary similarity transformation *Q'*A*Q*. The routine returns the matrices *V* and *T* which determine *Q* as a block reflector *I*-V*T*V'*, and also the matrix *Y = A*V*T*.

This is an auxiliary routine called by p?gehrd. In the following comments sub(*A*) denotes *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1).

Input Parameters

n	(global) INTEGER. The order of the distributed submatrix sub(*A*). $n \geq 0$.
k	(global) INTEGER. The offset for the reduction. Elements below the *k*-th subdiagonal in the first *nb* columns are reduced to zero.
nb	(global) INTEGER. The number of columns to be reduced.
a	(local). REAL for pslahrd DOUBLE PRECISION for pdlahrd COMPLEX for pclahrd COMPLEX*16 for pzlahrd. Pointer into the local memory to an array of DIMENSION (*lld_a*, *LOCc*(*ja*+*n*-*k*)). On entry, this array contains the local pieces of the *n*-by-(*n*-*k*+1) general distributed matrix *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-*k*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
iy, *jy*	(global) INTEGER. The row and column indices in the global array *Y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.
descy	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *Y*.
work	(local). REAL for pslahrd DOUBLE PRECISION for pdlahrd COMPLEX for pclahrd COMPLEX*16 for pzlahrd. Array, DIMENSION (*nb*).

Output Parameters

a	(local). On exit, the elements on and above the *k*-th subdiagonal in the first *nb* columns are overwritten with the corresponding elements of the reduced distributed matrix;the elements below the *k*-th subdiagonal, with the array *tau*, represent the matrix *Q* as a product of elementary reflectors. The other columns of *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-*k*) are unchanged. (See *Application Notes* below.)

tau (local)
REAL for pslahrd
DOUBLE PRECISION for pdlahrd
COMPLEX for pclahrd
COMPLEX*16 for pzlahrd.
Array, DIMENSION *LOCc*(*ja*+*n*-2). The scalar factors of the elementary reflectors (see *Application Notes* below). *tau* is tied to the distributed matrix *A*.

t (local)REAL for pslahrd
DOUBLE PRECISION for pdlahrd
COMPLEX for pclahrd
COMPLEX*16 for pzlahrd.
Array, DIMENSION (*nb_a*, *nb_a*) The upper triangular matrix *T*.

y (local).
REAL for pslahrd
DOUBLE PRECISION for pdlahrd
COMPLEX for pclahrd
COMPLEX*16 for pzlahrd.
Pointer into the local memory to an array of DIMENSION (*lld_y*, *nb_a*). On exit, this array contains the local pieces of the *n*-by-*nb* distributed matrix *Y*. *lld_y* ≥ *LOCr*(*ia*+*n*-1).

Application Notes

The matrix *Q* is represented as a product of *nb* elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*nb*).

Each *H*(*i*) has the form

H(*i*) = *i*-*tau***v***v*',

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1: *i*+*k*-1)= 0, *v*(*i*+*k*)= 1; *v*(*i*+*k*+1:*n*) is stored on exit in *A*(*ia*+*i*+*k*:*ia*+*n*-1, *ja*+*i*-1), and *tau* in *TAU*(*ja*+*i*-1).

The elements of the vectors *v* together form the (*n*-*k*+1)-by-*nb* matrix *V* which is needed, with *T* and *Y*, to apply the transformation to the unreduced part of the matrix, using an update of the form: *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-*k*) := (*I*-*V***T***V*')*(*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-*k*)-*Y***V*'). The contents of *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-*k*) on exit are illustrated by the following example with *n* = 7, *k* = 3, and *nb* = 2:

$$\begin{bmatrix} a & h & a & a & a \\ a & h & a & a & a \\ a & h & a & a & a \\ h & h & a & a & a \\ v1 & h & a & a & a \\ v1 & v2 & a & a & a \\ v1 & v2 & a & a & a \end{bmatrix}$$

where *a* denotes an element of the original matrix *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-*k*), *h* denotes a modified element of the upper Hessenberg matrix *H*, and *vi* denotes an element of the vector defining *H*(*i*).

p?laiect

Exploits IEEE arithmetic to accelerate the computations of eigenvalues. (C interface function).

Syntax

```
void pslaiect(float *sigma, int *n, float *d, int *count);
void pdlaiectb(float *sigma, int *n, float *d, int *count);
void pdlaiectl(float *sigma, int *n, float *d, int *count);
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the number of negative eigenvalues of ($A - \sigma I$). This implementation of the Sturm Sequence loop exploits IEEE arithmetic and has no conditionals in the innermost loop. The signbit for real routine `pslaiect` is assumed to be bit 32. Double precision routines `pdlaiectb` and `pdlaiectl` differ in the order of the double precision word storage and, consequently, in the signbit location. For `pdlaiectb`, the double precision word is stored in the big-endian word order and the signbit is assumed to be bit 32. For `pdlaiectl`, the double precision word is stored in the little-endian word order and the signbit is assumed to be bit 64.

Note that all arguments are call-by-reference so that this routine can be directly called from Fortran code.

This is a ScaLAPACK internal subroutine and arguments are not checked for unreasonable values.

Input Parameters

sigma	`Real`for `pslaiect` `DOUBLE PRECISION`for `pdlaiectb/pdlaiectl`. The shift. `p?laiect` finds the number of eigenvalues less than equal to *sigma*.
n	`INTEGER`. The order of the tridiagonal matrix *T*. $n \geq 1$.
d	`Real` for `pslaiect` `DOUBLE PRECISION` for `pdlaiectb/pdlaiectl`. Array of `DIMENSION`(2*n* -1). On entry, this array contains the diagonals and the squares of the off-diagonal elements of the tridiagonal matrix *T*. These elements are assumed to be interleaved in memory for better cache performance. The diagonal entries of *T* are in the entries *d*(1), *d*(3),..., *d*(2*n*-1), while the squares of the off-diagonal entries are *d*(2), *d*(4), ..., *d*(2*n*-2). To avoid overflow, the matrix must be scaled so that its largest entry is no greater than $overflow^{(1/2)} * underflow^{(1/4)}$ in absolute value, and for greatest accuracy, it should not be much smaller than that.

Output Parameters

n	INTEGER. The count of the number of eigenvalues of *T* less than or equal to *sigma*.

p?lange

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element, of a general rectangular matrix.

Syntax

val = pslange(*norm*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pdlange(*norm*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pclange(*norm*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pzlange(*norm*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1).

Input Parameters

norm	(global) CHARACTER. Specifies what value is returned by the routine: = 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*, it s not a matrix norm. = '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum), = 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum), = 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).
m	(global). INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(A). When *m* = 0, p?lange is set to zero. *m* ≥ 0.
n	(global). INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). When *n* = 0, p?lange is set to zero. *n* ≥ 0.
a	(local). Real for pslange DOUBLE PRECISION for pdlange COMPLEX for pclange

	COMPLEX*16 for pzlange. Pointer into the local memory to an array of DIMENSION (*lld_a*, *LOCc*(*ja*+*n*-1)) containing the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.
work	(local). Real for pslange DOUBLE PRECISION for pdlange COMPLEX for pclange COMPLEX*16 for pzlange. Array DIMENSION (*lwork*). *lwork* ≥ 0 if *norm* = 'M' or 'm' (not referenced), *nq*0 if *norm* = '1', 'O' or 'o', *mp*0 if *norm* = 'I' or 'i', 0 if *norm* = 'F', 'f', 'E' or 'e' (not referenced), where *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*), *iarow* = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*), *iacol* = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*), *mp*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*), *nq*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*), indxg2p and numroc are ScaLAPACK tool routines; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

val	The value returned by the routine.

p?lanhs

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element, of an upper Hessenberg matrix.

Syntax

val = pslanhs(*norm*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pdlanhs(*norm*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pclanhs(*norm*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pzlanhs(*norm*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of an upper Hessenberg distributed matrix sub(*A*) = *A*(*ia:ia+m-1*, *ja:ja+n-1*).

Input Parameters

norm
CHARACTER*1. Specifies the value to be returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

n
(global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). When *n* = 0, p?lanhs is set to zero. $n \geq 0$.

a
(local).
Real for pslanhs
DOUBLE PRECISION for pdlanhs
COMPLEX for pclanhs
COMPLEX*16 for pzlanhs.
Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)) containing the local pieces of the distributed matrix sub(*A*).

ia, *ja*
(global) INTEGER.
The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca
(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

work
(local).
Real for pslanhs
DOUBLE PRECISION for pdlanhs
COMPLEX for pclanhs
COMPLEX*16 for pzlanh.
Array, DIMENSION (*lwork*).
lwork ≥ 0 if *norm* = 'M' or 'm' (not referenced),
*nq*0 if *norm* = '1', 'O' or 'o',
*mp*0 if *norm* = 'I' or 'i',
0 if *norm* = 'F', 'f', 'E' or 'e' (not referenced),
where
iroffa = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),

iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
*mp*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*),
*nq*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*),
indxg2p and numroc are ScaLAPACK tool routines; *myrow*, *imycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

val The value returned by the fuction.

p?lansy, p?lanhe

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element, of a real symmetric or a complex Hermitian matrix.

Syntax

val = pslansy(*norm*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pdlansy(*norm*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pclansy(*norm*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pzlansy(*norm*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pclanhe(*norm*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pzlanhe(*norm*, *uplo*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

Description

The routines return the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1).

Input Parameters

norm (global) CHARACTER. Specifies what value is returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*, it s not a matrix norm.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo (global) CHARACTER. Specifies whether the upper or lower triangular part of the symmetric matrix sub(*A*) is to be referenced.
= 'U': Upper triangular part of sub(*A*) is referenced,

= 'L': Lower triangular part of sub(*A*) is referenced.

n (global) INTEGER.
The number of columns to be operated on i.e the number of columns of the distributed submatrix sub(*A*). When *n* = 0, p?lansy is set to zero. *n* ≥ 0.

a (local).
REAL for pslansy
DOUBLE PRECISION for pdlansy
COMPLEX for pclansy, pclanhe
COMPLEX*16 for pzlansy, pzlanhe.
Pointer into the local memory to an array of DIMENSION (*lld_a*, *LOCc*(*ja*+*n*-1)) containing the local pieces of the distributed matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular matrix whose norm is to be computed, and the strictly lower triangular part of this matrix is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular matrix whose norm is to be computed, and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja* (global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

work (local).
REAL for pslansy, pclansy, pclanhe
DOUBLE PRECISION for pdlansy, pzlansy, pzlanhe
Array DIMENSION (*lwork*).
lwork ≥ 0 if *norm* = 'M' or 'm' (not referenced),
2**nq*0+*mp*0+*ldw* if *norm* = '1', 'O' or 'o', 'I' or 'i',
where *ldw* is given by:

```
if( nprow.ne.npcol ) then
ldw = mb_a*iceil(iceil(np0,mb_a),(lcm/nprow))
else
ldw = 0
end if
```

0 if *norm* = 'F', 'f', 'E' or 'e' (not referenced),
where *lcm* is the least common multiple of *nprow* and *npcol*, *lcm* = ilcm(*nprow*, *npcol*) and iceil(*x*,*y*) is a ScaLAPACK function that returns ceiling (*x*/*y*).
iroffa = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
*mp*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*),
*nq*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*),

ilcm, iceil, indxg2p, and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

val The value returned by the routine.

p?lantr

Returns the value of the 1-norm, Frobenius norm, infinity-norm, or the largest absolute value of any element, of a triangular matrix.

Syntax

val = pslantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pdlantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pclantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

val = pzlantr(*norm*, *uplo*, *diag*, *m*, *n*, *a*, *ia*, *ja*, *desca*, *work*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine returns the value of the 1-norm, or the Frobenius norm, or the infinity norm, or the element of largest absolute value of a trapezoidal or triangular distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1).

Input Parameters

norm (global) CHARACTER. Specifies what value is returned by the routine:
= 'M' or 'm': *val* = max(abs(A_{ij})), largest absolute value of the matrix *A*, it s not a matrix norm.
= '1' or 'O' or 'o': *val* = norm1(*A*), 1-norm of the matrix *A* (maximum column sum),
= 'I' or 'i': *val* = normI(*A*), infinity norm of the matrix *A* (maximum row sum),
= 'F', 'f', 'E' or 'e': *val* = normF(*A*), Frobenius norm of the matrix *A* (square root of sum of squares).

uplo (global) CHARACTER.
Specifies whether the upper or lower triangular part of the symmetric matrix sub(*A*) is to be referenced.
= 'U': Upper trapezoidal,
= 'L': Lower trapezoidal.
Note that sub(*A*) is triangular instead of trapezoidal if *m* = *n*.

diag (global). CHARACTER.
Specifies whether the distributed matrix sub(*A*) has unit diagonal.
= 'N': Non-unit diagonal.
= 'U': Unit diagonal.

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(A). When *m* = 0, p?lantr is set to zero.

m ≥ 0.

n (global) INTEGER.
The number of columns to be operated on i.e the number of columns of the distributed submatrix sub(*A*). When *n* = 0, p?lantr is set to zero. *n* ≥ 0.

a (local).
Real for pslantr
DOUBLE PRECISION for pdlantr
COMPLEX for pclantr
COMPLEX*16 for pzlantr.
Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)) containing the local pieces of the distributed matrix sub(*A*).

ia, *ja* (global) INTEGER.
The row and column indices in the global array *a* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

work (local).
Real for pslantr
DOUBLE PRECISION for pdlantr
COMPLEX for pclantr
COMPLEX*16 for pzlantr.
Array DIMENSION (*lwork*).

lwork ≥ 0 if *norm* = 'M' or 'm' (not referenced),
*nq*0 if *norm* = '1', 'O' or 'o',
*mp*0 if *norm* = 'I' or 'i',
0 if *norm* = 'F', 'f', 'E' or 'e' (not referenced),
iroffa = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
*mp*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*),
*nq*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*),
indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

val The value returned by the routine.

p?lapiv

Applies a permutation matrix to a general distributed matrix, resulting in row or column pivoting.

Syntax

```
call pslapiv(direc, rowcol, pivroc, m, n, a, ia, ja, desca, ipiv, ip, jp, descip, iwork)
call pdlapiv(direc, rowcol, pivroc, m, n, a, ia, ja, desca, ipiv, ip, jp, descip, iwork)
call pclapiv(direc, rowcol, pivroc, m, n, a, ia, ja, desca, ipiv, ip, jp, descip, iwork)
call pzlapiv(direc, rowcol, pivroc, m, n, a, ia, ja, desca, ipiv, ip, jp, descip, iwork)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine applies either *P* (permutation matrix indicated by *ipiv*) or inv(*P*) to a general *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1), resulting in row or column pivoting. The pivot vector may be distributed across a process row or a column. The pivot vector should be aligned with the distributed matrix *A*. This routine will transpose the pivot vector, if necessary.

For example, if the row pivots should be applied to the columns of sub(*A*), pass *rowcol*='C' and *pivroc*='C'.

Input Parameters

direc (global) CHARACTER*1.
Specifies in which order the permutation is applied:
= 'F' (Forward). Applies pivots forward from top of matrix. Computes *P**sub(*A*).
= 'B' (Backward). Applies pivots backward from bottom of matrix. Computes inv(*P*)*sub(*A*).

rowcol (global) CHARACTER*1.
Specifies if the rows or columns are to be permuted:
= 'R' Rows will be permuted,
= 'C' Columns will be permuted.

pivroc (global) CHARACTER*1.
Specifies whether *ipiv* is distributed over a process row or column:
= 'R'*ipiv* is distributed over a process row,
= 'C'*ipiv* is distributed over a process column.

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). When *m* = 0, p?lapiv is set to zero.
m ≥ 0.

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). When *n* = 0, p?lapiv is set to zero. *n* ≥ 0.

a (local).

	Real for pslapiv DOUBLE PRECISION for pdlapiv COMPLEX for pclapiv COMPLEX*16 for pzlapiv. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)) containing the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.
ipiv	(local). INTEGER. Array, DIMENSION (*lipiv*) ; when *rowcol*='R' or 'r': *lipiv* ≥ *LOCr*(*ia*+*m*-1) + *mb_a* if *pivroc*='C' or 'c', *lipiv* ≥ *LOCc*(*m* + *mod*(*jp*-1, *nb_p*)) if *pivroc*='R' or 'r', and, when *rowcol*='C' or 'c': *lipiv* ≥ *LOCr*(*n* + mod(*ip*-1, *mb_p*)) if *pivroc*='C' or 'c', *lipiv* ≥ *LOCc*(*ja*+*n*-1) + *nb_a* if *pivroc*='R' or 'r'. This array contains the pivoting information. *ipiv(i)* is the global row (column), local row (column) *i* was swapped with. When *rowcol*='R' or 'r' and *pivroc*='C' or 'c', or *rowcol*='C' or 'c' and *pivroc*='R' or 'r', the last piece of this array of size *mb_a* (resp. *nb_a*) is used as workspace. In those cases, this array is tied to the distributed matrix *A*.
ip, *jp*	(global) INTEGER. The row and column indices in the global array *P* indicating the first row and the first column of the submatrix sub(*P*), respectively.
descip	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed vector *ipiv*.
iwork	(local). INTEGER. Array, DIMENSION (*ldw*), where *ldw* is equal to the workspace necessary for transposition, and the storage of the transposed *ipiv* :

Let *lcm* be the least common multiple of *nprow* and *npcol*.

```
If( rowcol.eq.'r' .and.  pivroc. eq.'r') then
      If( nprow.eq. npcol) then
ldw = LOCr( n_p + mod(jp-1, nb_p) ) + nb_p
     else
ldw = LOCr( n_p + mod(jp-1, nb_p) )+
nb_p * ceil( ceil(LOCc(n_p)/nb_p) / (lcm/npcol) )
   end if
 else if( rowcol.eq.'c' .and.  pivroc.eq.'c') then
       if( nprow.eq.
npcol ) then
ldw = LOCc( m_p + mod(ip-1, mb_p) ) + mb_p
 else
ldw = LOCc( m_p + mod(ip-1, mb_p) ) +
mb_p *ceil(ceil(LOCr(m_p)/mb_p) / (lcm/nprow) )
    end if
 else
iwork is not referenced.
 end if.
```

Output Parameters

a (local).
On exit, the local pieces of the permuted distributed submatrix.

p?laqge

Scales a general rectangular matrix, using row and column scaling factors computed by p?geequ *.*

Syntax

```
call pslaqge(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, equed)
call pdlaqge(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, equed)
call pclaqge(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, equed)
call pzlaqge(m, n, a, ia, ja, desca, r, c, rowcnd, colcnd, amax, equed)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine equilibrates a general *m*-by-*n* distributed matrix sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) using the row and scaling factors in the vectors *r* and *c* computed by p?geequ.

Input Parameters

m	(global). INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m* ≥0).
n	(global).INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n* ≥0).
a	(local). REAL for pslaqge DOUBLE PRECISION for pdlaqge COMPLEX for pclaqge COMPLEX*16 for pzlaqge. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, this array contains the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
r	(local). REAL for pslaqge DOUBLE PRECISION for pdlaqge COMPLEX for pclaqge COMPLEX*16 for pzlaqge. Array, DIMENSION *LOCr*(*m_a*). The row scale factors for sub(*A*). *r* is aligned with the distributed matrix *A*, and replicated across every process column. *r* is tied to the distributed matrix *A*.
c	(local). REAL for pslaqge DOUBLE PRECISION for pdlaqge COMPLEX for pclaqge COMPLEX*16 for pzlaqge. Array, DIMENSION *LOCc*(*n_a*). The row scale factors for sub(*A*). *c* is aligned with the distributed matrix *A*, and replicated across every process column. *c* is tied to the distributed matrix *A*.
rowcnd	(local). REAL for pslaqge DOUBLE PRECISION for pdlaqge COMPLEX for pclaqge COMPLEX*16 for pzlaqge.

	The global ratio of the smallest *r(i)* to the largest *r(i)*, *ia* ≤ *i* ≤ *ia*+*m*-1.
colcnd	(local). REAL for pslaqge DOUBLE PRECISION for pdlaqge COMPLEX for pclaqge COMPLEX*16 for pzlaqge. The global ratio of the smallest *c(i)* to the largest *c(i)*, *ia* ≤ *i* ≤ *ia*+*n*-1.
amax	(global). REAL for pslaqge DOUBLE PRECISION for pdlaqge COMPLEX for pclaqge COMPLEX*16 for pzlaqge. Absolute value of largest distributed submatrix entry.

Output Parameters

a	(local). On exit, the equilibrated distributed matrix. See *equed* for the form of the equilibrated distributed submatrix.
equed	(global) CHARACTER. Specifies the form of equilibration that was done. = 'N': No equilibration = 'R': Row equilibration, that is, sub(*A*) has been pre-multiplied by diag(r(ia:ia+m-1)), = 'C': column equilibration, that is, sub(*A*) has been post-multiplied by diag(c(ja:ja+n-1)), = 'B': Both row and column equilibration, that is, sub(*A*) has been replaced by diag(r(ia:ia+m-1))* sub(*A*) * diag(c(ja:ja+n-1)).

p?laqsy

Scales a symmetric/Hermitian matrix, using scaling factors computed by p?poequ .

Syntax

```
call pslaqsy(uplo, n, a, ia, ja, desca, sr, sc, scond, amax, equed)
call pdlaqsy(uplo, n, a, ia, ja, desca, sr, sc, scond, amax, equed)
call pclaqsy(uplo, n, a, ia, ja, desca, sr, sc, scond, amax, equed)
call pzlaqsy(uplo, n, a, ia, ja, desca, sr, sc, scond, amax, equed)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine equilibrates a symmetric distributed matrix sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) using the scaling factors in the vectors *sr* and *sc*. The scaling factors are computed by p?poequ.

Input Parameters

uplo (global) CHARACTER. Specifies the upper or lower triangular part of the symmetric distributed matrix sub(*A*) is to be referenced:
= 'U': Upper triangular part;
= 'L': Lower triangular part.

n (global) INTEGER.
The order of the distributed submatrix sub(*A*). $n \geq 0$.

a (local).
REAL for pslaqsy
DOUBLE PRECISION for pdlaqsy
COMPLEX for pclaqsy
COMPLEX*16 for pzlaqsy.
Pointer into the local memory to an array of DIMENSION (*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the distributed matrix sub(*A*). On entry, the local pieces of the distributed symmetric matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and the strictly lower triangular part of sub(*A*) is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja* (global) INTEGER.
The row and column indices in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix A.

sr (local)
REAL for pslaqsy
DOUBLE PRECISION for pdlaqsy
COMPLEX for pclaqsy
COMPLEX*16 for pzlaqsy.
Array, DIMENSION *LOCr*(*m_a*). The scale factors for *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1). *sr* is aligned with the distributed matrix *A*, and replicated across every process column. *sr* is tied to the distributed matrix *A*.

sc (local)
REAL for pslaqsy
DOUBLE PRECISION for pdlaqsy
COMPLEX for pclaqsy
COMPLEX*16 for pzlaqsy.

	Array, DIMENSION *LOCc*(*m_a*). The scale factors for *A* (*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1). *sr* is aligned with the distributed matrix *A*, and replicated across every process column. *sr* is tied to the distributed matrix *A*.
scond	(global). REAL for pslaqsy DOUBLE PRECISION for pdlaqsy COMPLEX for pclaqsy COMPLEX*16 for pzlaqsy. Ratio of the smallest *sr(i)* (respectively *sc(j)*) to the largest *sr(i)* (respectively *sc(j)*), with *ia* ≤ *i* ≤ *ia*+*n*-1 and *ja* ≤ *j* ≤ *ja*+*n*-1.
amax	(global). REAL for pslaqsy DOUBLE PRECISION for pdlaqsy COMPLEX for pclaqsy COMPLEX*16 for pzlaqsy. Absolute value of largest distributed submatrix entry.

Output Parameters

a	On exit, if *equed* = 'Y', the equilibrated matrix: diag(*sr*(*ia*:*ia*+*n*-1)) * sub(*A*) * diag(*sc*(*ja*:*ja*+*n*-1)).
equed	(global) CHARACTER*1. Specifies whether or not equilibration was done. = 'N': No equilibration. = 'Y': Equilibration was done, that is, sub(*A*) has been replaced by: diag(*sr*(*ia*:*ia*+*n*-1))* sub(*A*) * diag(*sc*(*ja*:*ja*+*n*-1)).

p?lared1d

Redistributes an array assuming that the input array, bycol, is distributed across rows and that all process columns contain the same copy of bycol.

Syntax

call pslared1d(*n*, *ia*, *ja*, *desc*, *bycol*, *byall*, *work*, *lwork*)

call pdlared1d(*n*, *ia*, *ja*, *desc*, *bycol*, *byall*, *work*, *lwork*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine redistributes a 1D array. It assumes that the input array *bycol* is distributed across rows and that all process column contain the same copy of *bycol*. The output array *byall* is identical on all processes and contains the entire array.

Input Parameters

np = Number of local rows in *bycol*()

n	(global). INTEGER. The number of elements to be redistributed. *n* ≥ 0.
ia, *ja*	(global) INTEGER. *ia*, *ja* must be equal to 1.
desc	(global and local) INTEGER array, DIMENSION 8. A 2D array descriptor, which describes *bycol*.
bycol	(local). REAL for pslared1d DOUBLE PRECISION for pdlared1d COMPLEX for pclared1d COMPLEX*16 for pzlared1d. Distributed block cyclic array global DIMENSION (*n*), local DIMENSION *np*. *bycol* is distributed across the process rows. All process columns are assumed to contain the same value.
work	(local). REAL for pslared1d DOUBLE PRECISION for pdlared1d COMPLEX for pclared1d COMPLEX*16 for pzlared1d. DIMENSION (*lwork*). Used to hold the buffers sent from one process to another.
lwork	(local) INTEGER. The size of the *work* array. *lwork* ≥ numroc(*n*, *desc*(*nb_*), 0, 0, *npcol*).

Output Parameters

byall	(global). REAL for pslared1d DOUBLE PRECISION for pdlared1d COMPLEX for pclared1d COMPLEX*16 for pzlared1d. Global DIMENSION (*n*), local DIMENSION (*n*). *byall* is exactly duplicated on all processes. It contains the same values as *bycol*, but it is replicated across all processes rather than being distributed.

p?lared2d

Redistributes an array assuming that the input array byrow is distributed across columns and that all process rows contain the same copy of byrow.

Syntax

```
call pslared2d(n, ia, ja, desc, byrow, byall, work, lwork)
call pdlared2d(n, ia, ja, desc, byrow, byall, work, lwork)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine redistributes a 1D array. It assumes that the input array *byrow* is distributed across columns and that all process rows contain the same copy of *byrow*. The output array *byall* will be identical on all processes and will contain the entire array.

Input Parameters

np = Number of local rows in *byrow*()

n	(global) `INTEGER`. The number of elements to be redistributed. $n \geq 0$.
ia, *ja*	(global) `INTEGER`. *ia*, *ja* must be equal to 1.
desc	(global and local) `INTEGER` array, `DIMENSION` (*dlen_*). A 2D array descriptor, which describes *byrow*.

byrow	(local).
	`REAL` for `pslared2d`
	`DOUBLE PRECISION` for `pdlared2d`
	`COMPLEX` for `pclared2d`
	`COMPLEX*16` for `pzlared2d`.
	Distributed block cyclic array global `DIMENSION` (*n*), local `DIMENSION` *np*. *bycol* is distributed across the process columns. All process rows are assumed to contain the same value.

work	(local).
	`REAL` for `pslared2d`
	`DOUBLE PRECISION` for `pdlared2d`
	`COMPLEX` for `pclared2d`
	`COMPLEX*16` for `pzlared2d`.
	`DIMENSION` (*lwork*). Used to hold the buffers sent from one process to another.

lwork	(local).`INTEGER`. The size of the *work* array. *lwork* ≥ numroc(*n*, *desc*(*nb_*), 0, 0, *npcol*).

Output Parameters

byall	(global). `REAL` for `pslared2d`
	`DOUBLE PRECISION` for `pdlared2d`
	`COMPLEX` for `pclared2d`
	`COMPLEX*16` for `pzlared2d`.
	Global `DIMENSION`(*n*), local `DIMENSION` (*n*). *byall* is exactly duplicated on all processes. It contains the same values as *bycol*, but it is replicated across all processes rather than being distributed.

p?larf

Applies an elementary reflector to a general rectangular matrix.

Syntax

```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine applies a real/complex elementary reflector Q (or Q^T) to a real/complex m-by-n distributed matrix sub(C) = C(ic:ic+m-1, jc:jc+n-1), from either the left or the right. Q is represented in the form

Q = I-tau*v*v',

where tau is a real/complex scalar and v is a real/complex vector.

If tau = 0, then Q is taken to be the unit matrix.

Input Parameters

side	(global). CHARACTER. = 'L': form Q*sub(C), = 'R': form sub(C)*Q, Q=Q^T.
m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(A). ($m \geq 0$).
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(A). ($n \geq 0$).
v	(local). REAL for pslarf DOUBLE PRECISION for pdlarf COMPLEX for pclarf COMPLEX*16 for pzlarf. Pointer into the local memory to an array of DIMENSION (lld_v,*) containing the local pieces of the distributed vectors V representing the Householder transformation Q, v(iv:iv+m-1, jv) if $side$ = 'L' and $incv$ = 1, v(iv, jv:jv+m-1) if $side$ = 'L' and $incv$ = m_v, v(iv:iv+n-1, jv) if $side$ = 'R' and $incv$ = 1, v(iv, jv:jv+n-1) if $side$ = 'R' and $incv$ = m_v. The vector v is the representation of Q. v is not used if tau = 0.

iv, *jv* (global) INTEGER. The row and column indices in the global array *V* indicating the first row and the first column of the submatrix sub(*V*), respectively.

descv (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix V.

incv (global) INTEGER.
The global increment for the elements of *v*. Only two values of *incv* are supported in this version, namely 1 and *m_v*.
incv must not be zero.

tau (local).
REAL for pslarf
DOUBLE PRECISION for pdlarf
COMPLEX for pclarf
COMPLEX*16 for pzlarf.
Array, DIMENSION *LOCc*(*jv*) if *incv* = 1, and *LOCr*(*iv*) otherwise. This array contains the Householder scalars related to the Householder vectors.
tau is tied to the distributed matrix *v*.

c (local).
REAL for pslarf
DOUBLE PRECISION for pdlarf
COMPLEX for pclarf
COMPLEX*16 for pzlarf.
Pointer into the local memory to an array of DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)), containing the local pieces of sub(*C*).

ic, *jc* (global) INTEGER.
The row and column indices in the global array *c* indicating the first row and the first column of the submatrix sub(*C*), respectively.

descc (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local).
REAL for pslarf
DOUBLE PRECISION for pdlarf
COMPLEX for pclarf
COMPLEX*16 for pzlarf.
Array, DIMENSION (*lwork*).
If *incv* = 1,
  if *side* = 'L',
   if *ivcol* = *iccol*,
     lwork≥*nqc*0
   else
     lwork≥*mpc*0 + max(1, *nqc*0)
   end if
  else if *side* = 'R' ,
    lwork≥*nqc*0 + max(max(1, *mpc*0), numroc(numroc(*n*+

icoffc,*nb_v*,0,0,*npcol*),*nb_v*,0,0,*lcmq*))
end if
else if *incv* = *m_v*,
if *side* = 'L',
lwork≥*mpc*0 + max(max(*1*, *nqc*0), numroc(
numroc(*m*+*iroffc*,*mb_v*,0,0,*nprow*),*mb_v*,0,0, *lcmp*))
else if *side* = 'R',
if *ivrow* = *icrow*,
lwork≥*mpc*0
else
lwork≥*nqc*0 + max(*1*, *mpc*0)
end if
end if
end if,

where *lcm* is the least common multiple of *nprow* and *npcol* and *lcm* = *ilcm*(*nprow*, *npcol*), *lcmp* = *lcm*/*nprow*, *lcmq* = *lcm*/*npcol*, iroffc = mod(*ic*-1, *mb_c*), *icoffc* = *mod*(*jc*-1, *nb_c*), icrow = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_c*, *nprow*), iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_c*, *npcol*), *mpc*0 = numroc(*m*+*iroffc*, *mb_c*, *myrow*, *icrow*, *nprow*), *nqc*0 = numroc(*n*+*icoffc*, *nb_c*, *mycol*, *iccol*, *npcol*), ilcm, indxg2p, and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

c (local).
On exit, sub(*C*) is overwritten by the *Q**sub(*C*) if *side* = 'L', or sub(*C*) * *Q* if *side* = 'R'.

p?larfb

Applies a block reflector or its transpose/conjugate-transpose to a general rectangular matrix.

Syntax

call pslarfb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

call pdlarfb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

call pclarfb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

call pzlarfb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine applies a real/complex block reflector Q or its transpose Q^T/conjugate transpose Q^H to a real/complex distributed m-by-n matrix sub(C) = C(ic:ic+m-1, jc:jc+n-1) from the left or the right.

Input Parameters

side	(global).CHARACTER. if *side* = 'L': apply Q or Q^T for real flavors (Q^H for complex flavors) from the Left; if *side* = 'R': apply Q or $Q^T$for real flavors (Q^H for complex flavors) from the Right.
trans	(global).CHARACTER. if *trans* = 'N': no transpose, apply Q; for real flavors, if *trans*='T': transpose, apply Q^T for complex flavors, if *trans* = 'C': conjugate transpose, apply Q^H;
direct	(global) CHARACTER. Indicates how Q is formed from a product of elementary reflectors. if *direct* = 'F': Q = H(1)*H(2)*...*H(k) (Forward) if *direct* = 'B': Q = H(k)*...*H(2)*H(1) (Backward)
storev	(global) CHARACTER. Indicates how the vectors that define the elementary reflectors are stored: if *storev* = 'C': Columnwise if *storev* = 'R': Rowwise.
m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(C). ($m \geq 0$).
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(C). ($n \geq 0$).
k	(global) INTEGER. The order of the matrix T.
v	(local). REAL for pslarfb DOUBLE PRECISION for pdlarfb COMPLEX for pclarfb COMPLEX*16 for pzlarfb. Pointer into the local memory to an array of DIMENSION (*lld_v*, *LOCc*(jv+k-1)) if *storev* = 'C', (*lld_v*, *LOCc*(jv+m-1)) if *storev* = 'R' and *side* = 'L', (*lld_v*, *LOCc*(jv+n-1)) if *storev* = 'R' and *side* = 'R'. It contains the local pieces of the distributed vectors V representing the Householder transformation.

if *storev* = 'C' and *side* = 'L', *lld_v* ≥ max(1,*LOCr*(*iv*+*m*-*1*));

if *storev* = 'C' and *side* = 'R', *lld_v* ≥ max(1,*LOCr*(*iv*+*n*-*1*));

if *storev* = 'R', *lld_v* ≥ *LOCr*(*jv*+*k*-1).

iv, *jv* (global) INTEGER.
The row and column indices in the global array *V* indicating the first row and the first column of the submatrix sub(*V*), respectively.

descv (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *V*.

c (local).
REAL for pslarfb
DOUBLE PRECISION for pdlarfb
COMPLEX for pclarfb
COMPLEX*16 for pzlarfb.
Pointer into the local memory to an array of DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)), containing the local pieces of sub(*C*).

ic, *jc* (global) INTEGER. The row and column indices in the global array *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.

descc (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local).
REAL for pslarfb
DOUBLE PRECISION for pdlarfb
COMPLEX for pclarfb
COMPLEX*16 for pzlarfb.
Workspace array, DIMENSION (*lwork*).
If *storev* = 'C',
 if *side* = 'L',
  lwork ≥ (*nqc*0 + *mpc*0) * *k*
 else if *side* = 'R',
  lwork ≥ (*nqc*0 + max(*npv*0 + numroc(numroc(*n* +

iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_*c, *npcol*),
MpC0 = numroc(*m*+*iroffc*, *mb_c*, *myrow*, *icrow*, *nprow*),
NpC0 = numroc(*n*+*icoffc*, *mb_c*, *myrow*, *icrow*, *nprow*),
NqC0 = numroc(*n*+*icoffc*, *nb_c*, *mycol*, *iccol*, *npcol*),
ilcm, indxg2p, and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

t (local).
REAL for pslarfb
DOUBLE PRECISION for pdlarfb
COMPLEX for pclarfb
COMPLEX*16 for pzlarfb.
Array, DIMENSION(*mb_v*, *mb_v*) if *storev* = 'R', and (*nb_v*, *nb_v*) if *storev* = 'C'. The triangular matrix *t* is the representation of the block reflector.

c (local).
On exit, sub(*C*) is overwritten by the *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q*, or sub(*C*)**Q'*. *Q'* is transpose (conjugate transpose) of *Q*.

p?larfc

Applies the conjugate transpose of an elementary reflector to a general matrix.

Syntax

call pclarfc(*side*, *m*, *n*, *v*, *iv*, *jv*, *descv*, *incv*, *tau*, *c*, *ic*, *jc*, *descc*, *work*)

call pzlarfc(*side*, *m*, *n*, *v*, *iv*, *jv*, *descv*, *incv*, *tau*, *c*, *ic*, *jc*, *descc*, *work*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine applies a complex elementary reflector Q^H to a complex *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1), from either the left or the right. *Q* is represented in the form

*Q = i-tau*v*v'*,

where *tau* is a complex scalar and *v* is a complex vector.

If *tau* = 0, then *Q* is taken to be the unit matrix.

Input Parameters

side (global).CHARACTER.
if *side* = 'L': form Q^H*sub(*C*) ;
if *side* = 'R': form sub (*C*)*Q^H.

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). (*m* ≥ 0).

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). (*n* ≥ 0).

v (local).
COMPLEX for pclarfc
COMPLEX*16 for pzlarfc.
Pointer into the local memory to an array of DIMENSION (*lld_v*,*) containing the local pieces of the distributed vectors *v* representing the Householder transformation *Q*,
v(*iv*:*iv*+*m*-1, *jv*) if *side* = 'L' and *incv* = 1,
v(*iv*, *jv*:*jv*+*m*-1) if *side* = 'L' and *incv* = *m_v*,
v(*iv*:*iv*+*n*-1, *jv*) if *side* = 'R' and *incv* = 1,
v(*iv*, *jv*:*jv*+*n*-1) if *side* = 'R' and *incv* = *m_v*.
The vector *v* is the representation of *Q*. *v* is not used if *tau* = 0.

iv, *jv* (global) INTEGER.
The row and column indices in the global array *V* indicating the first row and the first column of the submatrix sub(*V*), respectively.

descv (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *V*.

incv (global) INTEGER.
The global increment for the elements of *v*. Only two values of *incv* are supported in this version, namely 1 and *m_v*.
incv must not be zero.

tau (local)
COMPLEX for pclarfc
COMPLEX*16 for pzlarfc.
Array, DIMENSION *LOCc*(*jv*) if *incv* = 1, and *LOCr*(*iv*) otherwise. This array contains the Householder scalars related to the Householder vectors.
tau is tied to the distributed matrix *V*.

c (local).
COMPLEX for pclarfc
COMPLEX*16 for pzlarfc.
Pointer into the local memory to an array of DIMENSION (*lld_c*, *LOCc*(*jc*+*n*-1)), containing the local pieces of sub(*C*).

ic, *jc*
(global) INTEGER.
The row and column indices in the global array *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.

descc
(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.

work
(local).
COMPLEX for pclarfc
COMPLEX*16 for pzlarfc.
Workspace array, DIMENSION (*lwork*).
If *incv* = 1,
 if *side* = 'L' ,
  if *ivcol* = *iccol*,
   lwork ≥ *nqc*0
  else
   lwork ≥ *mpc*0 + max(1, *nqc*0)
  end if
 else if *side* = 'R',
  lwork ≥ *nqc*0 + max(max(1, *mpc*0), numroc(numroc(
   n+*icoffc*,*nb_v*,0,0,*npcol*), *nb_v*,0,0,*lcmq*))
 end if
else if *incv* = *m_v*,
 if *side* = 'L',
  lwork ≥ *mpc*0 + max(max(1, *nqc*0), numroc(numroc(
   m+*iroffc*,*mb_v*,0,0,*nprow*),*mb_v*,0,0,*lcmp*))
 else if *side* = 'R' ,
  if *ivrow* = *icrow*,
   lwork ≥ *mpc*0
  else
   lwork ≥ *nqc*0 + max(1, *mpc*0)
  end if
 end if
end if,
where *lcm* is the least common multiple of *nprow* and *npcol* and *lcm* = ilcm(*nprow*, *npcol*),
lcmp = *lcm*/*nprow*, *lcmq* = *lcm*/*npcol*,
iroffc = mod(*ic*-1, *mb_c*), *icoffc* = mod(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_*c, *nprow*),
iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_*c, *npcol*),
*mpc*0 = numroc(*m*+*iroffc*, *mb_c*, *myrow*, *icrow*, *nprow*),
*nqc*0 = numroc(*n*+*icoffc*, *nb_c*, *mycol*, *iccol*, *npcol*),
ilcm, indxg2p, and numroc are ScaLAPACK tool functions;*myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

c	(local). On exit, sub(*C*) is overwritten by the Q^H*sub(*C*) if *side* = 'L', or sub(*C*) * Q^H if *side* = 'R'.

p?larfg

Generates an elementary reflector (Householder matrix).

Syntax

```
call pslarfg(n, alpha, iax, jax, x, ix, jx, descx, incx, tau)
call pdlarfg(n, alpha, iax, jax, x, ix, jx, descx, incx, tau)
call pclarfg(n, alpha, iax, jax, x, ix, jx, descx, incx, tau)
call pzlarfg(n, alpha, iax, jax, x, ix, jx, descx, incx, tau)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine generates a real/complex elementary reflector *H* of order *n*, such that

$$H * \mathrm{sub}(X) = H * \begin{pmatrix} x(iax, jax) \\ x \end{pmatrix} = \begin{pmatrix} alpha \\ 0 \end{pmatrix}, \quad H'* H = I,$$

where *alpha* is a scalar (a real scalar - for complex flavors), and sub(*X*) is an (*n*-1)-element real/complex distributed vector *X*(*ix*:*ix*+*n*-2, *jx*) if *incx* = 1 and *X*(*ix*, *jx*:*jx*+*n*-2) if *incx* = *descx*(*m_*). *H* is represented in the form

$$H = I - tau * \begin{pmatrix} 1 \\ v \end{pmatrix} * (1 \; v')$$

where *tau* is a real/complex scalar and *v* is a real/complex (*n*-1)-element vector. Note that *H* is not Hermitian.

If the elements of sub(*X*) are all zero (and *X*(*iax*, *jax*) is real for complex flavors), then *tau* = 0 and *H* is taken to be the unit matrix.

Otherwise 1 ≤ real(*tau*) ≤ 2 and abs(*tau*-1) ≤ 1.

Input Parameters

n	(global) INTEGER. The global order of the elementary reflector. *n* ≥ 0.
iax, *jax*	(global) INTEGER.

	The global row and column indices in *x* of *X*(*iax*, *jax*).
x	(local). Real for pslarfg DOUBLE PRECISION for pdlarfg COMPLEX for pclarfg COMPLEX*16 for pzlarfg. Pointer into the local memory to an array of DIMENSION (*lld_x*, *). This array contains the local pieces of the distributed vector sub(*X*). Before entry, the incremented array sub(*X*) must contain vector *x*.
ix, *jx*	(global) INTEGER. The row and column indices in the global array *X* indicating the first row and the first column of sub(*X*), respectively.
descx	(global and local) INTEGER. Array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *X*.
incx	(global) INTEGER. The global increment for the elements of *x*. Only two values of *incx* are supported in this version, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

alpha	(local) REAL for pslafg DOUBLE PRECISION for pdlafg COMPLEX for pclafg COMPLEX*16 for pzlafg. On exit, *alpha* is computed in the process scope having the vector sub(*X*).
x	(local). On exit, it is overwritten with the vector *v*.
tau	(local). Real for pslarfg DOUBLE PRECISION for pdlarfg COMPLEX for pclarfg COMPLEX*16 for pzlarfg. Array, DIMENSION *LOCc*(*jx*) if *incx* = 1, and *LOCr*(*ix*) otherwise. This array contains the Householder scalars related to the Householder vectors. *tau* is tied to the distributed matrix *X*.

p?larft

*Forms the triangular vector T of a block reflector H=I-V*T*V^H.*

Syntax

```
call pslarft(direct, storev, n, k, v, iv, jv, descv, tau, t, work)
call pdlarft(direct, storev, n, k, v, iv, jv, descv, tau, t, work)
call pclarft(direct, storev, n, k, v, iv, jv, descv, tau, t, work)
call pzlarft(direct, storev, n, k, v, iv, jv, descv, tau, t, work)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine forms the triangular factor *T* of a real/complex block reflector *H* of order *n*, which is defined as a product of *k* elementary reflectors.

If *direct* = 'F', *H* = *H*(1)**H*(2)...**H*(*k*), and *T* is upper triangular;

If *direct* = 'B', *H* = *H*(*k*)*...**H*(2)**H*(1), and *T* is lower triangular.

If *storev* = 'C', the vector which defines the elementary reflector *H*(*i*) is stored in the *i*-th column of the distributed matrix *V*, and

H = *I*-*V***T***V*'

If *storev* = 'R', the vector which defines the elementary reflector *H*(*i*) is stored in the *i*-th row of the distributed matrix *V*, and

H = *I*-*V*'**T***V*.

Input Parameters

direct
(global) CHARACTER*1.
Specifies the order in which the elementary reflectors are multiplied to form the block reflector:
if *direct* = 'F': *H* = *H*(1)**H*(2)*...**H*(*k*) (forward)
if *direct* = 'B': *H* = *H*(*k*)*...**H*(2)**H*(1) (backward).

storev
(global) CHARACTER*1.
Specifies how the vectors that define the elementary reflectors are stored (See *Application Notes* below):
if *storev* = 'C': columnwise;
if *storev* = 'R': rowwise.

n
(global) INTEGER.
The order of the block reflector *H*. *n* ≥ 0.

k
(global) INTEGER.
The order of the triangular factor *T*, is equal to the number of elementary reflectors.
1 ≤ *k* ≤ *mb_v* (= *nb_v*).

v	REAL for pslarft DOUBLE PRECISION for pdlarft COMPLEX for pclarft COMPLEX*16 for pzlarft. Pointer into the local memory to an array of local DIMENSION (*LOCr*(*iv*+*n*-1), *LOCc*(*jv*+*k*-1)) if *storev* = 'C', and (*LOCr*(*iv*+*k*-1), *LOCc*(*jv*+*n*-1)) if *storev* = 'R'. The distributed matrix *V* contains the Householder vectors. (See *Application Notes* below).
iv, *jv*	(global) INTEGER. The row and column indices in the global array *v* indicating the first row and the first column of the submatrix sub(*V*), respectively.
descv	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *V*.
tau	(local) REAL for pslarft DOUBLE PRECISION for pdlarft COMPLEX for pclarft COMPLEX*16 for pzlarft. Array, DIMENSION*LOCr*(*iv*+*k*-1) if *incv* = *m_v*, and *LOCc*(*jv*+*k*-1) otherwise. This array contains the Householder scalars related to the Householder vectors. *tau* is tied to the distributed matrix *V*.
work	(local). REAL for pslarft DOUBLE PRECISION for pdlarft COMPLEX for pclarft COMPLEX*16 for pzlarft. Workspace array, DIMENSION (*k*(*k*-1)/2).

Output Parameters

v	REAL for pslarft DOUBLE PRECISION for pdlarft COMPLEX for pclarft COMPLEX*16 for pzlarft.
t	(local) REAL for pslarft DOUBLE PRECISION for pdlarft COMPLEX for pclarft COMPLEX*16 for pzlarft. Array, DIMENSION (*nb_v*,*nb_v*) if *storev* = 'C', and (*mb_v*,*mb_v*) otherwise. It contains the *k*-by-*k* triangular factor of the block reflector associated with *v*. If *direct* = 'F', *t* is upper triangular; if *direct* = 'B', *t* is lower triangular.

Application Notes

The shape of the matrix *V* and the storage of the vectors that define the *H*(*i*) is best illustrated by the following example with *n* = 5 and *k* = 3. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

direct = 'F' and *storev* = 'C':

$$V(iv:iv+n-1,\ jv:jv+k-1) = \begin{bmatrix} 1 & & \\ v1 & 1 & \\ v1 & v2 & 1 \\ v1 & v2 & v3 \\ v1 & v2 & v3 \end{bmatrix}$$

direct = 'F' and *storev* = 'R'

$$V(iv:iv+k-1,\ jv:jv+n-1) = \begin{bmatrix} 1 & v1 & v1 & v1 & v1 \\ & 1 & v2 & v2 & v2 \\ & & 1 & v3 & v3 \end{bmatrix}$$

direct = 'B' and *storev* = 'C'

$$V(iv:iv+n-1,\ jv:jv+k-1) = \begin{bmatrix} v1 & v2v & v3 \\ v1 & v2 & v3 \\ 1 & v2 & v3 \\ & 1 & v3 \\ & & 1 \end{bmatrix}$$

direct = 'B' and *storev* = 'R'

$$V(iv:iv+k-1,\ jv:jv+n-1) = \begin{bmatrix} v1 & v1 & 1 & & \\ v2 & v2 & v2 & 1 & \\ v3 & v3 & v3 & v3 & 1 \end{bmatrix}$$

p?larz

Applies an elementary reflector as returned by p?tzrzf *to a general matrix.*

Syntax

```
call pslarz(side, m, n, l, v, iv, jv, descv, incv, tau, c, ic, jc, descc, work)
call pdlarz(side, m, n, l, v, iv, jv, descv, incv, tau, c, ic, jc, descc, work)
call pclarz(side, m, n, l, v, iv, jv, descv, incv, tau, c, ic, jc, descc, work)

```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine applies a real/complex elementary reflector *Q* (or Q^T) to a real/complex *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1), from either the left or the right. *Q* is represented in the form

Q = I-*tau***v***v*',

where *tau* is a real/complex scalar and *v* is a real/complex vector.

If *tau* = 0, then *Q* is taken to be the unit matrix.

Q is a product of *k* elementary reflectors as returned by p?tzrzf.

Input Parameters

side	(global) CHARACTER. if *side* = 'L': form *Q**sub(*C*), if *side* = 'R': form sub(*C*)**Q*, *Q* = Q^T (for real flavors).
m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). (*m* ≥ 0).
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). (*n* ≥ 0).
l	(global). INTEGER. The columns of the distributed submatrix sub(*A*) containing the meaningful part of the Householder reflectors. If *side* = 'L', *m* ≥ *l* ≥ 0, if *side* = 'R', *n* ≥ *l* ≥ 0.
v	(local). REAL for pslarz DOUBLE PRECISION for pdlarz COMPLEX for pclarz COMPLEX*16 for pzlarz. Pointer into the local memory to an array of DIMENSION (*lld_v*,*) containing the local pieces of the distributed vectors *v* representing the Householder transformation *Q*, *v*(*iv*:*iv*+*l*-1, *jv*) if *side* = 'L' and *incv* = 1, *v*(*iv*, *jv*:*jv*+*l*-1) if *side* = 'L' and *incv* = *m_v*, *v*(*iv*:*iv*+*l*-1, *jv*) if *side* = 'R' and *incv* = 1, *v*(*iv*, *jv*:*jv*+*l*-1) if *side* = 'R' and *incv* = *m_v*. The vector *v* in the representation of *Q*. *v* is not used if *tau* = 0.
iv, *jv*	(global) INTEGER. The row and column indices in the global array *V* indicating the first row and the first column of the submatrix sub(*V*), respectively.
descv	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *V*.
incv	(global) INTEGER. The global increment for the elements of *v*. Only two values of *incv* are supported in this version, namely 1 and *m_v*. *incv* must not be zero.
tau	(local) REAL for pslarz DOUBLE PRECISION for pdlarz COMPLEX for pclarz COMPLEX*16 for pzlarz.

Array, DIMENSION *LOCc*(*jv*) if *incv* = 1, and *LOCr*(*iv*) otherwise. This array contains the Householder scalars related to the Householder vectors.
tau is tied to the distributed matrix *V*.

c (local).
REAL for pslarz
DOUBLE PRECISION for pdlarz
COMPLEX for pclarz
COMPLEX*16 for pzlarz.
Pointer into the local memory to an array of DIMENSION (*lld_c*, *LOCc*(*jc*+*n*-1)), containing the local pieces of sub(*C*).

ic, *jc* (global) INTEGER.
The row and column indices in the global array *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.

descc (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local).
REAL for pslarz
DOUBLE PRECISION for pdlarz
COMPLEX for pclarz
COMPLEX*16 for pzlarz.
Array, DIMENSION (*lwork*)
If *incv* = 1,
 if *side* = 'L' ,
  if *ivcol* = *iccol*,
   lwork ≥ *NqC*0
  else
   lwork ≥ *MpC*0 + max(1, *NqC*0)
  end if
 else if *side* = 'R' ,
  lwork ≥ *NqC*0 + max(max(1, *MpC*0),
numroc(numroc(*n*+*icoffc*,*nb_v*,0,0,*npcol*),*nb_v*,0,0,*lcmq*))
 end if
else if *incv* = *m_v*,
 if *side* = 'L' ,
  lwork ≥ *MpC*0 + max(max(1, *NqC*0),
numroc(numroc(*m*+*iroffc*,*mb_v*,0,0,*nprow*),*mb_v*,0,0,*lcmp*))
 else if *side* = 'R' ,
  if *ivrow* = *icrow*,
   lwork ≥ *MpC*0
  else
   lwork ≥ *NqC*0 + max(1, *MpC*0)
  end if
 end if
end if.

Here *lcm* is the least common multiple of *nprow* and *npcol* and
lcm = ilcm(*nprow*, *npcol*), *lcmp* = *lcm* / *nprow*,
lcmq = *lcm* / *npcol*,
iroffc = mod(*ic*-1, *mb_c*), *icoffc* = mod(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_c*, *nprow*),
iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_c*, *npcol*),
mpc0 = numroc(*m*+*iroffc*, *mb_c*, *myrow*, *icrow*, *nprow*),
nqc0 = numroc(*n*+*icoffc*, *nb_c*, *mycol*, *iccol*, *npcol*),
ilcm, indxg2p, and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

c (local).
On exit, sub(*C*) is overwritten by the *Q**sub(*C*) if *side* = 'L', or sub(*C*)**Q* if *side* = 'R'.

p?larzb

Applies a block reflector or its transpose/conjugate-transpose as returned by p?tzrzf *to a general matrix.*

Syntax

call pslarzb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *l*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

call pdlarzb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *l*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

call pclarzb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *l*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

call pzlarzb(*side*, *trans*, *direct*, *storev*, *m*, *n*, *k*, *l*, *v*, *iv*, *jv*, *descv*, *t*, *c*, *ic*, *jc*, *descc*, *work*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine applies a real/complex block reflector *Q* or its transpose Q^T (conjugate transpose Q^H for complex flavors) to a real/complex distributed *m*-by-*n* matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) from the left or the right.

Q is a product of *k* elementary reflectors as returned by p?tzrzf.

Currently, only *storev* = 'R' and *direct* = 'B' are supported.

Input Parameters

side (global) CHARACTER.

if *side* = 'L': apply *Q* or Q^T (Q^H for complex flavors) from the Left;
if *side* = 'R': apply *Q* or Q^T (Q^H for complex flavors) from the Right.

trans (global) CHARACTER.
if *trans* = 'N': No transpose, apply *Q*;
If *trans*='T': Transpose, apply Q^T (real flavors);
If *trans*='C': Conjugate transpose, apply Q^H (complex flavors).

direct (global) CHARACTER.
Indicates how *H* is formed from a product of elementary reflectors.
if *direct* = 'F': *H* = *H*(1)**H*(2)*...**H*(*k*) - forward (not supported) ;
if *direct* = 'B': *H* = *H*(*k*)*...**H*(2)**H*(1) - backward.

storev (global) CHARACTER.
Indicates how the vectors that define the elementary reflectors are stored:
if *storev* = 'C': columnwise (not supported).
if *storev* = 'R': rowwise.

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). (*m* ≥ 0).

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). (*n* ≥ 0).

k (global) INTEGER.
The order of the matrix *T*. (= the number of elementary reflectors whose product defines the block reflector).

l (global) INTEGER.
The columns of the distributed submatrix sub(*A*) containing the meaningful part of the Householder reflectors.

If *side* = 'L', *m* ≥ *l* ≥ 0,

if *side* = 'R', *n* ≥ *l* ≥ 0.

v (local).
REAL for pslarzb
DOUBLE PRECISION for pdlarzb
COMPLEX for pclarzb
COMPLEX*16 for pzlarzb.
Pointer into the local memory to an array of DIMENSION(*lld_v*, *LOCc*(*jv*+*m*-1)) if *side* = 'L', (*lld_v*, *LOCc*(*jv*+*m*-1)) if *side* = 'R'.
It contains the local pieces of the distributed vectors *V* representing the Householder transformation as returned by p?tzrzf.

lld_v ≥ *LOCr*(*iv*+*k*-1).

iv, *jv* (global) INTEGER.
The row and column indices in the global array *V* indicating the first row and the first column of the submatrix sub(*V*), respectively.

descv	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *V*.
t	(local) REAL for pslarzb DOUBLE PRECISION for pdlarzb COMPLEX for pclarzb COMPLEX*16 for pzlarzb. Array, DIMENSION *mb_v* by *mb_v*. The lower triangular matrix *T* in the representation of the block reflector.
c	(local). REAL for pslarfb DOUBLE PRECISION for pdlarfb COMPLEX for pclarfb COMPLEX*16 for pzlarfb. Pointer into the local memory to an array of DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)). On entry, the *m*-by-*n* distributed matrix sub(*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the global array *c* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local). REAL for pslarzb DOUBLE PRECISION for pdlarzb COMPLEX for pclarzb COMPLEX*16 for pzlarzb.

Array, DIMENSION (*lwork*).

If *storev* = 'C' ,

if *side* = 'L' ,

lwork ≥(*nqc0* + *mpc0*)* *k*

else if *side* = 'R' ,

lwork ≥ (*nqc0* + max(*npv0* + numroc(numroc(*n*+*icoffc*, *nb_v*, 0, 0, *npcol*),

nb_v, 0, 0, *lcmq*), *mpc0*))* *k*

npc0 = numroc(*n*+*icoffc*, *mb_c*, *myrow*, *icrow*, *nprow*),
nqc0 = numroc(*n*+*icoffc*, *nb_c*, *mycol*, *iccol*, *npcol*),
ilcm, indxg2p, and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

c (local).
On exit, sub(*C*) is overwritten by the *Q**sub(*C*), or *Q'**sub(*C*), or sub(*C*)**Q*, or sub(*C*)**Q'*, where *Q'* is the transpose (conjugate transpose) of *Q*.

p?larzc

Applies (multiplies by) the conjugate transpose of an elementary reflector as returned by p?tzrzf *to a general matrix.*

Syntax

```
call pclarzc(side, m, n, l, v, iv, jv, descv, incv, tau, c, ic, jc, descc, work)
call pzlarzc(side, m, n, l, v, iv, jv, descv, incv, tau, c, ic, jc, descc, work)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine applies a complex elementary reflector Q^H to a complex *m*-by-*n* distributed matrix sub(*C*) = *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1), from either the left or the right. *Q* is represented in the form

Q = *i*-*tau***v***v*',

where *tau* is a complex scalar and *v* is a complex vector.

If *tau* = 0, then *Q* is taken to be the unit matrix.

Q is a product of *k* elementary reflectors as returned by p?tzrzf.

Input Parameters

side — (global) CHARACTER.
if *side* = 'L': form Q^H*sub(*C*);
if *side* = 'R': form sub(*C*)*Q^H .

m — (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). (*m* ≥ 0).

n — (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). (*n* ≥ 0).

l — (global) INTEGER.
The columns of the distributed submatrix sub(*A*) containing the meaningful part of the Householder reflectors.
If *side* = 'L', *m* ≥ *l* ≥ 0,
if *side* = 'R', *n* ≥ *l* ≥ 0.

v — (local).
COMPLEX for pclarzc
COMPLEX*16 for pzlarzc.
Pointer into the local memory to an array of DIMENSION (*lld_v*,*) containing the local pieces of the distributed vectors *v* representing the Householder transformation *Q*,
v(*iv*:*iv*+*l*-1, *jv*) if *side* = 'L' and *incv* = 1,

v(*iv*, *jv*:*jv*+*l*-1) if *side* = 'L' and *incv* = *m_v*,
v(*iv*:*iv*+*l*-1, *jv*) if *side* = 'R' and *incv* = 1,
v(*iv*, *jv*:*jv*+*l*-1) if *side* = 'R' and *incv* = *m_v*.
The vector v in the representation of *Q*. *v* is not used if *tau* = 0.

iv, *jv* (global) INTEGER.
The row and column indices in the global array *V* indicating the first row and the first column of the submatrix sub(*V*), respectively.

descv (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *V*.

incv (global). INTEGER.
The global increment for the elements of *v*. Only two values of *incv* are supported in this version, namely 1 and *m_v*.
incv must not be zero.

tau (local)
COMPLEX for pclarzc
COMPLEX*16 for pzlarzc.
Array, DIMENSION*LOCc*(*jv*) if *incv* = 1, and *LOCr*(*iv*) otherwise. This array contains the Householder scalars related to the Householder vectors.
tau is tied to the distributed matrix *V*.

c (local).
COMPLEX for pclarzc
COMPLEX*16 for pzlarzc.
Pointer into the local memory to an array of DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)), containing the local pieces of sub(*C*).

ic, *jc* (global) INTEGER.
The row and column indices in the global array *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.

descc (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local).

If *incv* = 1,

  if *side* = 'L' ,

    if *ivcol* = *iccol*,

      lwork ≥ *nqc*0

    else

      lwork ≥ *mpc*0 + max(1, *nqc*0)

    end if

  else if *side* = 'R' ,

    lwork ≥ *nqc*0 + max(max(1, *mpc*0), numroc(numroc(*n*+*icoffc*, *nb_v*, 0, 0, *npcol*),

          nb_v, 0, 0, *lcmq*))

  end if

else if *incv* = *m_v*,

  if *side* = 'L' ,

    lwork ≥ *mpc*0 + max(max(1, *nqc*0), numroc(numroc(*m*+*iroffc*, *mb_v*, 0, 0, *nprow*),

    end if

  end if

      end if

Here *lcm* is the least common multiple of *nprow* and *npcol*;
lcm = ilcm(*nprow*, *npcol*), *lcmp* = *lcm*/*nprow*, *lcmq*= *lcm*/*npcol*,
iroffc = mod(*ic*-1, *mb_c*), *icoffc*= mod(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_c*, *nprow*),
iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_c*, *npcol*),
mpc0 = numroc(*m*+*iroffc*, *mb_c*, *myrow*, *icrow*, *nprow*),
nqc0 = numroc(*n*+*icoffc*, *nb_c*, *mycol*, *iccol*, *npcol*),
ilcm, indxg2p, and numroc are ScaLAPACK tool functions;
myrow, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

c	(local). On exit, sub(*C*) is overwritten by the Q^H*sub(*C*) if *side* = 'L', or sub(*C*)*Q^H if *side* = 'R'.

p?larzt

*Forms the triangular factor T of a block reflector H=I-V*T*V^H as returned by* p?tzrzf.

Syntax

call pslarzt(*direct*, *storev*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *tau*, *t*, *work*)

call pdlarzt(*direct*, *storev*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *tau*, *t*, *work*)

call pclarzt(*direct*, *storev*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *tau*, *t*, *work*)

call pzlarzt(*direct*, *storev*, *n*, *k*, *v*, *iv*, *jv*, *descv*, *tau*, *t*, *work*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine forms the triangular factor *T* of a real/complex block reflector *H* of order greater than *n*, which is defined as a product of *k* elementary reflectors as returned by p?tzrzf.

If *direct* = 'F', *H* = *H*(1)*H(2)*...*H(*k*), and *T* is upper triangular;

If *direct* = 'B', *H* = *H*(*k*)*...*H(2)*H(1), and *T* is lower triangular.

If *storev* = 'C', the vector which defines the elementary reflector *H*(*i*), is stored in the *i*-th column of the array *v*, and

H = *i*-*v***t***v*'.

If *storev* = 'R', the vector, which defines the elementary reflector *H*(*i*), is stored in the *i*-th row of the array *v*, and

H = *i*-*v*'**t***v*

Currently, only *storev* = 'R' and *direct* = 'B' are supported.

Input Parameters

direct	(global) CHARACTER. Specifies the order in which the elementary reflectors are multiplied to form the block reflector: if *direct* = 'F': *H* = *H*(1)*H(2)*...*H(*k*) (Forward, not supported) if *direct* = 'B': *H* = *H*(*k*)*...*H(2)*H(1) (Backward).
storev	(global) CHARACTER. Specifies how the vectors which defines the elementary reflectors are stored:

	if *storev* = 'C': columnwise (not supported); if *storev* = 'R': rowwise.
n	(global). INTEGER. The order of the block reflector *H*. *n* ≥ 0.
k	(global). INTEGER. The order of the triangular factor *T* (= the number of elementary reflectors). 1≤*k*≤*mb_v*(= *nb_v*).
v	REAL for pslarzt DOUBLE PRECISION for pdlarzt COMPLEX for pclarzt COMPLEX*16 for pzlarzt. Pointer into the local memory to an array of local DIMENSION(*LOCr*(*iv*+*k*-1), *LOCc*(*jv*+*n*-1)). The distributed matrix *V* contains the Householder vectors. See *Application Notes* below.
iv, *jv*	(global) INTEGER. The row and column indices in the global array *V* indicating the first row and the first column of the submatrix sub(*V*), respectively.
descv	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *V*.
tau	(local) REAL for pslarzt DOUBLE PRECISION for pdlarzt COMPLEX for pclarzt COMPLEX*16 for pzlarzt. Array, DIMENSION *LOCr*(*iv*+*k*-1) if *incv* = *m_v*, and *LOCc*(*jv*+*k*-1) otherwise. This array contains the Householder scalars related to the Householder vectors. *tau* is tied to the distributed matrix *V*.
work	(local). REAL for pslarzt DOUBLE PRECISION for pdlarzt COMPLEX for pclarzt COMPLEX*16 for pzlarzt. Workspace array, DIMENSION(*k**(*k*-1)/2).

Output Parameters

v	REAL for pslarzt DOUBLE PRECISION for pdlarzt COMPLEX for pclarzt COMPLEX*16 for pzlarzt.
t	(local) REAL for pslarzt

DOUBLE PRECISION for pdlarzt
COMPLEX for pclarzt
COMPLEX*16 for pzlarzt.
Array, DIMENSION (*mb_v*, *mb_v*). It contains the *k*-by-*k* triangular factor of the block reflector associated with *v*. *t* is lower triangular.

Application Notes

The shape of the matrix *V* and the storage of the vectors which define the *H*(*i*) is best illustrated by the following example with *n* = 5 and *k* = 3. The elements equal to 1 are not stored; the corresponding array elements are modified but restored on exit. The rest of the array is not used.

direct='*F*' and *storev*='*C*'

$$V = \begin{bmatrix} v1 & v2 & v3 \\ v1 & v2 & v3 \\ v1 & v2 & v3 \\ v1 & v2 & v3 \\ v1 & v2 & v3 \end{bmatrix} \begin{matrix} . & . & . \\ . & . & . \\ 1 & . & . \\ & 1 & . \\ & & 1 \end{matrix}$$

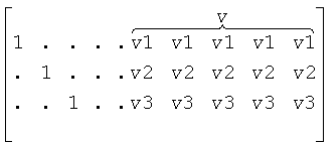
direct='*F*' and *storev*='*R*':

$$\begin{bmatrix} \overbrace{v1 & v1 & v1 & v1 & v1}^{V} & . & . & . & 1 \\ v2 & v2 & v2 & v2 & v2 & . & . & 1 & \\ v3 & v3 & v3 & v3 & v3 & . & 1 & & \end{bmatrix}$$

direct='*B*' and *storev*='*C*':

$$V = \begin{matrix} 1 & & \\ . & 1 & \\ . & . & 1 \\ . & . & . \\ . & . & . \end{matrix} \begin{bmatrix} v1 & v2 & v3 \\ v1 & v2 & v3 \\ v1 & v2 & v3 \\ v1 & v2 & v3 \\ v1 & v2 & v3 \end{bmatrix}$$

direct='*B*' and *storev*='*R*':



p?lascl

Multiplies a general rectangular matrix by a real scalar defined as C_{to}/C_{from}.

Syntax

`call pslascl(type, cfrom, cto, m, n, a, ia, ja, desca, info)`

`call pdlascl(type, cfrom, cto, m, n, a, ia, ja, desca, info)`

`call pclascl(type, cfrom, cto, m, n, a, ia, ja, desca, info)`

`call pzlascl(type, cfrom, cto, m, n, a, ia, ja, desca, info)`

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine multiplies the *m*-by-*n* real/complex distributed matrix sub(*A*) denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) by the real/complex scalar *cto/cfrom*. This is done without over/underflow as long as the final result *cto*A*(*i*,*j*)*/cfrom* does not over/underflow. *type* specifies that sub(*A*) may be full, upper triangular, lower triangular or upper Hessenberg.

Input Parameters

type	(global) CHARACTER. *type* indicates the storage type of the input distributed matrix. if *type* = 'G': sub(*A*) is a full matrix, if *type* = 'L': sub(*A*) is a lower triangular matrix, if *type* = 'U': sub(*A*) is an upper triangular matrix, if *type* = 'H': sub(*A*) is an upper Hessenberg matrix.
cfrom, *cto*	(global) REAL for pslascl/pclascl DOUBLE PRECISION for pdlascl/pzlascl. The distributed matrix sub(*A*) is multiplied by *cto/cfrom* . *A*(*i*,*j*) is computed without over/underflow if the final result *cto*A*(*i*,*j*)*/cfrom* can be represented without over/underflow. *cfrom* must be nonzero.
m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥0).
n	(global) INTEGER.

	The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n*≥0).
a	(local input/local output) REAL for pslascl DOUBLE PRECISION for pdlascl COMPLEX for pclascl COMPLEX*16 for pzlascl. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The column and row indices in the global array *A* indicating the first row and column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER . Array of DIMENSION (*dlen_*).The array descriptor for the distributed matrix *A*.

Output Parameters

a	(local). On exit, this array contains the local pieces of the distributed matrix multiplied by *cto/cfrom*.
info	(local) INTEGER. if *info* = 0: the execution is successful. if *info* < 0: If the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?laset

Initializes the offdiagonal elements of a matrix to alpha and the diagonal elements to beta.

Syntax

```
call pslaset(uplo, m, n, alpha, beta, a, ia, ja, desca)
call pdlaset(uplo, m, n, alpha, beta, a, ia, ja, desca)
call pclaset(uplo, m, n, alpha, beta, a, ia, ja, desca)
call pzlaset(uplo, m, n, alpha, beta, a, ia, ja, desca)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine initializes an *m*-by-*n* distributed matrix sub(*A*) denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) to *beta* on the diagonal and *alpha* on the offdiagonals.

Input Parameters

uplo (global) CHARACTER.
Specifies the part of the distributed matrix sub(*A*) to be set:
if *uplo* = 'U': upper triangular part; the strictly lower triangular part of sub(*A*) is not changed;
if *uplo* = 'L': lower triangular part; the strictly upper triangular part of sub(*A*) is not changed.
Otherwise: all of the matrix sub(*A*) is set.

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). (*m*≥0).

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). (*n*≥0).

alpha (global).
REAL for pslaset
DOUBLE PRECISION for pdlaset
COMPLEX for pclaset
COMPLEX*16 for pzlaset.
The constant to which the offdiagonal elements are to be set.

beta (global).
REAL for pslaset
DOUBLE PRECISION for pdlaset
COMPLEX for pclaset
COMPLEX*16 for pzlaset.
The constant to which the diagonal elements are to be set.

Output Parameters

a (local).
REAL for pslaset
DOUBLE PRECISION for pdlaset
COMPLEX for pclaset
COMPLEX*16 for pzlaset.
Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
This array contains the local pieces of the distributed matrix sub(*A*) to be set. On exit, the leading *m*-by-*n* submatrix sub(*A*) is set as follows:

if *uplo* = 'U', *A*(*ia*+*i*-1, *ja*+*j*-1) = *alpha*, 1≤*i*≤*j*-1, 1≤*j*≤*n*,

if *uplo* = 'L', *A*(*ia*+*i*-1, *ja*+*j*-1) = *alpha*, *j*+1≤*i*≤ *m*, 1≤*j*≤ *n*,

otherwise, *A*(*ia*+*i*-1, *ja*+*j*-1) = *alpha*, 1≤*i*≤*m*, 1≤*j*≤*n*, *ia*+*i*.*ne*.*ja*+*j*, and, for all *uplo*, *A*(*ia*+*i*-1, *ja*+*i*-1) = *beta*, 1≤*i*≤min(*m*,*n*).

ia, *ja* (global) INTEGER.
The column and row indices in the global array *A* indicating the first row and column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER .
Array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

p?lasmsub

Looks for a small subdiagonal element from the bottom of the matrix that it can safely set to zero.

Syntax

```
call pslasmsub(a, desca, i, l, k, smlnum, buf, lwork)
call pdlasmsub(a, desca, i, l, k, smlnum, buf, lwork)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine looks for a small subdiagonal element from the bottom of the matrix that it can safely set to zero. This routine does a global maximum and must be called by all processes.

Input Parameters

a (global)
REAL for pslasmsub
DOUBLE PRECISION for pdlasmsub
Array, DIMENSION(*desca*(*lld_*),*).
On entry, the Hessenberg matrix whose tridiagonal part is being scanned. Unchanged on exit.

desca (global and local) INTEGER.
Array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

i (global) INTEGER.
The global location of the bottom of the unreduced submatrix of *A*. Unchanged on exit.

l (global) INTEGER.
The global location of the top of the unreduced submatrix of *A*. Unchanged on exit.

smlnum (global)
REAL for pslasmsub
DOUBLE PRECISION for pdlasmsub

	On entry, a "small number" for the given matrix. Unchanged on exit.
lwork	(global) INTEGER. On exit, *lwork* is the size of the work buffer. This must be at least 2*ceil(ceil((*i*-*l*)/*hbl*)/ lcm(*nprow*,*npcol*)). Here lcm is least common multiple, and *nprow* x *npcol* is the logical grid size.

Output Parameters

k	(global) INTEGER. On exit, this yields the bottom portion of the unreduced submatrix. This will satisfy: $l \le m \le i$-1.
buf	(local). REAL for pslasmsub DOUBLE PRECISION for pdlasmsub Array of size *lwork*.

p?lassq

Updates a sum of squares represented in scaled form.

Syntax

call pslassq(*n*, *x*, *ix*, *jx*, *descx*, *incx*, *scale*, *sumsq*)

call pdlassq(*n*, *x*, *ix*, *jx*, *descx*, *incx*, *scale*, *sumsq*)

call pclassq(*n*, *x*, *ix*, *jx*, *descx*, *incx*, *scale*, *sumsq*)

call pzlassq(*n*, *x*, *ix*, *jx*, *descx*, *incx*, *scale*, *sumsq*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine returns the values *scl* and *smsq* such that
$scl^2 * smsq = x(1)^2 + ... + x(n)^2 + scale^2 * sumsq$,

where $x(i) = \text{sub}(X) = X(ix + (jx\text{-}1) * descx(m_) + (i - 1) * incx)$ for pslassq/pdlassq ,

and $x(i) = \text{sub}(X) = \text{abs}(X(ix + (jx\text{-}1) * descx(m_) + (i - 1) * incx)$ for pclassq/pzlassq.

For real routines pslassq/pdlassq the value of *sumsq* is assumed to be non-negative and *scl* returns the value $scl = \max(scale, \text{abs}(x(i)))$.

For complex routines pclassq/pzlassq the value of *sumsq* is assumed to be at least unity and the value of *ssq* will then satisfy

$$1.0 \le ssq \le sumsq + 2n$$

Value *scale* is assumed to be non-negative and *scl* returns the value

$$scl = \max_i \left(scale, \text{abs}\left(\text{real}\left(x\left(i\right)\right)\right), \text{abs}\left(\text{aimag}\left(x\left(i\right)\right)\right)\right)$$

For all routines p?lassq values *scale* and *sumsq* must be supplied in *scale* and *sumsq* respectively, and *scale* and *sumsq* are overwritten by *scl* and *ssq* respectively.

All routines p?lassq make only one pass through the vector sub(*x*).

Input Parameters

n (global) INTEGER.
The length of the distributed vector sub(*x*).

x REAL for pslassq
DOUBLE PRECISION for pdlassq
COMPLEX for pclassq
COMPLEX*16 for pzlassq.
The vector for which a scaled sum of squares is computed:
x(*ix* + (*jx*-1)**m_x* + (*i* - 1)**incx*), 1 ≤ *i* ≤ *n*.

ix (global) INTEGER.
The row index in the global array *X* indicating the first row of sub(*X*).

jx (global) INTEGER.
The column index in the global array *X* indicating the first column of sub(*X*).

descx (global and local) INTEGER array of DIMENSION (*dlen_*).
The array descriptor for the distributed matrix *X*.

incx (global) INTEGER.
The global increment for the elements of *X*. Only two values of *incx* are supported in this version, namely 1 and *m_x*. The argument *incx* must not equal zero.

scale (local).
REAL for pslassq/pclassq
DOUBLE PRECISION for pdlassq/pzlassq.
On entry, the value *scale* in the equation above.

sumsq (local)
REAL for pslassq/pclassq
DOUBLE PRECISION for pdlassq/pzlassq.
On entry, the value *sumsq* in the equation above.

Output Parameters

scale (local).
On exit, *scale* is overwritten with *scl* , the scaling factor for the sum of squares.

sumsq (local).
On exit, *sumsq* is overwritten with the value *smsq,* the basic sum of squares from which *scl* has been factored out.

p?laswp

Performs a series of row interchanges on a general rectangular matrix.

Syntax

```
call pslaswp(direc, rowcol, n, a, ia, ja, desca, k1, k2, ipiv)
call pdlaswp(direc, rowcol, n, a, ia, ja, desca, k1, k2, ipiv)
call pclaswp(direc, rowcol, n, a, ia, ja, desca, k1, k2, ipiv)
call pzlaswp(direc, rowcol, n, a, ia, ja, desca, k1, k2, ipiv)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine performs a series of row or column interchanges on the distributed matrix sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1). One interchange is initiated for each of rows or columns *k1* through *k2* of sub(*A*). This routine assumes that the pivoting information has already been broadcast along the process row or column. Also note that this routine will only work for *k1*-*k2* being in the same *mb* (or *nb*) block. If you want to pivot a full matrix, use p?lapiv.

Input Parameters

direc	(global) CHARACTER. Specifies in which order the permutation is applied: = 'F' - forward, = 'B' - backward.
rowcol	(global) CHARACTER. Specifies if the rows or columns are permuted: = 'R' - rows, = 'C' - columns.
n	(global) INTEGER. If *rowcol*='R', the length of the rows of the distributed matrix *A*(*, *ja*:*ja*+*n*-1) to be permuted; If *rowcol*='C', the length of the columns of the distributed matrix *A*(*ia*:*ia*+*n*-1 , *) to be permuted;
a	(local) REAL for pslaswp DOUBLE PRECISION for pdlaswp COMPLEX for pclaswp COMPLEX*16 for pzlaswp. Pointer into the local memory to an array of DIMENSION (*lld_a*, *). On entry, this array contains the local pieces of the distributed matrix to which the row/columns interchanges will be applied.
ia	(global) INTEGER. The row index in the global array *A* indicating the first row of sub(*A*).
ja	(global) INTEGER.

	The column index in the global array *A* indicating the first column of sub(*A*).
desca	(global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
k1	(global) INTEGER. The first element of *ipiv* for which a row or column interchange will be done.
k2	(global) INTEGER. The last element of *ipiv* for which a row or column interchange will be done.
ipiv	(local) INTEGER. Array, DIMENSION *LOCr*(*m_a*)+*mb_a* for row pivoting and *LOCr*(*n_a*)+*nb_a* for column pivoting. This array is tied to the matrix *A*, *ipiv*(*k*)=*l* implies rows (or columns) *k* and *l* are to be interchanged.

Output Parameters

A	(local) REAL for pslaswp DOUBLE PRECISION for pdlaswp COMPLEX for pclaswp COMPLEX*16 for pzlaswp. On exit, the permuted distributed matrix.

p?latra

Computes the trace of a general square distributed matrix.

Syntax

val = pslatra(*n*, *a*, *ia*, *ja*, *desca*)

val = pdlatra(*n*, *a*, *ia*, *ja*, *desca*)

val = pclatra(*n*, *a*, *ia*, *ja*, *desca*)

val = pzlatra(*n*, *a*, *ia*, *ja*, *desca*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

This function computes the trace of an *n*-by-*n* distributed matrix sub(*A*) denoting *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1). The result is left on every process of the grid.

Input Parameters

n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*). *n* ≥0.

a	(local). Real for pslatra DOUBLE PRECISION for pdlatra COMPLEX for pclatra COMPLEX*16 for pzlatra. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)) containing the local pieces of the distributed matrix, the trace of which is to be computed.
ia, *ja*	(global) INTEGER. The row and column indices respectively in the global array *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

val	The value returned by the fuction.

p?latrd

Reduces the first nb rows and columns of a symmetric/Hermitian matrix A to real tridiagonal form by an orthogonal/unitary similarity transformation.

Syntax

```
call pslatrd(uplo, n, nb, a, ia, ja, desca, d, e, tau, w, iw, jw, descw, work)
call pdlatrd(uplo, n, nb, a, ia, ja, desca, d, e, tau, w, iw, jw, descw, work)
call pclatrd(uplo, n, nb, a, ia, ja, desca, d, e, tau, w, iw, jw, descw, work)
call pzlatrd(uplo, n, nb, a, ia, ja, desca, d, e, tau, w, iw, jw, descw, work)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine reduces *nb* rows and columns of a real symmetric or complex Hermitian matrix sub(*A*)= *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) to symmetric/complex tridiagonal form by an orthogonal/unitary similarity transformation *Q'*sub(*A*)*Q*, and returns the matrices *V* and *W*, which are needed to apply the transformation to the unreduced part of sub(*A*).

If *uplo* = U, p?latrd reduces the last *nb* rows and columns of a matrix, of which the upper triangle is supplied;

if *uplo* = L, p?latrd reduces the first *nb* rows and columns of a matrix, of which the lower triangle is supplied.

This is an auxiliary routine called by p?sytrd/p?hetrd.

Input Parameters

uplo	(global) CHARACTER.

Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix sub(*A*) is stored:
= 'U': Upper triangular
= L: Lower triangular.

n (global) INTEGER.
The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*). *n* ≥ 0.

nb (global) INTEGER.
The number of rows and columns to be reduced.

a REAL for pslatrd
DOUBLE PRECISION for pdlatrd
COMPLEX for pclatrd
COMPLEX*16 for pzlatrd.
Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the symmetric/Hermitian distributed matrix sub(*A*).
If *uplo* = U, the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and its strictly lower triangular part is not referenced.
If *uplo* = L, the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and its strictly upper triangular part is not referenced.

ia (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

iw (global) INTEGER.
The row index in the global array *W* indicating the first row of sub(*W*).

jw (global) INTEGER.
The column index in the global array *W* indicating the first column of sub(*W*).

descw (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *W*.

work (local)
REAL for pslatrd
DOUBLE PRECISION for pdlatrd
COMPLEX for pclatrd
COMPLEX*16 for pzlatrd.
Workspace array of DIMENSION (*nb_a*).

Output Parameters

a (local)
On exit, if *uplo* = 'U', the last *nb* columns have been reduced to tridiagonal form, with the diagonal elements overwriting the diagonal elements of sub(*A*); the elements above the diagonal with the array *tau* represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors;
if *uplo* = 'L', the first *nb* columns have been reduced to tridiagonal form, with the diagonal elements overwriting the diagonal elements of sub(*A*); the elements below the diagonal with the array *tau* represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.

d (local)
REAL for pslatrd/pclatrd
DOUBLE PRECISION for pdlatrd/pzlatrd.
Array, DIMENSION *LOCc*(*ja*+*n*-1).
The diagonal elements of the tridiagonal matrix *T*: *d*(i) = *a*(i,i). *d* is tied to the distributed matrix *A*.

e (local)
REAL for pslatrd/pclatrd
DOUBLE PRECISION for pdlatrd/pzlatrd.
Array, DIMENSION *LOCc*(*ja*+*n*-1) if *uplo* = 'U', *LOCc*(*ja*+*n*-2) otherwise.
The off-diagonal elements of the tridiagonal matrix *T*:
e(*i*) = *a*(*i*, *i* + 1) if *uplo* = 'U',
e(*i*) = *a*(*i* + 1, *i*) if *uplo* = L.
e is tied to the distributed matrix *A*.

tau (local)
REAL for pslatrd
DOUBLE PRECISION for pdlatrd
COMPLEX for pclatrd
COMPLEX*16 for pzlatrd.
Array, DIMENSION *LOCc*(*ja*+*n*-1). This array contains the scalar factors *tau* of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

w (local)
REAL for pslatrd
DOUBLE PRECISION for pdlatrd
COMPLEX for pclatrd
COMPLEX*16 for pzlatrd.
Pointer into the local memory to an array of DIMENSION (*lld_w*, *nb_w*). This array contains the local pieces of the *n*-by-*nb_w* matrix *w* required to update the unreduced part of sub(*A*).

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors
Q = *H*(*n*)**H*(*n*-*1*)*...**H*(*n*-*nb*+1)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*' ,

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*i*:*n*) = 0 and *v*(*i*-1) = 1; *v*(1:*i*-1) is stored on exit in *A*(*ia*:*ia*+*i*-1, *ja*+*i*), and *tau* in *tau*(*ja*+*i*-1).

If *uplo* = L, the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*nb*)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*' ,

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*) = 0 and *v*(*i*+1) = 1; *v*(*i*+2:*n*) is stored on exit in *A*(*ia*+*i*+1: *ia*+*n*-1, *ja*+*i*-1), and *tau* in *tau*(*ja*+*i*-1).

The elements of the vectors *v* together form the *n*-by-*nb* matrix *V* which is needed, with *W*, to apply the transformation to the unreduced part of the matrix, using a symmetric/Hermitian rank-2*k* update of the form:

sub(*A*) := sub(*A*)-*vw*'-*wv*'.

The contents of *a* on exit are illustrated by the following examples with

n = 5 and *nb* = 2:

if *uplo*='U':

$$\begin{bmatrix} a & a & a & v_4 & v_5 \\ & a & a & v_4 & v_5 \\ & & a & 1 & v_5 \\ & & & d & 1 \\ & & & & d \end{bmatrix}$$

if *uplo*='L':

$$\begin{bmatrix} d & & & & \\ 1 & d & & & \\ v_1 & 1 & a & & \\ v_1 & v_2 & a & a & \\ v_1 & v_2 & a & a & a \end{bmatrix}$$

where *d* denotes a diagonal element of the reduced matrix, *a* denotes an element of the original matrix that is unchanged, and v_i denotes an element of the vector defining *H*(i).

p?latrs

Solves a triangular system of equations with the scale factor set to prevent overflow.

Syntax

call pslatrs(*uplo*, *trans*, *diag*, *normin*, *n*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *scale*, *cnorm*, *work*)

call pdlatrs(*uplo*, *trans*, *diag*, *normin*, *n*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *scale*, *cnorm*, *work*)

call pclatrs(*uplo*, *trans*, *diag*, *normin*, *n*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *scale*, *cnorm*, *work*)

call pzlatrs(*uplo*, *trans*, *diag*, *normin*, *n*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *scale*, *cnorm*, *work*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves a triangular system of equations $Ax = sb$, $A^Tx = sb$ or $A^Hx = sb$, where s is a scale factor set to prevent overflow. The description of the routine will be extended in the future releases.

Input Parameters

uplo — CHARACTER*1.
Specifies whether the matrix *A* is upper or lower triangular.
= 'U': Upper triangular
= 'L': Lower triangular

trans — CHARACTER*1.
Specifies the operation applied to *Ax*.
= 'N': Solve *Ax* = *s*b* (no transpose)
= 'T': Solve A^Tx = *s*b* (transpose)
= 'C': Solve A^Hx = *s*b* (conjugate transpose),
where *s* - is a scale factor

diag — CHARACTER*1.
Specifies whether or not the matrix *A* is unit triangular.
= 'N': Non-unit triangular
= 'U': Unit triangular

normin — CHARACTER*1.
Specifies whether *cnorm* has been set or not.
= 'Y': *cnorm* contains the column norms on entry;
= 'N': *cnorm* is not set on entry. On exit, the norms will be computed and stored in *cnorm*.

n — INTEGER.
The order of the matrix *A*. $n \geq 0$

a — REAL for pslatrs/pclatrs
DOUBLE PRECISION for pdlatrs/pzlatrs
Array, DIMENSION (*lda*, *n*). Contains the triangular matrix *A*.
If *uplo* = U, the leading *n*-by-*n* upper triangular part of the array *a* contains the upper triangular matrix, and the strictly lower triangular part of *a* is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the array *a* contains the lower triangular matrix, and the strictly upper triangular part of *a* is not referenced.
If *diag* = 'U', the diagonal elements of *a* are also not referenced and are assumed to be 1.

ia, *ja* — (global) INTEGER. The row and column indices in the global array *a* indicating the first row and the first column of the submatrix *A*, respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

x REAL for pslatrs/pclatrs
DOUBLE PRECISION for pdlatrs/pzlatrs
Array, DIMENSION (*n*). On entry, the right hand side *b* of the triangular system.

ix (global) INTEGER.The row index in the global array *x* indicating the first row of sub(*x*).

jx (global) INTEGER.
The column index in the global array *x* indicating the first column of sub(*x*).

descx (global and local) INTEGER.
Array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *X*.

cnorm REAL for pslatrs/pclatrs
DOUBLE PRECISION for pdlatrs/pzlatrs.
Array, DIMENSION (*n*). If *normin* = 'Y', *cnorm* is an input argument and *cnorm* (*j*) contains the norm of the off-diagonal part of the *j*-th column of *A*. If *trans* = 'N', *cnorm* (*j*) must be greater than or equal to the infinity-norm, and if *trans* = 'T' or 'C', *cnorm*(*j*) must be greater than or equal to the 1-norm.

work (local).
REAL for pslatrs
DOUBLE PRECISION for pdlatrs
COMPLEX for pclatrs
COMPLEX*16 for pzlatrs.
Temporary workspace.

Output Parameters

X On exit, *x* is overwritten by the solution vector *x*.

scale REAL for pslatrs/pclatrs
DOUBLE PRECISION for pdlatrs/pzlatrs.
Array, DIMENSION (*lda*, *n*). The scaling factor *s* for the triangular system as described above.
If *scale* = 0, the matrix *A* is singular or badly scaled, and the vector *x* is an exact or approximate solution to *Ax* = 0.

cnorm If *normin* = 'N', *cnorm* is an output argument and *cnorm*(*j*) returns the 1-norm of the off-diagonal part of the *j*-th column of *A*.

p?latrz

Reduces an upper trapezoidal matrix to upper triangular form by means of orthogonal/unitary transformations.

Syntax

```
call pslatrz(m, n, l, a, ia, ja, desca, tau, work)
call pdlatrz(m, n, l, a, ia, ja, desca, tau, work)
call pclatrz(m, n, l, a, ia, ja, desca, tau, work)
call pzlatrz(m, n, l, a, ia, ja, desca, tau, work)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine reduces the *m*-by-*n*(*m* ≤ *n*) real/complex upper trapezoidal matrix sub(*A*) = [*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*m*-1) *A*(*ia*:*ia*+*m*-1, *ja*+*n*-*l*:*ja*+*n*-1)] to upper triangular form by means of orthogonal/unitary transformations.

The upper trapezoidal matrix sub(*A*) is factored as

sub(*A*) = (*R* 0)**Z*,

where *Z* is an *n*-by-*n* orthogonal/unitary matrix and *R* is an *m*-by-*m* upper triangular matrix.

Input Parameters

m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*A*). *m* ≥ 0.
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*A*). *n* ≥ 0.
l	(global) INTEGER. The number of columns of the distributed submatrix sub(*A*) containing the meaningful part of the Householder reflectors. *l* > 0.
a	(local) REAL for pslatrz DOUBLE PRECISION for pdlatrz COMPLEX for pclatrz COMPLEX*16 for pzlatrz. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)). On entry, the local pieces of the *m*-by-*n* distributed matrix sub(*A*), which is to be factored.
ia	(global) INTEGER. The row index in the global array *A* indicating the first row of sub(*A*).
ja	(global) INTEGER.

The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*).
The array descriptor for the distributed matrix *A*.

work (local)
REAL for pslatrz
DOUBLE PRECISION for pdlatrz
COMPLEX for pclatrz
COMPLEX*16 for pzlatrz.
Workspace array, DIMENSION (*lwork*).

lwork ≥ *nq0* + max(1, *mp0*), where
iroff = mod(*ia*-1, *mb_a*),
icoff = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
mp0 = numroc(*m*+*iroff*, *mb_a*, *myrow*, *iarow*, *nprow*),
nq0 = numroc(*n*+*icoff*, *nb_a*, *mycol*, *iacol*, *npcol*),
numroc, indxg2p, and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.

Output Parameters

a On exit, the leading *m*-by-*m* upper triangular part of sub(*A*) contains the upper triangular matrix *R*, and elements *n*-*l*+1 to *n* of the first *m* rows of sub(*A*), with the array *tau*, represent the orthogonal/unitary matrix *Z* as a product of *m* elementary reflectors.

tau (local)
REAL for pslatrz
DOUBLE PRECISION for pdlatrz
COMPLEX for pclatrz
COMPLEX*16 for pzlatrz.
Array, DIMENSION(*LOCr*(*ja*+*m*-1)). This array contains the scalar factors of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

Application Notes

The factorization is obtained by Householder's method. The *k*-th transformation matrix, *Z*(*k*), which is used (or, in case of complex routines, whose conjugate transpose is used) to introduce zeros into the (*m* - *k* + 1)-th row of sub(*A*), is given in the form

$$Z(k)=\begin{bmatrix} I & 0 \\ 0 & T(k) \end{bmatrix},$$

where

$$T(k)=I - tau * u(k) * u(k)', \quad u(k)=\begin{bmatrix} 1 \\ 0 \\ z(k) \end{bmatrix}$$

tau is a scalar and *z*(*k*) is an (*n*-*m*)-element vector. *tau* and *z*(*k*) are chosen to annihilate the elements of the *k*-th row of sub(*A*). The scalar *tau* is returned in the *k*-th element of *tau* and the vector *u*(*k*) in the *k*-th row of sub(*A*), such that the elements of *z*(*k*) are in *a*(*k*, *m* + 1), ..., *a*(*k*, *n*). The elements of *R* are returned in the upper triangular part of sub(*A*).

Z is given by

Z = *Z*(1)*Z*(2)...*Z*(*m*).

p?lauu2

*Computes the product U*U' or L'*L, where U and L are upper or lower triangular matrices (local unblocked algorithm).*

Syntax

call pslauu2(*uplo*, *n*, *a*, *ia*, *ja*, *desca*)

call pdlauu2(*uplo*, *n*, *a*, *ia*, *ja*, *desca*)

call pclauu2(*uplo*, *n*, *a*, *ia*, *ja*, *desca*)

call pzlauu2(*uplo*, *n*, *a*, *ia*, *ja*, *desca*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the product *U*U*' or *L'*L*, where the triangular factor *U* or *L* is stored in the upper or lower triangular part of the distributed matrix

sub(*A*)= *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1).

If *uplo* = 'U' or 'u', then the upper triangle of the result is stored, overwriting the factor *U* in sub(*A*).

If *uplo* = 'L' or 'l', then the lower triangle of the result is stored, overwriting the factor *L* in sub(*A*).

This is the unblocked form of the algorithm, calling BLAS Level 2 Routines. No communication is performed by this routine, the matrix to operate on should be strictly local to one process.

Input Parameters

uplo (global) CHARACTER*1.
Specifies whether the triangular factor stored in the *matrix* sub(*A*) is upper or lower triangular:
= U: upper triangular
= L: lower triangular.

n (global) INTEGER.

	The number of rows and columns to be operated on, that is, the order of the triangular factor *U* or *L*. *n* ≥ 0.
a	(local) REAL for pslauu2 DOUBLE PRECISION for pdlauu2 COMPLEX for pclauu2 COMPLEX*16 for pzlauu2. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1). On entry, the local pieces of the triangular factor *U* or *L*.
ia	(global) INTEGER. The row index in the global array *A* indicating the first row of sub(*A*).
ja	(global) INTEGER. The column index in the global array *A* indicating the first column of sub(*A*).
desca	(global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a	(local) On exit, if *uplo* = 'U', the upper triangle of the distributed matrix sub(*A*) is overwritten with the upper triangle of the product *U***U*'; if *uplo* = 'L', the lower triangle of sub(*A*) is overwritten with the lower triangle of the product *L*'**L*.

p?lauum

*Computes the product U*U' or L'*L, where U and L are upper or lower triangular matrices.*

Syntax

```
call pslauum(uplo, n, a, ia, ja, desca)
call pdlauum(uplo, n, a, ia, ja, desca)
call pclauum(uplo, n, a, ia, ja, desca)
call pzlauum(uplo, n, a, ia, ja, desca)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes the product *U***U*' or *L*'**L*, where the triangular factor *U* or *L* is stored in the upper or lower triangular part of the matrix sub(*A*)= *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1).

If *uplo* = 'U' or 'u', then the upper triangle of the result is stored, overwriting the factor *U* in sub(*A*). If *uplo* = 'L' or 'l', then the lower triangle of the result is stored, overwriting the factor *L* in sub(*A*).

This is the blocked form of the algorithm, calling Level 3 PBLAS.

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the triangular factor stored in the matrix sub(*A*) is upper or lower triangular: = 'U': upper triangular = 'L': lower triangular.
n	(global) INTEGER. The number of rows and columns to be operated on, that is, the order of the triangular factor *U* or *L*. *n* ≥ 0.
a	(local) REAL for pslauum DOUBLE PRECISION for pdlauum COMPLEX for pclauum COMPLEX*16 for pzlauum. Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1). On entry, the local pieces of the triangular factor *U* or *L*.
ia	(global) INTEGER. The row index in the global array *A* indicating the first row of sub(*A*).
ja	(global) INTEGER. The column index in the global array *A* indicating the first column of sub(*A*).
desca	(global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a	(local) On exit, if *uplo* = 'U', the upper triangle of the distributed matrix sub(*A*) is overwritten with the upper triangle of the product *U***U*' ; if *uplo* = 'L', the lower triangle of sub(*A*) is overwritten with the lower triangle of the product *L*'**L*.

p?lawil

Forms the Wilkinson transform.

Syntax

```
call pslawil(ii, jj, m, a, desca, h44, h33, h43h34, v)
call pdlawil(ii, jj, m, a, desca, h44, h33, h43h34, v)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine gets the transform given by *h44*, *h33*, and *h43h34* into *v* starting at row *m*.

Input Parameters

ii (global) INTEGER.
Row owner of *h*(*m*+2, *m*+2).

jj (global) INTEGER.
Column owner of *h*(*m*+2, *m*+2).

m (global) INTEGER.
On entry, the location from where the transform starts (row *m*).
Unchanged on exit.

a (global)
REAL for pslawil
DOUBLE PRECISION for pdlawil
Array, DIMENSION (*desca(lld_)*,*).
On entry, the Hessenberg matrix. Unchanged on exit.

desca (global and local) INTEGER
Array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*. Unchanged on exit.

h43h34 (global)
REAL for pslawil
DOUBLE PRECISION for pdlawil
These three values are for the double shift *QR* iteration. Unchanged on exit.

Output Parameters

v (global)
REAL for pslawil
DOUBLE PRECISION for pdlawil
Array of size 3 that contains the transform on output.

p?org2l/p?ung2l

Generates all or part of the orthogonal/unitary matrix Q from a QL factorization determined by p?geqlf *(unblocked algorithm).*

Syntax

```
call psorg2l(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorg2l(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pcung2l(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzung2l(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

The routine p?org2l/p?ung2l generates an *m*-by-*n* real/complex distributed matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal columns, which is defined as the last *n* columns of a product of *k* elementary reflectors of order *m*:

Q = *H*(*k*)*...*H*(2)*H*(1) as returned by p?geqlf.

Input Parameters

m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix *Q*. *m* ≥ 0.
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix *Q*. *m* ≥ *n* ≥ 0.
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. *n*≥ *k* ≥ 0.
a	REAL for psorg2l DOUBLE PRECISION for pdorg2l COMPLEX for pcung2l COMPLEX*16 for pzung2l. Pointer into the local memory to an array, DIMENSION (*lld_a*, *LOCc*(*ja*+*n*-1). On entry, the *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja*+*n*-*k* ≤ *j* ≤ *ja*+*n*-*k*, as returned by p?geqlf in the *k* columns of its *distributed matrix* argument *A*(*ia*:*,*ja*+*n*-*k*:*ja*+*n*-1).
ia	(global) INTEGER. The row index in the global array *A* indicating the first row of sub(*A*).
ja	(global) INTEGER. The column index in the global array *A* indicating the first column of sub(*A*).
desca	(global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
tau	(local) REAL for psorg2l DOUBLE PRECISION for pdorg2l COMPLEX for pcung2l COMPLEX*16 for pzung2l. Array, DIMENSION *LOCc*(*ja*+*n*-1). This array contains the scalar factor *tau*(*j*) of the elementary reflector *H*(*j*), as returned by p?geqlf.
work	(local) REAL for psorg2l

DOUBLE PRECISION for pdorg2l
COMPLEX for pcung2l
COMPLEX*16 for pzung2l.
Workspace array, DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork* ≥ *mpa*0 + max(1, *nqa*0), where
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_a*, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*).
indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, this array contains the local pieces of the *m*-by-*n* distributed matrix *Q*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local) INTEGER.
= 0: successful exit
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value,
then *info* = - (*i**100 +*j*),
if the *i*-th argument is a scalar and had an illegal value,
then *info* = -*i*.

p?org2r/p?ung2r

Generates all or part of the orthogonal/unitary matrix Q from a QR factorization determined by p?geqrf *(unblocked algorithm).*

Syntax

```
call psorg2r(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorg2r(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pcung2r(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

call pzung2r(*m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *work*, *lwork*, *info*)

Description

The routine p?org2r/p?ung2r generates an *m*-by-*n* real/complex matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal columns, which is defined as the first *n* columns of a product of *k* elementary reflectors of order *m*:

Q = *H*(1)**H*(2)*...**H*(*k*)

as returned by p?geqrf.

Input Parameters

m — (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix *Q*. *m* ≥ 0.

n — (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix *Q*. *m* ≥ *n* ≥ 0.

k — (global) INTEGER.
The number of elementary reflectors whose product defines the matrix *Q*. *n* ≥ *k* ≥ 0.

a — REAL for psorg2r
DOUBLE PRECISION for pdorg2r
COMPLEX for pcung2r
COMPLEX*16 for pzung2r.
Pointer into the local memory to an array, DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1).
On entry, the *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja* ≤ *j* ≤ *ja*+*k*-1, as returned by p?geqrf in the *k* columns of its *distributed matrix* argument *A*(*ia*:*,*ja*:*ja*+*k*-1).

ia — (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja — (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca — (global and local) INTEGER array of DIMENSION (*dlen_*).
The array descriptor for the distributed matrix *A*.

tau — (local)
REAL for psorg2r
DOUBLE PRECISION for pdorg2r
COMPLEX for pcung2r
COMPLEX*16 for pzung2r.
Array, DIMENSION *LOCc*(*ja*+*k*-1).

This array contains the scalar factor *tau*(*j*) of the elementary reflector *H*(*j*), as returned by p?geqrf. This array is tied to the distributed matrix *A*.

work (local)
REAL for psorg2r
DOUBLE PRECISION for pdorg2r
COMPLEX for pcung2r
COMPLEX*16 for pzung2r.
Workspace array, DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork* ≥ *mpa*0 + max(1, *nqa*0),
where
iroffa = mod(*ia*-1, *mb_a* , *icoffa* = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_*a, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*).
indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, this array contains the local pieces of the *m*-by-*n* distributed matrix *Q*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local) INTEGER.
= 0: successful exit
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value,
then *info* = - (*i**100+*j*),
if the *i*-th argument is a scalar and had an illegal value,
then *info* = -*i*.

p?orgl2/p?ungl2

Generates all or part of the orthogonal/unitary matrix Q from an LQ factorization determined by p?gelqf *(unblocked algorithm).*

Syntax

```
call psorgl2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorgl2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pcungl2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungl2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

The routine p?orgl2/p?ungl2 generates a *m*-by-*n* real/complex matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the first *m* rows of a product of *k* elementary reflectors of order *n*

Q = *H*(*k*)*...*H*(2)*H(1) (for real flavors),

Q = $(H(k))^H$*...*$(H(2))^H$*$(H(1))^H$ (for complex flavors) as returned by p?gelqf.

Input Parameters

m — (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix *Q*. *m* ≥ 0.

n — (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix *Q*. *n* ≥ *m* ≥ 0.

k — (global) INTEGER.
The number of elementary reflectors whose product defines the matrix *Q*. *m* ≥ *k* ≥ 0.

a — REAL for psorgl2
DOUBLE PRECISION for pdorgl2
COMPLEX for pcungl2
COMPLEX*16 for pzungl2.
Pointer into the local memory to an array, DIMENSION (*lld_a*, *LOCc*(*ja*+*n*-1).
On entry, the *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia* ≤ *i* ≤ *ia*+*k*-1, as returned by p?gelqf in the *k* rows of its *distributed matrix* argument *A*(*ia*:*ia*+*k*-1, *ja*:*).

ia — (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja — (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psorgl2
DOUBLE PRECISION for pdorgl2
COMPLEX for pcungl2
COMPLEX*16 for pzungl2.
Array, DIMENSION *LOCr*(*ja*+*k*-1). This array contains the scalar factors *tau*(*i*) of the elementary reflectors *H*(*i*), as returned by p?gelqf. This array is tied to the distributed matrix *A*.

WORK (local)
REAL for psorgl2
DOUBLE PRECISION for pdorgl2
COMPLEX for pcungl2
COMPLEX*16 for pzungl2.
Workspace array, DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork* ≥ *nqa*0 + max(1, *mpa*0), where
iroffa = mod(*ia*-1, *mb_a*),
icoffa = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_*a, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*).
indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, this array contains the local pieces of the *m*-by-*n* distributed matrix *Q*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local) INTEGER.
= 0: successful exit
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value,
then *info* = - (*i**100+*j*),
if the *i*-th argument is a scalar and had an illegal value,

then *info* = -*i*.

p?orgr2/p?ungr2

Generates all or part of the orthogonal/unitary matrix Q from an RQ factorization determined by p?gerqf *(unblocked algorithm).*

Syntax

```
call psorgr2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pdorgr2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pcungr2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
call pzungr2(m, n, k, a, ia, ja, desca, tau, work, lwork, info)
```

Description

The routine p?orgr2/p?ungr2 generates an *m*-by-*n* real/complex matrix *Q* denoting *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1) with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors of order *n*

Q = *H*(1)**H*(2)*...**H*(*k*) (for real flavors);

Q = $(H(1))^H$*$(H(2))^H$...*$(H(k))^H$ (for complex flavors) as returned by p?gerqf.

Input Parameters

m — (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix *Q*. *m* ≥ 0.

n — (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix *Q*. *n* ≥ *m* ≥ 0.

k — (global) INTEGER.
The number of elementary reflectors whose product defines the matrix *Q*. *m* ≥ *k* ≥ 0.

a — REAL for psorgr2
DOUBLE PRECISION for pdorgr2
COMPLEX for pcungr2
COMPLEX*16 for pzungr2.
Pointer into the local memory to an array, DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1).
On entry, the *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia*+*m*-*k* ≤ *i* ≤ *ia*+*m*-1, as returned by p?gerqf in the *k* rows of its *distributed matrix* argument *A*(*ia*+*m*-*k*:*ia*+*m*-1, *ja*:*).

ia — (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psorgr2
DOUBLE PRECISION for pdorgr2
COMPLEX for pcungr2
COMPLEX*16 for pzungr2.
Array, DIMENSION *LOCr*(*ja*+*m*-1). This array contains the scalar factors *tau*(*i*) of the elementary reflectors *H*(*i*), as returned by p?gerqf. This array is tied to the distributed matrix *A*.

work (local)
REAL for psorgr2
DOUBLE PRECISION for pdorgr2
COMPLEX for pcungr2
COMPLEX*16 for pzungr2.
Workspace array, DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.

lwork is local input and must be at least *lwork* ≥ *nqa*0 + max(1, *mpa*0), where *iroffa* = mod(*ia*-1, *mb_a*), *icoffa* = mod(*ja*-1, *nb_a*),
iarow = indxg2p(*ia*, *mb_a*, *myrow*, *rsrc_*a, *nprow*),
iacol = indxg2p(*ja*, *nb_a*, *mycol*, *csrc_a*, *npcol*),
*mpa*0 = numroc(*m*+*iroffa*, *mb_a*, *myrow*, *iarow*, *nprow*),
*nqa*0 = numroc(*n*+*icoffa*, *nb_a*, *mycol*, *iacol*, *npcol*).
indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow,* and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

a On exit, this array contains the local pieces of the *m*-by-*n* distributed matrix *Q*.

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local) INTEGER.
= 0: successful exit
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value,

then *info* = - (*i**100+*j*),
if the *i*-th argument is a scalar and had an illegal value,
then *info* = -*i*.

p?orm2l/p?unm2l

Multiplies a general matrix by the orthogonal/unitary matrix from a QL factorization determined by p?geqlf *(unblocked algorithm).*

Syntax

call psorm2l(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdorm2l(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pcunm2l(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunm2l(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

The routine p?orm2l/p?unm2l overwrites the general real/complex *m*-by-*n* distributed matrix sub(*C*)=*C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) with

*Q**sub(*C*) if *side* = 'L' and *trans* = 'N', or

Q^T*sub(*C*) / Q^H*sub(*C*) if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

sub(*C*)**Q* if *side* = '*R*' and *trans* = 'N', or

sub(*C*)*Q^T / sub(*C*)*Q^H if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

where *Q* is a real orthogonal or complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)*...**H*(2)**H*(1) as returned by p?geqlf . *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER.
= 'L': apply *Q* or Q^T for real flavors (Q^H for complex flavors) from the left,
= 'R': apply *Q* or Q^T for real flavors (Q^H for complex flavors) from the right.

trans (global) CHARACTER.
= 'N': apply *Q* (no transpose)
= 'T': apply Q^T (transpose, for real flavors)
= 'C': apply Q^H (conjugate transpose, for complex flavors)

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). *m* ≥ 0.

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). *n* ≥ 0.

k (global) INTEGER.
The number of elementary reflectors whose product defines the matrix *Q*.

If *side* = 'L', *m* ≥ *k* ≥ 0;

if *side* = 'R', *n* ≥ *k* ≥ 0.

a (local)
REAL for psorm2l
DOUBLE PRECISION for pdorm2l
COMPLEX for pcunm2l
COMPLEX*16 for pzunm2l.
Pointer into the local memory to an array, DIMENSION(*lld_a*, *LOCc*(*ja*+*k*-1).
On entry, the *j*-th row must contain the vector that defines the elementary reflector *H*(*j*), *ja* ≤ *j* ≤ *ja*+*k*-1, as returned by p?geqlf in the *k* columns of its distributed matrix argument *A*(*ia*:*,*ja*:*ja*+*k*-1). The argument *A*(*ia*:*,*ja*:*ja*+*k*-1) is modified by the routine but restored on exit.

If *side* = 'L', lld_a ≥ max(1, *LOCr*(*ia*+*m*-1)),

if *side* = 'R', lld_a ≥ max(1, *LOCr*(*ia*+*n*-1)).

ia (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psorm2l
DOUBLE PRECISION for pdorm2l
COMPLEX for pcunm2l
COMPLEX*16 for pzunm2l.
Array, DIMENSION*LOCc*(*ja*+*n*-1). This array contains the scalar factor *tau*(*j*) of the elementary reflector *H*(*j*), as returned by p?geqlf. This array is tied to the distributed matrix *A*.

c (local)
REAL for psorm2l
DOUBLE PRECISION for pdorm2l

COMPLEX for pcunm2l
COMPLEX*16 for pzunm2l.
Pointer into the local memory to an array, DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)).On entry, the local pieces of the distributed matrix sub (*C*).

ic (global) INTEGER.
The row index in the global array *C* indicating the first row of sub(*C*).

jc (global) INTEGER.
The column index in the global array *C* indicating the first column of sub(*C*).

descc (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
REAL for psorm2l
DOUBLE PRECISION for pdorm2l
COMPLEX for pcunm2l
COMPLEX*16 for pzunm2l.
Workspace array, DIMENSION (*lwork*).
On exit, *work*(1) returns the minimal and optimal *lwork*.

lwork (local or global) INTEGER.
The dimension of the array *work*.
lwork is local input and must be at least

if *side* = 'L', *lwork* ≥ *mpc*0 + max(1, *nqc*0),

if *side* = 'R', *lwork* ≥ *nqc*0 + max(max(1, *mpc*0), numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, *npcol*), *nb_a*, 0, 0, *lcmq*)),
where
lcmq = *lcm*/*npcol*,
lcm = iclm(*nprow*, *npcol*),
iroffc = mod(*ic*-1, *mb_c*),
icoffc = mod(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_*c, *nprow*),
iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_*c, *npcol*),
Mqc0 = numroc(*m*+*icoffc*, *nb_c*, *mycol*, *icrow*, *nprow*),
Npc0 = numroc(*n*+*iroffc*, *mb_c*, *myrow*, *iccol*, *npcol*),
ilcm, indxg2p, and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	On exit, *c* is overwritten by *Q**sub(*C*), or Q^T*sub(*C*)/ Q^H*sub(*C*), or sub(*C*)**Q*, or sub(*C*)*Q^T / sub(*C*)*Q^H
work	On exit, *work*(1) returns the minimal and optimal *lwork*.
info	(local) INTEGER. = 0: successful exit < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

NOTE. The distributed submatrices *A*(*ia*:*, *ja*:*) and *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) must verify some alignment properties, namely the following expressions should be true:

If *side* = 'L', (*mb_a*.eq.*mb_c* .AND. *iroffa*.eq.*iroffc* .AND. *iarow*.eq.*icrow*)

If *side* = 'R', (*mb_a*.eq.*nb_c* .AND. *iroffa*.eq.*iroffc*).

p?orm2r/p?unm2r

Multiplies a general matrix by the orthogonal/unitary matrix from a QR factorization determined by p?geqrf *(unblocked algorithm).*

Syntax

call psorm2r(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdorm2r(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pcunm2r(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunm2r(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

The routine p?orm2r/p?unm2r overwrites the general real/complex *m*-by-*n* distributed matrix sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) with

*Q**sub(*C*) if *side* = 'L' and *trans* = 'N', or

Q^T*sub(*C*) / Q^H*sub(*C*) if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

sub(*C*)**Q* if *side* = *'R*' and *trans* = 'N', or

sub(*C*)**Q*^{T} / sub(*C*)**Q*^{H} if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

where *Q* is a real orthogonal or complex unitary matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)*...**H*(2)**H*(1) as returned by p?geqrf . *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER.
= 'L': apply *Q* or *Q*^{T} for real flavors (*Q*^{H} for complex flavors) from the left,
= 'R': apply *Q* or *Q*^{T} for real flavors (*Q*^{H} for complex flavors) from the right.

trans (global) CHARACTER.
= 'N': apply *Q* (no transpose)
= 'T': apply *Q*^{T} (transpose, for real flavors)
= 'C': apply *Q*^{H} (conjugate transpose, for complex flavors)

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). *m* ≥ 0.

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). *n* ≥ 0.

k (global) INTEGER.
The number of elementary reflectors whose product defines the matrix *Q*.
If *side* = 'L', *m* ≥ *k* ≥ 0;
if *side* = 'R', *n* ≥ *k* ≥ 0.

a (local)
REAL for psorm2r
DOUBLE PRECISION for pdorm2r
COMPLEX for pcunm2r
COMPLEX*16 for pzunm2r.
Pointer into the local memory to an array, DIMENSION(*lld_a*, *LOCc*(*ja*+*k*-1).
On entry, the *j*-th column must contain the vector that defines the elementary reflector *H*(*j*), *ja* ≤ *j* ≤ *ja*+*k*-1, as returned by p?geqrf in the *k* columns of its distributed matrix argument *A*(*ia*:*,*ja*:*ja*+*k*-1). The argument *A*(*ia*:*,*ja*:*ja*+*k*-1) is modified by the routine but restored on exit.
If *side* = 'L', lld_a ≥ max(1, *LOCr*(*ia*+*m*-1)),
if *side* = 'R', lld_a ≥ max(1, *LOCr*(*ia*+*n*-1)).

ia (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psorm2r
DOUBLE PRECISION for pdorm2r
COMPLEX for pcunm2r
COMPLEX*16 for pzunm2r.
Array, DIMENSION *LOCc*(*ja*+*k*-1). This array contains the scalar factors *tau*(*j*) of the elementary reflector *H*(*j*), as returned by p?geqrf. This array is tied to the distributed matrix *A*.

c (local)
REAL for psorm2r
DOUBLE PRECISION for pdorm2r
COMPLEX for pcunm2r
COMPLEX*16 for pzunm2r.
Pointer into the local memory to an array, DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)).
On entry, the local pieces of the distributed matrix sub (*C*).

ic (global) INTEGER.
The row index in the global array *C* indicating the first row of sub(*C*).

jc (global) INTEGER.
The column index in the global array *C* indicating the first column of sub(*C*).

descc (global and local) INTEGER array of DIMENSION (*dlen_*).
The array descriptor for the distributed matrix *C*.

work (local)
REAL for psorm2r
DOUBLE PRECISION for pdorm2r
COMPLEX for pcunm2r
COMPLEX*16 for pzunm2r.
Workspace array, DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.
lwork is local input and must be at least

if *side* = 'L', *lwork* ≥ *mpc*0 + max(1, *nqc*0),

if *side* = 'R', *lwork* ≥ *nqc*0 + max(max(1, *mpc*0), numroc(numroc(*n*+*icoffc*, *nb_a*, 0, 0, *npcol*), *nb_a*, 0, 0, *lcmq*)),
where
lcmq = *lcm*/*npcol* ,
lcm = *iclm*(*nprow*, *npcol*),
iroffc = mod(*ic*-1, *mb_c*),

icoffc = mod(*jc-1*, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_c*, *nprow*),
iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_c*, *npcol*),
Mqc0 = numroc(*m*+*icoffc*, *nb_c*, *mycol*, *icrow*, *nprow*),
Npc0 = numroc(*n*+*iroffc*, *mb_c*, *myrow*, *iccol*, *npcol*),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	On exit, *c* is overwritten by *Q**sub(*C*), or Q^T*sub(*C*)/ Q^H*sub(*C*), or sub(*C*)**Q*, or sub(*C*)*Q^T / sub(*C*)*Q^H
work	On exit, *work*(1) returns the minimal and optimal *lwork*.
info	(local) INTEGER. = 0: successful exit < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

NOTE. The distributed submatrices *A*(*ia*:*, *ja*:*) and *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) must verify some alignment properties, namely the following expressions should be true:

If *side* = 'L', (*mb_a*.eq.*mb_c* .AND. *iroffa*.eq.*iroffc* .AND. *iarow*.eq.*icrow*)

If *side* = 'R', (*mb_a*.eq.*nb_c* .AND. *iroffa*.eq.*iroffc*).

p?orml2/p?unml2

Multiplies a general matrix by the orthogonal/unitary matrix from an LQ factorization determined by p?gelqf *(unblocked algorithm).*

Syntax

call psorml2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdorml2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pcunml2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunml2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

The routine p?orml2/p?unml2 overwrites the general real/complex *m*-by-*n* distributed matrix sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) with

*Q**sub(*C*) if *side* = 'L' and *trans* = 'N', or

Q^T*sub(*C*) / Q^H*sub(*C*) if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

sub(*C*)**Q* if *side* = 'R' and *trans* = 'N', or

sub(*C*)*Q^T / sub(*C*)*Q^H if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

where *Q* is a real orthogonal or complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(*k*)*...**H*(2)**H*(1) (for real flavors)

Q = (*H*(*k*))^H*...*(*H*(2))^H*(*H*(1))^H (for complex flavors)

as returned by p?gelqf . *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	(global) CHARACTER. = 'L': apply *Q* or Q^T for real flavors (Q^H for complex flavors) from the left, = 'R': apply *Q* or Q^T for real flavors (Q^H for complex flavors) from the right.
trans	(global) CHARACTER. = 'N': apply *Q* (no transpose) = 'T': apply Q^T (transpose, for real flavors) = 'C': apply Q^H (conjugate transpose, for complex flavors)
m	(global) INTEGER. The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). *m* ≥ 0.
n	(global) INTEGER. The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). *n* ≥ 0.
k	(global) INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. If *side* = 'L', *m* ≥ *k* ≥ 0; if *side* = 'R', *n* ≥ *k* ≥ 0.
a	(local)

REAL for psorml2
DOUBLE PRECISION for pdorml2
COMPLEX for pcunml2
COMPLEX*16 for pzunml2.
Pointer into the local memory to an array, DIMENSION (*lld_a*, *LOCc*(*ja*+*m*-1) if *side*='L',
(*lld_a*, *LOCc*(*ja*+*n*-1) if *side*='R',
where *lld_a* ≥ max (1, *LOCr*(*ia*+*k*-1)).
On entry, the *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia* ≤ *i* ≤ *ia*+*k*-1, as returned by p?gelqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*). The argument *A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psorml2
DOUBLE PRECISION for pdorml2
COMPLEX for pcunml2
COMPLEX*16 for pzunml2.
Array, DIMENSION *LOCc*(*ia*+*k*-1). This array contains the scalar factors *tau*(*i*) of the elementary reflector *H*(*i*), as returned by p?gelqf. This array is tied to the distributed matrix *A*.

c (local)
REAL for psorml2
DOUBLE PRECISION for pdorml2
COMPLEX for pcunml2
COMPLEX*16 for pzunml2.
Pointer into the local memory to an array, DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)). On entry, the local pieces of the distributed matrix sub (*C*).

ic (global) INTEGER.
The row index in the global array *C* indicating the first row of sub(*C*).

jc (global) INTEGER.
The column index in the global array *C* indicating the first column of sub(*C*).

descc (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.

work (local)
REAL for psorml2

DOUBLE PRECISION for pdormql2
COMPLEX for pcunmql2
COMPLEX*16 for pzunmql2.
Workspace array, DIMENSION (*lwork*).

lwork (local or global) INTEGER.
The dimension of the array *work*.
lwork is local input and must be at least

if *side* = 'L', *lwork* ≥ *mqc*0 + max(max(1, *npc*0), numroc(numroc(*m*+*icoffc*, *mb_a*, 0, 0, *nprow*), *mb_a*, 0, 0, *lcmp*)),

if *side* = 'R', *lwork* ≥ *npc*0 + max(1, *mqc*0),

where
lcmp = *lcm* / *nprow*,
lcm = *iclm*(*nprow*, *npcol*),
iroffc = mod(*ic*-1, *mb_c*),
icoffc = mod(*jc*-1, *nb_c*),
icrow = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_c*, *nprow*),
iccol = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_c*, *npcol*),
Mpc0 = numroc(*m*+*icoffc*, *mb_c*, *mycol*, *icrow*, *nprow*),
Nqc0 = numroc(*n*+*iroffc*, *nb_c*, *myrow*, *iccol*, *npcol*),
ilcm, indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c On exit, *c* is overwritten by Q*sub(*C*), or Q^T*sub(*C*)/ Q^H*sub(*C*), or sub(*C*)*Q, or sub(*C*)*Q^T / sub(*C*)*Q^H

work On exit, *work*(1) returns the minimal and optimal *lwork*.

info (local) INTEGER.
= 0: successful exit
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value,
then *info* = - (*i**100+*j*),
if the *i*-th argument is a scalar and had an illegal value,
then *info* = -*i*.

NOTE. The distributed submatrices *A*(*ia*:*, *ja*:*) and *C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) must verify some alignment properties, namely the following expressions should be true:

If *side* = 'L', (*nb_a*.eq.*mb_c* .AND. *icoffa*.eq.*iroffc*)

If *side* = 'R', (*nb_a*.eq.*nb_c* .AND. *icoffa*.eq.*icoffc* .AND. *iacol*.eq.*iccol*).

p?ormr2/p?unmr2

Multiplies a general matrix by the orthogonal/unitary matrix from an RQ factorization determined by p?gerqf *(unblocked algorithm).*

Syntax

call psormr2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pdormr2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pcunmr2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

call pzunmr2(*side*, *trans*, *m*, *n*, *k*, *a*, *ia*, *ja*, *desca*, *tau*, *c*, *ic*, *jc*, *descc*, *work*, *lwork*, *info*)

Description

The routine p?ormr2/p?unmr2 overwrites the general real/complex *m*-by-*n* distributed matrix sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1) with

*Q**sub(*C*) if *side* = 'L' and *trans* = 'N', or

Q^T*sub(*C*) / Q^H*sub(*C*) if *side* = 'L' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors), or

sub(*C*)**Q* if *side* = 'R' and *trans* = 'N', or

sub(*C*)*Q^T / sub(*C*)*Q^H if *side* = 'R' and *trans* = 'T' (for real flavors) or *trans* = 'C' (for complex flavors).

where *Q* is a real orthogonal or complex unitary distributed matrix defined as the product of *k* elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*k*) (for real flavors)

Q = $(H(1))^H$*$(H(2))^H$*...*$(H(k))^H$ (for complex flavors)

as returned by p?gerqf . *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side (global) CHARACTER.
= 'L': apply *Q* or Q^T for real flavors (Q^H for complex flavors) from the left,
= 'R': apply *Q* or Q^T for real flavors (Q^H for complex flavors) from the right.

trans (global) CHARACTER.
= 'N': apply *Q* (no transpose)
= 'T': apply Q^T (transpose, for real flavors)
= 'C': apply Q^H (conjugate transpose, for complex flavors)

m (global) INTEGER.
The number of rows to be operated on, that is, the number of rows of the distributed submatrix sub(*C*). *m* ≥ 0.

n (global) INTEGER.
The number of columns to be operated on, that is, the number of columns of the distributed submatrix sub(*C*). *n* ≥ 0.

k (global) INTEGER.
The number of elementary reflectors whose product defines the matrix *Q*.

If *side* = 'L', *m* ≥ *k* ≥ 0;

if *side* = 'R', *n* ≥ *k* ≥ 0.

a (local)
REAL for psormr2
DOUBLE PRECISION for pdormr2
COMPLEX for pcunmr2
COMPLEX*16 for pzunmr2.
Pointer into the local memory to an array, DIMENSION
(*lld_a*, *LOCc*(*ja*+*m*-1) if *side*='L',
(*lld_a*, *LOCc*(*ja*+*n*-1) if *side*='R',

where *lld_a* ≥ max (1, *LOCr*(*ia*+*k*-1)).
On entry, the *i*-th row must contain the vector that defines the elementary reflector *H*(*i*), *ia* ≤ *i* ≤ *ia*+*k*-1, as returned by p?gerqf in the *k* rows of its distributed matrix argument *A*(*ia*:*ia*+*k*-1, *ja*:*). The argument *A*(*ia*:*ia*+*k*-1, *ja*:*) is modified by the routine but restored on exit.

ia (global) INTEGER.
The row index in the global array *A* indicating the first row of sub(*A*).

ja (global) INTEGER.
The column index in the global array *A* indicating the first column of sub(*A*).

desca (global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

tau (local)
REAL for psormr2
DOUBLE PRECISION for pdormr2
COMPLEX for pcunmr2
COMPLEX*16 for pzunmr2.
Array, DIMENSION *LOCc*(*ia*+*k*-1). This array contains the scalar factors *tau*(*i*) of the elementary reflector *H*(*i*), as returned by p?gerqf. This array is tied to the distributed matrix *A*.

c (local)
REAL for psormr2
DOUBLE PRECISION for pdormr2

	COMPLEX for pcunmr2 COMPLEX*16 for pzunmr2. Pointer into the local memory to an array, DIMENSION(*lld_c*, *LOCc*(*jc*+*n*-1)). On entry, the local pieces of the distributed matrix sub (*C*).
ic	(global) INTEGER. The row index in the global array *C* indicating the first row of sub(*C*).
jc	(global) INTEGER. The column index in the global array *C* indicating the first column of sub(*C*).
descc	(global and local) INTEGER array of DIMENSION (*dlen_*). The array descriptor for the distributed matrix *C*.
work	(local) REAL for psormr2 DOUBLE PRECISION for pdormr2 COMPLEX for pcunmr2 COMPLEX*16 for pzunmr2. Workspace array, DIMENSION (*lwork*).
lwork	(local or global) INTEGER. The dimension of the array *work*. *lwork* is local input and must be at least if *side* = 'L', *lwork* ≥ *mpc*0 + max(max(1, *nqc*0), numroc(numroc(*m*+*iroffc*, *mb_a*, 0, 0, *nprow*), *mb_a*, 0, 0, *lcmp*)), if *side* = 'R', *lwork* ≥ *nqc*0 + max(1, *mpc*0), where *lcmp* = *lcm*/*nprow*, lcm = iclm(*nprow*, *npcol*), *iroffc* = mod(*ic*-1, *mb_c*), *icoffc* = mod(*jc*-1, *nb_c*), *icrow* = indxg2p(*ic*, *mb_c*, *myrow*, *rsrc_c*, *nprow*), *iccol* = indxg2p(*jc*, *nb_c*, *mycol*, *csrc_c*, *npcol*), *Mpc0* = numroc(*m*+*iroffc*, *mb_c*, *myrow*, *icrow*, *nprow*), *Nqc0* = numroc(*n*+*icoffc*, *nb_c*, *mycol*, *iccol*, *npcol*), ilcm, indxg2p and numroc are ScaLAPACK tool functions; *myrow*, *mycol*, *nprow*, and *npcol* can be determined by calling the subroutine blacs_gridinfo. If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

Output Parameters

c	On exit, *c* is overwritten by Q*sub(*C*), or Q^T*sub(*C*)/ Q^H*sub(*C*), or sub(*C*)*Q, or sub(*C*)*Q^T / sub(*C*)*Q^H

work	On exit, *work*(1) returns the minimal and optimal *lwork*.
info	(local) INTEGER. = 0: successful exit < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

NOTE. The distributed submatrices *A*(*ia*:*, *ja*:*) and *C*(*ic*:*ic*+*m*-1,*jc*:*jc*+*n*-1) must verify some alignment properties, namely the following expressions should be true:

If *side* = 'L', (*nb_a*.eq.*mb_c* .AND. *icoffa*.eq.*iroffc*)

If *side* = 'R', (*nb_a*.eq.*nb_c* .AND. *icoffa*.eq.*icoffc* .AND. *iacol*.eq.*iccol*).

p?pbtrsv

Solves a single triangular linear system via frontsolve or backsolve where the triangular matrix is a factor of a banded matrix computed by p?pbtrf.

Syntax

call pspbtrsv(*uplo*, *trans*, *n*, *bw*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pdpbtrsv(*uplo*, *trans*, *n*, *bw*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pcpbtrsv(*uplo*, *trans*, *n*, *bw*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzpbtrsv(*uplo*, *trans*, *n*, *bw*, *nrhs*, *a*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine p?pbtrsv solves a banded triangular system of linear equations

A(1:*n*, *ja*:*ja*+*n*-1)**X* = *B*(*jb*:*jb*+*n*-1, 1:*nrhs*)

or

$A(1{:}n,\ ja{:}ja+n-1)^{T}*X = B(jb{:}jb+n-1,\ 1{:}nrhs)$ for real flavors,

$A(1{:}n,\ ja{:}ja+n-1)^{H}*X = B(jb{:}jb+n-1,\ 1{:}nrhs)$ for complex flavors,

where *A*(1:*n*, *ja*:*ja*+*n*-1) is a banded triangular matrix factor produced by the Cholesky factorization code p?pbtrf and is stored in *A*(1:*n*, *ja*:*ja*+*n*-1) and *af*. The matrix stored in *A*(1:*n*, *ja*:*ja*+*n*-1) is either upper or lower triangular according to *uplo*.

Routine p?pbtrf must be called first.

Input Parameters

uplo (global) CHARACTER. Must be 'U' or 'L'.
If *uplo* = 'U', upper triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored;
If *uplo* = 'L', lower triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored.

trans (global) CHARACTER. Must be 'N' or 'T' or 'C'.
If *trans* = 'N', solve with *A*(1:*n*, *ja*:*ja*+*n*-1);
If *trans* = 'T' or 'C' for real flavors, solve with *A*(1:*n*, *ja*:*ja*+*n*-1)^T.
If *trans* = 'C' for complex flavors, solve with conjugate transpose(*A*(1:*n*, *ja*:*ja*+*n*-1)^H.

n (global) INTEGER.
The number of rows and columns to be operated on, that is, the order of the distributed submatrix *A*(1:*n*, *ja*:*ja*+*n*-1). *n* ≥ 0.

bw (global) INTEGER.
The number of subdiagonals in 'L' or 'U', 0 ≤ *bw* ≤ *n*-1.

nrhs (global) INTEGER.
The number of right hand sides; the number of columns of the distributed submatrix *B*(*jb*:*jb*+*n*-1, 1:*nrhs*); *nrhs* ≥ 0.

a (local)
REAL for pspbtrsv
DOUBLE PRECISION for pdpbtrsv
COMPLEX for pcpbtrsv
COMPLEX*16 for pzpbtrsv.
Pointer into the local memory to an array with the first DIMENSION *lld_a* ≥ (*bw*+1), stored in *desca*.
On entry, this array contains the local pieces of the *n*-by-*n* symmetric banded distributed Cholesky factor *L* or *L*^{T}**A*(1:*n*, *ja*:*ja*+*n*-1).
This local portion is stored in the packed banded format used in LAPACK. See the *Application Notes* below and the ScaLAPACK manual for more detail on the format of distributed matrices.

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
If 1D type (*dtype_a* = 501), then *dlen* ≥ 7;
If 2D type (*dtype_a* = 1), then *dlen* ≥ 9.
Contains information on mapping of *A* to memory. (See ScaLAPACK manual for full description and options.)

b (local)
REAL for pspbtrsv

DOUBLE PRECISION for pdpbtrsv
COMPLEX for pcpbtrsv
COMPLEX*16 for pzpbtrsv.
Pointer into the local memory to an array of local lead DIMENSION *lld_b* ≥ *nb*.
On entry, this array contains the local pieces of the right hand sides *B*(*jb*:*jb*+*n*-1, 1:*nrhs*).

ib (global) INTEGER. The row index in the global array *B* that points to the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *B*.
If 1D type (*dtype_b* = 502), then *dlen* ≥ 7;
If 2D type (*dtype_b* = 1), then *dlen* ≥ 9.
Contains information on mapping of *B* to memory. Please, see ScaLAPACK manual for full description and options.

laf (local)
INTEGER. The size of user-input auxiliary Fillin space *af*. Must be *laf* ≥ (*nb*+2***bw*)***bw* . If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local)
REAL for pspbtrsv
DOUBLE PRECISION for pdpbtrsv
COMPLEX for pcpbtrsv
COMPLEX*16 for pzpbtrsv.
The array *work* is a temporary workspace array of DIMENSION *lwork*. This space may be overwritten in between calls to routines.

lwork (local or global) INTEGER. The size of the user-input workspace *work*, must be at least *lwork* ≥ *bw***nrhs*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned.

Output Parameters

af (local)
REAL for pspbtrsv
DOUBLE PRECISION for pdpbtrsv
COMPLEX for pcpbtrsv
COMPLEX*16 for pzpbtrsv.
The array *af* is of DIMENSION *laf*. It contains auxiliary Fillin space. Fillin is created during the factorization routine p?pbtrf and this is stored in *af*. If a linear system is to be solved using p?pbtrs after the factorization routine, *af* must not be altered after the factorization.

b On exit, this array contains the local piece of the solutions distributed matrix *X*.

work(1)	On exit, *work*(1) contains the minimum value of *lwork*.
info	(local) INTEGER. = 0: successful exit < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

Application Notes

If the factorization routine and the solve routine are to be called separately to solve various sets of right-hand sides using the same coefficient matrix, the auxiliary space *af* must not be altered between calls to the factorization routine and the solve routine.

The best algorithm for solving banded and tridiagonal linear systems depends on a variety of parameters, especially the bandwidth. Currently, only algorithms designed for the case N/P >> *bw* are implemented. These algorithms go by many names, including Divide and Conquer, Partitioning, domain decomposition-type, etc.

The Divide and Conquer algorithm assumes the matrix is narrowly banded compared with the number of equations. In this situation, it is best to distribute the input matrix *A* one-dimensionally, with columns atomic and rows divided amongst the processes. The basic algorithm divides the banded matrix up into *P* pieces with one stored on each processor, and then proceeds in 2 phases for the factorization or 3 for the solution of a linear system.

1. **Local Phase**: The individual pieces are factored independently and in parallel. These factors are applied to the matrix creating fill-in, which is stored in a non-inspectable way in auxiliary space *af*. Mathematically, this is equivalent to reordering the matrix *A* as PAP^T and then factoring the principal leading submatrix of size equal to the sum of the sizes of the matrices factored on each processor. The factors of these submatrices overwrite the corresponding parts of *A* in memory.
2. **Reduced System Phase**: A small (*bw**(*P*-1)) system is formed representing interaction of the larger blocks and is stored (as are its factors) in the space *af*. A parallel Block Cyclic Reduction algorithm is used. For a linear system, a parallel front solve followed by an analogous backsolve, both using the structure of the factored matrix, are performed.
3. **Back Subsitution Phase**: For a linear system, a local backsubstitution is performed on each processor in parallel.

p?pttrsv

Solves a single triangular linear system via frontsolve or backsolve where the triangular matrix is a factor of a tridiagonal matrix computed by p?pttrf *.*

Syntax

call pspttrsv(*uplo*, *n*, *nrhs*, *d*, *e*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pdpttrsv(*uplo*, *n*, *nrhs*, *d*, *e*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pcpttrsv(*uplo*, *trans*, *n*, *nrhs*, *d*, *e*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

call pzpttrsv(*uplo*, *trans*, *n*, *nrhs*, *d*, *e*, *ja*, *desca*, *b*, *ib*, *descb*, *af*, *laf*, *work*, *lwork*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves a tridiagonal triangular system of linear equations

A(1:*n*, *ja*:*ja*+*n*-1)**X* = *B*(*jb*:*jb*+*n*-1, 1:*nrhs*)

or

A(1:*n*, *ja*:*ja*+*n*-1)^T**X* = *B*(*jb*:*jb*+*n*-1, 1:*nrhs*) for real flavors,

A(1:*n*, *ja*:*ja*+*n*-1)^H**X* = *B*(*jb*:*jb*+*n*-1, 1:*nrhs*) for complex flavors,

where *A*(1:*n*, *ja*:*ja*+*n*-1) is a tridiagonal triangular matrix factor produced by the Cholesky factorization code p?pttrf and is stored in *A*(1:*n*, *ja*:*ja*+*n*-1) and *af*. The matrix stored in *A*(1:*n*, *ja*:*ja*+*n*-1) is either upper or lower triangular according to *uplo*.

Routine p?pttrf must be called first.

Input Parameters

uplo
(global) CHARACTER. Must be 'U' or 'L'.
If *uplo* = 'U', upper triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored;
If *uplo* = 'L', lower triangle of *A*(1:*n*, *ja*:*ja*+*n*-1) is stored.

trans
(global) CHARACTER. Must be 'N' or 'C'.
If *trans* = 'N', solve with *A*(1:*n*, *ja*:*ja*+*n*-1);
If *trans* = 'C' (for complex flavors), solve with conjugate transpose (*A*(1:*n*, *ja*:*ja*+*n*-1))^H.

n
(global) INTEGER.
The number of rows and columns to be operated on, that is, the order of the distributed submatrix *A*(1:*n*, *ja*:*ja*+*n*-1). *n* ≥ 0.

nrhs
(global) INTEGER.
The number of right hand sides; the number of columns of the distributed submatrix *B*(*jb*:*jb*+*n*-1, 1:*nrhs*); *nrhs* ≥ 0.

d
(local)
REAL for pspttrsv
DOUBLE PRECISION for pdpttrsv
COMPLEX for pcpttrsv
COMPLEX*16 for pzpttrsv.
Pointer to the local part of the global vector storing the main diagonal of the matrix; must be of size ≥ *desca*(*nb_*).

e
(local)
REAL for pspttrsv
DOUBLE PRECISION for pdpttrsv
COMPLEX for pcpttrsv
COMPLEX*16 for pzpttrsv.

Pointer to the local part of the global vector storing the upper diagonal of the matrix; must be of size ≥ *desca*(*nb_*). Globally, *du*(*n*) is not referenced, and *du* must be aligned with *d*.

ja (global) INTEGER. The index in the global array *A* that points to the start of the matrix to be operated on (which may be either all of *A* or a submatrix of *A*).

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

If 1D type (*dtype_a* = 501 or 502), then *dlen* ≥ 7;

If 2D type (*dtype_a* = 1), then *dlen* ≥ 9.

Contains information on mapping of *A* to memory. See ScaLAPACK manual for full description and options.

b (local)
REAL for pspttrsv
DOUBLE PRECISION for pdpttrsv
COMPLEX for pcpttrsv
COMPLEX*16 for pzpttrsv.
Pointer into the local memory to an array of local lead DIMENSION *lld_b* ≥ *nb*.
On entry, this array contains the local pieces of the right hand sides *B*(*jb*:*jb*+*n*-1, 1:*nrhs*).

ib (global) INTEGER. The row index in the global array *B* that points to the first row of the matrix to be operated on (which may be either all of *B* or a submatrix of *B*).

descb (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *B*.

If 1D type (*dtype_b* = 502), then *dlen* ≥ 7;

If 2D type (*dtype_b* = 1), then *dlen* ≥ 9.

Contains information on mapping of *B* to memory. See ScaLAPACK manual for full description and options.

laf (local)
INTEGER. The size of user-input auxiliary Fillin space *af*. Must be *laf* ≥ (*nb*+2**bw*)**bw*.
If *laf* is not large enough, an error code will be returned and the minimum acceptable size will be returned in *af*(1).

work (local)
REAL for pspttrsv
DOUBLE PRECISION for pdpttrsv
COMPLEX for pcpttrsv
COMPLEX*16 for pzpttrsv.
The array *work* is a temporary workspace array of DIMENSION *lwork*.
This space may be overwritten in between calls to routines.

lwork	(local or global) INTEGER. The size of the user-input workspace *work*, must be at least *lwork* ≥(10+2*min(100, *nrhs*))**npcol*+4**nrhs*. If *lwork* is too small, the minimal acceptable size will be returned in *work*(1) and an error code is returned.

Output Parameters

d, *e*	(local). REAL for pspttrsv DOUBLE PRECISION for pdpttrsv COMPLEX for pcpttrsv COMPLEX*16 for pzpttrsv. On exit, these arrays contain information on the factors of the matrix.
af	(local) REAL for pspttrsv DOUBLE PRECISION for pdpttrsv COMPLEX for pcpttrsv COMPLEX*16 for pzpttrsv. The array *af* is of DIMENSION *laf*. It contains auxiliary Fillin space. Fillin is created during the factorization routine p?pbtrf and this is stored in *af*. If a linear system is to be solved using p?pttrs after the factorization routine, *af* must not be altered after the factorization.
b	On exit, this array contains the local piece of the solutions distributed matrix *X*.
work(1)	On exit, *work*(1) contains the minimum value of *lwork*.
info	(local) INTEGER. = 0: successful exit < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?potf2

Computes the Cholesky factorization of a symmetric/Hermitian positive definite matrix (local unblocked algorithm).

Syntax

```
call pspotf2(uplo, n, a, ia, ja, desca, info)
call pdpotf2(uplo, n, a, ia, ja, desca, info)
call pcpotf2(uplo, n, a, ia, ja, desca, info)
call pzpotf2(uplo, n, a, ia, ja, desca, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the Cholesky factorization of a real symmetric or complex Hermitian positive definite distributed matrix sub (*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1).

The factorization has the form

sub(*A*) = *U*'**U*, if *uplo* = 'U', or sub(*A*) = *L***L*', if *uplo* = 'L',

where *U* is an upper triangular matrix, *L* is lower triangular. *X*' denotes transpose (conjugate transpose) of *X*.

Input Parameters

uplo
(global) CHARACTER.
Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix *A* is stored.
= 'U': upper triangle of sub (*A*) is stored;
= 'L': lower triangle of sub (*A*) is stored.

n
(global) INTEGER.
The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub (*A*). *n* ≥ 0.

a
(local)
REAL for pspotf2
DOUBLE PRECISION or pdpotf2
COMPLEX for pcpotf2
COMPLEX*16 for pzpotf2.
Pointer into the local memory to an array of DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)) containing the local pieces of the *n*-by-*n* symmetric distributed matrix sub(*A*) to be factored.
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular matrix and the strictly lower triangular part of this matrix is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular matrix and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja*
(global) INTEGER.
The row and column indices in the global array *A* indicating the first row and the first column of the sub(*A*), respectively.

desca
(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a
(local)
On exit,
if *uplo* = 'U', the upper triangular part of the distributed matrix contains the Cholesky factor U;

	if *uplo* = 'L', the lower triangular part of the distributed matrix contains the Cholesky factor L.
info	(local) INTEGER. = 0: successful exit < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = -(*i**100+*j*), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*. > 0: if *info* = *k*, the leading minor of order *k* is not positive definite, and the factorization could not be completed.

p?rscl

Multiplies a vector by the reciprocal of a real scalar.

Syntax

call psrscl(*n*, *sa*, *sx*, *ix*, *jx*, *descx*, *incx*)

call pdrscl(*n*, *sa*, *sx*, *ix*, *jx*, *descx*, *incx*)

call pcsrscl(*n*, *sa*, *sx*, *ix*, *jx*, *descx*, *incx*)

call pzdrscl(*n*, *sa*, *sx*, *ix*, *jx*, *descx*, *incx*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine multiplies an *n*-element real/complex vector sub(*x*) by the real scalar 1/a. This is done without overflow or underflow as long as the final result sub(*x*)/a does not overflow or underflow.

sub(*x*) denotes *x*(*ix*:*ix*+*n*-1, *jx*:*jx*), if *incx* = 1,

and *x*(*ix*:*ix*, *jx*:*jx*+*n*-1), if *incx* = *m_x*.

Input Parameters

n	(global) INTEGER. The number of components of the distributed vector sub(*x*). *n* ≥ 0.
sa	REAL for psrscl/pcsrscl DOUBLE PRECISION for pdrscl/pzdrscl. The scalar a that is used to divide each component of the vector *x*. This parameter must be ≥ 0.
sx	REAL forpsrscl DOUBLE PRECISION for pdrscl COMPLEX for pcsrscl COMPLEX*16 for pzdrscl.

	Array containing the local pieces of a distributed matrix of DIMENSION of at least ((*jx*-1)*m_x + *ix* + (*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix	(global) INTEGER.The row index of the submatrix of the distributed matrix *X* to operate on.
jx	(global) INTEGER. The column index of the submatrix of the distributed matrix *X* to operate on.
descx	(global and local). INTEGER. Array of DIMENSION 8. The array descriptor for the distributed matrix *X*.
incx	(global) INTEGER. The increment for the elements of *X*. This version supports only two values of *incx*, namely 1 and *m_x*.

Output Parameters

sx	On exit, the result *x/a*.

p?sygs2/p?hegs2

Reduces a symmetric/Hermitian definite generalized eigenproblem to standard form, using the factorization results obtained from p?potrf *(local unblocked algorithm).*

Syntax

```
call pssygs2(ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, info)
call pdsygs2(ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, info)
call pchegs2(ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, info)
call pzhegs2(ibtype, uplo, n, a, ia, ja, desca, b, ib, jb, descb, info)
```

Description

The routine p?sygs2/p?hegs2 reduces a real symmetric-definite or a complex Hermitian-definite generalized eigenproblem to standard form.

Here sub(*A*) denotes *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), and sub(*B*) denotes *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*n*-1).

If *ibtype* = 1, the problem is

sub(*A*)**x* = λ*sub(*B*)**x*

and sub(*A*) is overwritten by

inv(U^T)*sub(*A*)*inv(*U*) or inv(*L*)*sub(*A*)*inv(L^T) - for real flavors, and

inv(U^H)*sub(*A*)*inv(*U*) or inv(*L*)*sub(*A*)*inv(L^H) - for complex flavors.

If *ibtype* = 2 or 3, the problem is

sub(*A*)*sub(*B*)*x* = λ*x* or sub(*B*)*sub(*A*)*x* =λ*x*

and sub(*A*) is overwritten by

U*sub(*A*)*U^T or *L***T**sub(*A*)*L - for real flavors and

U*sub(*A*)*U^H or *L***H**sub(*A*)*L - for complex flavors.

The matrix sub(*B*) must have been previously factorized as U^T*U or L*L^T (for real flavors), or as U^H*U or L*L^H (for complex flavors) by p?potrf.

Input Parameters

ibtype (global) INTEGER.
= 1:
compute inv(U^T)*sub(*A*)*inv(*U*), or inv(*L*)*sub(*A*)*inv(L^T) for real subroutines,
and inv(U^H)*sub(*A*)*inv(*U*), or inv(*L*)*sub(*A*)*inv(L^H) for complex subroutines;
= 2 or 3:
compute U*sub(*A*)*U^T, or L^T*sub(*A*)*L for real subroutines,
and U*sub(*A*)*U^H or L^H*sub(*A*)*L for complex subroutines.

uplo (global) CHARACTER
Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix sub(*A*) is stored, and how sub(*B*) is factorized.
= 'U': Upper triangular of sub(*A*) is stored and sub(*B*) is factorized as U^T*U (for real subroutines) or as U^H*U (for complex subroutines).
= 'L': Lower triangular of sub(*A*) is stored and sub(*B*) is factorized as L*L^T (for real subroutines) or as L*L^H (for complex subroutines)

n (global) INTEGER.
The order of the matrices sub(*A*) and sub(*B*). *n* ≥ 0.

a (local)
REAL for pssygs2
DOUBLE PRECISION for pdsygs2
COMPLEX for pchegs2
COMPLEX*16 for pzhegs2.
Pointer into the local memory to an array, DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the *n*-by-*n* symmetric/Hermitian distributed matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and the strictly lower triangular part of sub(*A*) is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja*	(global) INTEGER. The row and column indices in the global array *A* indicating the first row and the first column of the sub(*A*), respectively.
desca	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.
B	(local) REAL for pssygs2 DOUBLE PRECISION for pdsygs2 COMPLEX for pchegs2 COMPLEX*16 for pzhegs2. Pointer into the local memory to an array, DIMENSION(*lld_b*, *LOCc*(*jb*+*n*-1)). On entry, this array contains the local pieces of the triangular factor from the Cholesky factorization of sub(*B*) as returned by p?potrf.
ib, *jb*	(global) INTEGER. The row and column indices in the global array *B* indicating the first row and the first column of the sub(*B*), respectively.
descb	(global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *B*.

Output Parameters

a	(local) On exit, if *info* = 0, the transformed matrix is stored in the same format as sub(*A*).
info	INTEGER. = 0: successful exit. < 0: if the *i*-th argument is an array and the *j*-entry had an illegal value, then *info* = - (*i**100), if the *i*-th argument is a scalar and had an illegal value, then *info* = -*i*.

p?sytd2/p?hetd2

Reduces a symmetric/Hermitian matrix to real symmetric tridiagonal form by an orthogonal/unitary similarity transformation (local unblocked algorithm).

Syntax

```
call pssytd2(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
call pdsytd2(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
call pchetd2(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
call pzhetd2(uplo, n, a, ia, ja, desca, d, e, tau, work, lwork, info)
```

Description

The routine p?sytd2/p?hetd2 reduces a real symmetric/complex Hermitian matrix sub(*A*) to symmetric/Hermitian tridiagonal form *T* by an orthogonal/unitary similarity transformation:

*Q'*sub(*A*)**Q* = *T*, where sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1).

Input Parameters

uplo (global) CHARACTER.
Specifies whether the upper or lower triangular part of the symmetric/Hermitian matrix sub(*A*) is stored:
= 'U': upper triangular
= 'L': lower triangular

n (global) INTEGER.
The number of rows and columns to be operated on, that is, the order of the distributed submatrix sub(*A*). *n* ≥ 0.

a (local)
REAL for pssytd2
DOUBLE PRECISION for pdsytd2
COMPLEX for pchetd2
COMPLEX*16 for pzhetd2.
Pointer into the local memory to an array, DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the *n*-by-*n* symmetric/Hermitian distributed matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of sub(*A*) contains the upper triangular part of the matrix, and the strictly lower triangular part of sub(*A*) is not referenced.
If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of sub(*A*) contains the lower triangular part of the matrix, and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja* (global) INTEGER.
The row and column indices in the global array *A* indicating the first row and the first column of the sub(*A*), respectively.

desca (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

work (local)
REAL for pssytd2
DOUBLE PRECISION for pdsytd2
COMPLEX for pchetd2
COMPLEX*16 for pzhetd2.
The array *work* is a temporary workspace array of DIMENSION *lwork*.

Output Parameters

a — On exit, if *uplo* = 'U', the diagonal and first superdiagonal of sub(*A*) are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors;
if *uplo* = 'L', the diagonal and first subdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau,* represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
See the *Application Notes* below.

d — (local)
REAL for pssytd2/pchetd2
DOUBLE PRECISION for pdsytd2/pzhetd2.
Array, DIMENSION(*LOCc*(*ja*+*n*-1)). The diagonal elements of the tridiagonal matrix *T*:
d(i) = *a*(i,i); *d* is tied to the distributed matrix *A*.

e — (local)
REAL for pssytd2/pchetd2
DOUBLE PRECISION for pdsytd2/pzhetd2.
Array, DIMENSION(*LOCc*(*ja*+*n*-1)),
if *uplo* = 'U', *LOCc*(*ja*+*n*-2) otherwise.
The off-diagonal elements of the tridiagonal matrix *T*:
e(i) = *a*(i,i+1) if *uplo* = 'U',
e(i) = *a*(i+1,i) if *uplo* = 'L'.
e is tied to the distributed matrix *A*.

tau — (local)
REAL for pssytd2
DOUBLE PRECISION for pdsytd2
COMPLEX for pchetd2
COMPLEX*16 for pzhetd2.
Array, DIMENSION(*LOCc*(*ja*+*n*-1)).
The scalar factors of the elementary reflectors. *tau* is tied to the distributed matrix *A*.

work(1) — On exit, *work*(1) returns the minimal and optimal value of *lwork*.

lwork — (local or global) INTEGER.
The dimension of the workspace array *work*.

lwork is local input and must be at least *lwork* ≥ 3*n*.
If *lwork* = -1, then *lwork* is global input and a workspace query is assumed; the routine only calculates the minimum and optimal size for all work arrays. Each of these values is returned in the first entry of the corresponding work array, and no error message is issued by pxerbla.

info — (local) INTEGER.
= 0: successful exit

< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value,
then *info* = -(*i**100),
if the *i*-th argument is a scalar and had an illegal value,
then *info* = -*i*.

Application Notes

If *uplo* = 'U', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(*n*-1)*...**H*(2)**H*(1)

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*',

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(*i*+1:*n*) = 0 and *v*(*i*) = 1; *v*(1:*i*-1) is stored on exit in *A*(*ia*:*ia*+*i*-2, *ja*+*i*), and *tau* in *TAU*(*ja*+*i*-1).

If *uplo* = 'L', the matrix *Q* is represented as a product of elementary reflectors

Q = *H*(1)**H*(2)*...**H*(*n*-1).

Each *H*(i) has the form

H(i) = *I* - *tau***v***v*' ,

where *tau* is a real/complex scalar, and *v* is a real/complex vector with *v*(1:*i*) = 0 and *v*(*i*+1) = 1; *v*(*i*+2:*n*) is stored on exit in *A*(*ia*+*i*+1:*ia*+*n*-1, *ja*+*i*-1), and *tau* in *TAU*(*ja*+*i*-1).

The contents of sub (*A*) on exit are illustrated by the following examples with *n* = 5:

if *uplo*='U':

$$\begin{bmatrix} d & e & v_2 & v_3 & v_4 \\ & d & e & v_3 & v_4 \\ & & d & e & v_4 \\ & & & d & e \\ & & & & d \end{bmatrix}$$

if *uplo*='L':

$$\begin{bmatrix} d & & & & \\ e & d & & & \\ v1 & e & d & & \\ v1 & v_2 & e & d & \\ v1 & v_2 & v_3 & e & d \end{bmatrix}$$

where *d* and *e* denotes diagonal and off-diagonal elements of *T*, and v_i denotes an element of the vector defining *H*(i).

NOTE. The distributed submatrix sub(*A*) must verify some alignment properties, namely the following expression should be true:

(*mb_a*.eq.*nb_a* .AND. *iroffa*.eq.*icoffa*) with *iroffa* = mod(*ia* - 1, *mb_a*) and *icoffa* = mod(*ja* -1, *nb_a*).

p?trti2

Computes the inverse of a triangular matrix (local unblocked algorithm).

Syntax

```
call pstrti2(uplo, diag, n, a, ia, ja, desca, info)
call pdtrti2(uplo, diag, n, a, ia, ja, desca, info)
call pctrti2(uplo, diag, n, a, ia, ja, desca, info)
call pztrti2(uplo, diag, n, a, ia, ja, desca, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes the inverse of a real/complex upper or lower triangular block matrix sub (*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1).

This matrix should be contained in one and only one process memory space (local operation).

Input Parameters

uplo
(global) CHARACTER*1.
Specifies whether the matrix sub (*A*) is upper or lower triangular.
= 'U': sub (*A*) is upper triangular
= 'L': sub (*A*) is lower triangular.

diag
(global) CHARACTER*1.
Specifies whether or not the matrix *A* is unit triangular.
= 'N': sub (*A*) is non-unit triangular
= 'U': sub (*A*) is unit triangular.

n
(global) INTEGER.
The number of rows and columns to be operated on, i.e., the order of the distributed submatrix sub(*A*). *n* ≥ 0.

a
(local)
REAL for pstrti2
DOUBLE PRECISION for pdtrti2
COMPLEX for pctrti2
COMPLEX*16 for pztrti2.
Pointer into the local memory to an array, DIMENSION(*lld_a*, *LOCc*(*ja*+*n*-1)).
On entry, this array contains the local pieces of the triangular matrix sub(*A*).
If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of the matrix sub(*A*) contains the upper triangular part of the matrix, and the strictly lower triangular part of sub(*A*) is not referenced.

If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of the matrix sub(*A*) contains the lower triangular part of the matrix, and the strictly upper triangular part of sub(*A*) is not referenced. If *diag* = 'U', the diagonal elements of sub(*A*) are not referenced either and are assumed to be 1.

ia, *ja* — (global) INTEGER.
The row and column indices in the global array *A* indicating the first row and the first column of the sub(*A*), respectively.

desca — (global and local) INTEGER array, DIMENSION (*dlen_*). The array descriptor for the distributed matrix *A*.

Output Parameters

a — On exit, the (triangular) inverse of the original matrix, in the same storage format.

info — INTEGER.
= 0: successful exit
< 0: if the *i*-th argument is an array and the *j*-entry had an illegal value,
then *info* = - (*i**100),
if the *i*-th argument is a scalar and had an illegal value,
then *info* = -*i*.

?lamsh

Sends multiple shifts through a small (single node) matrix to maximize the number of bulges that can be sent through.

Syntax

```
call slamsh(s, lds, nbulge, jblk, h, ldh, n, ulp)
call dlamsh(s, lds, nbulge, jblk, h, ldh, n, ulp)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine sends multiple shifts through a small (single node) matrix to see how small consecutive subdiagonal elements are modified by subsequent shifts in an effort to maximize the number of bulges that can be sent through. The subroutine should only be called when there are multiple shifts/bulges (*nbulge* > 1) and the first shift is starting in the middle of an unreduced Hessenberg matrix because of two or more small consecutive subdiagonal elements.

Input Parameters

s — (local)
INTEGER. REAL for slamsh
DOUBLE PRECISION for dlamsh

	Array, DIMENSION (*lds*,*). On entry, the matrix of shifts. Only the 2x2 diagonal of *s* is referenced. It is assumed that *s* has *jblk* double shifts (size 2).
lds	(local) INTEGER. On entry, the leading dimension of *S*; unchanged on exit. 1<*nbulge* ≤ *jblk* ≤ *lds*/2.
nbulge	(local) INTEGER. On entry, the number of bulges to send through *h* (>1). *nbulge* should be less than the maximum determined (*jblk*). 1<*nbulge* ≤ *jblk* ≤ *lds*/2.
jblk	(local) INTEGER. On entry, the leading dimension of *S*; unchanged on exit.
h	(local) INTEGER. REAL for slamsh DOUBLE PRECISION for dlamsh Array, DIMENSION (*lds*, *n*). On entry, the local matrix to apply the shifts on. *h* should be aligned so that the starting row is 2.
ldh	(local) INTEGER. On entry, the leading dimension of *H*; unchanged on exit.
n	(local) INTEGER. On entry, the size of *H*. If all the bulges are expected to go through, *n* should be at least 4*nbulge*+2. Otherwise, *nbulge* may be reduced by this routine.
ulp	(local) REAL for slamsh DOUBLE PRECISION for dlamsh On entry, machine precision. Unchanged on exit.

Output Parameters

s	On exit, the data is rearranged in the best order for applying.
nbulge	On exit, the maximum number of bulges that can be sent through.
h	On exit, the data is destroyed.

?laref

Applies Householder reflectors to matrices on either their rows or columns.

Syntax

```
call slaref(type, a, lda, wantz, z, ldz, block, irow1, icol1, istart, istop, itmp1, itmp2, liloz, lihiz, vecs, v2, v3, t1, t2, t3)
```

call dlaref(*type*, *a*, *lda*, *wantz*, *z*, *ldz*, *block*, *irow1*, *icol1*, *istart*, *istop*, *itmp1*, *itmp2*, *liloz*, *lihiz*, *vecs*, *v2*, *v3*, *t1*, *t2*, *t3*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine applies one or several Householder reflectors of size 3 to one or two matrices (if column is specified) on either their rows or columns.

Input Parameters

type (global) CHRACTER*1.
If *type* = 'R', apply reflectors to the rows of the matrix (apply from left). Otherwise, apply reflectors to the columns of the matrix.
Unchanged on exit.

a (global) REAL for slaref
DOUBLE PRECISION for dlaref
Array, DIMENSION (*lda*, *).
On entry, the matrix to receive the reflections.

lda (local) INTEGER.
On entry, the leading dimension of *A*; unchanged on exit.

wantz (global) LOGICAL.
If *wantz* = .TRUE., apply any column reflections to *Z* as well.
If *wantz* = .FALSE., do no additional work on *Z*.

z (global) REAL for slaref
DOUBLE PRECISION for dlaref
Array, DIMENSION (*ldz*, *).
On entry, the second matrix to receive column reflections.

ldz (local) INTEGER.
On entry, the leading dimension of *Z*; unchanged on exit.

block (global). LOGICAL.
= .TRUE. : apply several reflectors at once and read their data from the *vecs* array;
= .FALSE. : apply the single reflector given by *v2*, *v3*, *t1*, *t2*, and *t3*.

irow1 (local) INTEGER.
On entry, the local row element of the matrix A.

icol1 (local) INTEGER.
On entry, the local column element of the matrix A.

istart (global) INTEGER.
Specifies the "number" of the first reflector.
istart is used as an index into *vecs* if *block* is set. *istart* is ignored if *block* is .FALSE. .

istop (global) INTEGER.
Specifies the "number" of the last reflector.
istop is used as an index into *vecs* if *block* is set. *istop* is ignored if *block* is .FALSE. .

itmp1	(local) INTEGER. Starting range into *A*. For rows, this is the local first column. For columns, this is the local first row.
itmp2	(local) INTEGER. Ending range into *A*. For rows, this is the local last column. For columns, this is the local last row.
liloz, *lihiz*	(local). INTEGER. Serve the same purpose as *itmp1*, *itmp2* but for *Z* when *wantz* is set.
vecs	(global) REAL for slaref DOUBLE PRECISION for dlaref. Array of size 3 **n* (matrix size). This array holds the size 3 reflectors one after another and is only accessed when *block* is .TRUE.
v2,*v3*,*t1*,*t2*,*t3*	(global). INTEGER. REAL for slaref DOUBLE PRECISION for dlaref. These parameters hold information on a single size 3 Householder reflector and are read when *block* is .FALSE., and overwritten when *block* is .TRUE..

Output Parameters

a	On exit, the updated matrix.
z	Changed only if *wantz* is set. If *wantz* is .FALSE. , *z* is not referenced.
irow1	Undefined.
icol1	Undefined.
v2,*v3*,*t1*,*t2*,*t3*	These parameters are read when *block* is .FALSE., and overwritten when *block* is .TRUE..

?lasorte

Sorts eigenpairs by real and complex data types.

Syntax

```
call slasorte(s, lds, j, out, info)
call dlasorte(s, lds, j, out, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine sorts eigenpairs so that real eigenpairs are together and complex eigenpairs are together. This helps to employ 2x2 shifts easily since every second subdiagonal is guaranteed to be zero. This routine does no parallel work and makes no calls.

Input Parameters

s	(local) INTEGER. REAL for slasorte DOUBLE PRECISION for dlasorte Array, DIMENSION (*lds*). On entry, a matrix already in Schur form.
lds	(local) INTEGER. On entry, the leading dimension of the array *s*; unchanged on exit.
j	(local) INTEGER. On entry, the order of the matrix *S*; unchanged on exit.
out	(local) INTEGER. REAL for slasorte DOUBLE PRECISION for dlasorte Array, DIMENSION (2**j*). The work buffer required by the routine.
info	(local) INTEGER. Set, if the input matrix had an odd number of real eigenvalues and things could not be paired or if the input matrix *S* was not originally in Schur form. 0 indicates successful completion.

Output Parameters

s	On exit, the diagonal blocks of *S* have been rewritten to pair the eigenvalues. The resulting matrix is no longer similar to the input.
out	Work buffer.

?lasrt2

Sorts numbers in increasing or decreasing order.

Syntax

```
call slasrt2(id, n, d, key, info)
call dlasrt2(id, n, d, key, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine is modified LAPACK routine ?lasrt, which sorts the numbers in *d* in increasing order (if *id* = 'I') or in decreasing order (if *id* = 'D'). It uses Quick Sort, reverting to Insertion Sort on arrays of size ≤ 20. Dimension of STACK limits *n* to about 2^{32}.

Input Parameters

id	CHARACTER*1. = 'I': sort *d* in increasing order; = 'D': sort *d* in decreasing order.

n	INTEGER. The length of the array *d*.
d	REAL for slasrt2 DOUBLE PRECISION for dlasrt2. Array, DIMENSION (*n*). On entry, the array to be sorted.
key	INTEGER. Array, DIMENSION (*n*). On entry, *key* contains a key to each of the entries in *d*( ). Typically, *key*(*i*) = *i* for all *i* .

Output Parameters

D	On exit, *d* has been sorted into increasing order (*d*(1) ≤ ... ≤ *d*(*n*)) or into decreasing order (*d*(1) ≥ ... ≥ *d*(*n*)), depending on *id*.
info	INTEGER. = 0: successful exit < 0: if *info* = -i, the *i*-th argument had an illegal value.
key	On exit, *key* is permuted in exactly the same manner as *d*() was permuted from input to output. Therefore, if *key*(*i*) = *i* for all *i* upon input, then *d*_out(*i*) = *d*_in(*key*(*i*)).

?stein2

Computes the eigenvectors corresponding to specified eigenvalues of a real symmetric tridiagonal matrix, using inverse iteration.

Syntax

call sstein2(*n*, *d*, *e*, *m*, *w*, *iblock*, *isplit*, *orfac*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

call dstein2(*n*, *d*, *e*, *m*, *w*, *iblock*, *isplit*, *orfac*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine is a modified LAPACK routine ?stein. It computes the eigenvectors of a real symmetric tridiagonal matrix *T* corresponding to specified eigenvalues, using inverse iteration.

The maximum number of iterations allowed for each eigenvector is specified by an internal parameter *maxits* (currently set to 5).

Input Parameters

n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
m	INTEGER. The number of eigenvectors to be found (0 ≤ *m* ≤ *n*).
d, *e*, *w*	REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.
Arrays: *d*(*), DIMENSION (*n*). The *n* diagonal elements of the tridiagonal matrix *T*.
e(*), DIMENSION (*n*).
The (*n*-1) subdiagonal elements of the tridiagonal matrix *T*, in elements 1 to *n*-1. *e*(*n*) need not be set.
w(*), DIMENSION (*n*).
The first *m* elements of *w* contain the eigenvalues for which eigenvectors are to be computed. The eigenvalues should be grouped by split-off block and ordered from smallest to largest within the block. (The output array *w* from ?stebz with ORDER = 'B' is expected here).
The dimension of *w* must be at least max(1, *n*).

iblock — INTEGER.
Array, DIMENSION (*n*).
The submatrix indices associated with the corresponding eigenvalues in *w* ;
iblock(*i*) = 1, if eigenvalue *w*(*i*) belongs to the first submatrix from the top,
iblock(*i*) = 2, if eigenvalue *w*(*i*) belongs to the second submatrix, etc. (The output array *iblock* from ?stebz is expected here).

isplit — INTEGER.
Array, DIMENSION (*n*).
The splitting points, at which *T* breaks up into submatrices. The first submatrix consists of rows/columns 1 to *isplit*(1), the second submatrix consists of rows/columns *isplit*(1)+1 through *isplit*(2), etc. (The output array *isplit* from ?stebz is expected here).

orfac — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
orfac specifies which eigenvectors should be orthogonalized. Eigenvectors that correspond to eigenvalues which are within *orfac**||*T*|| of each other are to be orthogonalized.

ldz — INTEGER. The leading dimension of the output array *z*; *ldz* ≥ max(1, *n*).

work — REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Workspace array, DIMENSION (5*n*).

iwork — INTEGER. Workspace array, DIMENSION (*n*).

Output Parameters

z — REAL for sstein2
DOUBLE PRECISION for dstein2
Array, DIMENSION (*ldz*, *m*).
The computed eigenvectors. The eigenvector associated with the eigenvalue *w*(*i*) is stored in the *i*-th column of *z*. Any vector that fails to converge is set to its current iterate after *maxits* iterations.

ifail	INTEGER. Array, DIMENSION (*m*). On normal exit, all elements of *ifail* are zero. If one or more eigenvectors fail to converge after *maxits* iterations, then their indices are stored in the array *ifail*.
info	INTEGER. *info* = 0, the exit is successful. *info* < 0: if *info* = -*i*, the *i*-th had an illegal value. *info* > 0: if *info* = *i*, then *i* eigenvectors failed to converge in *maxits* iterations. Their indices are stored in the array *ifail*.

?dbtf2

Computes an LU factorization of a general band matrix with no pivoting (local unblocked algorithm).

Syntax

```
call sdbtf2(m, n, kl, ku, ab, ldab, info)
call ddbtf2(m, n, kl, ku, ab, ldab, info)
call cdbtf2(m, n, kl, ku, ab, ldab, info)
call zdbtf2(m, n, kl, ku, ab, ldab, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine computes an *LU* factorization of a general real/complex *m*-by-*n* band matrix *A* without using partial pivoting with row interchanges.

This is the unblocked version of the algorithm, calling BLAS Routines and Functions.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*(*m* ≥ 0).
n	INTEGER. The number of columns in *A*(*n* ≥ 0).
kl	INTEGER. The number of sub-diagonals within the band of *A*(*kl* ≥ 0).
ku	INTEGER. The number of super-diagonals within the band of *A*(*ku* ≥ 0).
ab	REAL for sdbtf2 DOUBLE PRECISION for ddbtf2 COMPLEX for cdbtf2 COMPLEX*16 for zdbtf2. Array, DIMENSION (*ldab*, *n*).

The matrix *A* in band storage, in rows *kl*+1 to 2*kl*+*ku*+1; rows 1 to *kl* of the array need not be set. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows: *ab*(*kl*+*ku*+1+*i*-*j*,*j*) = *A*(*i*,*j*) for max(1,*j*-*ku*) ≤ *i* ≤ min(*m*,*j*+*kl*).

ldab — INTEGER. The leading dimension of the array *ab*. (*ldab* ≥ 2*kl* + *ku* +1)

Output Parameters

ab — On exit, details of the factorization: *U* is stored as an upper triangular band matrix with *kl*+*ku* superdiagonals in rows 1 to *kl*+*ku*+1, and the multipliers used during the factorization are stored in rows *kl*+*ku*+2 to 2**kl*+*ku*+1. See the *Application Notes* below for further details.

info — INTEGER.
= 0: successful exit
< 0: if *info* = - *i*, the *i*-th argument had an illegal value,
> 0: if *info* = + *i*, *u*(*i*,*i*) is 0. The factorization has been completed, but the factor *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

Application Notes

The band storage scheme is illustrated by the following example, when *m* = *n* = 6, *kl* = 2, *ku* = 1:

on entry

$$\begin{bmatrix} * & a12 & a23 & a34 & a45 & a56 \\ a11 & a22 & a33 & a44 & a55 & a66 \\ a21 & a32 & a43 & a54 & a65 & * \\ a31 & a42 & a53 & a64 & * & * \end{bmatrix}$$

on exit

$$\begin{bmatrix} * & u12 & u23 & u34 & u45 & u56 \\ u11 & u22 & u33 & u44 & u55 & u66 \\ m21 & m32 & m43 & m54 & m65 & * \\ m31 & m42 & m53 & m64 & * & * \end{bmatrix}$$

The routine does not use array elements marked *; elements marked + need not be set on entry, but the routine requires them to store elements of *U*, because of fill-in resulting from the row interchanges.

?dbtrf

Computes an LU factorization of a general band matrix with no pivoting (local blocked algorithm).

Syntax

```
call sdbtrf(m, n, kl, ku, ab, ldab, info)
call ddbtrf(m, n, kl, ku, ab, ldab, info)
call cdbtrf(m, n, kl, ku, ab, ldab, info)
call zdbtrf(m, n, kl, ku, ab, ldab, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine computes an LU factorization of a real *m*-by-*n* band matrix *A* without using partial pivoting or row interchanges.

This is the blocked version of the algorithm, calling BLAS Routines and Functions.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
kl	INTEGER. The number of sub-diagonals within the band of *A* ($kl \geq 0$).
ku	INTEGER. The number of super-diagonals within the band of *A* ($ku \geq 0$).
ab	REAL for sdbtrf DOUBLE PRECISION for ddbtrf COMPLEX for cdbtrf COMPLEX*16 for zdbtrf. Array, DIMENSION (*ldab*, *n*). The matrix *A* in band storage, in rows *kl*+1 to 2*kl*+*ku*+1; rows 1 to *kl* of the array need not be set. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows: $ab(kl+ku+1+i-j,j) = A(i,j)$ for $\max(1,j-ku) \leq i \leq \min(m,j+kl)$.
ldab	INTEGER. The leading dimension of the array *ab*. ($ldab \geq 2kl + ku + 1$)

Output Parameters

ab	On exit, details of the factorization: *U* is stored as an upper triangular band matrix with *kl*+*ku* superdiagonals in rows 1 to *kl*+*ku*+1, and the multipliers used during the factorization are stored in rows *kl*+*ku*+2 to 2**kl*+*ku*+1. See the *Application Notes* below for further details.
info	INTEGER. = 0: successful exit < 0: if $info = -i$, the *i*-th argument had an illegal value, > 0: if $info = +i$, $u(i,i)$ is 0. The factorization has been completed, but the factor *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

Application Notes

The band storage scheme is illustrated by the following example, when $m = n = 6$, $kl = 2$, $ku = 1$:

on entry

$$\begin{bmatrix} * & a12 & a23 & a34 & a45 & a56 \\ a11 & a22 & a33 & a44 & a55 & a66 \\ a21 & a32 & a43 & a54 & a65 & * \\ a31 & a42 & a53 & a64 & * & * \end{bmatrix}$$

on exit

$$\begin{bmatrix} * & u12 & u23 & u34 & u45 & u56 \\ u11 & u22 & u33 & u44 & u55 & u66 \\ m21 & m32 & m43 & m54 & m65 & * \\ m31 & m42 & m53 & m64 & * & * \end{bmatrix}$$

The routine does not use array elements marked *.

?dttrf

Computes an LU factorization of a general tridiagonal matrix with no pivoting (local blocked algorithm).

Syntax

```
call sdttrf(n, dl, d, du, info)
call ddttrf(n, dl, d, du, info)
call cdttrf(n, dl, d, du, info)
call zdttrf(n, dl, d, du, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine computes an *LU* factorization of a real or complex tridiagonal matrix *A* using elimination without partial pivoting.

The factorization has the form *A = L*U*, where *L* is a product of unit lower bidiagonal matrices and *U* is upper triangular with nonzeros only in the main diagonal and first superdiagonal.

Input Parameters

n	INTEGER. The order of the matrix *A*(*n* ≥ 0).
dl, *d*, *du*	REAL for sdttrf DOUBLE PRECISION for ddttrf COMPLEX for cdttrf COMPLEX*16 for zdttrf. Arrays containing elements of *A*. The array *dl* of DIMENSION(*n* - 1) contains the sub-diagonal elements of *A*. The array *d* of DIMENSION *n* contains the diagonal elements of *A*. The array *du* of DIMENSION(*n* - 1) contains the super-diagonal elements of *A*.

Output Parameters

dl	Overwritten by the (*n*-1) multipliers that define the matrix *L* from the *LU* factorization of *A*.
d	Overwritten by the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.
du	Overwritten by the (*n*-1) elements of the first super-diagonal of *U*.
info	INTEGER. = 0: successful exit < 0: if *info* = - *i*, the *i*-th argument had an illegal value, > 0: if *info* = *i*, *u*(*i*,*i*) is exactly 0. The factorization has been completed, but the factor *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

?dttrsv

Solves a general tridiagonal system of linear equations using the LU factorization computed by ?dttrf.

Syntax

```
call sdttrsv(uplo, trans, n, nrhs, dl, d, du, b, ldb, info)
call ddttrsv(uplo, trans, n, nrhs, dl, d, du, b, ldb, info)
call cdttrsv(uplo, trans, n, nrhs, dl, d, du, b, ldb, info)
call zdttrsv(uplo, trans, n, nrhs, dl, d, du, b, ldb, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves one of the following systems of linear equations:

$L*X = B$, $L^T*X = B$, or $L^H*X = B$,

$U*X = B$, $U^T*X = B$, or $U^H*X = B$

with factors of the tridiagonal matrix *A* from the *LU* factorization computed by ?dttrf.

Input Parameters

uplo	CHARACTER*1. Specifies whether to solve with *L* or *U*.
trans	CHARACTER. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then *A***X*=*B* is solved for *X* (no transpose). If *trans* = 'T', then $A^T*X = B$ is solved for *X* (transpose). If *trans* = 'C', then $A^H*X = B$ is solved for *X* (conjugate transpose).
n	INTEGER. The order of the matrix *A*(*n* ≥ 0).

nrhs	INTEGER. The number of right-hand sides, that is, the number of columns in the matrix *B*(*nrhs* ≥ 0).
dl,*d*,*du*,*b*	REAL for sdttrsv DOUBLE PRECISION for ddttrsv COMPLEX for cdttrsv COMPLEX*16 for zdttrsv. Arrays of DIMENSIONs: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *b*(*ldb*,*nrhs*). The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A*. The array *d* contains *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. The array *du* contains the (*n* - 1) elements of the first super-diagonal of *U*. On entry, the array *b* contains the right-hand side matrix *B*.
ldb	INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?pttrsv

*Solves a symmetric (Hermitian) positive-definite tridiagonal system of linear equations, using the L*D*L^H^ factorization computed by* ?pttrf.

Syntax

```
call spttrsv(trans, n, nrhs, d, e, b, ldb, info)
call dpttrsv(trans, n, nrhs, d, e, b, ldb, info)
call cpttrsv(uplo, trans, n, nrhs, d, e, b, ldb, info)
call zpttrsv(uplo, trans, n, nrhs, d, e, b, ldb, info)
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine solves one of the triangular systems:

$L^T*X = B$, or $L*X = B$ for real flavors,

or

$L*X = B$, or $L^H*X = B$,

$U*X = B$, or $U^H*X = B$ for complex flavors,

where *L* (or *U* for complex flavors) is the Cholesky factor of a Hermitian positive-definite tridiagonal matrix *A* such that

A = *L***D***L*^{H} (computed by spttrf/dpttrf)

or

A = *U*^{H}**D***U* or *A* = *L***D***L*^{H} (computed by cpttrf/zpttrf).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix *A* is stored and the form of the factorization: If *uplo* = 'U', *e* is the superdiagonal of *U*, and *A* = *U*^{H}**D***U* or *A* = *L***D***L*^{H}; if *uplo* = 'L', *e* is the subdiagonal of *L*, and *A* = *L***D***L*^{H}. The two forms are equivalent, if *A* is real.
trans	CHARACTER. Specifies the form of the system of equations: for real flavors: if *trans* = 'N': *L***X* = *B* (no transpose) if *trans* = 'T': *L*^{T}**X* = *B* (transpose) for complex flavors: if *trans* = 'N': *U***X* = *B* or *L***X* = *B* (no transpose) if *trans* = 'C': *U*^{H}**X* = *B* or *L*^{H}**X* = *B* (conjugate transpose).
n	INTEGER. The order of the tridiagonal matrix *A*. *n* ≥ 0.
nrhs	INTEGER. The number of right hand sides, that is, the number of columns of the matrix *B*. *nrhs* ≥ 0.
d	REAL array, DIMENSION (*n*). The *n* diagonal elements of the diagonal matrix *D* from the factorization computed by ?pttrf.
e	COMPLEX array, DIMENSION(*n*-1). The (*n*-1) off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf. See *uplo*.
b	COMPLEX array, DIMENSION (*ldb*, *nrhs*). On entry, the right hand side matrix *B*.
ldb	INTEGER. The leading dimension of the array *b*. *ldb* ≥ max(1, *n*).

Output Parameters

b	On exit, the solution matrix *X*.
info	INTEGER. = 0: successful exit < 0: if *info* = -*i*, the *i*-th argument had an illegal value.

?steqr2

Computes all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the implicit QL or QR method.

Syntax

```
call ssteqr2(compz, n, d, e, z, ldz, nr, work, info)
call dsteqr2(compz, n, d, e, z, ldz, nr, work, info)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine is a modified version of LAPACK routine `?steqr`. The routine `?steqr2` computes all eigenvalues and, optionally, eigenvectors of a symmetric tridiagonal matrix using the implicit QL or QR method. `?steqr2` is modified from `?steqr` to allow each ScaLAPACK process running `?steqr2` to perform updates on a distributed matrix Q. Proper usage of `?steqr2` can be gleaned from examination of ScaLAPACK routine `p?syev`.

Input Parameters

compz	CHARACTER*1. Must be 'N' or 'I'. If *compz* = 'N', the routine computes eigenvalues only. If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix *T*. *z* must be initialized to the identity matrix by `p?laset` or `?laset` prior to entering this subroutine.
n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
d, *e*, *work*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d* contains the diagonal elements of *T*. The dimension of *d* must be at least max(1, *n*). *e* contains the (*n*-1) subdiagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *work* is a workspace array. The dimension of *work* is max(1, 2**n*-2). If *compz* = 'N', then *work* is not referenced.
z	(local) REAL for ssteqr2 DOUBLE PRECISION for dsteqr2 Array, global DIMENSION (*n*, *n*), local DIMENSION (*ldz*, *nr*). If *compz* = 'V', then *z* contains the orthogonal matrix used in the reduction to tridiagonal form.
ldz	INTEGER. The leading dimension of the array *z*. Constraints: *ldz* ≥ 1, *ldz* ≥ max(1, *n*), if eigenvectors are desired.
nr	INTEGER. *nr* = max(1, *numroc*(*n*, *nb*, *myprow*, 0, *nprocs*)).

If *compz* = 'N', then *nr* is not referenced.

Output Parameters

d	REAL array, DIMENSION (*n*), for ssteqr2. DOUBLE PRECISION array, DIMENSION (*n*), for dsteqr2. On exit, the eigenvalues in ascending order, if *info* = 0. See also *info*.
e	REAL array, DIMENSION (*n*-1), for ssteqr2. DOUBLE PRECISION array, DIMENSION (*n*-1), for dsteqr2. On exit, *e* has been destroyed.
z	(local) REAL for ssteqr2 DOUBLE PRECISION for dsteqr2 Array, global DIMENSION (*n*, *n*), local DIMENSION (*ldz*, *nr*). On exit, if *info* = 0, then, if *compz* = 'V', *z* contains the orthonormal eigenvectors of the original symmetric matrix, and if *compz* = 'I', *z* contains the orthonormal eigenvectors of the symmetric tridiagonal matrix. If *compz* = 'N', then *z* is not referenced.
info	INTEGER. *info* = 0, the exit is successful. *info* < 0: if *info* = -*i*, the *i*-th had an illegal value. *info* > 0: the algorithm has failed to find all the eigenvalues in a total of 30*n* iterations; if *info* = *i*, then *i* elements of *e* have not converged to zero; on exit, *d* and *e* contain the elements of a symmetric tridiagonal matrix, which is orthogonally similar to the original matrix.

Utility Functions and Routines

This section describes ScaLAPACK utility functions and routines. Summary information about these routines is given in the following table:

Table 7-2 ScaLAPACK Utility Functions and Routines

Routine Name	Data Types	Description
p?labad	s,d	Returns the square root of the underflow and overflow thresholds if the exponent-range is very large.
p?lachkieee	s,d	Performs a simple check for the features of the IEEE standard. (C interface function).
p?lamch	s,d	Determines machine parameters for floating-point arithmetic.
p?lasnbt	s,d	Computes the position of the sign bit of a floating-point number. (C interface function).

Routine Name	Data Types	Description
pxerbla		Error handling routine called by ScaLAPACK routines.

p?labad

Returns the square root of the underflow and overflow thresholds if the exponent-range is very large.

Syntax

`call pslabad(`*`ictxt, small, large`*`)`

`call pdlabad(`*`ictxt, small, large`*`)`

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine takes as input the values computed by `p?lamch` for underflow and overflow, and returns the square root of each of these values if the log of *large* is sufficiently large. This subroutine is intended to identify machines with a large exponent range, such as the Crays, and redefine the underflow and overflow limits to be the square roots of the values computed by `p?lamch`. This subroutine is needed because `p?lamch` does not compensate for poor arithmetic in the upper half of the exponent range, as is found on a Cray.

In addition, this routine performs a global minimization and maximization on these values, to support heterogeneous computing networks.

Input Parameters

ictxt (global) `INTEGER`.
The BLACS context handle in which the computation takes place.

small (local).
`REAL PRECISION` for `pslabad`.
`DOUBLE PRECISION` for `pdlabad`.
On entry, the underflow threshold as computed by `p?lamch`.

large (local).
`REAL PRECISION` for `pslabad`.
`DOUBLE PRECISION` for `pdlabad`.
On entry, the overflow threshold as computed by `p?lamch`.

Output Parameters

small (local).
On exit, if *log10(large)* is sufficiently large, the square root of *small*, otherwise unchanged.

large (local).
On exit, if *log10(large)* is sufficiently large, the square root of *large*, otherwise unchanged.

p?lachkieee

Performs a simple check for the features of the IEEE standard. (C interface function).

Syntax

```
void pslachkieee(int *isieee, float *rmax, float *rmin);
void pdlachkieee(int *isieee, float *rmax, float *rmin);
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine performs a simple check to make sure that the features of the IEEE standard are implemented. In some implementations, `p?lachkieee` may not return.

Note that all arguments are call-by-reference so that this routine can be directly called from Fortran code.

This is a ScaLAPACK internal subroutine and arguments are not checked for unreasonable values.

Input Parameters

rmax	(local).
	`REAL` for `pslachkieee`
	`DOUBLE PRECISION` for `pdlachkieee`
	The overflow threshold(`= ?lamch ('O')`).

rmin	(local).
	`REAL` for `pslachkieee`
	`DOUBLE PRECISION` for `pdlachkieee`
	The underflow threshold(`= ?lamch ('U')`).

Output Parameters

isieee	(local). `INTEGER`. On exit, *isieee* `= 1` implies that all the features of the IEEE standard that we rely on are implemented. On exit, *isieee* `= 0` implies that some the features of the IEEE standard that we rely on are missing.

p?lamch

Determines machine parameters for floating-point arithmetic.

Syntax

```
val = pslamch(ictxt, cmach)
val = pdlamch(ictxt, cmach)
```

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

The routine determines single precision machine parameters.

Input Parameters

ictxt	(global). INTEGER.The BLACS context handle in which the computation takes place.
cmach	(global) CHARACTER*1. Specifies the value to be returned by p?lamch: = 'E' or 'e', p?lamch := eps = 'S' or 's' , p?lamch := sfmin = 'B' or 'b', p?lamch := base = 'P' or 'p', p?lamch := eps*base = 'N' or 'n', p?lamch := t = 'R' or 'r', p?lamch := rnd = 'M' or 'm', p?lamch := emin = 'U' or 'u', p?lamch := rmin = 'L' or 'l', p?lamch := emax = 'O' or 'o', p?lamch := rmax, where eps = relative machine precision sfmin = safe minimum, such that 1/sfmin does not overflow base = base of the machine prec = eps*base t = number of (base) digits in the mantissa rnd = 1.0 when rounding occurs in addition, 0.0 otherwise emin = minimum exponent before (gradual) underflow rmin = underflow threshold - $base^{(emin-1)}$ emax = largest exponent before overflow rmax = overflow threshold - $(base^{emax})*(1-eps)$

Output Parameters

val	Value returned by the routine.

p?lasnbt

Computes the position of the sign bit of a floating-point number. (C interface function).

Syntax

```
void pslasnbt(int *ieflag);
```

```
void pdlasnbt(int *ieflag);
```

Description

For C interface, this routine is declared in mkl_scalapack.h file.

The routine finds the position of the signbit of a single/double precision floating point number. This routine assumes IEEE arithmetic, and hence, tests only the 32-nd bit (for single precision) or 32-nd and 64-th bits (for double precision) as a possibility for the signbit. `sizeof(int)` is assumed equal to 4 bytes.

If a compile time flag (`NO_IEEE`) indicates that the machine does not have IEEE arithmetic, *`ieflag`* `= 0` is returned.

Output Parameters

`ieflag`	`INTEGER`. This flag indicates the position of the signbit of any single/double precision floating point number. *`ieflag`* `= 0`, if the compile time flag `NO_IEEE` indicates that the machine does not have IEEE arithmetic, or if `sizeof(int)` is different from 4 bytes. *`ieflag`* `= 1` indicates that the signbit is the 32-nd bit for a single precision routine. In the case of a double precision routine: *`ieflag`* `= 1` indicates that the signbit is the 32-nd bit (Big Endian). *`ieflag`* `= 2` indicates that the signbit is the 64-th bit (Little Endian).

pxerbla

Error handling routine called by ScaLAPACK routines.

Syntax

`call pxerbla(`*`ictxt`*`, `*`srname`*`, `*`info`*`)`

Description

For C interface, this routine is declared in `mkl_scalapack.h` file.

This routine is an error handler for the *ScaLAPACK* routines. It is called by a *ScaLAPACK* routine if an input parameter has an invalid value. A message is printed. Program execution is not terminated. For the ScaLAPACK driver and computational routines, a `RETURN` statement is issued following the call to `pxerbla`.

Control returns to the higher-level calling routine, and it is left to the user to determine how the program should proceed. However, in the specialized low-level ScaLAPACK routines (auxiliary routines that are Level 2 equivalents of computational routines), the call to `pxerbla( )` is immediately followed by a call to `BLACS_ABORT( )` to terminate program execution since recovery from an error at this level in the computation is not possible.

It is always good practice to check for a nonzero value of *`info`* on return from a ScaLAPACK routine. Installers may consider modifying this routine in order to call system-specific exception-handling facilities.

Input Parameters

`ictxt`	(global) `INTEGER` The BLACS context handle, indicating the global context of the operation. The context itself is global.
`srname`	(global) `CHARACTER*6` The name of the routine which called `pxerbla`.

info (global) INTEGER.
The position of the invalid parameter in the parameter list of the calling routine.

8 Sparse Solver Routines

Intel® Math Kernel Library (Intel® MKL) provides user-callable sparse solver software to solve real or complex, symmetric, structurally symmetric or non-symmetric, positive definite, indefinite or Hermitian sparse linear system of equations.

The terms and concepts required to understand the use of the Intel MKL sparse solver routines are discussed in the Appendix A "Linear Solvers Basics". If you are familiar with linear sparse solvers and sparse matrix storage schemes, you can skip these sections and go directly to the interface descriptions.

This chapter describes the direct sparse solver PARDISO* and the alternative interface for the direct sparse solver referred to here as DSS interface; iterative sparse solvers (ISS) based on the reverse communication interface (RCI); and two preconditioners based on the incomplete LU factorization technique.

PARDISO* - Parallel Direct Sparse Solver Interface

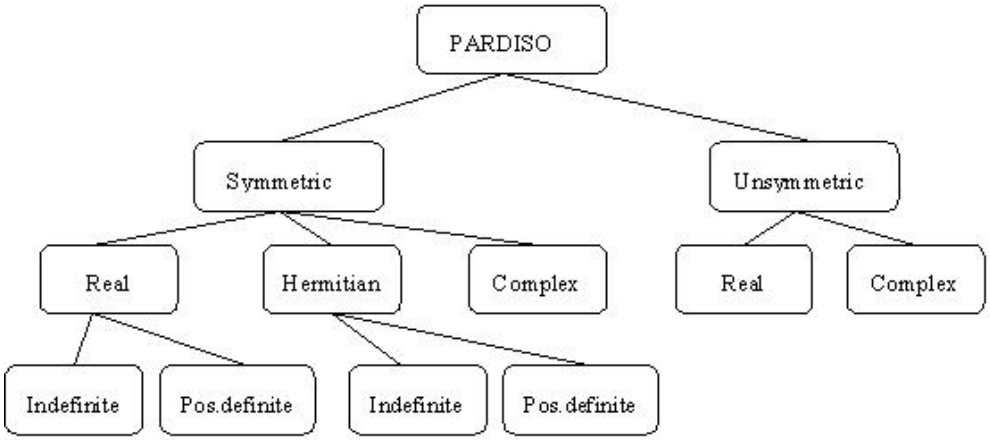
This section describes the interface to the shared-memory multiprocessing parallel direct sparse solver known as the PARDISO* solver. The interface is Fortran, but can be called from C programs by observing Fortran parameter passing and naming conventions used by the supported compilers and operating systems. A discussion of the algorithms used in the PARDISO* software and more information on the solver can be found at http://www.pardiso-project.org.

The current implementation of the PARDISO* solver additionally supports the out-of-core (OOC) version.

The PARDISO* package is a high-performance, robust, memory efficient and easy to use software for solving large sparse symmetric and unsymmetric linear systems of equations on shared memory multiprocessors. The solver uses a combination of left- and right-looking Level-3 BLAS supernode techniques [Schenk00-2]. To improve sequential and parallel sparse numerical factorization performance, the algorithms are based on a Level-3 BLAS update and pipelining parallelism is used with a combination of left- and right-looking supernode techniques [Schenk00, Schenk01, Schenk02, Schenk03]. The parallel pivoting methods allow complete supernode pivoting to compromise numerical stability and scalability during the factorization process. For sufficiently large problem sizes, numerical experiments demonstrate that the scalability of the parallel algorithm is nearly independent of the shared-memory multiprocessing architecture and a speedup of up to seven using eight processors has been observed.

The PARDISO* solver supports a wide range of sparse matrix types (see Figure 8-1 below) and computes the solution of real or complex, symmetric, structurally symmetric or unsymmetric, positive definite, indefinite or Hermitian sparse linear system of equations on shared-memory multiprocessing architectures.

Figure 8-1 Sparse Matrices That Can Be Solved with the PARDISO* Solver



You can find a code example that uses the PARDISO interface routine to solve systems of linear equations in the `examples\solver\source` folder of your Intel MKL directory.

pardiso

Calculates the solution of a set of sparse linear equations with multiple right-hand sides.

Syntax

Fortran:

`call pardiso (pt, maxfct, mnum, type, phase, n, a, ia, ja, perm, nrhs, iparm, msglvl, b, x, error)`

C:

`pardiso (pt, &maxfct, &mnum, &mtype, &phase, &n, a, ia, ja, perm, &nrhs, iparm, &msglvl, b, x, &error);`

(

`SUBROUTINE pardiso (pt, maxfct, mnum, mtype, phase, n, a, ia, ja, perm, nrhs, iparm, msglvl, b, x, error)`

`PARDISO_POINTER_TYPE pt (64)`

`INTEGER maxfct, mnum, mtype, phase, n, nrhs, error, ia(*), ja(*), perm(*), iparm(*)`

`PARDISO_DATA_TYPE a(*), b(n,nrhs), x(n,nrhs)`

`PARDISO_POINTER_TYPE` can be `INTEGER` for 32-bit architectures, or `INTEGER*8` for 64-bit architectures.

`PARDISO_DATA_TYPE` can be one of the following types:

`DOUBLE PRECISION` - for real types of matrices (*mtype*=1, 2, -2 and 11) and for double precision `pardiso` (*iparm*(28)=0)

`REAL` - for real types of matrices (*mtype*=1, 2, -2 and 11) and for single precision `pardiso` (*iparm*(28)=1)

DOUBLE COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for double precision pardiso (*iparm*(28)=0)

COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for single precision pardiso (*iparm*(28)=1)

Description

This routine is declared in mkl_pardiso.f77 for FORTRAN 77 interface, in mkl_pardiso.f90 for Fortran 90 interface, and in mkl_pardiso.h for C interface.

pardiso calculates the solution of a set of sparse linear equations

*A*X = B*

with multiple right-hand sides, using a parallel *LU*, *LDL* or LL^T factorization, where *A* is an *n*-by-*n* matrix, and *X* and *B* are *n*-by-*nrhs* matrices. The routine pardiso performs the following analysis steps depending on the structure of the input matrix *A*.

Symmetric Matrices: The solver first computes a symmetric fill-in reducing permutation *P* based on either the minimum degree algorithm [Liu85] or the nested dissection algorithm from the METIS package [Karypis98] (included with Intel MKL), followed by the parallel left-right looking numerical Cholesky factorization [Schenk00-2] of $PAP^T = LL^T$ for symmetric positive-definite matrices, or $PAP^T = LDL^T$ for symmetric indefinite matrices. The solver uses diagonal pivoting, or 1x1 and 2x2 Bunch and Kaufman pivoting for symmetric indefinite matrices, and an approximation of *X* is found by forward and backward substitution and iterative refinements.

The coefficient matrix is perturbed whenever numerically acceptable 1x1 and 2x2 pivots cannot be found within the diagonal supernode block. One or two passes of iterative refinements may be required to correct the effect of the perturbations. This restricting notion of pivoting with iterative refinements is effective for highly indefinite symmetric systems. Furthermore the accuracy of this method is for a large set of matrices from different applications areas as accurate as a direct factorization method that uses complete sparse pivoting techniques [Schenk04].

Another possibility to improve the pivoting accuracy is to use symmetric weighted matching algorithms. These methods identify large entries in the coefficient matrix *A* that, if permuted close to the diagonal, permit the factorization process to identify more acceptable pivots and proceed with fewer pivot perturbations. The methods are based on maximum weighted matchings and improve the quality of the factor in a complementary way to the alternative idea of using more complete pivoting techniques.

The inertia is also computed for real symmetric indefinite matrices.

Structurally Symmetric Matrices: The solver first computes a symmetric fill-in reducing permutation *P* followed by the parallel numerical factorization of $PAP^T = QLU^T$. The solver uses partial pivoting in the supernodes and an approximation of *X* is found by forward and backward substitution and iterative refinements.

Unsymmetric Matrices: The solver first computes a non-symmetric permutation P_{MPS} and scaling matrices D_r and D_c with the aim to place large entries on the diagonal that enhances reliability of the numerical factorization process [Duff99]. In the next step the solver computes a fill-in reducing permutation *P* based on the matrix $P_{MPS}A + (P_{MPS}A)_T$ followed by the parallel numerical factorization

$QLUR = PP_{MPS}D_rAD_cP$

with supernode pivoting matrices *Q* and *R*. When the factorization algorithm reaches a point where it cannot factorize the supernodes with this pivoting strategy, it uses a pivoting perturbation strategy similar to [Li99]. The magnitude of the potential pivot is tested against a constant threshold of alpha = eps*||*A2*||$_{inf}$, where

eps is the machine precision, $A2 = P*P_{MPS}*D_r*A*D_c*P$, and $||A2||_{inf}$ is the infinity norm of the scaled and permuted matrix A. Any tiny pivots encountered during elimination are set to the sign (l_{II})*eps*$||A2||_{inf}$, which trades off some numerical stability for the ability to keep pivots from getting too small. Although many failures could render the factorization well-defined but essentially useless, in practice the diagonal elements are rarely modified for a large class of matrices. The result of this pivoting approach is that the factorization is, in general, not exact and iterative refinement may be needed.

Direct-Iterative Preconditioning for Unsymmetric Linear Systems. The solver also allows for a combination of direct and iterative methods [Sonn89] to accelerate the linear solution process for transient simulation. Most of applications of sparse solvers require solutions of systems with gradually changing values of the nonzero coefficient matrix, but the same identical sparsity pattern. In these applications, the analysis phase of the solvers has to be performed only once and the numerical factorizations are the important time-consuming steps during the simulation. PARDISO uses a numerical factorization $A = LU$ for the first system and applies the factors L and U for the next steps in a preconditioned Krylow-Subspace iteration. If the iteration does not converge, the solver automatically switches back to the numerical factorization. This method can be applied to unsymmetric matrices in PARDISO and the user can select the method using only one input parameter. For further details see the parameter description (*iparm*(4), *iparm*(20)).

Single and Double Precision Computations

PARDISO solves tasks using single or double precision. Each precision has its own pros and cons. Double precision variables have more digits to store value, so solver uses more memory for keeping data. But this mode allows to solve matrices with better accuracy, and input matrices can have big condition numbers.

Single precision variables have fewer digits to store values, so solver uses less memory than in the double precision mode. Additionally this mode usually takes less time. But as computations are made more roughly, only numerically stable process can be made using single precision.

Separate Forward and Backward Substitution.

The solver execution step (see parameter *phase* =33 below) can be divided into two or three separate substitutions: forward, backward and diagonal (if possible). This separation can be explained on the examples of solving system with different matrix types.

Real symmetric positive definite matrix A (*mtype* = 2) is factorized by PARDISO as $A = L*L^T$. In this case solution of the system $A*x=b$ can be found as sequence of substitutions: $L*y=b$ (forward substitution, *phase* =331) and $L^T*x=y$ (backward substitution, *phase* =333).

Real unsymmetric matrix A (*mtype* = 11) is factorized by PARDISO as $A = L*U$. In this case solution of the system $A*x=b$ can be found by the following sequence: $L*y=b$ (forward substitution, *phase* =331) and $U*x=y$ (backward substitution, *phase* =333).

Solving system with a real symmetric indefinite matrix A (*mtype* = -2) is slightly different from above cases. PARDISO factorizes this matrix as $A=LDL^T$, and solution of the system $A*x=b$ can be calculated as the following sequence of substitutions: $L*y=b$ (forward substitution, *phase* =331) s: $D*v=y$ (diagonal substitution, *phase* =332) and, finally $L^T*x=v$ (backward substitution, *phase* =333). Diagonal substitution makes sense only for indefinite matrices (*mtype* = -2, -4, 6). For matrices of other types solution can be found as described in the first two examples.

NOTE. Number of refinement steps (*iparm*(8)) must be set to zero if solution is calculated step by step (*phase* = 331, 332, 333), otherwise PARDISO produces wrong result.

NOTE. Different pivoting (*iparm*(21)) produces different LDL^T factorization. Therefore results of forward, diagonal and backward substitutions with diagonal pivoting can differ from results of the same steps with Bunch and Kaufman pivoting. Of course the final results of sequential execution of forward, diagonal and backward substitution are equal to the results of the full solving step (*phase*=33) regardless of the pivoting used.

The sparse data storage in PARDISO follows the scheme described in Sparse Matrix Storage Format section with *ja* standing for *columns*, *ia* for *rowIndex*, and *a* for *values*. The algorithms in PARDISO require column indices *ja* to be increasingly ordered per row and the presence of the diagonal element per row for any symmetric or structurally symmetric matrix. For unsymmetric matrices the diagonal elements are not necessary: they may be present or not.

PARDISO performs four tasks:

- analysis and symbolic factorization
- numerical factorization
- forward and backward substitution including iterative refinement
- termination to release all internal solver memory.

When an input data structure is not accessed in a call, a NULL pointer or any valid address can be passed as a place holder for that argument.

NOTE. This routine supports the Progress Routine feature (for the numeric factorization phase only). See Progress Function section for details.

Input Parameters

(See also PARDISO parameters in tabular form.)

pt
INTEGER
Array, DIMENSION (64)
On entry, solver internal data address pointer. These addresses are passed to the solver and all related internal memory management is organized through this pointer

NOTE. *pt* is an integer array with 64 entries. It is very important that the pointer is initialized with zero at the first call of PARDISO. After that first call you should never modify the pointer, as a serious memory leak can occur. The integer length should be 4-byte on 32-bit operating systems and 8-byte on 64-bit operating systems.

maxfct
INTEGER

Maximal number of factors with identical nonzero sparsity structure that the user would like to keep at the same time in memory. It is possible to store several different factorizations with the same nonzero structure at the same time in the internal data management of the solver. In most of the applications this value is equal to 1.
PARDISO can process several matrices with identical matrix sparsity pattern and store the factors of these matrices at the same time. Matrices with a different sparsity structure can be kept in memory with different memory address pointers *pt*.

mnum

INTEGER
Actual matrix for the solution phase. With this scalar you can define the matrix that you would like to factorize. The value must be: $1 \le mnum \le maxfct$.
In most applications this value is equal to 1.

mtype

INTEGER
This scalar value defines the matrix type. The PARDISO solver supports the following matrices:

= 1	real and structurally symmetric matrix
= 2	real and symmetric positive definite matrix
= -2	real and symmetric indefinite matrix
= 3	complex and structurally symmetric matrix
= 4	complex and Hermitian positive definite matrix
= -4	complex and Hermitian indefinite matrix
= 6	complex and symmetric matrix
= 11	real and unsymmetric matrix
= 13	complex and unsymmetric matrix

This parameter influences the pivoting method.

phase

INTEGER
Controls the execution of the solver. Usually it is a two-digit integer *ij* ($10I + j$, $1 \le I \le 3$, $I \le j \le 3$ for normal execution modes). The *I* digit indicates the starting phase of execution, and *j* indicates the ending phase. PARDISO has the following phases of execution:

- Phase 1: Fill-reduction analysis and symbolic factorization
- Phase 2: Numerical factorization
- Phase 3: Forward and Backward solve including iterative refinements

  This phase can be divided into two or three separate substitutions: forward, backward, and diagonal (see above).
- Termination and Memory Release Phase (*phase* $\le$ 0)

If a previous call to the routine has computed information from previous phases, execution may start at any phase. The *phase* parameter can have the following values:

phase	**Solver Execution Steps**
11	Analysis
12	Analysis, numerical factorization
13	Analysis, numerical factorization, solve, iterative refinement
22	Numerical factorization
23	Numerical factorization, solve, iterative refinement
33	Solve, iterative refinement
331	like *phase*=33, but only forward substitution
332	like *phase*=33, but only diagonal substitution
333	like *phase*=33, but only backward substitution
0	Release internal memory for *L* and *U* matrix number *mnum*
-1	Release all internal memory for all matrices

n

INTEGER
Number of equations in the sparse linear systems of equations *A***X* = *B*. Constraint: *n* > 0.

a

DOUBLE PRECISION - for real types of matrices (*mtype*=1, 2, -2 and 11) and for double precision PARDISO (*iparm*(28)=0)
REAL - for real types of matrices (*mtype*=1, 2, -2 and 11) and for single precision PARDISO (*iparm*(28)=1)
DOUBLE COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for double precision PARDISO (*iparm*(28)=0)
COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for single precision PARDISO (*iparm*(28)=1)
Array. Contains the non-zero elements of the coefficient matrix *A* corresponding to the indices in *ja*. The size of *a* is the same as that of *ja* and the coefficient matrix can be either real or complex. The matrix must be stored in compressed sparse row format with increasing values of *ja* for each row. Refer to *values* array description in Sparse Matrix Storage Format for more details.

NOTE. The non-zero elements of each row of the matrix *A* must be stored in increasing order. For symmetric or structural symmetric matrices, it is also important that the diagonal elements are available and stored in the matrix. If the matrix is symmetric, the array *a* is only accessed in the factorization phase, in the triangular solution and iterative refinement phase. Unsymmetric matrices are accessed in all phases of the solution process.

ia
INTEGER
Array, dimension (*n*+1). For *I*≤*n*, *ia*(*I*) points to the first column index of row *I* in the array *ja* in compressed sparse row format. That is, *ia*(*I*) gives the index of the element in array *a* that contains the first non-zero element from row *I* of *A*. The last element *ia*(*n*+1) is taken to be equal to the number of non-zero elements in *A*, plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Format for more details. The array *ia* is also accessed in all phases of the solution process. Note that the row and columns numbers start from 1.

ja
INTEGER
Array. *ja*(*) contains column indices of the sparse matrix *A* stored in compressed sparse row format. The indices in each row must be sorted in increasing order. The array *ja* is also accessed in all phases of the solution process. For symmetric and structurally symmetric matrices it is assumed that zero diagonal elements are also stored in the list of non-zero elements in *a* and *ja*. For symmetric matrices, the solver needs only the upper triangular part of the system as is shown for *columns* array in Sparse Matrix Storage Format.

perm
INTEGER
Array, dimension (*n*). Holds the permutation vector of size *n*. The array *perm* is defined as follows. Let *A* be the original matrix and $B = P*A*P^T$ be the permuted matrix. Row (column) *I* of *A* is the *perm*(*I*) row (column) of *B*. The numbering of the array must start with 1 and must describe a permutation.
On entry, you can apply your own fill-in reducing ordering to the solver. The permutation vector *perm* is used by the solver if *iparm*(5) = 1. The second purpose of the array *perm* is to return the permutation vector calculated during fill-in reducing ordering stage of PARDISO to the user. The permutation vector is returned into the *perm* array if *iparm*(5) = 2.

nrhs
INTEGER
Number of right-hand sides that need to be solved for.

iparm
INTEGER
Array, dimension (64). This array is used to pass various parameters to PARDISO and to return some useful information after execution of the solver. If *iparm*(1) = 0, PARDISO fills *iparm*(2), and *iparm*(4) through *iparm*(64)with default values and uses them.
Individual components of the *iparm* array are described below (some of them are described in the Output Parameters section).
***iparm*(1)- use default values.**
If *iparm*(1) = 0, *iparm*(2) and *iparm*(4) through *iparm*(64) are filled with default values, otherwise the user has to supply all values in *iparm* from *iparm*(2) to *iparm*(64).
***iparm*(2) - fill-in reducing ordering.**
iparm(2) controls the fill-in reducing ordering for the input matrix. If *iparm*(2) = 0, the minimum degree algorithm is applied [Li99].

If *iparm*(2) = 2, the solver uses the nested dissection algorithm from the METIS package [Karypis98].
If *iparm*(2) = 3, the parallel (OpenMP) version of the nested dissection algorithm is used. It can decrease the time of computations on multi-core computers, especially when the time of the PARDISO Phase 1 is significant for your task.
The default value of *iparm*(2) is 2.

CAUTION. User can control the parallel execution of the solver by explicitly setting MKL_NUM_THREADS. If less processors are available than specified, the execution may slow down instead of speeding up. If the variable MKL_NUM_THREADS is not defined, then the solver uses all available processors.

***iparm*(3)- currently is not used.**
***iparm*(4) - preconditioned CGS.**
This parameter controls preconditioned CGS [Sonn89] for unsymmetric or structural symmetric matrices and Conjugate-Gradients for symmetric matrices. *iparm*(4) has the form *iparm*(4)= 10*L+K
The *K* and *L* values have the meanings as follow.

Value of *K*	Description
0	The factorization is always computed as required by *phase*.
1	CGS iteration replaces the computation of *LU*. The preconditioner is *LU* that was computed at a previous step (the first step or last step with a failure) in a sequence of solutions needed for identical sparsity patterns.
2	CGS iteration for symmetric matrices replaces the computation of *LU*. The preconditioner is *LU* that was computed at a previous step (the first step or last step with a failure) in a sequence of solutions needed for identical sparsity patterns.

Value *L*:
The value *L* controls the stopping criterion of the Krylow-Subspace iteration:
$eps_{CGS} = 10^{-L}$ is used in the stopping criterion
$||dx_I|| \ / \ ||dx_I|| < eps_{CGS}$
with $||dx_I|| = ||inv(L*U)*r_I||$ and r_I is the residuum at iteration *I* of the preconditioned Krylow-Subspace iteration.
Strategy: A maximum number of 150 iterations is fixed by expecting that the iteration will converge before consuming half the factorization time. Intermediate convergence rates and residuum excursions are checked and can terminate the iteration process. If *phase* =23, then the factorization for a given *A* is automatically recomputed in these

cases where the Krylow-Subspace iteration failed, and the corresponding direct solution is returned. Otherwise the solution from the preconditioned Krylow-Subspace iteration is returned. Using *phase* =33 results in an error message (*error* =4) if the stopping criteria for the Krylow-Subspace iteration can not be reached. More information on the failure can be obtained from *iparm*(20).
The default is *iparm*(4)=0, and other values are only recommended for an advanced user. *iparm*(4) must be greater or equal to zero. Examples:

iparm(4)	Description
31	*LU*-preconditioned CGS iteration with a stopping criterion of 1.0E-3 for unsymmetric matrices
61	*LU*-preconditioned CGS iteration with a stopping criterion of 1.0E-6 for unsymmetric matrices
62	*LU*-preconditioned CGS iteration with a stopping criterion of 1.0E-6 for symmetric matrices

***iparm*(5)- user permutation.**
This parameter controls whether the user supplied fill-in reducing permutation is used instead of the integrated multiple-minimum degree or nested dissection algorithms. Another possible use of this parameter is to control obtaining the fill-in reducing permutation vector calculated during the reordering stage of PARDISO.
This option may be useful for testing reordering algorithms, adapting the code to special applications problems (for instance, to move zero diagonal elements to the end $P*A*P^T$), or if the user wants to use the permutation vector more than once for equal or similar matrices. For definition of the permutation, see description of the *perm* parameter.
If *parm*(5)=0 (default value), then the array *perm* is not used by PARDISO;
if *parm*(5)=1, then the user supplied fill-in reducing permutation is used;
if *parm*(5)=2, then PARDISO returns the permutation vector into the array *perm.*
***iparm*(6)- write solution on *x*.**
If *iparm*(6) = 0 (default value), then the array *x* contains the solution and the value of *b* is not changed.
If *iparm*(6) = 1, then the solver will store the solution on the right hand side *b*.
Note that the array *x* is always used. The default value of *iparm*(6) is 0.
***iparm*(8) - iterative refinement step.**
On entry to the solve and iterative refinement step, *iparm*(8)should be set to the maximum number of iterative refinement steps that the solver will perform. The solver will not perform more than the absolute value of *iparm*(8)steps of iterative refinement and will stop the process if a satisfactory level of accuracy of the solution in terms of backward error has been achieved.

Note that if *iparm*(8)< 0, the accumulation of the residuum is using extended precision real and complex data types. Perturbed pivots result in iterative refinement (independent of *iparm*(8)=0) and the iteration number executed is reported on *iparm*(7).
The solver automatically performs two steps of iterative refinements when perturbed pivots are obtained during the numerical factorization and *iparm*(8) = 0.
The number of performed iterative refinement steps is reported on *iparm*(8).
The default value for *iparm*(8) is 0.

***iparm*(9)**

This parameter is reserved for future use. Its value must be set to 0.

***iparm*(10)- pivoting perturbation.**

This parameter instructs PARDISO how to handle small pivots or zero pivots for unsymmetric matrices (*mtype* =11 or *mtype* =13) and symmetric matrices (*mtype* =-2, *mtype* =-4, or *mtype* =6). For these matrices the solver uses a complete supernode pivoting approach. When the factorization algorithm reaches a point where it cannot factorize the supernodes with this pivoting strategy, it uses a pivoting perturbation strategy similar to [Li99], [Schenk04].
The magnitude of the potential pivot is tested against a constant threshold of
alpha = eps*$||A2||_{inf}$,
where eps = $10^{(-iparm(10))}$, $A2 = P*P_{MPS}*D_r*A*D_c*P$, and $||A2||_{inf}$ is the infinity norm of the scaled and permuted matrix *A*. Any tiny pivots encountered during elimination are set to the sign
(l_{II})*eps*$||A2||_{inf}$ - this trades off some numerical stability for the ability to keep pivots from getting too small. Small pivots are therefore perturbed with eps = $10^{(-iparm(10))}$.
The default value of *iparm*(10) is 13 and therefore eps = 1.0E-13 for unsymmetric matrices (*mtype* =11 or *mtype* =13).
The default value of *iparm*(10) is 8, and therefore eps = 1.0E-8 for symmetric indefinite matrices (*mtype* =-2, *mtype* =-4, or *mtype* =6).

***iparm*(11)- scaling vectors.**

PARDISO uses a maximum weight matching algorithm to permute large elements on the diagonal and to scale the matrix so that the diagonal elements are equal to 1 and the absolute values of the off-diagonal entries are less or equal to 1. This scaling method is applied only to unsymmetric matrices (*mtype* =11 or *mtype* =13). The scaling can also be used for symmetric indefinite matrices (*mtype* =-2, *mtype* =-4, or *mtype* =6) when the symmetric weighted matchings are applied (*iparm*(13)= 1).
Use *iparm*(11) = 1 (scaling) and *iparm*(13) = 1 (matching) for highly indefinite symmetric matrices, for example, from interior point optimizations or saddle point problems. Note that in the analysis phase (*phase*=11) you must provide the numerical values of the matrix *A* in case of scaling and symmetric weighted matching.

The default value of *iparm*(11) is 1 for unsymmetric matrices (*mtype* =11 or *mtype* =13). The default value of *iparm*(11) is 0 for symmetric indefinite matrices (*mtype* =-2, *mtype* =-4, or *mtype* =6).

iparm(12)

This parameter is reserved for future use. Its value must be set to 0.

iparm(13) - improved accuracy using (non-)symmetric weighted matchings.

PARDISO can use a maximum weighted matching algorithm to permute large elements close the diagonal. This strategy adds an additional level of reliability to our factorization methods and can be seen as a complement to the alternative idea of using more complete pivoting techniques during the numerical factorization.

It is recommended to use *iparm*(11)=1 (scalings) and *iparm*(13)=1 (matchings) for highly indefinite symmetric matrices, for example from interior point optimizations or saddle point problems. It is also very important to note that in the analysis phase (*phase* =11) you must provide the numerical values of the matrix *A* in the case of scalings and symmetric weighted matchings.

The default value of *iparm*(13) is 1 for unsymmetric matrices (*mtype* =11 or *mtype* =13). The default value of *iparm*(13) is 0 for symmetric matrices (*mtype* =-2, *mtype* =-4, or *mtype* =6).

iparm(18)

The solver will report the numbers of non-zero elements on the factors if *iparm*(18)< 0 on entry.

The default value of *iparm*(18) is -1.

iparm(19)- MFlops of factorization.

If *iparm*(19)< 0 on entry, the solver will report MFlop (1.0E6) that are necessary to factor the matrix *A*. This will increase the reordering time.

The default value of *iparm*(19) is 0.

iparm(21) - pivoting for symmetric indefinite matrices.

iparm(21) controls the pivoting method for sparse symmetric indefinite matrices.

If *iparm*(21) = 0, then 1x1 diagonal pivoting is used.

If *iparm*(21) = 1, then 1x1 and 2x2 Bunch and Kaufman pivoting will be used in the factorization process.

NOTE. It is also recommended to use *iparm*(11) = 1 (scaling) and *iparm*(13) = 1 (matchings) for highly indefinite symmetric matrices, for example from interior point optimizations or saddle point problems.

The default value of *iparm*(21) is 1. Bunch and Kaufman pivoting is available for matrices: *mtype*=-2, *mtype*=-4, or *mtype*=6.

iparm(27) - matrix checker.

If *iparm*(27)=0 (default value), the PARDISO doesn't check the sparse matrix representation.

If *iparm*(27)=1, then PARDISO check integer arrays *ia* and *ja*. In particular, PARDISO checks whether column indices are sorted in increasing order within each row.

***iparm*(28) - single or double precision of PARDISO.**

iparm(28) switch PARDISO precision between single and double modes.

If *iparm*(28)=0, then the input arrays (matrix *a*, vectors *x* and *b*) as well as all internal arrays are supposed to be in double precision.

If *iparm*(28)=1, then the input arrays must be presented in single precision. In this case all internal computations are made in single precision.

Note that for double precision accuracy (*iparm*(28)=0) refinement steps can be calculated in quad/double precision depending on the sign of *iparm*(8). For single precision accuracy these computations are made in double/single precision.

Default value of *iparm*(28) is 0 - double precision.

Important. Please note that *iparm*(28) value is stored in the PARDISO handle between PARDISO calls, so the precision mode can be changed only on the solver's phase 1.

***iparm*(60) - version of PARDISO.**

iparm(60) controls what version of PARDISO - out-of-core (OOC) version or in-core version - is used. The OOC PARDISO can solve very large problems by holding the matrix factors in files on the disk. Because of that the amount of main memory required by OOC PARDISO is significantly reduced.

If *iparm*(60) is set to 0, then the in-core PARDISO is used. If *iparm*(60) is set to 2 - the OOC PARDISO is used. If *iparm*(60) is set to 1 - the in-core PARDISO is used if the total memory (in MBytes) needed for storing the matrix factors is less than the value of the environment variable MKL_PARDISO_OOC_MAX_CORE_SIZE (its default value is 2000), and OOC PARDISO is used otherwise.

The default value of *iparm*(60) is 0.

Note that if *iparm*(60) is equal to 1 or 2, and the total peak memory needed for strong local arrays is more than MKL_PARDISO_OOC_MAX_CORE_SIZE, the program stops with error -9. In this case, increase of MKL_PARDISO_OOC_MAX_CORE_SIZE is recommended.

OOC parameters can be set in the configuration file. You can set the path to this file and its name via environmental variable MKL_PARDISO_OOC_CFG_PATH and MKL_PARDISO_OOC_CFG_FILE_NAME. Path and name are as follows:

<MKL_PARDISO_OOC_CFG_PATH >/< MKL_PARDISO_OOC_CFG_FILE_NAME> for Linux* OS, and

<MKL_PARDISO_OOC_CFG_PATH >\< MKL_PARDISO_OOC_CFG_FILE_NAME> for Windows* OS.

By default, the name of the file is `pardiso_ooc.cfg` and it is placed to the current directory.
All temporary data files can be deleted or stored when the calculations are completed in accordance with the value of the environmental variable `MKL_PARDISO_OOC_KEEP_FILE`. If it is set to 1 (default value) - all files are deleted, if it is set to 0 - all files are stored.
By default, the OOC PARDISO uses the current directory for storing data, and all work arrays associated with the matrix factors are stored in files named `ooc_temp` with different extensions. These default values can be changed by using the environmental variable `MKL_PARDISO_OOC_PATH`.
To set the environmental variables `MKL_PARDISO_OOC_MAX_CORE_SIZE`, `MKL_PARDISO_OOC_KEEP_FILE`, and `MKL_PARDISO_OOC_PATH`, the configuration file should be created with the following lines:

```
MKL_PARDISO_OOC_PATH = <path>\ooc_file
MKL_PARDISO_OOC_MAX_CORE_SIZE = N
MKL_PARDISO_OOC_KEEP_FILE = 0 (or 1)
```

where `<path>` - the directory for storing data, `ooc_file` - file name without extension, N - memory size in MBytes, it is not recommended to set this value greater than the size of the available RAM (default value - 2000 MBytes).

WARNING. Maximum length of the path lines in the configuration files is 1000 characters.

Alternatively the environment variables can be set via command line:

```
export MKL_PARDISO_OOC_PATH = <path>/ooc_file
export MKL_PARDISO_OOC_MAX_CORE_SIZE = N
export MKL_PARDISO_OOC_KEEP_FILE = 0 (or 1)
```

for Linux* OS, and

```
set MKL_PARDISO_OOC_PATH = <path>\ooc_file
set MKL_PARDISO_OOC_MAX_CORE_SIZE = N
set MKL_PARDISO_OOC_KEEP_FILE = 0 (or 1)
```

for Windows* OS.

NOTE. The values specified in a command line have higher priorities - it means that if variable is changed in the configuration file and in the command line, OOC PARDISO uses only value defined in the command line. Setting OOC parameters via command line is recommended.

msglvl

`INTEGER`
Message level information. If *`msglvl`* `= 0` then PARDISO generates no output, if *`msglvl`* `= 1` the solver prints statistical information to the screen.

b

DOUBLE PRECISION - for real types of matrices (*mtype*=1, 2, -2 and 11) and for double precision PARDISO (*iparm*(28)=0)
REAL - for real types of matrices (*mtype*=1, 2, -2 and 11) and for single precision PARDISO (*iparm*(28)=1)
DOUBLE COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for double precision PARDISO (*iparm*(28)=0)
COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for single precision PARDISO (*iparm*(28)=1)
Array, dimension (*n, nrhs*). On entry, contains the right hand side vector/matrix *B*. Note that *b* is only accessed in the solution phase.

Output Parameters

pt

This parameter contains internal address pointers.

iparm

On output, some *iparm* values will report useful information, for example, numbers of non-zero elements in the factors, and so on.
***iparm*(7)- number of performed iterative refinement steps.**
The number of iterative refinement steps that are actually performed during the solve step.
***iparm*(14)- number of perturbed pivots.**
After factorization, *iparm*(14) contains the number of perturbed pivots during the elimination process for *mtype* =11, *mtype* =13, *mtype* =-2, *mtype* =-4, or *mtype* =-6.
***iparm*(15) - peak memory symbolic factorization.**
The parameter *iparm*(15) provides the user with the total peak memory in KBytes that the solver needed during the analysis and symbolic factorization phase. This value is only computed in phase 1.
***iparm*(16) - permanent memory symbolic factorization.**
The parameter *iparm*(16) provides the user with the permanent memory in KBytes that the solver needed from the analysis and symbolic factorization phase in the factorization and solve phases. This value is only computed in phase 1.
***iparm*(17) - memory numerical factorization and solution.**
The parameter *iparm*(17) provides the user with the total double precision memory consumption (KBytes) of the solver for the factorization and solve phases. This value is only computed in phase 2.
Note that the total peak memory solver consumption is max(*iparm*(15), *iparm*(16)+*iparm*(17))
***iparm*(18) - number of non-zero elements in factors.**
The solver will report the numbers of non-zero elements on the factors if *iparm*(18) < 0 on entry.
***iparm*(19) - MFlops of factorization.**
Number of operations in MFlop (1.0E6 operations) that are necessary to factor the matrix *A* are returned to the user if *iparm*(19) < 0 on entry.
***iparm*(20) - CG/CGS diagnostics.**

The value is used to give CG/CGS diagnostics (for example, the number of iterations and cause of failure):
If *iparm*(20)> 0, CGS succeeded, and the number of iterations executed are reported in *iparm*(20).
If *iparm*(20)< 0, iterations executed, but CG/CGS failed. The error report details in *iparm*(20) are of the form: *iparm*(20)= - it_cgs*10 - cgs_error.
If *phase*= 23, then the factors *L*, *U* are recomputed for the matrix *A* and the error flag *error*=0 in case of a successful factorization. If *phase* =33, then *error* = -4 signals the failure.
Description of cgs_error is given in the table below:

cgs_error	Description
1	- fluctuations of the residuum are too large
2	- $\|\|dx_{max_it_cgs/2}\|\|$ too large (slow convergence)
3	- stopping criterion not reached at max_it_cgs
4	- perturbed pivots caused iterative refinement
5	- factorization is too fast for this matrix. It is better to use the factorization method with *iparm*(4)=0

***iparm*(22) - inertia: number of positive eigenvalues.**
The parameter *iparm*(22) reports the number of positive eigenvalues for symmetric indefinite matrices.
***iparm*(23) - inertia: number of negative eigenvalues.**
The parameter *iparm*(23) reports the number of negative eigenvalues for symmetric indefinite matrices.
iparm(30) - the number of equation where PARDISO detects zero or negative pivot for MTYPE=2 (real positive definite matrix) and MTYPE=4 (complex and Hermitian positive definite matrices). If the solver detects a zero or negative pivot for these matrix types, the factorization is stopped, PARDISO returns immediately with an error (*error* = -4) and *iparm*(30) contains the number of the equation where the first zero or negative pivot is detected.
iparm(31) to *iparm*(59)
These parameters are reserved for future use. Their values must be set to 0.
***iparm*(61)** - the total peak memory in MBytes that the solver used during the analysis and symbolic factorization phases if the in-core PARDISO is used. *iparm*(61) is returned only in the in-core mode. It is similar to *iparm*(15), but *iparm*(15) returns the value of the total peak memory for both in-core and OOC modes of PARDISO.
***iparm*(62)** - the total double precision memory consumption in MBytes that the solver used during the analysis and symbolic factorization phase in the factorization and solver phases if the in-core PARDISO is used. *iparm*(62) is returned only in the in-core mode. It is similar to *iparm*(16), but *iparm*(16) returns the value of the memory consumption for both in-core and OOC modes of PARDISO.

iparm(63) - the total double precision memory consumption in MBytes that the solver used for factorization and solution phases if the in-core PARDISO is used. *iparm*(63) is returned only in the in-core mode. It is similar to *iparm*(17), but *iparm*(17) returns the value of the memory consumption for both in-core and OOC modes of PARDISO.

b — On output, the array is replaced with the solution if *iparm*(6) = 1.

x — DOUBLE PRECISION - for real types of matrices (*mtype*=1, 2, -2 and 11) and for double precision PARDISO (*iparm*(28)=0)
REAL - for real types of matrices (*mtype*=1, 2, -2 and 11) and for single precision PARDISO (*iparm*(28)=1)
DOUBLE COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for double precision PARDISO (*iparm*(28)=0)
COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for single precision PARDISO (*iparm*(28)=1)
Array, dimension (*n*, *nrhs*). On output, contains solution if *iparm*(6)=0. Note that *x* is only accessed in the solution phase.

error — INTEGER
The error indicator according to the below table:

error	Information
0	no error
-1	input inconsistent
-2	not enough memory
-3	reordering problem
-4	zero pivot, numerical factorization or iterative refinement problem
-5	unclassified (internal) error
-6	preordering failed (matrix types 11, 13 only)
-7	diagonal matrix is singular
-8	32-bit integer overflow problem
-9	not enough memory for OOC
-10	problems with opening OOC temporary files
-11	read/write problems with the OOC data file

pardiso_64

Calculates the solution of a set of sparse linear equations with multiple right-hand sides, 64-bit integer version.

Syntax

Fortran:

```
call pardiso_64 (pt, maxfct, mnum, type, phase, n, a, ia, ja, perm, nrhs, iparm, msglvl, b, x, error)
```

C:

```
pardiso_64 (pt, &maxfct, &mnum, &mtype, &phase, &n, a, ia, ja, perm, &nrhs, iparm, &msglvl, b, x, &error);
```

```
SUBROUTINE pardiso_64 (pt, maxfct, mnum, mtype, phase, n, a, ia, ja, perm, nrhs, iparm, msglvl, b, x, error)
```

```
INTEGER*8 pt (64)
```

```
INTEGER*8 maxfct, mnum, mtype, phase, n, nrhs, error, ia(*), ja(*), perm(*), iparm(*)
```

```
PARDISO_DATA_TYPE a(*), b(n,nrhs), x(n,nrhs)
```

PARDISO_DATA_TYPE can be one of the following types:

DOUBLE PRECISION - for real types of matrices (*mtype*=1, 2, -2 and 11) and for double precision pardiso_64 (*iparm*(28)=0)

REAL - for real types of matrices (*mtype*=1, 2, -2 and 11) and for single precision pardiso_64 (*iparm*(28)=1)

DOUBLE COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for double precision pardiso_64 (*iparm*(28)=0)

COMPLEX - for complex types of matrices (*mtype*=3, 6, 13, 14 and -4) and for single precision pardiso_64 (*iparm*(28)=1)

Description

This routine is declared in mkl_pardiso.f77 for FORTRAN 77 interface, in mkl_pardiso.f90 for Fortran 90 interface, and in mkl_pardiso.h for C interface.

pardiso_64 is an alternative ILP64 (64-bit integer) version of the pardiso routine (see Description section for more details). The interface of pardiso_64 is equal to the interface of pardiso, but it accepts and returns all INTEGER data as INTEGER*8.

Use pardiso_64 interface for solving large matrices (with the number of non-zero elements ~500 millions and more). You can use it together with the usual LP64 interfaces for the rest of Intel MKL functionality. In other words, if you use 64-bit integer version - pardiso_64, you do not need to re-link your applications with ILP64 libraries. Take into account that pardiso_64 may perform slower than regular pardiso on Reordering and Symbolic factorization phase.

NOTE. pardiso_64 is available in Intel MKL version 10.2.6 and higher.

NOTE. `pardiso_64` is supported only in the 64-bit libraries. If `pardiso_64` is called from the 32-bit libraries, it returns *`error`* `=-12`.

Input Parameters

The input parameters of `pardiso_64` are equal to the input parameters of `pardiso`, but `pardiso_64` accepts all INTEGER data as `INTEGER*8`.

Output Parameters

The output parameters of `pardiso_64` are equal to the output parameters of `pardiso`, but `pardiso_64` returns all INTEGER data as `INTEGER*8`.

PARDISO Parameters in Tabular Form

The following table lists all parameters of PARDISO and gives their brief descriptions.

Parameter	Type	Description	Values	Comments	In/Out
pt(64)	INTEGER for 32-bit architectures INTEGER*8 for 64-bit architectures	Solver internal data address pointer	0	must be initialized by 0. Never modify this parameter!	in/out
maxfct	INTEGER	Maximal number of factors in memory	*	generally used value is 1	in
mnum	INTEGER	The number of matrix (from 1 to *maxfct*) to solve	*	Generally used value is 1, 1 ≤ *mnum* ≤ *maxfct*	in
type	INTEGER	Matrix type	1	real and structurally symmetric	in
			2	real and symmetric positive definite	
			-2	real and symmetric indefinite	
			3	complex and structurally symmetric	
			4	complex and Hermitian positive definite	
			-4	complex and Hermitian indefinite	
			6	complex and symmetric matrix	

Parameter	Type	Description	Values	Comments	In/Out
			11	real and unsymmetric matrix	
			13	complex and unsymmetric matrix	
phase	INTEGER	Controls the execution of the solver	11	Analysis	in
			12	Analysis, numerical factorization	
			13	Analysis, numerical factorization, solve	
			22	Numerical factorization	
			23	Numerical factorization, solve	
			33	Solve, iterative refinement	
			331	*phase*=33, but only forward substitution	
			332	*phase*=33, but only diagonal substitution	
			333	*phase*=33, but only backward substitution	
			0	Release internal memory for L and U of the matrix number *mnum*	
			-1	Release all internal memory for all matrices	
n	INTEGER	Number of equations in the sparse linear system *A*X = B*	>0		in
a(*)	PARDISO_DATA_TYPE	Contains the non-zero elements of the coefficient matrix *A*	*	The size of *a* is the same as that of *ja*, and the coefficient matrix can be either real or complex. The matrix must be stored in CSR format with increasing values of *ja* for each row	in
ia(n+1)	INTEGER	*rowIndex* array in CSR format	*	0 < *ia*(*i*) <= *ia*(*i*+1) *ia*(*i*) gives the index of the element in array *a* that contains the first non-zero element from row *i* of *A*. The last element *ia*(*n*+1) is taken	in

Parameter	Type	Description	Values	Comments	In/Out
				to be equal to the number of non-zero elements in *A*, plus one. Note: *iparm*(35) indicates whether row/column indexing starts from 1 or 0.	
ja(*)	INTEGER	*columns* array in CSR format	*	The indices in each row must be sorted in increasing order. For symmetric and structurally symmetric matrices zero diagonal elements are also stored in *a* and *ja*. For symmetric matrices, the solver needs only the upper triangular part of the system. Note: *iparm*(35) indicates whether row/column indexing starts from 1 or 0.	in
perm(n)	INTEGER	Holds the permutation vector of size *n*	>0	Let *B = P*A*PT* be the permuted matrix. Row (column) *i* of *A* is the *perm*(*i*) row (column) of *B*. The numbering of the array must start with 1 and must describe a permutation. You can apply your own fill-in reducing ordering (*iparm*(5)=1) or return the permutation from the solver (i*iparm*(5)=2).	in/out
nrhs	INTEGER	Number of right-hand sides that need to be solved for	>=0	Generally used value is 1	in
iparm(64)	INTEGER	This array is used to pass various parameters to PARDISO and to return some useful information after execution of the solver	*	If *iparm*(1)=0 , PARDISO fills *iparm*(2) through *iparm*(64) with default values and uses them.	in/out
msglvl	INTEGER	Message level information	0 1	PARDISO generates no output PARDISO prints statistical information	in

Parameter	Type	Description	Values	Comments	In/Out
*b(n*nrhs)*	PARDISO_DATA_TYPE	Right-hand side vectors	*	On entry, contains the right hand side vector/matrix *B*, which is placed contiguously in memory, namely *b*(i+(k-1)×*nrhs*) must hold the i-th component of k-th right-hand side vector. Note that *b* is only accessed in the solution phase.	in/out
				On output, the array is replaced with the solution if *iparm*(6)=1.	
*x(n*nrhs)*	PARDISO_DATA_TYPE	Solution vectors	*	On output, if *iparm*(6)=1, contains solution vector/matrix *X* which is placed contiguously in memory , namely *x*(i+(k-1)×*nrhs*) must hold the i-th component of k-th solution vector. Note that *x* is only accessed in the solution phase.	out
error	INTEGER	Error indicator	0	no error	out
			-1	input inconsistent	
			-2	not enough memory	
			-3	reordering problem	
			-4	zero pivot, numerical factorization or iterative refinement problem	
			-5	unclassified (internal) error	
			-6	reordering failed (matrix types 11, 13 only)	
			-7	diagonal matrix problem	
			-8	32-bit integer overflow problem	
			-9	not enough memory for OOC	
			-10	problems with opening OOC temporary files	
			-11	read/write problems with the OOC data file	

The following table lists the values of PARDISO_DATA_TYPE depending on the matrix types and values of the parameter *iparm*(28).

Data type value	Matrix type *mtype*	*iparm*(28)	comments
DOUBLE PRECISION	1, 2, -2, 11	0	real matrices, double precision
REAL		1	real matrices, single precision
DOUBLE COMPLEX	3, 6, 13, 4, -4	0	complex matrices, double precision
COMPLEX		1	complex matrices, single precision

The following table lists all individual components of the PARDISO *iparm()* parameter and their brief descriptions. Components not listed in the table must be initialized with 0. Default values in the column **Values** are denoted as X*.

Component	Description	Values	Comments	In/Out
INPUT, INPUT/OUTPUT PARAMETERS				
iparm(1)	Use default values	0	*iparm*(2) -*iparm*(64) are filled with default values.	in
		!=0	You must supply all values in components *iparm*(2) -*iparm*(64)	
iparm(2)	Fill-in reducing ordering for the input matrix	0	The minimum degree algorithm.	in
		2*	The nested dissection algorithm from the METIS package	
		3	The parallel (OpenMP) version of the nested dissection algorithm.	
iparm(4)	Preconditioned CGS/CG	0*	Do not perform preconditioned Krylow-Subspace iterations.	in
		10**L*+1	CGS iteration replaces the computation of LU. The preconditioner is LU that is computed at the previous step (the first step or last step with a failure) in a sequence of solutions needed for identical sparsity patterns.	
			L controls the stopping criterion of the Krylow-Subspace iteration: `epsCGS = 10^(-L)` is used in the stopping criterion `||dxi|| / ||dx0|| < epsCGS`, with `||dxi|| = ||inv(L*U)*ri||` and `ri` is the residuum at iteration `i` of the preconditioned Krylow-Subspace iteration.	
		10**L*+2	Same as above, but CG iteration replaces the computation of LU. Designed for symmetric positive definite matrices.	

Component	Description	Values	Comments	In/Out
iparm(5)	User permutation	0*	User permutation in *perm* array is ignored.	in
		1	PARDISO uses the user supplied fill-in reducing permutation from *perm* array. *iparm*(2) is ignored.	
		2	PARDISO returns the permutation vector computed at phase 1 into *perm* array	
iparm(6)	Write solution on *x*	0*	The array *x* contains the solution; right-hand side vector *b* is kept unchanged.	in
		1	The solver stores the solution on the right-hand side *b*. Note that the array *x* is always used.	
iparm(8)	Iterative refinement step	0*	The solver automatically performs two steps of iterative refinements when perturbed pivots are obtained during the numerical factorization.	in
		>0	Maximum number of iterative refinement steps that the solver performs. The solver performs not more than the absolute value of *iparm*(8) steps of iterative refinement and stops the process if a satisfactory level of accuracy of the solution in terms of backward error is achieved. The number of executed iterations is reported in *iparm*(7).	
		<0	Same as above, but the accumulation of the residuum uses extended precision real and complex data types.	
iparm(10)	Pivoting perturbation	*	This parameter instructs PARDISO how to handle small pivots or zero pivots for unsymmetric matrices (*mtype* =11, *mtype* =13) and symmetric matrices (*mtype* =-2, *mtype* =-4, *mtype* =6). Small pivots are perturbed with eps = 10^(-*iparm*(10)).	in
		13*	The default value for unsymmetric matrices(*mtype* =11, *mtype*=13), eps = 10^(-13).	
		8*	The default value for symmetric indefinite matrices (*mtype* =-2, *mtype*=-4, *mtype*=6), eps = 10^(-8).	
iparm(11)	Scaling	0*	Disable scaling. Default for symmetric indefinite matrices.	in
		1*	Enable scaling. Default for unsymmetric matrices.	

Component	Description	Values	Comments	In/Out
			Scale the matrix so that the diagonal elements are equal to 1 and the absolute values of the off-diagonal entries are less or equal to 1. This scaling method is applied to unsymmetric matrices (*mtype* = 11, *mtype* = 13). The scaling can also be used for symmetric indefinite matrices (*mtype* = -2, *mtype* = -4, *mtype* = 6) when the symmetric weighted matchings are applied (*iparm*(13)= 1). Note that in the analysis phase (*phase*=11) you must provide the numerical values of the matrix *A* in case of scaling.	
iparm(13)	Improved accuracy using (non-) symmetric weighted matching	0*	Disable matching. Default for symmetric indefinite matrices.	in
		1*	Enable matching. Default for symmetric indefinite matrices. Maximum weighted matching algorithm to permute large elements close to the diagonal. It is recommended to use *iparm*(11)= 1 (scaling) and *iparm*(13)= 1 (matching) for highly indefinite symmetric matrices, for example from interior point optimizations or saddle point problems. Note that in the analysis phase (*phase*=11) you must provide the numerical values of the matrix *A* in case of symmetric weighted matching.	
iparm(18)	Report the number of non-zero elements in the factors	<0	Enable reporting if *iparm*(18) < 0 on entry. -1 is a default value.	in/out
		>=0	Disable reporting	
iparm(19)	Report Mflops that are necessary to factor the matrix *A*.	<0	Enable report if *iparm*(18) < 0 on entry. This increases the reordering time.	in/out
		>=0	Disable report. 0 is a default value.	
iparm(21)	Pivoting for symmetric indefinite matrices	0	Apply 1x1 diagonal pivoting during the factorization process.	in
		1*	Apply 1x1 and 2x2 Bunch and Kaufman pivoting during the factorization process.	
iparm(27)	Matrix checker	0*	PARDISO does not check the sparse matrix representation.	in
		1	PARDISO checks integer arrays *ia* and *ja*. In particular, PARDISO checks whether column indices are sorted in increasing order within each row.	

Component	Description	Values	Comments	In/Out
iparm(28)	Single or double precision of PARDISO	0*	Input arrays (*a*, *x* and *b*) and all internal arrays must be presented in double precision.	in
		1	Input arrays (*a*, *x* and *b*) must be presented in single precision. In this case all internal computations are performed in single precision	
iparm(60)	PARDISO mode	0*	In-core PARDISO	in
		2	Out-of-core (OOC) PARDISO The OOC PARDISO can solve very large problems by holding the matrix factors in files on the disk. Hence the amount of RAM required by OOC PARDISO is significantly reduced.	
OUTPUT PARAMETERS				
iparm(7)	Number of performed iterative refinement steps	>=0	Reports the number of iterative refinement steps that were actually performed during the solve step.	out
iparm(14)	Number of perturbed pivots	>=0	After factorization, contains the number of perturbed pivots for the matrix types: 11, 13, -2, -4 and -6.	out
iparm(15)	Peak memory on symbolic factorization	>0 KBytes	The total peak memory in KBytes that the solver needs during the analysis and symbolic factorization phase. This value is only computed in phase 1.	out
iparm(16)	Permanent memory on symbolic factorization	>0 KBytes	Permanent memory from the analysis and symbolic factorization phase in KBytes that the solver needs in the factorization and solve phases. This value is only computed in phase 1.	out
iparm(17)	Size of factors/Peak memory on numerical factorization and solution	>0 KBytes	This parameter is computed in phases 1 and 2 with different meanings. *iparm*(17) computed in phase 1 provides the user with an estimate of size of factors (KBytes). In OOC mode, this information gives an estimate of disk space for storing needed data. *iparm*(17) computed in phase 2 provides the user with the total memory of type PARDISO_DATA_TYPE (KBytes) that the solver needs for the factorization and solve phases. Note that the total peak memory consumed by PARDISO is max(*iparm*(15), *iparm*(16)+*iparm*(17))	out
iparm(20)	CG/CGS diagnostics	>0	CGS succeeded, reports the number of completed iterations.	out
		<0	CG/CGS failed (*error*=-4 after the solution phase)	

Component	Description	Values	Comments	In/Out
			iparm(20)= - it_cgs*10 - cgs_error. Possible values of cgs_error: 1 - fluctuations of the residuum are too large 2 - ||dx at max_it_cgs/2|| is too large (slow convergence) 3 - stopping criterion is not reached at max_it_cgs 4 - perturbed pivots causes iterative refinement	
iparm(22)	Inertia: number of positive eigenvalues	>=0	PARDISO reports the number of positive eigenvalues for symmetric indefinite matrices	out
iparm(23)	Inertia: number of negative eigenvalues	>=0	PARDISO reports the number of negative eigenvalues for symmetric indefinite matrices.	out
iparm(30)	Number of zero or negative pivots	>=0	If PARDISO detects zero or negative pivot for *mtype*=2 or *mtype*=4 types, the factorization is stopped, PARDISO returns immediately with an *error* = -4; and *iparm*(30) reports the number of the equation where the first zero or negative pivot is detected.	out

Direct Sparse Solver (DSS) Interface Routines

Intel MKL supports an alternative to the PARDISO* interface for the direct sparse solver referred to here as DSS interface. The DSS interface implements a group of user-callable routines that are used in the step-by-step solving process and exploits the general scheme described in Linear Solvers Basics for solving sparse systems of linear equations. This interface also includes one routine for gathering statistics related to the solving process and an auxiliary routine for passing character strings from Fortran routines to C routines.

The current implementation of the DSS interface additionally supports the out-of-core (OOC) version.

Table 8-1 lists the names of the routines and describes their general use.

Table 8-1 DSS Interface Routines

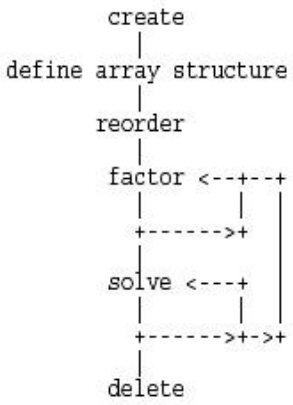
Routine	Description
dss_create	Initializes the solver and creates the basic data structures necessary for the solver. This routine must be called before any other DSS routine.
dss_define_structure	Informs the solver of the locations of the non-zero elements of the array.
dss_reorder	Based on the non-zero structure of the matrix, this routine computes a permutation vector to reduce fill-in during the factoring process.
dss_factor_real, dss_factor_complex	Computes the LU, LDT^T or LL^T factorization of a real or complex matrix.

Routine	Description
dss_solve_real, dss_solve_complex	Computes the solution vector for a system of equations based on the factorization computed in the previous phase.
dss_delete	Deletes all data structures created during the solving process.
dss_statistics	Returns statistics about various phases of the solving process. Gathers the following statistics: time taken to do reordering, time taken to do factorization, problem solving duration, determinant of a matrix, inertia of a matrix, number of floating point operations taken during factorization, peak memory symbolic factorization, permanent memory symbolic factorization, and memory numerical factorization and solution. This routine can be invoked in any phase of the solving process after the "reorder" phase, but before the "delete" phase. Note that appropriate argument(s) must be supplied to this routine to match the phase in which it is invoked.
mkl_cvt_to_null_terminated_str	Passes character strings from Fortran routines to C routines.

To find a single solution vector for a single system of equations with a single right hand side, the Intel MKL DSS interface routines are invoked in the order in which they are listed in Table 8-1 , with the exception of dss_statistics, which is invoked as described in the table.

However, in certain applications it is necessary to produce solution vectors for multiple right-hand sides for a given factorization and/or factor several matrices with the same non-zero structure. Consequently, it is necessary to invoke the Intel MKL sparse routines in an order other than listed in the table. The DSS interface provides such option. The solving process is conceptually divided into six phases, as shown in Figure 8-2 , that indicates the typical order(s) in which the DSS interface routines can be invoked.

Figure 8-2 Typical order for invoking DSS interface routines



See code examples that uses the DSS interface routines to solve systems of linear equations in the `examples\solver\source` folder of your Intel MKL directory (`dss_sym_f.f`, `dss_sym_c.c`, `dss_sym_f90.f90`).

DSS Interface Description

As noted in Memory Allocation and Handles section, each DSS routine reads or writes an opaque data object called a handle. It is declared as being of type `MKL_DSS_HANDLE` in this documentation. You can refer to Memory Allocation and Handles to determine the correct method for declaring a handle argument.

All other types in this documentation refer to the common Fortran types, `INTEGER`, `REAL`, `COMPLEX`, `DOUBLE PRECISION`, and `DOUBLE COMPLEX`.

C and C++ programmers should refer to Calling Direct Sparse Solver and Preconditioner Routines From C/C++ section for information on mapping Fortran types to C/C++ types.

Routine Options

The DSS routines have an integer argument (referred below to as *opt*) for passing various options to the routines. The permissible values for *opt* should be specified using only the symbol constants defined in the language-specific header files (see Implementation Details). The routines accept options for setting the message and termination levels as described in Table 8-2 . Additionally, the routines accept the option `MKL_DSS_DEFAULTS` that establishes the documented default options for each DSS routine.

Table 8-2 Symbolic Names for the Message and Termination Levels Options

Message Level	Termination Level
`MKL_DSS_MSG_LVL_SUCCESS`	`MKL_DSS_TERM_LVL_SUCCESS`
`MKL_DSS_MSG_LVL_INFO`	`MKL_DSS_TERM_LVL_INFO`
`MKL_DSS_MSG_LVL_WARNING`	`MKL_DSS_TERM_LVL_WARNING`
`MKL_DSS_MSG_LVL_ERROR`	`MKL_DSS_TERM_LVL_ERROR`
`MKL_DSS_MSG_LVL_FATAL`	`MKL_DSS_TERM_LVL_FATAL`

The settings for message and termination levels can be set on any call to a DSS routine. However, once set to a particular level, they remain at that level until they are changed in another call to a DSS routine.

Users can specify multiple options for a DSS routine by adding the options together. For example, to set the message level to debug and the termination level to `error` for all the DSS routines, use the following call:

```
CALL dss_create( handle, MKL_DSS_MSG_LVL_INFO + MKL_DSS_TERM_LVL_ERROR)
```

User Data Arrays

Many of the DSS routines take arrays of user data as input. For example, user arrays are passed to the routine `dss_define_structure` to describe the location of the non-zero entries in the matrix. To minimize storage requirements and improve overall run-time efficiency, the Intel MKL DSS routines do not make copies of the user input arrays.

WARNING. The contents of these arrays cannot be modified after they are passed to one of the solver routines.

DSS Routines

dss_create

Initializes the solver.

Syntax

C:

`dss_create(handle, opt)`

Fortran:

`call dss_create(handle, opt)`

Include Files

The FORTRAN 77 interface is specified in the `mkl_dss.f77` include file, the Fortran 90 interface is specified in the `mkl_dss.f90` include file, and the C interface is specified in the `mkl_dss.h` include file.

Description

The `dss_create` routine initializes the solver. After the call to `dss_create`, all subsequent invocations of the Intel MKL DSS routines must use the value of handle returned by the routine `dss_create`.

WARNING. Do not write the value of handle directly.

The default value of the parameter *opt* is

`MKL_DSS_MSG_LVL_WARNING + MKL_DSS_TERM_LVL_ERROR`.

By default, the DSS routines use double precision for solving systems of linear equations. The precision used by the DSS routines can be set to single mode by specifying the following value:

`MKL_DSS_SINGLE_PRECISION`.

As for PARDISO, input data and internal arrays are required to have single precision.

By default, the DSS routines use Fortran style indexing for input arrays of integer types (first value is referenced as array element 1). The indexing can be set to C style (first value is referenced as array element 0) by specifying the following value:

`MKL_DSS_ZERO_BASED_INDEXING`.

This parameter can also control number of refinement steps used on the solution stage by specifying the two following values:

`MKL_DSS_REFINEMENT_OFF` - maximum number of refinement steps is set to zero; `MKL_DSS_REFINEMENT_ON` (default value) - maximum number of refinement steps is set to 2.

This parameter can contain additionally one of two possible values to launch the out-of-core version of DSS (OOC DSS): `MKL_DSS_OOC_VARIABLE` and `MKL_DSS_OOC_STRONG`.

MKL_DSS_OOC_STRONG - OOC DSS is used.

MKL_DSS_OOC_VARIABLE - OOC DSS uses the in-core kernels of PARDISO* if there is enough memory for storing work arrays associated with the matrix factors in the main memory. Specifically, if the memory needed for the matrix factors is less than the value of the environment variable MKL_PARDISO_OOC_MAX_CORE_SIZE, then the OOC version of PARDISO* uses the in-core computations, otherwise it uses the OOC computations.

The variable MKL_PARDISO_OOC_MAX_CORE_SIZE defines the maximum size of the main memory allowed for storing work arrays associated with the matrix factors. It is ignored if MKL_DSS_OOC_STRONG is set. The default value of MKL_PARDISO_OOC_MAX_CORE_SIZE is 2000 MBytes. This value and default path and file name for storing temporary data can be changed using the configuration file pardiso_ooc.cfg or command line (See more details in the PARDISO Parameters description above).

WARNING. Do not change the behavior of the OOC DSS after it is specified in the routine dss_create.

Input Parameters

Name	Type	Description
opt	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Parameter to pass the DSS options. The default value is MKL_DSS_MSG_LVL_WARNING + MKL_DSS_TERM_LVL_ERROR.

Output Parameters

Name	Type	Description
handle	**FORTRAN 77:** INTEGER*8 **Fortran 90:** TYPE (MKL_DSS_HANDLE), INTENT(OUT) **C:** _MKL_DSS_HANDLE_t*	Pointer to the data structure storing intermediate DSS results (MKL_DSS_HANDLE).

Return Values

MKL_DSS_SUCCESS

MKL_DSS_INVALID_OPTION

MKL_DSS_OUT_OF_MEMORY

dss_define_structure

Communicates locations of non-zero elements in the matrix to the solver.

Syntax

C:

```
dss_define_structure(handle, opt, rowIndex, nRows, nCols, columns, nNonZeros);
```

Fortran:

```
call dss_define_structure(handle, opt, rowIndex, nRows, nCols, columns, nNonZeros);
```

Include Files

The FORTRAN 77 interface is specified in the `mkl_dss.f77` include file, the Fortran 90 interface is specified in the `mkl_dss.f90` include file, and the C interface is specified in the `mkl_dss.h` include file.

Description

The routine `dss_define_structure` communicates the locations of the *nNonZeros* number of non-zero elements in a matrix of *nRows* by *nCols* size to the solver.

Note that currently the Intel MKL DSS software operates only on square matrices, so *nRows* must be equal to *nCols*.

To communicate the locations of non-zeros in the matrix, do the following:

1. Define the general non-zero structure of the matrix by specifying the value for the options argument *opt*. You can set the following values for real matrices:
   - `MKL_DSS_SYMMETRIC_STRUCTURE`
   - `MKL_DSS_SYMMETRIC`
   - `MKL_DSS_NON_SYMMETRIC`

   and for complex matrices:
   - `MKL_DSS_SYMMETRIC_STRUCTURE_COMPLEX`
   - `MKL_DSS_SYMMETRIC_COMPLEX`
   - `MKL_DSS_NON_SYMMETRIC_COMPLEX`

     The information about the matrix type must be defined in `dss_define_structure` starting from the 10.2 release.
2. Provide the actual locations of the non-zeros by means of the arrays *rowIndex* and *columns* (see Sparse Matrix Storage Format).

Input Parameters

Name	Type	Description
opt	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Parameter to pass the DSS options. The default value for the matrix structure is MKL_DSS_SYMMETRIC.
rowIndex	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Array of size min(*nRows*, *nCols*)+1. Defines the location of non-zero entries in the matrix.
nRows	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Number of rows in the matrix.
nCols	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Number of columns in the matrix.
columns	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Array of size *nNonZeros*. Defines the location of non-zero entries in the matrix.
nNonZeros	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Number of non-zero elements in the matrix.

Output Parameters

Name	Type	Description
handle	**FORTRAN 77:** INTEGER*8 **Fortran 90:** TYPE (MKL_DSS_HANDLE), INTENT(INOUT) **C:** _MKL_DSS_HANDLE_t*	Pointer to the data structure storing intermediate DSS results (MKL_DSS_HANDLE).

Return Values

MKL_DSS_SUCCESS

MKL_DSS_STATE_ERR

MKL_DSS_INVALID_OPTION

MKL_DSS_COL_ERR

MKL_DSS_NOT_SQUARE

MKL_DSS_TOO_FEW_VALUES

MKL_DSS_TOO_MANY_VALUES

dss_reorder

Computes permutation vector that minimizes the fill-in during the factorization phase.

Syntax

C:

`dss_reorder(handle, opt, perm)`

Fortran:

`call dss_reorder(handle, opt, perm)`

Include Files

The FORTRAN 77 interface is specified in the `mkl_dss.f77` include file, the Fortran 90 interface is specified in the `mkl_dss.f90` include file, and the C interface is specified in the `mkl_dss.h` include file.

Description

If *opt* contains the option `MKL_DSS_AUTO_ORDER`, then the routine `dss_reorder` computes a permutation vector that minimizes the fill-in during the factorization phase. For this option, the *perm* array is never accessed.

If *opt* contains the option `MKL_DSS_METIS_OPENMP_ORDER`, then the routine `dss_reorder` computes permutation vector using the parallel (OpenMP) nested dissections algorithm to minimize the fill-in during the factorization phase. This option can be used to decrease the time of `dss_reorder` call on multi-core computers. For this option, the *perm* array is also never accessed.

If *opt* contains the option `MKL_DSS_MY_ORDER`, then the array *perm* is considered to be a permutation vector supplied by the user. In this case, the array *perm* is of length *nRows*, where *nRows* is the number of rows in the matrix as defined by the previous call to dss_define_structure.

If *opt* contains the option `MKL_DSS_GET_ORDER`, then the permutation vector computed during the `dss_reorder` call is copied to the array *perm*. In this case the array *perm* must be allocated by the user beforehand. The permutation vector is computed in the same way as if the option `MKL_DSS_AUTO_ORDER` is set.

Input Parameters

Name	Type	Description
opt	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `_INTEGER_t const*`	Parameter to pass the DSS options. The default value for the permutation type is `MKL_DSS_AUTO_ORDER`.

Name	Type	Description
perm	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Array of length *nRows*. Contains a user-defined permutation vector (accessed only if *opt* contains MKL_DSS_MY_ORDER or MKL_DSS_GET_ORDER).

Output Parameters

Name	Type	Description
handle	**FORTRAN 77:** INTEGER*8 **Fortran 90:** TYPE (MKL_DSS_HANDLE), INTENT(INOUT) **C:** _MKL_DSS_HANDLE_t*	Pointer to the data structure storing intermediate DSS results (MKL_DSS_HANDLE).

Return Values

MKL_DSS_SUCCESS

MKL_DSS_STATE_ERR

MKL_DSS_INVALID_OPTION

MKL_DSS_OUT_OF_MEMORY

dss_factor_real, dss_factor_complex

Compute factorization of the matrix with previously specified location.

Syntax

C:

dss_factor_real(*handle*, *opt*, *rValues*)

dss_factor_complex(*handle*, *opt*, *cValues*)

FORTRAN 77:

call dss_factor_real(*handle*, *opt*, *rValues*)

call dss_factor_complex(*handle*, *opt*, *cValues*)

Fortran 90:
unified Fortran 90 interface:

call dss_factor(*handle*, *opt*, *Values*)

or FORTRAN 77 like interface:

call dss_factor_real(*handle*, *opt*, *rValues*)

call dss_factor_complex(*handle*, *opt*, *cValues*)

Include Files

The FORTRAN 77 interface is specified in the `mkl_dss.f77` include file, the Fortran 90 interface is specified in the `mkl_dss.f90` include file, and the C interface is specified in the `mkl_dss.h` include file.

Description

These routines compute factorization of the matrix whose non-zero locations were previously specified by a call to dss_define_structure and whose non-zero values are given in the array *rValues*, *cValues* or *Vulues* . These arrays are assumed to be of length *nNonZeros* as defined in a previous call to `dss_define_structure`.

The *opt* argument should contain one of the following options:

- `MKL_DSS_POSITIVE_DEFINITE`,
- `MKL_DSS_INDEFINITE`,
- `MKL_DSS_HERMITIAN_POSITIVE_DEFINITE`,
- `MKL_DSS_HERMITIAN_INDEFINITE` ,

depending on whether the user's matrix is positive definite, indefinite, or Hermitian.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

Name	Type	Description
handle	**FORTRAN 77:** `INTEGER*8` **Fortran 90:** `TYPE (MKL_DSS_HANDLE), INTENT(INOUT)` **C:** `_MKL_DSS_HANDLE_t*`	Pointer to the data structure storing intermediate DSS results (`MKL_DSS_HANDLE`).
opt	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `_INTEGER_t const*`	Parameter to pass the DSS options. The default value is `MKL_DSS_POSITIVE_DEFINITE`.
rValues	**FORTRAN 77:** `REAL*4` or `REAL*8` **Fortran 90:** `REAL(KIND=4), INTENT(IN)` or `REAL(KIND=8), INTENT(IN)` **C:** `VOID const*`	Array of elements of the matrix *A*. Real data, single or double precision*).
cValues	**FORTRAN 77:** `COMPLEX*8` or `COMPLEX*16`	Array of elements of the matrix *A*. Complex data, single or double precision*).

Name	Type	Description
	Fortran 90: `COMPLEX(KIND=4)`, `INTENT(IN)` or `COMPLEX(KIND=8), INTENT(IN)` **C:** `VOID const*`	
Values	**Fortran 90:** `REAL(KIND=4)`, `INTENT(OUT)`, or `REAL(KIND=8), INTENT(OUT)`, or `COMPLEX(KIND=4), INTENT(OUT)`, or `COMPLEX(KIND=8), INTENT(OUT)`	Array of elements of the matrix *A*. Real or complex data, single or double precision*).

*) - data type (single or double precision) must be in correspondence with precision specified by the parameter *opt* in the routine `dss_create`.

Return Values

`MKL_DSS_SUCCESS`

`MKL_DSS_STATE_ERR`

`MKL_DSS_INVALID_OPTION`

`MKL_DSS_OPTION_CONFLICT`

`MKL_DSS_OUT_OF_MEMORY`

`MKL_DSS_ZERO_PIVOT`

dss_solve_real, dss_solve_complex

Compute the corresponding solutions vector and place it in the output array.

Syntax

C:

`dss_solve_real(`*`handle`*`, `*`opt`*`, `*`rRhsValues`*`, `*`nRhs`*`, `*`rSolValues`*`)`

`dss_solve_complex(`*`handle`*`, `*`opt`*`, `*`cRhsValues`*`, `*`nRhs`*`, `*`cSolValues`*`)`

FORTRAN 77:

`call dss_solve_real(`*`handle`*`, `*`opt`*`, `*`rRhsValues`*`, `*`nRhs`*`, `*`rSolValues`*`)`

`call dss_solve_complex(`*`handle`*`, `*`opt`*`, `*`cRhsValues`*`, `*`nRhs`*`, `*`cSolValues`*`)`

Fortran 90:

unified Fortran 90 interface:

```
call dss_solve(handle, opt, RhsValues, nRhs, SolValues)
```

or FORTRAN 77 like interface:

```
call dss_solve_real(handle, opt, rRhsValues, nRhs, rSolValues)
call dss_solve_complex(handle, opt, cRhsValues, nRhs, cSolValues)
```

Include Files

The FORTRAN 77 interface is specified in the `mkl_dss.f77` include file, the Fortran 90 interface is specified in the `mkl_dss.f90` include file, and the C interface is specified in the `mkl_dss.h` include file.

Description

For each right hand side column vector defined in the arrays *rRhsValues*, *cRhsValues*, or *RhsValues*, these routines compute the corresponding solutions vector and place it in the arrays *rSolValues*, *cSolValues*, or *SolValues* respectively.

The lengths of the right-hand side and solution vectors, *nCols* and *nRows* respectively, must be defined in a previous call to dss_define_structure.

By default, both routines perform full solution step (it corresponds to *phase* =33 in PARDISO). The parameter *opt* enables to calculate the final solution step-by-step, calling forward and backward substitutions. If it is set to `MKL_DSS_FORWARD_SOLVE` - the forward substitution (corresponding to *phase* =331 in PARDISO) is performed, if it is set to `MKL_DSS_DIAGONAL_SOLVE` - the diagonal substitution (corresponding to *phase* =332 in PARDISO) is performed, and if it is set to `MKL_DSS_BACKWARD_SOLVE` - the backward substitution (corresponding to *phase* =333 in PARDISO) is performed. For more details about using these substitutions for different types of matrices, see description of the PARDISO solver.

This parameter also can control number of refinement steps that is used on the solution stage: if it is set to `MKL_DSS_REFINEMENT_OFF`, the maximum number of refinement steps equal to zero, and if it is set to `MKL_DSS_REFINEMENT_ON` (default value), the maximum number of refinement steps is equal to 2.

Input Parameters

Name	Type	Description
handle	**FORTRAN 77:** `INTEGER*8` **Fortran 90:** `TYPE (MKL_DSS_HANDLE), INTENT(INOUT)` **C:** `_MKL_DSS_HANDLE_t*`	Pointer to the data structure storing intermediate DSS results (`MKL_DSS_HANDLE`).
opt	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `_INTEGER_t const*`	Parameter to pass the DSS options.

Name	Type	Description
nRhs	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Number of the right-hand sides in the linear equation.
rRhsValues	**FORTRAN 77:** REAL*4 or REAL*8 **Fortran 90:** REAL(KIND=4), INTENT(IN) or REAL(KIND=8), INTENT(IN) **C:** VOID const*	Array of size *nRows* by *nRhs*. Contains real right-hand side vectors. Real data, single or double precision*).
cRhsValues	**FORTRAN 77:** COMPLEX*8 or COMPLEX*16 **Fortran 90:** COMPLEX(KIND=4), INTENT(IN) or COMPLEX(KIND=8), INTENT(IN) **C:** VOID const*	Array of size *nRows* by *nRhs*. Contains complex right-hand side vectors. Complex data, single or double precision*).
RhsValues	**Fortran 90:** REAL(KIND=4), INTENT(IN), or REAL(KIND=8), INTENT(IN), or COMPLEX(KIND=4), INTENT(IN), or COMPLEX(KIND=8), INTENT(IN)	Array of size *nRows* by *nRhs*. Contains right-hand side vectors. Real or complex data, single or double precision*).

*) - data type (single or double precision) must be in correspondence with precision specified by the parameter *opt* in the routine dss_create.

Output Parameters

Name	Type	Description
rSolValues	**FORTRAN 77:** REAL*4 or REAL*8 **Fortran 90:** REAL(KIND=4), INTENT(OUT) or REAL(KIND=8), INTENT(OUT) **C:** VOID const*	Array of size *nCols* by *nRhs*. Contains real solution vectors. Real data, single or double precision*).

Name	Type	Description
cSolValues	**FORTRAN 77:** COMPLEX*8 or COMPLEX*16 **Fortran 90:** COMPLEX(KIND=4), INTENT(OUT) or COMPLEX(KIND=8), INTENT(OUT) **C:** VOID const*	Array of size *nCols* by *nRhs*. Contains complex solution vectors. Complex data, single or double precision*).
SolValues	**Fortran 90:** REAL(KIND=4), INTENT(OUT), or REAL(KIND=8), INTENT(OUT), or COMPLEX(KIND=4), INTENT(OUT), or COMPLEX(KIND=8), INTENT(OUT)	Array of size *nColws* by *nRhs*. Contains solution vectors. Real or complex data, single or double precision*).

*) - data type (single or double precision) must be in correspondence with precision specified by the parameter *opt* in the routine dss_create.

Return Values

MKL_DSS_SUCCESS

MKL_DSS_STATE_ERR

MKL_DSS_INVALID_OPTION

MKL_DSS_OUT_OF_MEMORY

dss_delete

Deletes all of data structures created during the solutions process.

Syntax

C:

dss_delete(*handle*, *opt*)

Fortran:

call dss_delete(*handle*, *opt*)

Include Files

The FORTRAN 77 interface is specified in the mkl_dss.f77 include file, the Fortran 90 interface is specified in the mkl_dss.f90 include file, and the C interface is specified in the mkl_dss.h include file.

Description

The routine dss_delete deletes all data structures created during the solving process.

Input Parameters

Name	Type	Description
opt	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** _INTEGER_t const*	Parameter to pass the DSS options. The default value is MKL_DSS_MSG_LVL_WARNING + MKL_DSS_TERM_LVL_ERROR.

Output Parameters

Name	Type	Description
handle	**FORTRAN 77:** INTEGER*8 **Fortran 90:** TYPE (MKL_DSS_HANDLE), INTENT(INOUT) **C:** _MKL_DSS_HANDLE_t*	Pointer to the data structure storing intermediate DSS results (MKL_DSS_HANDLE).

Return Values

MKL_DSS_SUCCESS

MKL_DSS_INVALID_OPTION

MKL_DSS_OUT_OF_MEMORY

dss_statistics

Returns statistics about various phases of the solving process.

Syntax

C:

```
dss_statistics(handle, opt, statArr, retValues)
```

Fortran:

```
call dss_statistics(handle, opt, statArr, retValues)
```

Include Files

The FORTRAN 77 interface is specified in the mkl_dss.f77 include file, the Fortran 90 interface is specified in the mkl_dss.f90 include file, and the C interface is specified in the mkl_dss.h include file.

Description

The dss_statistics routine returns statistics about various phases of the solving process. This routine gathers the following statistics:

- time taken to do reordering,
- time taken to do factorization,

- problem solving duration,
- determinant of a matrix,
- inertia of a matrix,
- number of floating point operations taken during factorization,
- total peak memory needed during the analysis and symbolic factorization,
- permanent memory needed from the analysis and symbolic factorization,
- memory consumption for the factorization and solve phases.

Statistics are returned in accordance with the input string specified by the parameter *statArr*. The value of the statistics is returned in double precision in a return array allocated by user.

For multiple statistics, multiple string constants separated by commas can be used as input. Return values are put into the return array in the same order as specified in the input string.

Statistics must be requested only at the appropriate stages of the solving process. For example, inquiring about `FactorTime` before a matrix is factored leads to errors.

The following table shows the point at which each individual statistics item can be called:

Table 8-3 Statistics Calling Sequences

Type of Statistics	When to Call
`ReorderTime`	After `dss_reorder` is completed successfully.
`FactorTime`	After `dss_factor_real` or `dss_factor_complex` is completed successfully.
`SolveTime`	After `dss_solve_real` or `dss_solve_complex` is completed successfully.
`Determinant`	After `dss_factor_real` or `dss_factor_complex` is completed successfully.
`Inertia`	After `dss_factor_real` is completed successfully and the matrix is real, symmetric, and indefinite.
`Flops`	After `dss_factor_real` or `dss_factor_complex` is completed successfully.
`Peakmem`	After `dss_reorder` is completed successfully.
`Factormem`	After `dss_reorder` is completed successfully.
`Solvemem`	After `dss_factor_real` or `dss_factor_complex` is completed successfully.

Input Parameters

Name	Type	Description
handle	**FORTRAN 77:** `INTEGER*8` **Fortran 90:** `TYPE (MKL_DSS_HANDLE), INTENT(IN)` **C:** `_MKL_DSS_HANDLE_t*`	Pointer to the data structure storing intermediate DSS results (`MKL_DSS_HANDLE`).
opt	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `_INTEGER_t const*`	Parameter to pass the DSS options.

Name	Type	Description
statArr	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** char const*	Input string that defines the type of the returned statistics. The parameter can include one or more of the following string constants (case of the input string has no effect): `ReorderTime` — Amount of time taken to do the reordering. `FactorTime` — Amount of time taken to do the factorization. `SolveTime` — Amount of time taken to solve the problem after factorization. `Determinant` — Determinant of the matrix *A*. For real matrices: the determinant is returned as `det_pow`, `det_base` in two consecutive return array locations, where `1.0` ≤`abs(`*det_base*`) < 10.0` and `determinant =` *det_base*`*10`$^{(det_pow)}$. For complex matrices: the determinant is returned as *det_pow*, *det_re*, *det_im* in three consecutive return array locations, where `1.0` ≤`abs(`*det_re*`) + abs(`*det_im*`) < 10.0` and `determinant =` *det_re*, *det_im*`*10`$^{(det_pow)}$. `Inertia` — Inertia of a real symmetric matrix is defined as a triplet of nonnegative integers (*p*,*n*,*z*), where *p* is the number of positive eigenvalues, *n* is the number of negative eigenvalues, and *z* is the number of zero eigenvalues. `Inertia` is returned as three consecutive return array locations as *p*, *n*, *z*. Computing `Inertia` is recommended only for stable matrices. Unstable matrices can lead to incorrect results. `Inertia` of a *k*-by-*k* real symmetric positive definite matrix is always (*k*, `0, 0`). Therefore `Inertia` is returned only in cases of real symmetric indefinite matrices. For all other matrix types, an error message is returned. `Flops` — Number of floating point operations performed during the factorization. `Peakmem` — Total peak memory in KBytes that the solver needs during the analysis and symbolic factorization phase. `Factormem` — Permanent memory in KBytes that the solver needs from the analysis and symbolic factorization phase in the factorization and solve phases.

Name	Type	Description
	Solvemem	Total double precision memory consumption (KBytes) of the solver for the factorization and solve phases.

NOTE. To avoid problems in passing strings from Fortran to C, Fortran users must call the mkl_cvt_to_null_terminated_str routine before calling dss_statistics. Refer to the description of mkl_cvt_to_null_terminated_str for details.

Output Parameters

Name	Type	Description
retValues	**FORTRAN 77:** REAL*8 **Fortran 90:** REAL(KIND=8), INTENT(OUT) **C:** VOID const*	Value of the statistics returned.

Finding 'time used to reorder' and 'inertia' of a matrix

The example below illustrates the use of the dss_statistics routine.

To find the above values, call dss_statistics(*handle*, *opt*, *statArr*, *retValues*), where *statArr* is "ReorderTime,Inertia"

In this example, *retValues* has the following values:

Return Values

MKL_DSS_SUCCESS

MKL_DSS_STATISTICS_INVALID_MATRIX

MKL_DSS_STATISTICS_INVALID_STATE

MKL_DSS_STATISTICS_INVALID_STRING

mkl_cvt_to_null_terminated_str

Passes character strings from Fortran routines to C routines.

Syntax

mkl_cvt_to_null_terminated_str (*destStr*, *destLen*, *srcStr*)

Description

This routine is declared in mkl_dss.f77 for FORTRAN 77 interface and in mkl_dss.f90 for Fortran 90 interface.

The routine `mkl_cvt_to_null_terminated_str` passes character strings from Fortran routines to C routines. The strings are converted into integer arrays before being passed to C. Using this routine avoids the problems that can occur on some platforms when passing strings from Fortran to C. The use of this routine is highly recommended.

Input Parameters

destLen	INTEGER. Length of the output array *destStr*.
srcStr	STRING. Input string.

Output Parameters

destStr	INTEGER. One-dimensional array of integer.

Implementation Details

Several aspects of the Intel MKL DSS interface are platform-specific and language-specific. To promote portability across platforms and ease of use across different languages, one of the following Intel MKL DSS language-specific header files can be included:

- `mkl_dss.f77` for F77 programs
- `mkl_dss.f90` for F90 programs
- `mkl_dss.h` for C programs

These header files define symbolic constants for error returns, function options, certain defined data types, and function prototypes.

NOTE. Constants for options, error returns, and message severities must be referred only by the symbolic names that are defined in these header files. Use of the Intel MKL DSS software without including one of the above header files is not supported.

Memory Allocation and Handles

To simplify the use of the Intel MKL DSS routines, they do not require the user to allocate any temporary working storage. The solver itself allocates any required storage. To enable multiple users to access the solver simultaneously, the solver keeps track of the storage allocated for a particular application by using an opaque data object called a *handle*.

Each of the Intel MKL DSS routines creates, uses or deletes a handle. Consequently, user programs must be able to allocate storage for a handle. The exact syntax for allocating storage for a handle varies from language to language. To standardize the handle declarations, the language-specific header files declare constants and defined data types that should be used when declaring a handle object in the user code.

Fortran 90 programmers should declare a handle as:

```
INCLUDE "mkl_dss.f90"

TYPE(MKL_DSS_HANDLE) handle
```

C and C++ programmers should declare a handle as:

```
#include "mkl_dss.h"

_MKL_DSS_HANDLE_t handle;
```

FORTRAN 77 programmers using compilers that support eight byte integers, should declare a handle as:

```
INCLUDE "mkl_dss.f77"

INTEGER*8 handle
```

Otherwise they should replace the `INTEGER*8` data types with the `DOUBLE PRECISION` data type.

In addition to the definition for the correct declaration of a handle, the include file also defines the following:

- function prototypes for languages that support prototypes
- symbolic constants that are used for the error returns
- user options for the solver routines
- message severity.

Iterative Sparse Solvers based on Reverse Communication Interface (RCI ISS)

Intel MKL supports the iterative sparse solvers (ISS) based on the reverse communication interface (RCI), referred to here as . The RCI ISS interface implements a group of user-callable routines that are used in the step-by-step solving process of a symmetric positive definite system (RCI Conjugate Gradient Solver, or RCI CG), and of a non-symmetric indefinite (non-degenerate) system (RCI Flexible Generalized Minimal RESidual Solver, or RCI FGMRES) of linear algebraic equations and exploits the general RCI scheme described in [Dong95].

See the Linear Solvers Basics for discussion of terms and concepts related to the ISS routines.

RCI means that when the solver needs the results of certain operations (for example, matrix-vector multiplications), the user himself must perform them and pass the result to the solver. This gives the great universality to the solver as it is independent of the specific implementation of the operations like the matrix-vector multiplication. To perform such operations, the user can use the built-in sparse matrix-vector multiplications and triangular solvers routines (see Sparse BLAS Level 2 and Level 3).

NOTE. The RCI CG solver is implemented in two versions: for system of equations with single right hand side, and for system of equations with multiple right hand sides.

The CG method may fail to compute the solution or compute the wrong solution if the matrix of the system is not symmetric and positive definite.

The FGMRES method may fail if the matrix is degenerate.

Table 8-4 lists the names of the routines, and describes their general use.

Table 8-4 RCI ISS Interface Routines

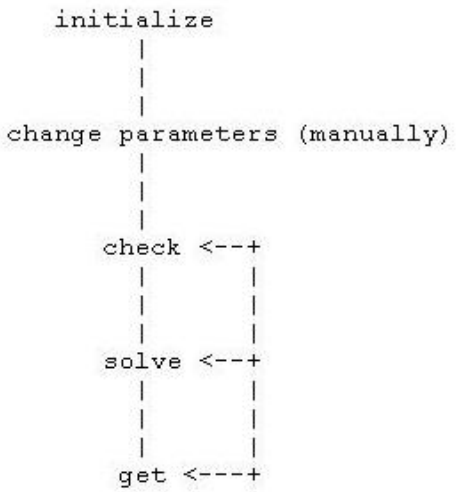
Routine	Description
`dcg_init`, `dcgmrhs_init`, `dfgmres_init`	Initializes the solver.
`dcg_check`, `dcgmrhs_check`, `dfgmres_check`	Checks the consistency and correctness of the user defined data.

Routine	Description
dcg, dcgmrhs, dfgmres	Computes the approximate solution vector.
dcg_get, dcgmrhs_get, dfgmres_get	Retrieves the number of the current iteration.

The Intel MKL RCI ISS interface routines are normally invoked in the order listed in Table8-4, with the exception of dcg_get, dcgmrhs_get, and dfgmres_get routines that can be invoked at any place in the code. However, in this case some precautions should be taken to avoid the wrong results. Advanced users can change that order if they need it. Others should follow the above order of calls.

The following diagram in Figure 8-3 indicates the typical order in which the RCI ISS interface routines can be invoked.

Figure 8-3 Typical Order for Invoking RCI ISS interface Routines



Code examples that use the RCI ISS interface routines to solve systems of linear equations can be found in the `examples\solver\source` folder of your Intel MKL directory (`cg_no_precon.f`, `cg_no_precon_c.c`, `cg_mrhs.f`, `cg_mrhs_precond.f`, `cg_mrhs_stop_crt.f`, `fgmres_no_precon_f.f`, `fgmres_no_precon_c.c`).

CG Interface Description

All types in this documentation refer to the common Fortran types, `INTEGER`, and `DOUBLE PRECISION`.

C and C++ programmers should refer to the section Calling Sparse Solver and Preconditioner Routines From C/C++ for information on mapping Fortran types to C/C++ types.

Each routine for the RCI CG solver is implemented in two versions: for a system of equations with a single right hand side (SRHS), and for a system of equations with multiple right hand sides (MRHS). The names of routines for a system with MRHS contain the suffix `mrhs`.

Routines Options

All of the RCI CG routines have parameters for passing various options to the routines. The values for these parameters should be specified very carefully (see CG Common Parameters), and they can be changed during computations according to the user's needs.

NOTE. Provide correct and consistent parameters to the subroutines to avoid fails or wrong results.

User Data Arrays

Many of the RCI CG routines take arrays of user data as input. For example, user arrays are passed to the routine dcg to compute the solution of a system of linear algebraic equations. The Intel MKL RCI CG routines do not make copies of the user input arrays to minimize storage requirements and improve overall run-time efficiency.

CG Common Parameters

NOTE. The default and initial values listed below are assigned to the parameters by calling the `dcg_init/dcgmrhs_init` routine.

n - INTEGER, this parameter sets the size of the problem in the `dcg_init/dcgmrhs_init` routine. All the other routines uses the *ipar*(1) parameter instead.

x - DOUBLE PRECISION array of size *n* for SRHS, or matrix of size *n*-by-*nrhs* for MRHS. This parameter contains the current approximation to the solution. Before the first call to the dcg/dcgmrhs routine, it contains the initial approximation to the solution.

nrhs - INTEGER, this parameter sets the number of right-hand sides for MRHS routines.

b - DOUBLE PRECISION array containing a single right-hand side vector, or matrix (*nrhs*, *n*) containing right-hand side vectors.

RCI_request - INTEGER, this parameter informs about the result of work of the RCI CG routines. The negative values of the parameter indicate that the routine is completed with errors or warnings. The 0 value indicates the successful completion of the task. The positive values mean that the user must perform certain actions, specifically:

- *RCI_request*= 1 - to multiply the matrix by *tmp* (1:*n*,1), put the result in *tmp*(1:*n*,2), and return the control to the dcg/dcgmrhs routine;
- *RCI_request*= 2 - to perform the stopping tests. If they fail, return the control to the dcg/dcgmrhs routine. Otherwise, the solution is found and stored in the *x* array;
- *RCI_request*= 3 - for SRHS: to apply the preconditioner to *tmp*(1:*n*,3), put the result in *tmp*(1:*n*,4), and return the control to the dcg routine;
  - for MRHS: to apply the preconditioner to *tmp*(:,3+*ipar*(3)), put the result in *tmp*(:,3), and return the control to the dcgmrhs routine.

Note that the `dcg_get/dcgmrhs_get` routine does not change the parameter *RCI_request*. This enables to use this routine inside the Reverse Communication computations.

ipar - INTEGER array, of size 128 for SRHS, and of size (128+2**nrhs*) for MRHS; this parameter specifies the integer set of data for the RCI CG computations:

ipar(1) - specifies the size of the problem. The dcg_init/dcgmrhs_init routine assigns *ipar*(1)=*n*. All the other routines uses this parameter instead of *n*. There is no default value for this parameter.

ipar(2) - specifies the type of output for error and warning messages generated by the RCI CG routines. The default value 6 means that all messages are displayed on the screen. Otherwise the error and warning messages are written to the newly created files dcg_errors.txt and dcg_check_warnings.txt respectively. Note that if *ipar*(6) and *ipar*(7) parameters are set to 0, error and warning messages are not generated at all.

ipar(3) - for SRHS: contains the current stage of the RCI CG computations, the initial value is 1;
- for MRHS: contains the right-hand side for which the calculations are currently performed.

WARNING. Avoid altering this variable during computations.

ipar(4) - contains the current iteration number, the initial value is 0.

ipar(5) - specifies the maximum number of iterations, the default value is min{150, *n*}.

ipar(6) - if the value is not equal to 0, the routines output error messages in accordance with the parameter *ipar*(2). Otherwise, the routines do not output error messages at all, but return a negative value of the parameter *RCI_request*. The default value is 1.

ipar(7) - if the value is not equal to 0, the routines output warning messages in accordance with the parameter *ipar*(2). Otherwise, the routines do not output warning messages at all, but they return a negative value of the parameter *RCI_request*. The default value is 1.

ipar(8) - if the value is not equal to 0, the dcg/dcgmrhs routine performs the stopping test for the maximum number of iterations, namely, *ipar*(4)≤*ipar*(5). Otherwise, the method is stopped and the corresponding value is assigned to the *RCI_request*. If the value is 0, the routine does not perform this stopping test. The default value is 1.

ipar(9) - if the value is not equal to 0, the dcg/dcgmrhs routine performs the residual stopping test, namely, *dpar*(5)≤*dpar*(4)=*dpar*(1)**dpar*(3)+*dpar*(2). Otherwise, the method is stopped and corresponding value is assigned to the *RCI_request*. If the value is 0, the routine does not perform this stopping test. The default value is 0.

ipar(10) - if the value is not equal to 0, the dcg/dcgmrhs routine requests a user-defined stopping test by setting the output parameter *RCI_request*=2. If the value is 0, the routine does not perform the user defined stopping test. The default value is 1.

NOTE. At least one of the parameters *ipar*(8)-*ipar*(10) must be set to 1.

ipar(11) - if the value is equal to 0, the dcg/dcgmrhs routine runs the non-preconditioned version of the corresponding Conjugate Gradient method. Otherwise, the routine runs the preconditioned version of the Conjugate Gradient method, and requests the user to perform the preconditioning step by setting the output parameter *RCI_request*=3. The default value is 0.

ipar(11:128), *ipar*(11:128+2**nrhs*) are reserved and not used in the current RCI CG SRHS and MRHS routines respectively.

NOTE. Advanced users can define the array in the code using RCI CG SRHS as INTEGER *ipar*(11). However, to guarantee compatibility with the future releases of Intel MKL, declaring the array *ipar* with length 128 is highly recommended.

dpar - DOUBLE PRECISION array, for SRHS of size 128, for MRHS of size (128+2**nrhs*); this parameter is used to specify the double precision set of data for the RCI CG computations, specifically:

dpar(1) - specifies the relative tolerance. The default value is 1.0D-6.

dpar(2) - specifies the absolute tolerance. The default value is 0.0D-0.

dpar(3) - specifies the square norm of the initial residual (if it is computed in the dcg/dcgmrhs routine). The initial value is 0.

dpar(4)	- service variable equal to *dpar*(1)**dpar*(3)+*dpar*(2) (if it is computed in the dcg/dcgmrhs routine). The initial value is 0.
dpar(5)	- specifies the square norm of the current residual. The initial value is 0.0.
dpar(6)	- specifies the square norm of residual from the previous iteration step (if available). The initial value is 0.0.
dpar(7)	- contains the *alpha* parameter of the CG method. The initial value is 0.0.
dpar(8)	- contains the *beta* parameter of the CG method, it is equal to *dpar*(5)/*dpar*(6) The initial value is 0.0.
dpar(9:128), *dpar*(9:128+2**nrhs*)	are reserved and not used in the current RCI CG SRHS and MRHS routines respectively.

NOTE. Advanced users can define this array in the code using RCI CG SRHS as DOUBLE PRECISION *dpar*(8). However, to guarantee compatibility with the future releases of Intel MKL, declaring the array *dpar* with length 128 is highly recommended.

tmp - DOUBLE PRECISION array of size (*n*,4)for SRHS, and (*n*,3+*nrhs*)for MRHS. This parameter is used to supply the double precision temporary space for the RCI CG computations, specifically:

tmp(:,1)	- specifies the current search direction. The initial value is 0.0.
tmp(:,2)	- contains the matrix multiplied by the current search direction. The initial value is 0.0.
tmp(:,3)	- contains the current residual. The initial value is 0.0.
tmp(:,4)	- contains the inverse of the preconditioner applied to the current residual. There is no initial value for this parameter.

NOTE. Advanced users can define this array in the code using RCI CG SRHS as DOUBLE PRECISION *tmp*(*n*,3) if they run only non-preconditioned CG iterations.

Scheme of Using the RCI CG Routines

The following pseudocode shows the general schemes of using the RCI CG routines.

```
...
generate matrix A
generate preconditioner C (optional)
   call dcg_init(n, x, b, RCI_request, ipar, dpar, tmp)
   change parameters in ipar, dpar if necessary
   call dcg_check(n, x, b, RCI_request, ipar, dpar, tmp)
1  call dcg(n, x, b, RCI_request, ipar, dpar, tmp)
   if (RCI_request.eq.1) then
    multiply the matrix A by tmp(1:n,1) and put the result in tmp(1:n,2)
   It is possible to use MKL Sparse BLAS Level 2 subroutines for this operation
c  proceed with CG iterations
     goto 1
   endif
   if (RCI_request.eq.2)then
    do the stopping test
    if (test not passed) then
c  proceed with CG iterations
     go to 1
    else
c  stop CG iterations
     goto 2
    endif
   endif
   if (RCI_request.eq.3) then (optional)
   apply the preconditioner C inverse to tmp(1:n,3) and put the result in tmp(1:n,4)
c  proceed with CG iterations
    goto 1
   end
2 call dcg_get(n, x, b, RCI_request, ipar, dpar, tmp, itercount)
  current iteration number is in itercount
  the computed approximation is in the array x
```

FGMRES Interface Description

All types in this documentation refer to the common Fortran types, INTEGER, and DOUBLE PRECISION.

C and C++ programmers should refer to the section Calling Sparse Solver Routines From C/C++ for information on mapping Fortran types to C/C++ types.

Routines Options

All of the RCI FGMRES routines have parameters for passing various options to the routines. The values for these parameters should be specified very carefully (see FGMRES Common Parameters), and they can be changed during computations according to the user's needs.

NOTE. Provide correct and consistent parameters to the subroutines to avoid fails or wrong results.

User Data Arrays

Many of the RCI FGMRES routines take arrays of user data as input. For example, user arrays are passed to the routine dfgmres to compute the solution of a system of linear algebraic equations. To minimize storage requirements and improve overall run-time efficiency, the Intel MKL RCI FGMRES routines do not make copies of the user input arrays.

FGMRES Common Parameters

NOTE. The default and initial values listed below are assigned to the parameters by calling the dfgmres_init routine.

n - INTEGER, this parameter sets the size of the problem in the dfgmres_init routine. All the other routines uses *ipar*(1) parameter instead.

x - DOUBLE PRECISION array, this parameter contains the current approximation to the solution vector. Before the first call to the dfgmres routine, it contains the initial approximation to the solution vector.

b - DOUBLE PRECISION array, this parameter contains the right-hand side vector. Depending on user requests, it may later contain the approximate solution.

RCI_request - INTEGER, this parameter informs about the result of work of the RCI FGMRES routines. The negative values of the parameter indicate that the routine is completed with errors or warnings. The 0 value indicates the successful completion of the task. The positive values mean that the user must perform certain actions, specifically:

RCI_request= 1 - multiply the matrix by *tmp*(*ipar*(22)), put the result in *tmp*(*ipar*(23)), and return the control to the dfgmres routine;

RCI_request= 2 - perform the stopping tests. If they fail, return the control to the dfgres routine. Otherwise, the solution can be updated by a subsequent call to dfgmres_get routine;

RCI_request= 3 - apply the preconditioner to *tmp*(*ipar*(22)), put the result in *tmp(ipar*(23)), and return the control to the dfgmres routine.

RCI_request= 4 - check if the norm of the current orthogonal vector is not zero within the rounding/computational errors. Return the control to the dfgmres routine if it is not zero, otherwise complete the solution process by calling dfgmres_get routine.

ipar(128) - INTEGER array, this parameter specifies the integer set of data for the RCI FGMRES computations:

ipar(1) - specifies the size of the problem. The dfgmres_init routine assigns *ipar*(1)=*n*. All the other routines uses this parameter instead of *n*. There is no default value for this parameter.

ipar(2) - specifies the type of output for error and warning messages that are generated by the RCI FGMRES routines. The default value 6 means that all messages are displayed on the screen. Otherwise the error and warning messages are written to the newly created file MKL_RCI_FGMRES_Log.txt. Note that if *ipar*(6) and *ipar*(7) parameters are set to 0, error and warning messages are not generated at all.

ipar(3) - contains the current stage of the RCI FGMRES computations, the initial value is 1.

WARNING. Avoid altering this variable during computations.

ipar(4) - contains the current iteration number. The initial value is 0.

ipar(5) - specifies the maximum number of iterations. The default value is *min* {150,*n*}.

ipar(6) - if the value is not equal to 0, the routines output error messages in accordance with the parameter *ipar*(2). Otherwise, the routines do not output error messages at all, but return a negative value of the parameter *RCI_request*. The default value is 1.

ipar(7) - if the value is not equal to 0, the routines output warning messages in accordance with the parameter *ipar*(2). Otherwise, the routines do not output

warning messages at all, but they return a negative value of the parameter *RCI_request*. The default value is 1.

ipar(8) - if the value is not equal to 0, the dfmres routine performs the stopping test for the maximum number of iterations, namely, *ipar*(4)≤*ipar*(5). Otherwise, the method is stopped and the corresponding value is assigned to the *RCI_request*. If the value is 0, the dfgmres routine does not perform this stopping test. The default value is 1.

ipar(9) - if the value is not equal to 0, the dfgmres routine performs the residual stopping test, namely, *dpar*(5)≤*dpar*(4) = *dpar*(1)·*dpar*(3)+*dpar*(2). If the criterion is met, the method is stopped and corresponding value is assigned to the output parameter *RCI_request*. If the value is 0, the dfgmres routine does not perform this stopping test. The default value is 0.

ipar(10) - if the value is not equal to 0, the dfgmres routine requests for the user defined stopping test by setting *RCI_request*=2. If the value is 0, the dfgmres routine does not perform the user defined stopping test. The default value is 1.

NOTE. At least one of the parameters *ipar*(8)-*ipar*(10) must be set to 1.

ipar(11) - if the value is equal to 0, the dfgmres routine runs the non-preconditioned version of the FGMRES method. Otherwise, the routine runs the preconditioned version of the FGMRES method, and requests the user to perform the preconditioning step by setting the output parameter *RCI_request*=3. The default value is 0.

ipar(12) - if the value is not equal to 0, the dfgmres routine performs the automatic test for zero norm of the currently generated vector, namely, *dpar*(7)≤*dpar*(8), where *dpar*(8) contains the tolerance value. Otherwise, the routine requests the user to perform this check by setting the output parameter *RCI_request*=4. The default value is 0.

ipar(13) - if the value is equal to 0, the dfgmres_get routine updates the solution to the vector *x* according to the computations done by the dfgmres routine. If the value is positive, the routine writes the solution to the right

hand side vector *b*. If the value is negative, the routine returns only the number of the current iteration, and does not update the solution. The default value is 0

NOTE. Advanced users may use the `dfgmres_get` routine at any place in the code. In this case special attention should be paid to the parameter *ipar*(13). The RCI FGMRES iterations can be continued after the call to `dfgmres_get` routine only if the parameter *ipar*(13) is not equal to zero. If *ipar*(13) is positive, then the updated solution overwrites the right hand side in the vector *b*. If the user wants to run the restarted version of FGMRES with the same right hand side, then it must be saved in a different memory location before the first call to the `dfgmres_get` routine with positive *ipar*(13).

ipar(14) - contains the internal iteration counter that counts the number of iterations before the restart takes place. The initial value is 0.

WARNING. Avoid altering this variable during computations.

ipar(15) - specifies the length of the non-restarted FGMRES iterations. To run the restarted version of the FGMRES method, the user must assign the number of iterations to *ipar*(15) before the restart. The default value is *min* {150, *n*}, that is, by default the non-restarted version of FGMRES method is used.

ipar(16) - service variable, specifies the location of the rotated Hessenberg matrix from which the matrix stored in the packed format (see Matrix Arguments in the Appendix B for details) is started in the *tmp* array.

ipar(17) - service variable, specifies the location of the rotation cosines from which the vector of cosines is started in the *tmp* array.

ipar(18) - service variable, specifies the location of the rotation sines from which the vector of sines is started in the *tmp* array.

ipar(19) - service variable, specifies the location of the rotated residual vector from which the vector is started in the *tmp* array.

ipar(20) - service variable, specifies the location of the least squares solution vector from which the vector is started in the *tmp* array.

ipar(21) - service variable, specifies the location of the set of preconditioned vectors from which the set is started in the *tmp* array. The memory locations in the *tmp* array starting from *ipar*(21) are used only for the preconditioned FGMRES method.

ipar(22) - specifies the memory location from which the first vector (source) used in operations requested via *RCI_request* is started in the *tmp* array.

ipar(23) - specifies the memory location from which the second vector (source) used in operations requested via *RCI_request* is started in the *tmp* array.

ipar(24:128) are reserved and not used in the current RCI FGMRES routines.

NOTE. Advanced users can define the array in the code as INTEGER *ipar*(23). However, to guarantee compatibility with the future releases of Intel MKL, declaring the array *ipar* with length 128 is highly recommended.

dpar(128) - DOUBLE PRECISION array, this parameter specifies the double precision set of data for the RCI CG computations, specifically:

dpar(1) - specifies the relative tolerance. The default value is 1.0D-6.

dpar(2) - specifies the absolute tolerance. The default value is 0.0D-0.

dpar(3) - specifies the Euclidean norm of the initial residual (if it is computed in the dfgmres routine). The initial value is 0.0.

dpar(4) - service variable equal to *dpar*(1)*dpar(3)+*dpar*(2) (if it is computed in the dfgmres routine). The initial value is 0.0.

dpar(5) - specifies the Euclidean norm of the current residual. The initial value is 0.0.

dpar(6) - specifies the Euclidean norm of residual from the previous iteration step (if available). The initial value is 0.0.

dpar(7) - contains the norm of the generated vector. The initial value is 0.0.

NOTE. For reference only: in terms of [Saad03] this parameter is the coefficient $h_{k+1,k}$ of the Hessenberg matrix.

dpar(8) - contains the tolerance for the zero norm of the currently generated vector. The default value is 1.0D-12.

dpar(9:128) are reserved and not used in the current RCI FGMRES routines.

NOTE. Advanced users can define this array in the code as follows: DOUBLE PRECISION *dpar*(8). However, to guarantee compatibility with the future releases of Intel MKL, declaring the array *dpar* with length 128 is highly recommended.

tmp -DOUBLE PRECISION array of size ((2**ipar*(15)+1)**n* + *ipar*(15)*(*ipar*(15)+9)/2 + 1)), this parameter is used to supply the double precision temporary space for the RCI FGMRES computations, specifically:

tmp(1:ipar(16)*-1)* - contains the sequence of generated by the FGMRES method vectors. The initial value is 0.0 for the first part of this memory of length *n*;

tmp(ipar(16)*:ipar*(17)*-1)* contains the rotated Hessenberg matrix generated by the FGMRES method; the matrix is stored in the packed format. There is no initial value for this part of *tmp* array.

tmp(ipar(17)*:ipar*(18)*-1)* - contains the rotation cosines vector generated by the FGMRES method. There is no initial value for this part of *tmp* array.

tmp(ipar(18)*:ipar*(19)*-1)* contains the rotation sines vector generated by the FGMRES method. There is no initial value for this part of *tmp* array.

tmp(ipar(19)*:ipar*(20)*-1)* contains the rotated residual vector generated by the FGMRES method. There is no initial value for this part of *tmp* array.

tmp(ipar(20)*:ipar*(21)*-1)* contains the solution vector to the least squares problem generated by the FGMRES method. There is no initial value for this part of *tmp* array.

tmp(*ipar*(21):)	contains the set of preconditioned vectors generated for the FGMRES method by the user. This part of *tmp* array is not used if non-preconditioned version of FGMRES method is called. There is no initial value for this part of *tmp* array.

NOTE. Advanced users can define this array in the code as DOUBLE PRECISION *tmp*((2**ipar*(15)+1)**n* + *ipar*(15)*(*ipar*(15)+9)/2 + 1)) if they run only non-preconditioned FGMRES iterations.

Schemes of Using the RCI FGMRES Routines

The following pseudocode shows the general schemes of using the RCI FGMRES routines.

```
...
generate matrix A
generate preconditioner C (optional)
  call dfgmres_init(n, x, b, RCI_request, ipar, dpar, tmp)
   change parameters in ipar, dpar if necessary
   call dfgmres_check(n, x, b, RCI_request, ipar, dpar, tmp)
1  call dfgmres(n, x, b, RCI_request, ipar, dpar, tmp)
   if (RCI_request.eq.1) then
     multiply the matrix A by tmp(ipar(22)) and put the result in tmp(ipar(23))
    It is possible to use MKL Sparse BLAS Level 2 subroutines for this operation
c   proceed with FGMRES iterations
    goto 1
   endif
   if (RCI_request.eq.2) then
    do the stopping test
    if (test not passed) then
c   proceed with FGMRES iterations
     go to 1
    else
c   stop FGMRES iterations
     goto 2
```

```
    endif
   endif
   if (RCI_request.eq.3) then (optional)
   apply the preconditioner C inverse to tmp(ipar(22)) and put the result in tmp(ipar(23))
c  proceed with FGMRES iterations
    goto 1
   endif
   if (RCI_request.eq.4) then
   check the norm of the next orthogonal vector, it is contained in dpar(7)
    if (the norm is not zero up to rounding/computational errors) then
c  proceed with FGMRES iterations
     goto 1
    else
c  stop FGMRES iterations
     goto 2
    endif
   endif
2 call dfgmres_get(n, x, b, RCI_request, ipar, dpar, tmp, itercount)
current iteration number is in itercount
the computed approximation is in the array x
```

NOTE. For the FGMRES method the array *x* initially contains the current initial approximation to the solution that can be updated only by calling the routine `dfgmres_get`. It updates the solution in accordance with the computations performed by the routine `dfgmres`.

The above pseudocode demonstrates two main differences in the use of RCI FGMRES interface comparing with the RCI CG interface. The first difference relates to *RCI_request*=3 (different locations in the *tmp* array, which is 2-dimensional for CG and 1-dimensional for FGMRES). The second difference relates to *RCI_request*=4 (the RCI CG interface never produces *RCI_request*=4).

RCI ISS Routines

dcg_init

Initializes the solver.

Syntax

`dcg_init(n, x, b, RCI_request, ipar, dpar, tmp)`

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine `dcg_init` initializes the solver. After initialization, all subsequent invocations of the Intel MKL RCI CG routines use the values of all parameters returned by the routine `dcg_init`. Advanced users can skip this step and set these parameters directly in the corresponding routines.

WARNING. Users can modify the contents of these arrays after they are passed to the solver routine only if they are sure that the values are correct and consistent. Basic check for correctness and consistency can be done by calling the `dcg_check` routine, but it does not guarantee that the method will work correctly.

Input Parameters

n	`INTEGER`. Contains the size of the problem, and the sizes of arrays *x* and *b*.
x	`DOUBLE PRECISION` array of size *n*. Contains the initial approximation to the solution vector. Normally it is equal to 0 or to *b*.
b	`DOUBLE PRECISION` array of size *n*. Contains the right-hand side vector.

Output Parameters

RCI_request	`INTEGER`. Informs about result of work of the routine.
ipar	`INTEGER` array of size 128. Refer to the CG Common Parameters.
dpar	`DOUBLE PRECISION` array of size 128. Refer to the CG Common Parameters.
tmp	`DOUBLE PRECISION` array of size `(n,4)`. Refer to the CG Common Parameters.

Return Values

RCI_request= 0	The routine completes the task normally.
RCI_request= -10000	The routine fails to complete the task.

dcg_check

Checks consistency and correctness of the user defined data.

Syntax

`dcg_check(n, x, b, RCI_request, ipar, dpar, tmp)`

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine `dcg_check` checks consistency and correctness of the parameters to be passed to the solver routine `dcg`. However this operation does not guarantee that the method gives the correct result. It only reduces the chance of making a mistake in the parameters of the method. Advanced users may skip this operation if they are sure that the correct data is specified in the solver parameters.

WARNING. Users can modify the contents of these arrays after they are passed to the solver routine only if they are sure that the values are correct and consistent. Basic check for correctness and consistency can be done by calling the `dcg_check` routine, but it does not guarantee that the method will work correctly.

Note that lengths of all vectors are assumed to have been defined in a previous call to the `dcg_init` routine.

Input Parameters

n	`INTEGER`. Contains the size of the problem, and size of arrays *x* and *b*.
x	`DOUBLE PRECISION` array of size *n*. Contains the initial approximation to the solution vector. Normally it is equal to 0 or to *b*.
b	`DOUBLE PRECISION` array of size *n*. Contains the right-hand side vector.

Output Parameters

RCI_request	`INTEGER`. Informs about result of work of the routine.
ipar	`INTEGER` array of size 128. Refer to the CG Common Parameters.
dpar	`DOUBLE PRECISION` array of size 128. Refer to the CG Common Parameters.
tmp	`DOUBLE PRECISION` array of size `(n,4)`. Refer to the CG Common Parameters.

Return Values

RCI_request = 0	The routine completes task normally.
RCI_request = -1100	The routine is interrupted, errors occur.
RCI_request = -1001	The routine returns some warning messages.

RCI_request= -1010	The routine changes some parameters to make them consistent or correct.
RCI_request= -1011	The routine returns some warning messages and changes some parameters.

dcg

Computes the approximate solution vector.

Syntax

`dcg(n, x, b, RCI_request, ipar, dpar, tmp)`

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine `dcg` computes the approximate solution vector using the CG method [Young71]. The routine `dcg` uses the value that was in the vector *x* before the first call as an initial approximation to the solution. The parameter *RCI_request* informs the user about the task completion and requests results of certain operations that are required by the solver.

Note that lengths of all vectors are assumed to have been defined in a previous call to the `dcg_init` routine.

Input Parameters

n	`INTEGER`. Contains the size of the problem, and size of arrays *x* and *b*.
x	`DOUBLE PRECISION` array of size *n*. Contains the initial approximation to the solution vector.
b	`DOUBLE PRECISION` array of size *n*. Contains the right-hand side vector.
tmp	`DOUBLE PRECISION` array of size `(n,4)`. Refer to the CG Common Parameters.

Output Parameters

RCI_request	`INTEGER`. Informs about result of work of the routine.
x	`DOUBLE PRECISION` array of size *n*. Contains the updated approximation to the solution vector.
ipar	`INTEGER` array of size *128*. Refer to the CG Common Parameters.
dpar	`DOUBLE PRECISION` array of size *128*. Refer to the CG Common Parameters.
tmp	`DOUBLE PRECISION` array of size `(n,4)`. Refer to the CG Common Parameters.

Return Values

RCI_request=0	The routine completes task normally, the solution is found and stored in the vector *x*. This occurs only if the stopping tests are fully automatic. For the user defined stopping tests, see the comments to the *RCI_request*= 2.
RCI_request=-1	The routine is interrupted because the maximal number of iterations is reached, but the relative stopping criterion is not met - this situation occurs only if both tests are requested by the user.
RCI_request=-2	The routine is interrupted because attempt to divide by zero occurs. This situation happens if the matrix is (almost) non-positive definite.
RCI_request=- 10	The routine is interrupted because the residual norm is invalid. Probably, the value *dpar*(6) was altered outside of the routine, or the dcg_check routine was not called.
RCI_request=-11	The routine is interrupted because it enters the infinite cycle. Probably, the values *ipar*(8), *ipar*(9), *ipar*(10) were altered outside of the routine, or the dcg_check routine was not called.
RCI_request= 1	Requests the user to multiply the matrix by *tmp*(1:*n*,1), put the result in the *tmp*(1:*n*,2), and return the control back to the routine dcg.
RCI_request= 2	Requests the user to perform the stopping tests. If they fail, the control must be returned back to the dcg routine. Otherwise, the solution is found and stored in the vector *x*.
RCI_request= 3	Requests the user to apply the preconditioner to *tmp*(:, 3), put the result in the *tmp*(:, 4), and return the control back to the routine dcg.

dcg_get

Retrieves the number of the current iteration.

Syntax

dcg_get(*n*, *x*, *b*, *RCI_request*, *ipar*, *dpar*, *tmp*, *itercount*)

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dcg_get retrieves the current iteration number of the solutions process.

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of arrays *x* and *b*.

x	DOUBLE PRECISION array of size *n*. Contains the initial approximation vector to the solution.
b	DOUBLE PRECISION array of size *n*. Contains the right-hand side vector.
RCI_request	INTEGER. This parameter is not used.
ipar	INTEGER array of size 128. Refer to the CG Common Parameters.
dpar	DOUBLE PRECISION array of size 128. Refer to the CG Common Parameters.
tmp	DOUBLE PRECISION array of size (*n*,4). Refer to the CG Common Parameters.

Output Parameters

itercount	INTEGER argument. Contains the value of the current iteration number.

Return Values

The routine dcg_get does not return any value.

dcgmrhs_init

Initializes the RCI CG solver with MHRS.

Syntax

dcgmrhs_init(*n*, *x*, *nrhs*, *b*, *method*, *RCI_request*, *ipar*, *dpar*, *tmp*)

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dcgmrhs_init initializes the solver. After initialization all subsequent invocations of the Intel MKL RCI CG with multiple right hand sides (MRHS) routines use the values of all parameters that are returned by dcgmrhs_init. Advanced users may skip this step and set the values to these parameters directly in the corresponding routines.

WARNING. Users can modify the contents of these arrays after they are passed to the solver routine only if they are sure that the values are correct and consistent. Basic check for correctness and consistency can be done by calling the dcgmrhs_check routine, but it does not guarantee that the method will work correctly.

NOTE. To use this routine with the name dcg_init, switch on the compiler preprocessor and include the files mkl_solver.h for C/C++, or mkl_solver.f77 for FORTRAN.

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of arrays *x* and *b*.

x	DOUBLE PRECISION matrix of size *n*-by-*nrhs*. Contains the initial approximation to the solution vectors. Normally it is equal to 0 or to *b*.
nrhs	INTEGER. This parameter sets the number of right-hand sides.
b	DOUBLE PRECISION matrix of size (*nrhs*, *n*). Contains the right-hand side vectors.
method	INTEGER. Specifies the method of solution: 1 - CG with multiple right hand sides; default value 2 - Block-CG (not supported now).

Output Parameters

RCI_request	INTEGER. Informs about result of work of the routine.
ipar	INTEGER array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
dpar	DOUBLE PRECISION array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
tmp	DOUBLE PRECISION array of size (*n*, 3+*nrhs*). Refer to the CG Common Parameters.

Return Values

RCI_request= 0	The routine completes task normally.
RCI_request= -10000	The routine fails to complete the task.

dcgmrhs_check

Checks consistency and correctness of the user defined data.

Syntax

`dcgmrhs_check(n, x, nrhs, b, RCI_request, ipar, dpar, tmp)`

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine `dcgmrhs_check` checks consistency and correctness of the parameters to be passed to the solver routine `dcgmrhs`. However this operation does not guarantee that the method gives the correct result. It only reduces the chance of making a mistake in the parameters of the method. Advanced users may skip this operation if they are sure that the correct data is specified in the solver parameters.

WARNING. Users can modify the contents of these arrays after they are passed to the solver routine only if they are sure that the values are correct and consistent. Basic check for correctness and consistency can be done by calling the `dcgmrhs_check` routine, but it does not guarantee that the method will work correctly.

Note that lengths of all vectors are assumed to have been defined in a previous call to the dcgmrhs_init routine.

NOTE. To use this routine with the name dcg_check, switch on the compiler preprocessor and include the files mkl_solver.h for C/C++, or mkl_solver.f77 for FORTRAN.

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of arrays *x* and *b*.
x	DOUBLE PRECISION matrix of size *n* by *nrhs*. Contains the initial approximation to the solution vectors. Normally it is equal to 0 or to *b*.
nrhs	INTEGER. This parameter sets the number of right-hand sides.
b	DOUBLE PRECISION matrix of size (*nrhs*,*n*). Contains the right-hand side vectors.

Output Parameters

RCI_request	INTEGER. Informs about result of work of the routine.
ipar	INTEGER array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
dpar	DOUBLE PRECISION array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
tmp	DOUBLE PRECISION array of size (*n*, 3+*nrhs*). Refer to the CG Common Parameters.

Return Values

RCI_request= 0	The routine completes task normally.
RCI_request= -1100	The routine is interrupted, errors occur.
RCI_request= -1001	The routine returns some warning messages.
RCI_request= -1010	The routine changes some parameters to make them consistent or correct.
RCI_request= -1011	The routine returns some warning messages and changes some parameters.

dcgmrhs

Computes the approximate solution vectors.

Syntax

dcgmrhs(*n*, *x*, *nrhs*, *b*, *RCI_request*, *ipar*, *dpar*, *tmp*)

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dcgmrhs computes the approximate solution vectors using the CG with multiple right hand sides (MRHS) method [Young71]. The routine dcgmrhs uses the value that was in the *x* before the first call as an initial approximation to the solution. The parameter *RCI_request* informs the user about task completion status and requests results of certain operations that are required by the solver.

Note that lengths of all vectors are assumed to have been defined in a previous call to the dcgmrhs_init routine.

NOTE. To use this routine with the name dcg, the user must switch on the compiler's preprocessor and include the files mkl_solver.h for C/C++, or mkl_solver.f77 for FORTRAN.

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of arrays *x* and *b*.
x	DOUBLE PRECISION matrix of size *n*-by-*nrhs*. Contains the initial approximation to the solution vectors.
nrhs	INTEGER. This parameter sets the number of right-hand sides.
b	DOUBLE PRECISION matrix of size (*nrhs*,*n*). Contains the right-hand side vectors.
tmp	DOUBLE PRECISION array of size (*n*, 3+*nrhs*). Refer to the CG Common Parameters.

Output Parameters

RCI_request	INTEGER. Informs about result of work of the routine.
x	DOUBLE PRECISION matrix of size *n*-by-*nrhs*. Contains the updated approximation to the solution vectors.
ipar	INTEGER array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
dpar	DOUBLE PRECISION array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
tmp	DOUBLE PRECISION array of size (*n*, 3+*nrhs*). Refer to the CG Common Parameters.

Return Values

RCI_request=0	The routine completes task normally, the solution is found and stored in the matrix *x*. This occurs only if the stopping tests are fully automatic. For the user defined stopping tests, see the comments to the *RCI_request*= 2.
RCI_request=-1	The routine is interrupted because the maximal number of iterations is reached, but the relative stopping criterion is not satisfied. This situation occurs only if both tests are requested by the user.

RCI_request=-2	The routine is interrupted because attempt to divide by zero occurs. This happens if the matrix is (almost) non-positive definite.
RCI_request=- 10	The routine is interrupted because the residual norm is invalid. Probably, the value *dpar*(6) was altered outside of the routine, or the routine dcgmrhs_check was not called.
RCI_request=-11	The routine is interrupted because it enters the infinite cycle. Probably, the values *ipar*(8), *ipar*(9), *ipar*(10) were altered outside of the routine, or the routine dcgmrhs_check was not called.
RCI_request= 1	Requests the user to multiply the matrix by *tmp*(1:*n*,1), put the result in the *tmp*(1:*n*,2), and return the control back to the routine dcgmrhs.
RCI_request= 2	Requests the user to perform the stopping tests. If they fail, the control must be returned back to the routine dcgmrhs. Otherwise, the solution is found and stored in the matrix *x*.
RCI_request= 3	Requests the user to apply the preconditioner to *tmp*(:,3+*ipar*(3)), put the result in *tmp*(:,3), and return the control back to the routine dcgmrhs.

dcgmrhs_get

Retrieves the number of the current iteration.

Syntax

dcgmrhs_get(*n*, *x*, *b*, *RCI_request*, *ipar*, *dpar*, *tmp*, *itercount*)

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dcgmrhs_get retrieves the current iteration number of the solving process.

NOTE. To use this routine with the name dcg_get, switch on the compiler preprocessor and include the files mkl_solver.h for C/C++, or mkl_solver.f77 for FORTRAN.

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of arrays *x* and *b*.
x	DOUBLE PRECISION matrix of size *n*-by-*nrhs*. Contains the initial approximation to the solution vectors.
nrhs	INTEGER. This parameter sets the number of right-hand sides.
b	DOUBLE PRECISION matrix of size (*nrhs*,*n*). Contains the right-hand side .

`RCI_request`	`INTEGER`. This parameter is not used.
ipar	`INTEGER` array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
dpar	`DOUBLE PRECISION` array of size *(128+2*nrhs)*. Refer to the CG Common Parameters.
tmp	`DOUBLE PRECISION` array of size (*n*, 3+*nrhs*). Refer to the CG Common Parameters.

Output Parameters

itercount	`INTEGER` argument. Contains the value of the current iteration number.

Return Values

The routine `dcgmrhs_get` does not return any value.

dfgmres_init

Initializes the solver.

Syntax

`dfgmres_init(n, x, b, RCI_request, ipar, dpar, tmp)`

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine `dfgmres_init` initializes the solver. After initialization all subsequent invocations of Intel MKL RCI FGMRES routines use the values of all parameters that are returned by `dfgmres_init`. Advanced users may skip this step and set the values to these parameters directly in the corresponding routines.

WARNING. Users can modify the contents of these arrays after they are passed to the solver routine only if they are sure that the values are correct and consistent. Basic check for correctness and consistency can be done by calling the `dfgmres_check` routine, but it does not guarantee that the method will work correctly.

Input Parameters

n	`INTEGER`. Contains the size of the problem, and the sizes of arrays *x* and *b*.
x	`DOUBLE PRECISION` array of size *n*. Contains the initial approximation to the solution vector. Normally it is equal to 0 or to *b*.
b	`DOUBLE PRECISION` array of size *n*. Contains the right-hand side vector.

Output Parameters

RCI_request	`INTEGER`. Informs about result of work of the routine.
ipar	`INTEGER` array of size 128. Refer to the FGMRES Common Parameters.

dpar	DOUBLE PRECISION array of size 128. Refer to the FGMRES Common Parameters.
tmp	DOUBLE PRECISION array of size ((2*ipar(15)+1)*n+ipar(15)*ipar(15)+9)/2 + 1). Refer to the FGMRES Common Parameters.

Return Values

RCI_request= 0	The routine completes task normally.
RCI_request= -10000	The routine fails to complete the task.

dfgmres_check

Checks consistency and correctness of the user defined data.

Syntax

dfgmres_check(*n*, *x*, *b*, *RCI_request*, *ipar*, *dpar*, *tmp*)

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dfgmres_check checks consistency and correctness of the parameters to be passed to the solver routine dfgmres. However this operation does not guarantee that the method gives the correct result. It only reduces the chance of making a mistake in the parameters of the method. Advanced users may skip it if they are sure that the correct data is specified in the solver parameters.

WARNING. Users can modify the contents of these arrays after they are passed to the solver routine only if they are sure that the values are correct and consistent. Basic check for correctness and consistency can be done by calling the dfgmres_check routine, but it does not guarantee that the method will work correctly.

Note that lengths of all vectors are assumed to have been defined in a previous call to the dfgmres_init routine.

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of arrays *x* and *b*.
x	DOUBLE PRECISION array of size *n*. Contains the initial approximation to the solution vector. Normally it is equal to 0 or to *b*.
b	DOUBLE PRECISION array of size *n*. Contains the right-hand side vector.

Output Parameters

RCI_request	INTEGER. Informs about result of work of the routine.
ipar	INTEGER array of size *128*. Refer to the FGMRES Common Parameters.

dpar	DOUBLE PRECISION array of size *128*. Refer to the FGMRES Common Parameters.
tmp	DOUBLE PRECISION array of size ((2*ipar(15)+1)*n+ipar(15)*ipar(15)+9)/2 + 1). Refer to the FGMRES Common Parameters.

Return Values

RCI_request= 0	The routine completes task normally.
RCI_request= -1100	The routine is interrupted, errors occur.
RCI_request= -1001	The routine returns some warning messages.
RCI_request= -1010	The routine changes some parameters to make them consistent or correct.
RCI_request= -1011	The routine returns some warning messages and changes some parameters.

dfgmres

Makes the FGMRES iterations.

Syntax

dfgmres(*n*, *x*, *b*, *RCI_request*, *ipar*, *dpar*, *tmp*)

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dfgmres performs the FGMRES iterations [Saad03]. The routine dfgmres uses the value that was in the vector *x* before the first call as an initial approximation to the solution. To update the current approximation to the solution, the dfgmres_get routine must be called. The RCI FGMRES iterations can be continued after the call to the dfgmres_get routine only if the value of the parameter *ipar*(13) is not equal to 0 (default value). Note that the updated solution overwrites the right hand side in the vector *b* if the parameter *ipar*(13) is positive, and the restarted version of the FGMRES method can not be run. If the right hand side should be kept, it must be saved in a different memory location before the first call to the dfgmres_get routine with a positive *ipar*(13).

The parameter *RCI_request* informs the user about the task completion and requests results of certain operations that are needed to the solver.

Note that lengths of all the vectors are assumed to have been defined in a previous call to the dfgmres_init routine.

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of arrays *x* and *b*.
x	DOUBLE PRECISION array of size *n*. Contains the initial approximation to the solution vector.
b	DOUBLE PRECISION array of size *n*. Contains the right-hand side vector.

tmp	DOUBLE PRECISION array of size ((2*ipar(15)+1)*n+ipar(15)*ipar(15)+9)/2 + 1). Refer to the FGMRES Common Parameters.

Output Parameters

RCI_request	INTEGER. Informs about result of work of the routine.
ipar	INTEGER array of size *128*. Refer to the FGMRES Common Parameters.
dpar	DOUBLE PRECISION array of size *128*. Refer to the FGMRES Common Parameters.
tmp	DOUBLE PRECISION array of size ((2*ipar(15)+1)*n+ipar(15)*ipar(15)+9)/2 + 1). Refer to the FGMRES Common Parameters.

Return Values

RCI_request= 0	The routine completes task normally, the solution is found. This occurs only if the stopping tests are fully automatic. For the user defined stopping tests, see the comments to the *RCI_request*= 2 or 4.
RCI_request= -1	The routine is interrupted because the maximal number of iterations is reached, but the relative stopping criterion is not met. This situation occurs only if both tests are requested by the user.
RCI_request= -10	The routine is interrupted because attempt to divide by zero occurs. Normally it happens if the matrix is (almost) degenerate. However it may happen if the parameter *dpar* is altered by mistake, or if the method is not stopped when the solution is found.
RCI_request= -11	The routine is interrupted because it enters the infinite cycle. Probably, the values *ipar*(8), *ipar*(9), *ipar*(10) were altered outside of the routine, or the dfgmres_check routine was not called.
RCI_request= -12	The routine is interrupted because errors are found in the method parameters. Normally this happens if the parameters *ipar* and *dpar* are altered by mistake outside the routine.
RCI_request= 1	Requests the user to multiply the matrix by *tmp*(*ipar*(22)), put the result in the *tmp*(*ipar*(23)), and return the control back to the routine dfgmres.
RCI_request= 2	Requests the user to perform the stopping tests. If they fail, the control back must be returned to the dfgmres routine. Otherwise, the FGMRES solution is found, and the fgmres_get routine can be run to update the computed solution in the vector *x*.

RCI_request= 3	Requests the user to apply the inverse preconditioner to *ipar*(22), put the result in the *ipar*(23), and return the control back to the routine dfgmres.
RCI_request= 4	Requests the user to check the norm of the currently generated vector. If it is not zero within the computational/rounding errors, the control must be returned back to the dfgmres routine. Otherwise, the FGMRES solution is found, and the dfgmres_get routine can be run to update the computed solution in the vector *x*.

dfgmres_get

Retrieves the number of the current iteration and updates the solution.

Syntax

dfgmres_get(*n*, *x*, *b*, *RCI_request*, *ipar*, *dpar*, *tmp*, *itercount*)

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dfgmres_get retrieves the current iteration number of the solution process and updates the solution according to the computations performed by the dfgmres routine. To retrieve the current iteration number only, set the parameter *ipar*(13)= -1 beforehand. This is normally recommended to do to proceed further with the computations. If the intermediate solution is needed, the method parameters must be set properly, see for details FGMRES Common Parameters and Iterative Sparse Solver code examples in the examples\solver\source folder of your Intel MKL directory (cg_no_precon.f, cg_no_precon_c.c, cg_mrhs.f, cg_mrhs_precond.f, cg_mrhs_stop_crt.f, fgmres_no_precon_f.f, fgmres_no_precon_c.c).

Input Parameters

n	INTEGER. Contains the size of the problem, and the sizes of the arrays *x* and *b*.
ipar	INTEGER array of size *128*. Refer to the FGMRES Common Parameters.
dpar	DOUBLE PRECISION array of size *128*. Refer to the FGMRES Common Parameters.
tmp	DOUBLE PRECISION array of size ((2**ipar*(15)+1)**n*+*ipar*(15)**ipar*(15)+9)/2 + 1). Refer to the FGMRES Common Parameters.

Output Parameters

x	DOUBLE PRECISION array of size *n*. If *ipar*(13)= 0, it contains the updated approximation to the solution according to the computations done in dfgmres routine. Otherwise, it is not changed.

b	DOUBLE PRECISION array of size *n*. If *ipar*(13)> 0, it contains the updated approximation to the solution according to the computations done in dfgmres routine. Otherwise, it is not changed.
RCI_request	INTEGER. Informs about result of work of the routine.
itercount	INTEGER argument. Contains the value of the current iteration number.

Return Values

RCI_request = 0	The routine completes task normally.
RCI_request = -12	The routine is interrupted because errors are found in the method parameters. Normally this happens if the parameters *ipar* and *dpar* are altered by mistake outside the routine.
RCI_request = -10000	The routine fails to complete the task.

Implementation Details

Several aspects of the Intel MKL RCI ISS interface are platform-specific and language-specific. To promote portability across platforms and ease of use across different languages, include one of the Intel MKL RCI ISS language-specific header files. Currently, there is one language specific header file for C programs.

This language-specific header file defines function prototypes and they are the following:

```
void dcg_init(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar,
double *tmp);
```

```
void dcg_check(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar,
double *tmp);
```

```
void dcg(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar, double
*tmp);
```

```
void dcg_get(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar, double
*tmp, int *itercount);
```

```
void dcgmrhs_init(int *n, double *x, int *nRhs, double *b, int *method, int *rci_request,
int *ipar, double dpar, double *tmp);
```

```
void dcgmrhs_check(int *n, double *x, int *nRhs, double *b, int *rci_request, int *ipar,
double dpar, double *tmp);
```

```
void dcgmrhs(int *n, double *x, int *nRhs, double *b, int *rci_request, int *ipar, double
dpar, double *tmp);
```

```
void dcgmrhs_get(int *n, double *x, int *nRhs, double *b, int *rci_request, int *ipar,
double dpar, double *tmp, int *itercount);
```

```
void dfgmres_init(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar,
double *tmp);
```

```
void dfgmres_check(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar,
double *tmp);
```

```
void dfgmres(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar, double
*tmp);
```

```
void dfgmres_get(int *n, double *x, double *b, int *rci_request, int *ipar, double dpar,
double *tmp, int *itercount);
```

NOTE. Intel MKL does not support the RCI ISS interface without the language specific header file included.

Preconditioners based on Incomplete LU Factorization Technique

Usually, preconditioners, or accelerators are used to accelerate an iterative solution process. In some cases, their use can reduce the number of iterations dramatically and thus lead to better solver performance. Although the terms 'preconditioner' and 'accelerator' are synonyms, hereafter only 'preconditioner' is used.

Currently, Intel MKL provides two preconditioners, ILU0 and ILUT, for the sparse matrix presented only in the format accepted in the Intel MKL direct sparse solvers (three-array variation of the CSR storage format, see Sparse Matrix Storage Format section). The used algorithms are described in [Saad03].

The ILU0 preconditioner is based on a well-known factorization of the original matrix into a product of two triangular matrices: low triangular and upper triangular matrices. Usually, such decomposition leads to some fill-in in the resulting matrix structure in comparison with the original matrix. The distinctive feature of the ILU0 preconditioner is that it preserves the structure of the original matrix in the result.

Unlike the ILU0 preconditioner, the ILUT preconditioner preserves some resulting fill-in in the preconditioner matrix structure. The distinctive feature of the ILUT preconditioner is that it saves the resulting entry of the preconditioner if the entry satisfies two conditions simultaneously: the value of the entry is greater than the product of the given tolerance and matrix row norm, and the entry is in the given bandwidth of the resulting preconditioner matrix.

Both ILU0 and ILUT preconditioners can apply to any non-degenerate matrix. They can be used alone or together with the Intel MKL RCI FGMRES solver (see Sparse Solver Routines). Avoid using these preconditioners with MKL RCI CG solver because in general, they produce non-symmetric resulting matrix even if the original matrix is symmetric. Usually, an inverse of the preconditioner is required in this case. To do this the Intel MKL triangular solver routine `mkl_dcsrtrsv` must be applied twice: for the low triangular part of the preconditioner, and then for its upper triangular part.

NOTE. Although ILU0 and ILUT preconditioners apply to any non-degenerate matrix, in some cases the algorithm may fail to ensure successful termination and the required result. The result of the preconditioner routine can be checked only in practice.

A preconditioner may increase the number of iterations for an arbitrary case of the system and the initial guess, and even ruin the convergence. It is user's responsibility to carefully use a suitable preconditioner.

General Scheme of Using ILUT and RCI FGMRES Routines

The scheme is the same for both preconditioners. Some differences exist in the calling parameters of the preconditioners and in the subsequent call of two triangular solvers. You can see all these differences in the code examples for both preconditioners in the `examples\solver\source` folder of your Intel MKL directory (`dcsrilu0_exampl1.c`, `dcsrilu0_exampl2.f`, `dcsrilut_exampl1.c`, `dcsrilut_exampl2.f`).

The following pseudocode shows the general scheme of using the ILUT preconditioner in the RCI FGMRES context.

...

```
generate matrix A
generate preconditioner C (optional)
  call dfgmres_init(n, x, b, RCI_request, ipar, dpar, tmp)
   change parameters in ipar, dpar if necessary
   call dcsrilut(n, a, ia, ja, bilut, ibilut, jbilut, tol, maxfil, ipar, dpar, ierr)
   call dfgmres_check(n, x, b, RCI_request, ipar, dpar, tmp)
1  call dfgmres(n, x, b, RCI_request, ipar, dpar, tmp)
   if (RCI_request.eq.1) then
     multiply the matrix A by tmp(ipar(22)) and put the result in tmp(ipar(23))
c   proceed with FGMRES iterations
    goto 1
   endif
   if (RCI_request.eq.2) then
    do the stopping test
    if (test not passed) then
c  proceed with FGMRES iterations
     go to 1
    else
c   stop FGMRES iterations.
     goto 2
    endif
   endif
   if (RCI_request.eq.3) then
c   Below, trvec is an intermediate vector of length at least n
c   Here is the recommended use of the result produced by the ILUT routine.
c   via standard Intel MKL Sparse Blas solver routine mkl_dcsrtrsv.
   call mkl_dcsrtrsv('L','N','U', n, bilut, ibilut, jbilut, tmp(ipar(22)),trvec)
   call mkl_dcsrtrsv('U','N','N', n, bilut, ibilut, jbilut, trvec, tmp(ipar(23)))
c  proceed with FGMRES iterations
    goto 1
   endif
   if (RCI_request.eq.4) then
   check the norm of the next orthogonal vector, it is contained in dpar(7)
```

```
    if (the norm is not zero up to rounding/computational errors) then
c   proceed with FGMRES iterations
     goto 1
    else
c   stop FGMRES iterations
     goto 2
    endif
   endif
2 call dfgmres_get(n, x, b, RCI_request, ipar, dpar, tmp, itercount)
```

current iteration number is in *itercount*

the computed approximation is in the array *x*

ILU0 and ILUT Preconditioners Interface Description

The concepts required to understand the use of the Intel MKL preconditioner routines are discussed in the Linear Solvers Basics.

In this section the FORTRAN style notations are used.

All types in this documentation refer to the standard Fortran types, `INTEGER`, and `DOUBLE PRECISION`.

C and C++ programmers should refer to the section Calling Sparse Solver Routines From C/C++ for information on mapping Fortran types to C/C++ types.

User Data Arrays

The preconditioner routines take arrays of user data as input, for example, user arrays representing the original matrix. To minimize storage requirements and improve overall run-time efficiency, the Intel MKL preconditioner routines do not make copies of the user input arrays.

Common Parameters

The preconditioners have parameters for passing various options to the routine. The values for these parameters should be specified very carefully. These values can be changed during computations according to the user's needs.

Some parameters are common with the FGMRES Common Parameters. Only the routine `dfgmres_init` specifies their default and initial values. However, some parameters can be redefined with other values. These parameters are listed below.

For the ILU0 preconditioner:

ipar`(2)` - specifies the destination of error messages generated by the ILU0 routine. The default value 6 means that all error messages are displayed on the screen. Otherwise the error messages are written to the newly created file `MKL_PREC_log.txt`. Note if the parameter *ipar*`(6)` is set to 0, then error messages are not generated at all.

ipar(6) - if its value is not equal to 0, the ILU0 routine returns error messages in accordance with the parameter *ipar*(2). Otherwise, the routine does not generate error messages at all, but returns a negative value of the parameter *ierr*. The default value is 1.

For the ILUT preconditioner:

ipar(2) - specifies the destination of error messages generated by the ILUT routine. The default value 6 means that all messages are displayed on the screen. Otherwise the error messages are written to the newly created file MKL_PREC_log.txt. Note if the parameter *ipar*(6) is set to 0, error messages are not generated at all.

ipar(6) - if its value is not equal to 0, the ILUT routine returns error messages in accordance with the parameter *ipar*(2). Otherwise, the routine does not generate error messages at all, but returns a negative value of the parameter *ierr*. The default value is 1.

ipar(7) - if its value is greater than 0, the ILUT routine generates warning messages in accordance with the parameter *ipar*(2)and continues calculations. Otherwise, if its value is equal to 0, the routine returns a positive value of the parameter *ierr*, if its value is less than 0, the routine generates a warning message in accordance with the parameter *ipar*(2)and returns a positive value of the parameter *ierr*. The default value is 1.

NOTE. Users must provide correct and consistent parameters to the routine to avoid fails or wrong results.

dcsrilu0

ILU0 preconditioner based on incomplete LU factorization of a sparse matrix in the CSR format (PARDISO variation).

Syntax

Fortran:

```
call dcsrilu0(n, a, ia, ja, bilu0, ipar, dpar, ierr)
```

C:

```
dcsrilu0(&n, a, ia, ja, bilu0, ipar, dpar, &ierr);
```

Input Parameters

n	INTEGER. Size (number of rows or columns) of the original square *n*-by-*n*-matrix *A*.
a	DOUBLE PRECISION. Array containing the set of elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to values array description in the Sparse Matrix Storage Format section for more details.
ia	INTEGER. Array of size (*n*+1) containing begin indices of rows of matrix *A* such that *ia*(I) is the index in the array *A* of the first non-zero element from the row I. The value of the last element *ia*(*n*+1) is equal

to the number of non-zeros in the matrix *A* plus one. Refer to the *rowIndex* array description in the Sparse Matrix Storage Format section for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its size is equal to the size of the array *a*. Refer to the *columns* array description in the Sparse Matrix Storage Format section for more details.

NOTE. Column indices should be put in increasing order for each row of matrix.

ipar INTEGER array of size *128*. This parameter is used to specify the integer set of data for both the ILU0 and RCI FGMRES computations. Refer to the *ipar* array description in the FGMRES Common Parameters for more details on FGMRES parameter entries. The entries that are specific to ILU0 are listed below.

ipar(31) - specifies how the routine operates if zero diagonal element occurs during calculation. If this parameter is set to 0 (default value set by the routine `dfgmres_init`) then that the calculations are stopped and the routine returns non-zero error value. Otherwise the value of the diagonal element is set to the specified value and the calculations are continued.

NOTE. Advanced users can define this array in the code as follows: `INTEGER` *ipar*`(31)`. However, to guarantee the compatibility with the future releases of the Intel MKL it is highly recommended to declare the array *ipar* of length 128.

dpar `DOUBLE PRECISION` array of size *128*. This parameter is used to specify the double precision set of data for both the ILU0 and RCI FGMRES computations. Refer to the *dpar* array description in the FGMRES Common Parameters for more details on FGMRES parameter entries. The entries that are specific to ILU0 are listed below.

dpar(31) - specifies the small value that is compared with the diagonal elements during calculations; if the value of the diagonal element is smaller, then it is set to *dpar*(32), or the calculations are stopped, in accordance with *ipar*(31); the default value is 1.0D-16

NOTE. This parameter can be set to the negative value, because its absolute value is actually used in calculations.

If this parameter is set to 0, the comparison with the diagonal element is not performed.

dpar(32) - specifies the value that is assigned to the diagonal element if its value is less than *dpar*(31) (see above); the default value is 1.0D-10

NOTE. Advanced users can define this array in the code as follows: DOUBLE PRECOSION*dpar*(32). However, to guarantee the compatibility with the future releases of the Intel MKL it is highly recommended to declare the array *dpar* of length 128.

Output Parameters

bilu0 DOUBLE PRECISION. Array *B* stored in the PARDISO CSR format containing non-zero elements of the resulting preconditioning matrix. Its size is equal to the number of non-zero elements in the matrix *A*. Refer to the *values* array description in the Sparse Matrix Storage Format section for more details.

ierr INTEGER. Error flag, informs about the routine completion status.

NOTE. To present the resulting preconditioning matrix in the CSR format the arrays *ia* (row indices) and *ja* (column indices) of the input matrix must be used.

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine dcsrilu0 computes a preconditioner *B* [Saad03] of a given sparse matrix *A* stored in the CSR format accepted in PARDISO:

*A~B=L*U* , where *L* is a low triangular matrix with unit diagonal, *U* is an upper triangular matrix with non-unit diagonal, and the portrait of the original matrix *A* is used to store the incomplete factors *L* and *U*.

Return Values

ierr=0 The routine completed task normally.

ierr=-101	The routine is interrupted, the error occurs: at least one diagonal element is omitted from the matrix in CSR format (see Sparse Matrix Storage Format).
ierr=-102	The routine is interrupted because the matrix contains zero diagonal element, routine can not perform operations.
ierr=-103	The routine is interrupted as the matrix contains too small diagonal element, and an overflow may occur because of the division by its value required to complete the task, or a bad approximation to ILU0 with use of this element will be computed.
ierr=-104	The routine is interrupted because the memory is insufficient for the internal work array.
ierr=-105	The routine is interrupted because the input matrix size *n* isless than or equal to 0.
ierr=-106	The routine is interrupted because the the column indices *ja* are placed in not increasing order.

Interfaces

FORTRAN 77 and Fortran 95:

```
SUBROUTINE dcsrilu0 (n, a, ia, ja, bilu0, ipar, dpar, ierr)
INTEGER n, ierr, ipar(128)
INTEGER ia(*), ja(*)
  DOUBLE PRECISION a(*), bilu0(*), dpar(128)
```

C:

```
void dcsrilu0 (int *n, double *a, int *ia, int *ja, double  *bilu0, int *ipar, double *dpar, int *ierr);
```

dcsrilut

ILUT preconditioner based on the incomplete LU factorization with a threshold of a sparse matrix.

Syntax

Fortran:

```
call dcsrilut(n, a, ia, ja, bilut, bilut, ibilut, jbilut, tol, maxfil, ipar, dpar, ierr)
```

C:

```
dcsrilut(&n, a, ia, ja, bilut, bilut, ibilut, jbilut, &tol, &maxfil, ipar, dpar, &ierr);
```

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine dcsrilut computes a preconditioner *B* [Saad03] of a given sparse matrix *A* stored in the format accepted in the direct sparse solvers:

*A~B=L*U* , where *L* is a low triangular matrix with unit diagonal, *U* is an upper triangular matrix with non-unit diagonal.

The following threshold criteria are used to generate the incomplete factors *L* and *U*:

1) the resulting entry must be greater than the matrix current row norm multiplied by the parameter *tol*, and

2) the number of the non-zero elements in each row of the resulting *L* and *U* factors must not be greater than the value of the parameter *maxfil*.

Input Parameters

n — INTEGER. Size (number of rows or columns) of the original square *n*-by-*n* matrix *A*.

a — DOUBLE PRECISION. Array containing all non-zero elements of the matrix *A*. The length of the array is equal to their number. Refer to *values* array description in the Sparse Matrix Storage Format section for more details.

ia — INTEGER. Array of size (*n*+1) containing indices of non-zero elements in the array *A*. *ia*(I)is the index of the first non-zero element from the row I. The value of the last element *ia*(*n*+1) is equal to the number of non-zeros in the matrix *A* plus one. Refer to the *rowIndex* array description in the Sparse Matrix Storage Format section for more details.

ja — INTEGER. Array of size equal to the size of the array *a*. This array contains the column numbers for each non-zero element of the matrix *A*. Refer to the *columns* array description in the Sparse Matrix Storage Format section for more details.

NOTE. Column numbers must be in increasing order for each row of matrix.

tol — DOUBLE PRECISION. Tolerance for threshold criterion for the resulting entries of the preconditioner.

maxfil — INTEGER. Maximum fill-in, half of the preconditioner bandwidth. The number of non-zero elements in the rows of the preconditioner can not exceed (2**maxfil*+1).

ipar — INTEGER array of size *128*. This parameter is used to specify the integer set of data for both the ILUT and RCI FGMRES computations. Refer to the *ipar* array description in the FGMRES Common Parameters for more details on FGMRES parameter entries. The entries specific to ILUT are listed below.

ipar(31) - specifies how the routine operates if the value of the computed diagonal element is less than the current matrix row norm multiplied by the value of the parameter *tol*. If *ipar*(31) = 0,

then the calculation is stopped and the routine returns non-zero error value. Otherwise, the value of the diagonal element is set to the certain value (see description of the parameter *dpar*(31) below), and the calculation continues.

NOTE. There is no default value for *ipar*(31) entry even if the preconditioner is used within the RCI ISS context. Always set the value of this entry.

NOTE. Advanced users can define this array in the code as INTEGER *ipar*(31). However, to guarantee the compatibility with the future releases of the Intel MKL, declare the array *ipar* of length 128.

dpar DOUBLE PRECISION array of size *128*. This parameter specifies the double precision set of data for both ILUT and RCI FGMRES computations. Refer to the *dpar* array description in the FGMRES Common Parameters for more details on FGMRES parameter entries. The entries that are specific to ILUT are listed below.

dpar(31) - specifies the value that being multiplied by the matrix row norm is assigned to those diagonal elements whose value is less than the matrix row norm multiplied by the value of the parameter *tol*, if the calculation is not stopped in accordance with *ipar*(31).

NOTE. There is no default value for *dpar*(31) entry even if the preconditioner is used within RCI ISS context. Always set the value of this entry.

NOTE. Advanced users can define this array in the code as DOUBLE PRECISION *dpar*(31). However, to guarantee the compatibility with the future releases of the Intel MKL, declare the array *dpar* of length 128.

Output Parameters

bilut DOUBLE PRECISION. Array *B* containing non-zero elements of the resulting preconditioning matrix, stored format accepted in the direct sparse solvers. Refer to the *values* array description in the Sparse Matrix Storage Format section for more details. The size of the array is equal to (2*maxfil+1)*n-maxfil*(maxfil+1)+1.

NOTE. Provide enough memory for this array before calling the routine. Otherwise, the routine may fail to complete successfully with a correct result.

ibilut INTEGER. Array of size (*n*+1) containing indices of non-zero elements in the array *B*. *ibilut*(I) is the index of the first non-zero element from the row I. The value of the last element *ibilut*(*n*+1) is equal to the number of non-zeros in the matrix *B* plus one. Refer to the *rowIndex* array description in the Sparse Matrix Storage Format section for more details..

jbilut INTEGER. Array, its size is equal to the size of the array *bilut*. This array contains the column numbers for each non-zero element of the matrix *B*. Refer to the *columns* array description in the Sparse Matrix Storage Format section for more details.

ierr INTEGER. Error flag, informs about the routine completion.

Return Values

ierr=0	The routine completes the task normally.
ierr=-101	The routine is interrupted, the error occurs: the number of elements in some matrix row specified in the sparse format is equal to or less than 0.
ierr=-102	The routine is interrupted because the value of the computed diagonal element is less than the product of the given tolerance and the current matrix row norm, and it cannot be replaced as *ipar*(31)=0.
ierr=-103	The routine is interrupted, the error occurs: the element *ia*(I+1) is less than or equal to the element *ia*(I) (see Sparse Matrix Storage Format section).
ierr=-104	The routine is interrupted because the memory is insufficient for the internal work arrays.
ierr=-105	The routine is interrupted because the input value of *maxfil* is less than 0.
ierr=-106	The routine is interrupted because the size *n* of the input matrix is less than 0.

ierr=-107	The routine is interrupted, the error occurs: an element of the array *ja* is less than 0, or greater than *n* (see Sparse Matrix Storage Format section).
ierr=101	The value of *maxfil* is greater than or equal to *n*. The calculation is performed with the value of *maxfil* set to (*n*-1).
ierr=102	The value of *tol* is less than 0. The calculation is performed with the value of the parameter set to (-*tol*)
ierr=103	The absolute value of *tol* is greater than value of *dpar*(31); it can result in instability of the calculation.
ierr=104	The value of *dpar*(31) is equal to 0. It can cause the fail of the calculations.

Interfaces

FORTRAN 77 and Fortran 95:

```
SUBROUTINE dcsrilut (n, a, ia, ja, bilut, ibilut, jbilut, tol, maxfil, ipar, dpar, ierr)
INTEGER n, ierr, ipar(*), maxfil
INTEGER ia(*), ja(*), ibilut(*), jbilut(*)
  DOUBLE PRECISION a(*), bilut(*), dpar(*), tol
```

C:

```
void dcsrilut (int *n, double *a, int *ia, int *ja, double *bilut, int *ibilut, int *jbilut, double *tol,
int *maxfil, int *ipar, double *dpar, int *ierr);
```

Calling Sparse Solver and Preconditioner Routines from C/C++

The calling interface for all of the Intel MKL sparse solver and preconditioner routines is designed to be used easily from FORTRAN 77 or Fortran 90. However, any of these routines can be invoked directly from C or C++ if users are familiar with the inter-language calling conventions of their platforms. These conventions include, but are not limited to, the argument passing mechanisms for the language, the data type mappings from Fortran to C/C++, and the platform specific method of decoration for Fortran external names.

To promote portability, the C header files provide a set of macros and type definitions intended to hide the inter-language calling conventions and provide an interface to the Intel MKL sparse solver routines that appears natural for C/C++.

For example, consider a hypothetical library routine `foo` that takes a real vector of length *n*, and returns an integer status. Fortran users would access such a function as:

```
INTEGER n, status, foo
REAL x(*)
status = foo(x, n)
```

As noted above, to invoke `foo`, C users need to know what C data types correspond to Fortran types `INTEGER` and `REAL`; what argument passing mechanism the Fortran compiler uses; and what, if any, name decoration the Fortran compiler performs when generating the external symbol `foo`.

However, by using the C specific header file, for example `mkl_solver.h`, the invocation of `foo`, within a C program would look as follows:

```
#include "mkl_solver.h"

_INTEGER_t i, status;

_REAL_t x[];

status = foo( x, i );
```

Note that in the above example, the header file `mkl_solver.h` provides definitions for the types `_INTEGER_t` and `_REAL_t` that correspond to the Fortran types `INTEGER` and `REAL`.

To simplify calling of the Intel MKL sparse solver routines from C and C++, the following approach of providing C definitions of Fortran types is used: if an argument or a result from a sparse solver is documented as having the Fortran language specific type XXX, then the C and C++ header files provide an appropriate C language type definitions for the name _XXX_t.

Caveat for C Users

One of the key differences between C/C++ and Fortran is the argument passing mechanisms for the languages: Fortran programs use pass-by-reference semantics and C/C++ programs use pass-by-value semantics. In the above example, the header file `mkl_solver.h` attempts to hide this difference, by defining a macro `foo`, which takes the address of the appropriate arguments. For example, on the Tru64 UNIX* operating system `mkl_solver.h` defines the macro as follows:

```
#define foo(a,b) foo_((a), &(b))
```

Note how constants are treated when using the macro form of `foo`. `foo( x, 10 )` is converted into `foo_( x, &10 )`. In a strictly ANSI compliant C compiler, taking the address of a constant is not permitted, so a strictly conforming program would look like:

```
INTEGER_t iTen = 10;

_REAL_t * x;

status = foo( x, iTen );
```

However, some C compilers in a non-ANSI compliant mode enable taking the address of a constant for ease of use with Fortran programs. The form `foo( x, 10 )` is acceptable for such compilers.

9 Vector Mathematical Functions

This chapter describes Intel® MKL Vector Mathematical Functions Library (VML), which computes the mathematical function of each of the vector elements. VML includes a set of highly optimized mathematical functions (power, trigonometric, exponential, hyperbolic, etc.) that operate on vectors of real and complex numbers.

Application programs that might significantly improve performance with VML include nonlinear programming software, computation of integrals, financial calculations, computer graphics, and many others.

VML functions are divided into the following groups according to the operations they perform:

- VML Mathematical Functions compute values of mathematical functions (such as sine, cosine, exponential, logarithm and so on) on vectors stored contiguously in memory (stride 1).
- VML Pack/Unpack Functions convert to and from vectors with positive increment indexing, vector indexing and mask indexing (see Appendix B for details on vector indexing methods).
- VML Service Functions set/get the accuracy modes and the error codes.

The VML mathematical functions take an input vector as an argument, compute values of the respective function element-wise, and return the results in an output vector. All the VML math functions can perform in-place operations, where the input and output arrays are at the same memory locations.

All Intel MKL VML FORTRAN 77 interfaces are declared in `mkl_vml.f77`, Fortran 90 interfaces in `mkl_vml.fi`, and C interfaces in `mkl_vml_functions.h`.

Examples that demonstrate usage of the Vector Mathematical functions are available in the following directories:

`${MKL}/examples/vmlc/source`

`${MKL}/examples/vmlf/source`.

Data Types and Accuracy Modes

Mathematical and pack/unpack vector functions in VML are implemented for vector arguments of single and double precision real and compex data types. The library provides both the Fortran- and C-interfaces to all the functions, including the VML service functions. The Function Naming Conventions section below details the differences in naming and calling the functions for different interfaces.

Each VML vector function (for each data format) can work in three modes, which vary in the amount of accuracy they return: High Accuracy (HA), Low Accuracy (LA), and Enhanced Performance (EP). For many functions, using the LA version improves performance at the cost of slight reduction in accuracy (1-2 least significant bits). In contrast to the LA accuracy flavor, the EP version provides better performance at the cost of significantly reduced accuracy. In both single and double precision, only about half of the bits in the mantissa are correct. Subtle argument paths for certain functions (for example, large arguments in trigonometric functions) may be calculated with even less accuracy. The EP flavor does not guarantee accurate processing of corner cases and special values.

Although the default accuracy is HA, LA is sufficient in most cases. For applications that require less accuracy (for example, media applications, some Monte Carlo simulations, etc.) you may find the EP accuracy flavor sufficient.

VML handles special values in accordance with the C99 standard [C99].

Use `vmlSetMode(mode)`(see Table 9-14) to switch between the modes (HA, LA, EP). The function `vmlGetMode()` returns the current mode. The default mode is High Accuracy (HA).

Function Naming Conventions

All VML function names are lowercase for Fortran (`vsabs`) and of mixed (lower and upper) case for C (`vsAbs`).

VML mathematical and pack/unpack function names have the following structure:

v<*?*><name><*mod*>

The initial letter *v* is a prefix indicating vector operations.

The <*?*> field is a precision prefix that indicates the data type:

s	`REAL` for the Fortran interface, or `float` for the C interface
d	`DOUBLE PRECISION` for the Fortran interface, or `double` for the C interface.
c	`COMPLEX` for the Fortran interface, or `MKL_Complex8` for the C interface.
z	`DOUBLE COMPLEX` for the Fortran interface, or `MKL_Complex16` for the C interface.

The <name> field indicates the function short name, with some of its letters in uppercase for C interface (see for example Table 9-2 or Table 9-13).

The <*mod*> field (written in uppercase for C interface) is present in pack/unpack functions only; it indicates the indexing method used:

i	indexing with positive increment
v	indexing with index vector
m	indexing with mask vector.

VML service function full names have the following structure:

vml<name>

To call VML functions from an application program, use conventional function calls. For example, the vector single precision real exponential function can be called as

`call vsexp ( n, a, y )` for the Fortran interface, or

`vsExp ( n, a, y );` for the C interface.

Function Interfaces

The interfaces of VML functions include function names and the arguments list. The Fortran- and C-interface descriptions for different groups of VML functions are given below. Note that some functions (`Div`, `Pow`, and `Atan2`) have two input vectors *a* and *b* as their arguments, while `SinCos` function has two output vectors *y* and *z*.

VML Mathematical Functions

Fortran:

```
call v<p><name>( n, a, y )
call v<p><name>( n, a, b, y )
call v<p><name>( n, a, y, z )
```

C:

```
v<p><name>( n, a, y );
v<p><name>( n, a, b, y );
v<p><name>( n, a, y, z );
```

Pack Functions

Fortran:

```
call v<p>packi( n, a, inca, y )
call v<p>packv( n, a, ia, y )
call v<p>packm( n, a, ma, y )
```

C:

```
v<p>PackI( n, a, inca, y );
v<p>PackV( n, a, ia, y );
v<p>PackM( n, a, ma, y );
```

Unpack Functions

Fortran:

```
call v<p>unpacki( n, a, y, incy )
call v<p>unpackv( n, a, y, iy )
call v<p>unpackm( n, a, y, my )
```

C:

```
v<p>UnpackI( n, a, y, incy );
v<p>UnpackV( n, a, y, iy );
v<p>UnpackM( n, a, y, my );
```

Service Functions

Fortran:

```
oldmode = vmlsetmode( mode )
mode = vmlgetmode( )
olderr = vmlseterrstatus ( err )
err = vmlgeterrstatus( )
olderr = vmlclearerrstatus( )
oldcallback = vmlseterrorcallback( callback )
callback = vmlgeterrorcallback( )
oldcallback = vmlclearerrorcallback( )
```

C:

```
oldmode = vmlSetMode( mode );
mode = vmlGetMode( void );
olderr = vmlSetErrStatus ( err );
err = vmlGetErrStatus( void );
olderr = vmlClearErrStatus( void );
oldcallback = vmlSetErrorCallBack( callback );
callback = vmlGetErrorCallBack( void );
oldcallback = vmlClearErrorCallBack( void );
```

Input Parameters

n	number of elements to be calculated
a	first input vector
b	second input vector
inca	vector increment for the input vector *a*
ia	index vector for the input vector *a*
ma	mask vector for the input vector *a*
incy	vector increment for the output vector *y*
iy	index vector for the output vector *y*
my	mask vector for the output vector *y*
err	error code
mode	VML mode
callback	address of the callback function

Output Parameters

y	first output vector
z	second output vector
err	error code
mode	VML mode
olderr	former error code
oldmode	former VML mode
callback	address of the callback function
oldcallback	address of the former callback function

See the data types of the parameters used in each function in the respective function description section. All Intel MKL VML mathematical functions can perform in-place operations.

Vector Indexing Methods

VML mathematical functions work only with unit stride. Arrays with other increments, or more complicated indexing, can be accommodated by gathering the elements into a contiguous vector and then scattering them after the computation is complete.

Three following indexing methods are used to gather/scatter the vector elements in VML:

- positive increment
- index vector
- mask vector.

The indexing method used in a particular function is indicated by the indexing modifier (see the description of the <*mod*> field in Function Naming Conventions). For more information on indexing methods, see Vector Arguments in VML in Appendix B.

Error Diagnostics

The VML library has its own error handler. The only difference for the C and Fortran interfaces is that the Intel MKL error reporting routine XERBLA can be called after the Fortran interface VML function encounters an error, and this routine gets information on `VML_STATUS_BADSIZE` and `VML_STATUS_BADMEM` input errors (see Table 9-16).

The VML error handler has the following properties:

- The Error Status (`vmlErrStatus`) global variable is set after each VML function call. The possible values of this variable are shown in the Table 9-16.
- Depending on the VML mode, the error handler function invokes:
  - *errno* variable setting. The possible values are shown in the Table 9-1.
  - writing error text information to the *stderr* stream
  - raising the appropriate exception on error, if necessary
  - calling the additional error handler callback function.

Table 9-1. Set Values of the *errno* Variable

Value of *errno*	Description
0	No errors are detected.
EINVAL	The array dimension is not positive.
EACCES	NULL pointer is passed.
EDOM	At least one of array values is out of a range of definition.
ERANGE	At least one of array values caused a singularity, overflow or underflow.

NOTE. By design and in conformity with the C99 standard [C99], complex VML functions do not report floating point error messages.

Vector Math Functions Performance Tips

VML provides six performance gradations for real and complex math functions, depending on precision (single or double) and on accuracy level (HA, LA, or EP). VML single precision versions are faster than corresponding double precision versions. EP is faster than corresponding LA, LA is faster than HA.

The actual performance depends on a number of factors, including vectorization and threading overhead. The recommended usage is as follows:

- Use VML for vector lengths larger than 10-40.
- Use Intel® Compiler functions for smaller vector lengths.

VML Mathematical Functions

This section describes VML functions that compute values of mathematical functions on real and complex vector arguments with unit increment.

Each function group is introduced by its short name, a brief description of its purpose, and the calling sequence for each type of data both for Fortran- and C-interfaces, as well as a description of the input/output arguments.

For all the VML mathematical functions, the input range of parameters is equal to the mathematical range of definition in the set of defined values for the respective data type. Several VML functions, specifically `Div`, `Exp`, `Sinh`, `Cosh`, and `Pow`, can result in an overflow. For these functions, the respective input threshold values that mark off the precision overflow are specified in the function description section. Note that in these specifications, *FLT_MAX* denotes the maximum number representable in single precision real data type, while *DBL_MAX* denotes the maximum number representable in double precision real data type.

Table 9-2 lists available mathematical functions and associated data types.

Table 9-2. VML Mathematical Functions

Function	Data Types	Description
Arithmetic Functions		
v?Add	*s*, *d*, *c*, *z*	Addition of vector elements
v?Sub	*s*, *d*, *c*, *z*	Subtraction of vector elements
v?Sqr	*s*, *d*	Squaring of vector elements
v?Mul	*s*, *d*, *c*, *z*	Multiplication of vector elements
v?MulByConj	*c*, *z*	Multiplication of elements of one vector by conjugated elements of the second vector
v?Conj	*c*, *z*	Conjugation of vector elements
v?Abs	*s*, *d*, *c*, *z*	Absolute value of vector elements
v?Arg	*c*, *z*	Argument of vector elements
Power and Root Functions		
v?Inv	*s*, *d*	Inversion of vector elements
v?Div	*s*, *d*, *c*, *z*	Division of elements of one vector by elements of the second vector
v?Sqrt	*s*, *d*, *c*, *z*	Square root of vector elements
v?InvSqrt	*s*, *d*	Inverse square root of vector elements
v?Cbrt	*s*, *d*	Cube root of vector elements
v?InvCbrt	*s*, *d*	Inverse cube root of vector elements
v?Pow2o3	*s*, *d*	Each vector element raised to 2/3
v?Pow3o2	*s*, *d*	Each vector element raised to 3/2
v?Pow	*s*, *d*, *c*, *z*	Each vector element raised to the specified power
v?Powx	*s*, *d*, *c*, *z*	Each vector element raised to the constant power
v?Hypot	*s*, *d*	Square root of sum of squares
Exponential and Logarithmic Functions		
v?Exp	*s*, *d*, *c*, *z*	Exponential of vector elements
v?Expm1	*s*, *d*	Exponential of vector elements decreased by 1
v?Ln	*s*, *d*, *c*, *z*	Natural logarithm of vector elements
v?Log10	*s*, *d*, *c*, *z*	Denary logarithm of vector elements

Function	Data Types	Description
v?Log1p	*s*, *d*	Natural logarithm of vector elements that are increased by 1
Trigonometric Functions		
v?Cos	*s*, *d*, *c*, *z*	Cosine of vector elements
v?Sin	*s*, *d*, *c*, *z*	Sine of vector elements
v?SinCos	*s*, *d*	Sine and cosine of vector elements
v?CIS	*c*, *z*	Complex exponent of vector elements (cosine and sine combined to complex value)
v?Tan	*s*, *d*, *c*, *z*	Tangent of vector elements
v?Acos	*s*, *d*, *c*, *z*	Inverse cosine of vector elements
v?Asin	*s*, *d*, *c*, *z*	Inverse sine of vector elements
v?Atan	*s*, *d*, *c*, *z*	Inverse tangent of vector elements
v?Atan2	*s*, *d*	Four-quadrant inverse tangent of elements of two vectors
Hyperbolic Functions		
v?Cosh	*s*, *d*, *c*, *z*	Hyperbolic cosine of vector elements
v?Sinh	*s*, *d*, *c*, *z*	Hyperbolic sine of vector elements
v?Tanh	*s*, *d*, *c*, *z*	Hyperbolic tangent of vector elements
v?Acosh	*s*, *d*, *c*, *z*	Inverse hyperbolic cosine of vector elements
v?Asinh	*s*, *d*, *c*, *z*	Inverse hyperbolic sine of vector elements
v?Atanh	*s*, *d*, *c*, *z*	Inverse hyperbolic tangent of vector elements.
Special Functions		
v?Erf	*s*, *d*	Error function value of vector elements
v?Erfc	*s*, *d*	Complementary error function value of vector elements
v?CdfNorm	*s*, *d*	Cumulative normal distribution function value of vector elements
v?ErfInv	*s*, *d*	Inverse error function value of vector elements
v?ErfcInv	*s*, *d*	Inverse complementary error function value of vector elements
v?CdfNormInv	*s*, *d*	Inverse cumulative normal distribution function value of vector elements
Rounding Functions		
v?Floor	*s*, *d*	Rounding towards minus infinity
v?Ceil	*s*, *d*	Rounding towards plus infinity
v?Trunc	*s*, *d*	Rounding towards zero infinity
v?Round	*s*, *d*	Rounding to nearest integer
v?NearbyInt	*s*, *d*	Rounding according to current mode
v?Rint	*s*, *d*	Rounding according to current mode and raising inexact result exception
v?Modf	*s*, *d*	Integer and fraction parts

Special Value Notations

This section describes notations used in special value behavior tables for complex functions.

X and Y are non-zero positive finite floating point numbers. The imaginary unit is i, $i^2=-1$. RE(z) is the real part of z and IM(z) is the imaginary part of z. The argument z for the function is defined by RE(z)+i·IM(z).

CONJ(x+i·y)=x-i·y

CIS(y)=Cos(y)+i·Sin(y).

The result of the function for the argument z is found in the cell at the intersection of the RE(z) column and the IM(z) row. If the function raises exception on the argument z, the lower part of this cell shows the raised exception. An empty cell indicates that this argument is not special and the result is defined mathematically.

Arithmetic Functions

v?Add

Performs element by element addition of vector a and vector b.

Syntax

Fortran:

```
call vsadd( n, a, b, y )
call vdadd( n, a, b, y )
call vcadd( n, a, b, y )
call vzadd( n, a, b, y )
```

C:

```
vsAdd( n, a, b, y );
vdAdd( n, a, b, y );
vcAdd( n, a, b, y );
vzAdd( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a, *b*	**FORTRAN 77:** REAL for vsadd DOUBLE PRECISION for vdadd COMPLEX for vcadd DOUBLE COMPLEX for vzadd **Fortran 90:** REAL, INTENT(IN) for vsadd DOUBLE PRECISION, INTENT(IN) for vdadd	**FORTRAN:** Arrays, specify the input vectors *a* and *b*. **C:** Pointers to arrays that contain the input vectors *a* and *b*.

Name	Type	Description
	`COMPLEX`, `INTENT(IN)` for `vcadd`	
	`DOUBLE COMPLEX`, `INTENT(IN)` for `vzadd`	
	C: `const float*` for `vsAdd`	
	`const double*` for `vdAdd`	
	`const MKL_Complex8*` for `vcAdd`	
	`const MKL_Complex16*` for `vzAdd`	

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** `REAL` for `vsadd`	**FORTRAN:** Array, specifies the output vector *y*.
	`DOUBLE PRECISION` for `vdadd`	**C:** Pointer to an array that contains the output vector *y*.
	`COMPLEX`, for `vcadd`	
	`DOUBLE COMPLEX` for `vzadd`	
	Fortran 90: `REAL`, `INTENT(OUT)` for `vsadd`	
	`DOUBLE PRECISION`, `INTENT(OUT)` for `vdadd`	
	`COMPLEX`, `INTENT(OUT)` for `vcadd`	
	`DOUBLE COMPLEX`, `INTENT(OUT)` for `vzadd`	
	C: `float*` for `vsAdd`	
	`double*` for `vdAdd`	
	`MKL_Complex8*` for `vcAdd`	
	`MKL_Complex16*` for `vzAdd`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function performs element by element addition of vector *a* and vector *b*.

Special values for Real Function v?Add(x)

Argument 1	Argument 2	Result	Exception
+0	+0	+0	
+0	-0	+0	
-0	+0	+0	

Argument 1	Argument 2	Result	Exception
-0	-0	-0	
+∞	+∞	+∞	
+∞	-∞	QNAN	INVALID
-∞	+∞	QNAN	INVALID
-∞	-∞	-∞	
SNAN	any value	QNAN	INVALID
any value	SNAN	QNAN	INVALID
QNAN	non-SNAN	QNAN	
non-SNAN	QNAN	QNAN	

Specifications for special values of the complex functions are found according to the formula

`Add(X1+i*Y1,X2+i*Y2) = (X1+X2) + i*(Y1+Y2).`

v?Sub

Performs element by element subtraction of vector b from vector a.

Syntax

Fortran:

```
call vssub( n, a, b, y )
call vdsub( n, a, b, y )
call vcsub( n, a, b, y )
call vzsub( n, a, b, y )
```

C:

```
vsSub( n, a, b, y );
vdSub( n, a, b, y );
vcSub( n, a, b, y );
vzSub( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.

Name	Type	Description
a, *b*	**FORTRAN 77:** REAL for vssub DOUBLE PRECISION for vdsub COMPLEX for vcsub DOUBLE COMPLEX for vzsub **Fortran 90:** REAL, INTENT(IN) for vssub DOUBLE PRECISION, INTENT(IN) for vdsub COMPLEX, INTENT(IN) for vcsub DOUBLE COMPLEX, INTENT(IN) for vzsub **C:** const float* for vsSub const double* for vdSub const MKL_Complex8* for vcSub const MKL_Complex16* for vzSub	**FORTRAN:** Arrays, specify the input vectors *a* and *b*. **C:** Pointers to arrays that contain the input vectors *a* and *b*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vssub DOUBLE PRECISION for vdsub COMPLEX for vcsub DOUBLE COMPLEX for vzsub **Fortran 90:** REALINTENT(OUT) for vssub DOUBLE PRECISION, INTENT(OUT) for vdsub COMPLEX, INTENT(OUT) for vcsub DOUBLE COMPLEX, INTENT(OUT) for vzsub **C:** float* for vsSub double* for vdSub MKL_Complex8* for vcSub MKL_Complex16* for vzSub	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function performs element by element subtraction of vector *b* from vector *a*.

Special values for Real Function v?Sub(x)

Argument 1	Argument 2	Result	Exception
+0	+0	+0	
+0	-0	+0	
-0	+0	-0	
-0	-0	+0	
+∞	+∞	QNAN	INVALID
+∞	-∞	+∞	
-∞	+∞	-∞	
-∞	-∞	QNAN	INVALID
SNAN	any value	QNAN	INVALID
any value	SNAN	QNAN	INVALID
QNAN	non-SNAN	QNAN	
non-SNAN	QNAN	QNAN	

Specifications for special values of the complex functions are found according to the formula

`Sub(X1+i*Y1,X2+i*Y2) = (X1-X2) + i*(Y1-Y2).`

v?Sqr

Performs element by element squaring of the vector.

Syntax

Fortran:

```
call vssqr( n, a, y )
call vdsqr( n, a, y )
```

C:

```
vsSqr( n, a, y );
vdSqr( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)`	Specifies the number of elements to be calculated.

Name	Type	Description
	C: `const int`	

a	**FORTRAN 77:** REAL for `vssqr`
	`DOUBLE PRECISION` for `vdsqr`
	Fortran 90: REAL, `INTENT(IN)` for `vssqr`
	`DOUBLE PRECISION`, `INTENT(IN)` for `vdsqr`
	C: `const float*` for `vsSqr`
	`const double*` for `vdSqr`
		FORTRAN: Array, specifies the input vector *a*.
		C: Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** REAL for `vssqr`
	`DOUBLE PRECISION` for `vdsqr`
	Fortran 90: REAL, `INTENT(OUT)` for `vssqr`
	`DOUBLE PRECISION`, `INTENT(OUT)` for `vdsqr`
	C: `float*` for `vsSqr`
	`double*` for `vdSqr`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function performs element by element squaring of the vector.

Special Values for Real Function v?Sqr(x)

Argument	Result	Exception
+0	+0	
-0	+0	
+∞	+∞	
-∞	+∞	
QNAN	QNAN	
SNAN	QNAN	INVALID

v?Mul

Performs element by element multiplication of vector a and vector b.

Syntax

Fortran:

```
call vsmul( n, a, b, y )
call vdmul( n, a, b, y )
call vcmul( n, a, b, y )
call vzmul( n, a, b, y )
```

C:

```
vsMul( n, a, b, y );
vdMul( n, a, b, y );
vcMul( n, a, b, y );
vzMul( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a, *b*	**FORTRAN 77:** REAL for vsmul DOUBLE PRECISION for vdmul COMPLEX for vcmul DOUBLE COMPLEX for vzmul **Fortran 90:** REAL, INTENT(IN) for vsmul DOUBLE PRECISION, INTENT(IN) for vdmul COMPLEX, INTENT(IN) for vcmul DOUBLE COMPLEX, INTENT(IN) for vzmul **C:** const float* for vsMul const double* for vdMul	**FORTRAN:** Arrays, specify the input vectors *a* and *b*. **C:** Pointers to arrays that contain the input vectors *a* and *b*.

Name	Type	Description
	`const MKL_Complex8*` for `vcMul`	
	`const MKL_Complex16*` for `vzMul`	

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vsmul`
	`DOUBLE PRECISION` for `vdmul`
	`COMPLEX`, for `vcmul`
	`DOUBLE COMPLEX` for `vzmul`
	Fortran 90: `REAL, INTENT(OUT)` for `vsmul`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdmul`
	`COMPLEX, INTENT(OUT)` for `vcmul`
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzmul`
	C: `float*` for `vsMul`
	`double*` for `vdMul`
	`MKL_Complex8*` for `vcMul`
	`MKL_Complex16*` for `vzMul`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The performs element by element multiplication of vector *a* and vector *b*.

Special values for Real Function v?Mul(x)

Argument 1	Argument 2	Result	Exception
+0	+0	+0	
+0	-0	-0	
-0	+0	-0	
-0	-0	+0	
+0	+∞	QNAN	INVALID
+0	-∞	QNAN	INVALID
-0	+∞	QNAN	INVALID
-0	-∞	QNAN	INVALID

Argument 1	Argument 2	Result	Exception
+∞	+0	QNAN	INVALID
+∞	-0	QNAN	INVALID
-∞	+0	QNAN	INVALID
-∞	-0	QNAN	INVALID
+∞	+∞	+∞	
+∞	-∞	-∞	
-∞	+∞	-∞	
-∞	-∞	+∞	
SNAN	any value	QNAN	INVALID
any value	SNAN	QNAN	INVALID
QNAN	non-SNAN	QNAN	
non-SNAN	QNAN	QNAN	

Specifications for special values of the complex functions are found according to the formula

`Mul(X1+i*Y1,X2+i*Y2) = (X1*X2-Y1*Y2) + i*(X1*Y2+Y1*X2).`

v?MulByConj

Performs element by element multiplication of vector a element and conjugated vector b element.

Syntax

Fortran:

```
call vcmulbyconj( n, a, b, y )
call vzmulbyconj( n, a, b, y )
```

C:

```
vcMulByConj( n, a, b, y );
vzMulByConj( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.
a, *b*	**FORTRAN 77:** `COMPLEX` for `vcmulby-conj`	**FORTRAN:** Arrays, specify the input vectors *a* and *b*.

Name	Type	Description
	DOUBLE COMPLEX for vzmulbyconj **Fortran 90:** COMPLEX, INTENT(IN) for vcmulbyconj DOUBLE COMPLEX, INTENT(IN) for vzmulbyconj **C:** const MKL_Complex8* for vcMulByConj const MKL_Complex16* for vzMulByConj	**C:** Pointers to arrays that contain the input vectors *a* and *b*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** COMPLEX for vcmulbyconj DOUBLE COMPLEX for vzmulbyconj **Fortran 90:** COMPLEX, INTENT(OUT) for vcmulbyconj DOUBLE COMPLEX, INTENT(OUT) for vzmulbyconj **C:** MKL_Complex8* for vcMulByConj MKL_Complex16* for vzMulByConj	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function performs element by element multiplication of vector *a* element and conjugated vector *b* element.

Specifications for special values of the functions are found according to the formula

MulByConj(X1+i*Y1,X2+i*Y2) = Mul(X1+i*Y1,X2-i*Y2).

v?Conj

Performs element by element conjugation of the vector.

Syntax

Fortran:

```
call vcconj( n, a, y )
call vzconj( n, a, y )
```

C:

```
vcConj( n, a, y );
vzConj( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** COMPLEX, INTENT(IN) for vcconj DOUBLE COMPLEX, INTENT(IN) for vzconj **Fortran 90:** COMPLEX, INTENT(IN) for vcconj DOUBLE COMPLEX, INTENT(IN) for vzconj **C:** const MKL_Complex8* for vcConj const MKL_Complex16* for vzConj	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** COMPLEX, for vcconj DOUBLE COMPLEX for vzconj **Fortran 90:** COMPLEX, INTENT(OUT) for vcconj DOUBLE COMPLEX, INTENT(OUT) for vzconj **C:** MKL_Complex8* for vcConj MKL_Complex16* for vzConj	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function performs element by element conjugation of the vector.

No special values are specified. The function does not raise floating-point exceptions.

v?Abs

Computes absolute value of vector elements.

Syntax

Fortran:

```
call vsabs( n, a, y )
call vdabs( n, a, y )
call vcabs( n, a, y )
call vzabs( n, a, y )
```

C:

```
vsAbs( n, a, y );
vdAbs( n, a, y );
vcAbs( n, a, y );
vzAbs( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsabs DOUBLE PRECISION for vdabs COMPLEX for vcabs DOUBLE COMPLEX for vzabs **Fortran 90:** REAL, INTENT(IN) for vsabs DOUBLE PRECISION, INTENT(IN) for vdabs COMPLEX, INTENT(IN) for vcabs DOUBLE COMPLEX, INTENT(IN) for vzabs **C:** const float* for vsAbs const double* for vdAbs const MKL_Complex8* for vcAbs	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	`const MKL_Complex16*` for `vzAbs`	

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vsabs`, `vcabs`
	`DOUBLE PRECISION` for `vdabs`, `vzabs`
	Fortran 90: `REAL, INTENT(OUT)` for `vsabs`, `vcabs`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdabs`, `vzabs`
	C: `float*` for `vsAbs`, `vcAbs`
	`double*` for `vdAbs`, `vzAbs`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes absolute value of vector elements.

Special Values for Real Function v?Abs(x)

Argument	Result	Exception
+0	+0	
-0	+0	
+∞	+∞	
-∞	+∞	
QNAN	QNAN	
SNAN	QNAN	INVALID

Specifications for special values of the complex functions are found according to the formula

`Abs(z) = Hypot(RE(z),IM(z))`.

v?Arg

Computes argument of vector elements.

Syntax

Fortran:

```
call vcarg( n, a, y )
call vzarg( n, a, y )
```

C:

```
vcArg( n, a, y );
vzArg( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN77:** COMPLEX for vcarg DOUBLE COMPLEX for vzarg **Fortran 90:** COMPLEX, INTENT(IN) for vcarg DOUBLE COMPLEX, INTENT(IN) for vzarg **C:** const MKL_Complex8* for vcArg const MKL_Complex16* for vzArg	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vcarg DOUBLE PRECISION for vzarg **Fortran 90:** REAL, INTENT(OUT) for vcarg DOUBLE PRECISION, INTENT(OUT) for vzarg **C:** float* for vcArg double* for vzArg	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes argument of vector elements.

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?Arg(z)

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
+i·∞	+3·π/4	+π/2	+π/2	+π/2	+π/2	+π/4	NAN
+i·Y	+π		+π/2	+π/2		+0	NAN
+i·0	+π	+π	+π	+0	+0	+0	NAN
-i·0	-π	-π	-π	-0	-0	-0	NAN
-i·Y	-π		-π/2	-π/2		-0	NAN
-i·∞	-3·π/4	-π/2	-π/2	-π/2	-π/2	-π/4	NAN
+i·NAN	NAN	NAN	NAN	NAN	NAN	NAN	NAN

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is `SNAN`
- does not change `ERROR CODE`
- `Arg(z)=Atan2(IM(z),RE(z))`.

Power and Root Functions

v?Inv

Performs element by element inversion of the vector.

Syntax

Fortran:

```
call vsinv( n, a, y )
call vdinv( n, a, y )
```

C:

```
vsInv( n, a, y );
vdInv( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.

Name	Type	Description
a	**FORTRAN 77:** REAL for vsinv DOUBLE PRECISION for vdinv **Fortran 90:** REAL, INTENT(IN) for vsinv DOUBLE PRECISION, INTENT(IN) for vdinv **C:** const float* for vsInv const double* for vdInv	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsinv DOUBLE PRECISION for vdinv **Fortran 90:** REAL, INTENT(OUT) for vsinv DOUBLE PRECISION, INTENT(OUT) for vdinv **C:** float* for vsInv double* for vdInv	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function performs element by element inversion of the vector.

Special Values for Real Function v?Inv(x)

Argument	Result	Error Code	Exception
+0	+∞	VML_STATUS_SING	ZERODIVIDE
-0	-∞	VML_STATUS_SING	ZERODIVIDE
+∞	+0		
-∞	-0		
QNAN	QNAN		
SNAN	QNAN		INVALID

v?Div

Performs element by element division of vector a by vector b

Syntax

Fortran:

```
call vsdiv( n, a, b, y )
call vddiv( n, a, b, y )
call vcdiv( n, a, b, y )
call vzdiv( n, a, b, y )
```

C:

```
vsDiv( n, a, b, y );
vdDiv( n, a, b, y );
vcDiv( n, a, b, y );
vzDiv( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a, *b*	**FORTRAN 77:** REAL for vsdiv DOUBLE PRECISION for vddiv COMPLEX for vcdiv DOUBLE COMPLEX for vzdiv **Fortran 90:** REAL, INTENT(IN) for vsdiv DOUBLE PRECISION, INTENT(IN) for vddiv COMPLEX, INTENT(IN) for vcdiv DOUBLE COMPLEX, INTENT(IN) for vzdiv **C:** const float* for vsDiv const double* for vdDiv	**FORTRAN:** Arrays, specify the input vectors *a* and *b*. **C:** Pointers to arrays that contain the input vectors *a* and *b*.

Name	Type	Description
	`const MKL_Complex8*` for `vcDiv`	
	`const MKL_Complex16*` for `vzDiv`	

Table 9-3 Precision Overflow Thresholds for Div Real Function

Data Type	Threshold Limitations on Input Parameters
single precision	`abs(a[i]) < abs(b[i]) * FLT_MAX`
double precision	`abs(a[i]) < abs(b[i]) * DBL_MAX`

NOTE. Overflow can occur also in `Div` complex function, but the exact formula is beyond the scope of this document.

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vsdiv`
	`DOUBLE PRECISION` for `vddiv`
	`COMPLEX` for `vcdiv`
	`DOUBLE COMPLEX` for `vzdiv`
	Fortran 90: `REAL, INTENT(OUT)` for `vsdiv`
	`DOUBLE PRECISION, INTENT(OUT)` for `vddiv`
	`COMPLEX, INTENT(OUT)` for `vcdiv`
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzdiv`
	C: `float*` for `vsDiv`
	`double*` for `vdDiv`
	`MKL_Complex8*` for `vcDiv`
	`MKL_Complex16*` for `vzDiv`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function performs element by element division of vector *a* by vector *b*.

Special values for Real Function v?Div(x)

Argument 1	Argument 2	Result	Error Code	Exception
X > +0	+0	+∞	VML_STATUS_SING	ZERODRIVE
X > +0	-0	-∞	VML_STATUS_SING	ZERODRIVE
X < +0	+0	-∞	VML_STATUS_SING	ZERODRIVE
X < +0	-0	+∞	VML_STATUS_SING	ZERODRIVE
+0	+0	QNAN	VML_STATUS_SING	
-0	-0	QNAN	VML_STATUS_SING	
X > +0	+∞	+0		
X > +0	-∞	-0		
+∞	+∞	QNAN		
-∞	-∞	QNAN		
QNAN	QNAN	QNAN		
SNAN	SNAN	QNAN		INVALID

Specifications for special values of the complex functions are found according to the formula

`Div(X1+i*Y1,X2+i*Y2) = (X1+i*Y1)*(X2-i*Y2)/(X2*X2+Y2*Y2).`

v?Sqrt

Computes a square root of vector elements.

Syntax

Fortran:

```
call vssqrt( n, a, y )
call vdsqrt( n, a, y )
call vcsqrt( n, a, y )
call vzsqrt( n, a, y )
```

C:

```
vsSqrt( n, a, y );
vdSqrt( n, a, y );
vcSqrt( n, a, y );
vzSqrt( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vssqrt DOUBLE PRECISION for vdsqrt COMPLEX for vcsqrt DOUBLE COMPLEX for vzsqrt **Fortran 90:** REAL, INTENT(IN) for vssqrt DOUBLE PRECISION, INTENT(IN) for vdsqrt COMPLEX, INTENT(IN) for vcsqrt DOUBLE COMPLEX, INTENT(IN) for vzsqrt **C:** const float* for vsSqrt const double* for vdSqrt const MKL_Complex8* for vcSqrt const MKL_Complex16* for vzSqrt	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN:** REAL for vssqrt DOUBLE PRECISION for vdsqrt COMPLEX for vcsqrt DOUBLE COMPLEX for vzsqrt **C:** float* for vsSqrt double* for vdSqrt MKL_Complex8* for vcSqrt MKL_Complex16* for vzSqrt	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes a square root of vector elements.

Special Values for Real Function v?Sqrt(x)

Argument	Result	Error Code	Exception
X < +0	QNAN	VML_STATUS_ERRDOM	INVALID
+0	+0		
-0	-0		
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
+∞	+∞		
QNAN	QNAN		
SNAN	QNAN		INVALID

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?Sqrt(z)

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
+i·∞	+∞+i·∞	+∞+i·∞	+∞+i·∞	+∞+i·∞	+∞+i·∞	+∞+i·∞	+∞+i·∞
+i·Y	+0+i·∞					+∞+i·0	QNAN+i·QNAN
+i·0	+0+i·∞		+0+i·0	+0+i·0		+∞+i·0	QNAN+i·QNAN
-i·0	+0-i·∞		+0-i·0	+0-i·0		+∞-i·0	QNAN+i·QNAN
-i·Y	+0-i·∞					+∞-i·0	QNAN+i·QNAN
-i·∞	+∞-i·∞	+∞-i·∞	+∞-i·∞	+∞-i·∞	+∞-i·∞	+∞-i·∞	+∞-i·∞
+i·NAN	QNAN+i·QNAN	QNAN+i·QNAN	QNAN+i·QNAN	QNAN+i·QNAN	QNAN+i·QNAN	+∞+i·QNAN	QNAN+i·QNAN

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is `SNAN`
- does not change `ERROR CODE`
- `Sqrt(CONJ(z))=CONJ(Sqrt(z))`.

v?InvSqrt

Computes an inverse square root of vector elements.

Syntax

Fortran:

```
call vsinvsqrt( n, a, y )
call vdinvsqrt( n, a, y )
```

C:

```
vsInvSqrt( n, a, y );
vdInvSqrt( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsinvsqrt DOUBLE PRECISION for vdinvsqrt **Fortran 90:** REAL, INTENT(IN) for vsinvsqrt DOUBLE PRECISION, INTENT(IN) for vdinvsqrt **C:** const float* for vsInvSqrt const double* for vdInvSqrt	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsinvsqrt DOUBLE PRECISION for vdinvsqrt **Fortran 90:** REAL, INTENT(OUT) for vsinvsqrt DOUBLE PRECISION, INTENT(OUT) for vdinvsqrt **C:** float* for vsInvSqrt	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`double*` for `vdInvSqrt`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes an inverse square root of vector elements.

Special Values for Real Function v?InvSqrt(x)

Argument	Result	Error Code	Exception
X < +0	QNAN	VML_STATUS_ERRDOM	INVALID
+0	+∞	VML_STATUS_SING	ZERODIVIDE
-0	-∞	VML_STATUS_SING	ZERODIVIDE
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
+∞	+0		
QNAN	QNAN		
SNAN	QNAN		INVALID

v?Cbrt

Computes a cube root of vector elements.

Syntax

Fortran:

```
call vscbrt( n, a, y )
call vdcbrt( n, a, y )
```

C:

```
vsCbrt( n, a, y );
vdCbrt( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** `REAL` for `vscbrt` `DOUBLE PRECISION` for `vdcbrt`	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	Fortran 90: REAL, INTENT(IN) for vscbrt DOUBLE PRECISION, INTENT(IN) for vdcbrt **C:** const float* for vsCbrt const double* for vdCbrt	

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vscbrt DOUBLE PRECISION for vdcbrt **Fortran 90:** REAL, INTENT(OUT) for vscbrt DOUBLE PRECISION, INTENT(OUT) for vdcbrt **C:** float* for vsCbrt double* for vdCbrt	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes a cube root of vector elements.

Special Values for Real Function v?Cbrt(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+∞	
-∞	-∞	
QNAN	QNAN	
SNAN	QNAN	INVALID

v?InvCbrt

Computes an inverse cube root of vector elements.

Syntax

Fortran:

```
call vsinvcbrt( n, a, y )
call vdinvcbrt( n, a, y )
```

C:

```
vsInvCbrt( n, a, y );
vdInvCbrt( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsinvcbrt DOUBLE PRECISION for vdinvcbrt **Fortran 90:** REAL, INTENT(IN) for vsinvcbrt DOUBLE PRECISION, INTENT(IN) for vdinvcbrt **C:** const float* for vsInvCbrt const double* for vdInvCbrt	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsinvcbrt DOUBLE PRECISION for vdinvcbrt **Fortran 90:** REAL, INTENT(OUT) for vsinvcbrt DOUBLE PRECISION, INTENT(OUT) for vdinvcbrt **C:** float* for vsInvCbrt	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`double*` for `vdInvCbrt`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes an inverse cube root of vector elements.

Special Values for Real Function v?InvCbrt(x)

Argument	Result	Error Code	Exception
+0	+∞	VML_STATUS_SING	ZERODIVIDE
-0	-∞	VML_STATUS_SING	ZERODIVIDE
+∞	+0		
-∞	-0		
QNAN	QNAN		
SNAN	QNAN		INVALID

v?Pow2o3

Raises each element of a vector to the constant power 2/3.

Syntax

Fortran:

```
call vspow2o3( n, a, y )
call vdpow2o3( n, a, y )
```

C:

```
vsPow2o3( n, a, y );
vdPow2o3( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** `REAL` for `vspow2o3` `DOUBLE PRECISION` for `vdpow2o3`	**FORTRAN:** Arrays, specify the input vector *a*. **C:** Pointers to arrays that contain the input vector *a*.

Name	Type	Description
	Fortran 90: REAL, INTENT(IN) for vspow2o3 DOUBLE PRECISION, INTENT(IN) for vdpow2o3 **C:** const float* for vsPow2o3 const double* for vdPow2o3	

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vspow2o3 DOUBLE PRECISION for vdpow2o3 **Fortran 90:** REAL, INTENT(OUT) for vspow2o3 DOUBLE PRECISION, INTENT(OUT) for vdpow2o3 **C:** float* for vsPow2o3 double* for vdPow2o3	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function raises each element of a vector to the constant power 2/3.

Special Values for Real Function v?Pow2o3(x)

Argument	Result	Exception
+0	+0	
-0	+0	
+∞	+∞	
-∞	+∞	
QNAN	QNAN	
SNAN	QNAN	INVALID

v?Pow3o2

Raises each element of a vector to the constant power 3/2.

Syntax

Fortran:

```
call vspow3o2( n, a, y )
call vdpow3o2( n, a, y )
```

C:

```
vsPow3o2( n, a, y );
vdPow3o2( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vspow3o2 DOUBLE PRECISION for vdpow3o2 **Fortran 90:** REAL, INTENT(IN) for vspow3o2 DOUBLE PRECISION, INTENT(IN) for vdpow3o2 **C:** const float* for vsPow3o2 const double* for vdPow3o2	**FORTRAN:** Arrays, specify the input vector *a*. **C:** Pointers to arrays that contain the input vector *a*.

Table 9-4 Precision Overflow Thresholds for Pow3o2 Function

Data Type	Threshold Limitations on Input Parameters
single precision	abs(*a*[i]) < (FLT_MAX)$^{2/3}$
double precision	abs(*a*[i]) < (DBL_MAX)$^{2/3}$

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vspow3o2 DOUBLE PRECISION for vdpow3o2	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	Fortran 90: `REAL, INTENT(OUT)` for `vspow3o2`	
	`DOUBLE PRECISION, INTENT(OUT)` for `vdpow3o2`	
	C: `float*` for `vsPow3o2`	
	`double*` for `vdPow3o2`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function raises each element of a vector to the constant power 3/2.

Special Values for Real Function v?Pow3o2(x)

Argument	Result	Error Code	Exception
X < +0	QNAN	VML_STATUS_ERRDOM	INVALID
+0	+0		
-0	-0		
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
+∞	+∞		
QNAN	QNAN		
SNAN	QNAN		INVALID

v?Pow

Computes a to the power b for elements of two vectors.

Syntax

Fortran:

```
call vspow( n, a, b, y )
call vdpow( n, a, b, y )
call vcpow( n, a, b, y )
call vzpow( n, a, b, y )
```

C:

```
vsPow( n, a, b, y );
vdPow( n, a, b, y );
vcPow( n, a, b, y );
vzPow( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a, *b*	**FORTRAN 77:** REAL for vspow DOUBLE PRECISION for vdpow COMPLEX for vcpow DOUBLE COMPLEX for vzpow **Fortran 90:** REAL, INTENT(IN) for vspow DOUBLE PRECISION, INTENT(IN) for vdpow COMPLEX, INTENT(IN) for vcpow DOUBLE COMPLEX, INTENT(IN) for vzpow **C:** const float* for vsPow const double* for vdPow const MKL_Complex8* for vcPow const MKL_Complex16* for vzPow	**FORTRAN:** Arrays, specify the input vectors *a* and *b*. **C:** Pointers to arrays that contain the input vectors *a* and *b*.

Table 9-5 Precision Overflow Thresholds for Pow Real Function

Data Type	Threshold Limitations on Input Parameters
single precision	abs(*a*[i]) < (FLT_MAX)$^{1/b[i]}$
double precision	abs(*a*[i]) < (DBL_MAX)$^{1/b[i]}$

NOTE. Overflow can occur also in Pow complex function, but the exact formula is beyond the scope of this document.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vspow DOUBLE PRECISION for vdpow COMPLEX for vcpow	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`DOUBLE COMPLEX` for `vzpow`	
	Fortran 90: `REAL, INTENT(OUT)` for `vspow`	
	`DOUBLE PRECISION, INTENT(OUT)` for `vdpow`	
	`COMPLEX, INTENT(OUT)` for `vcpow`	
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzpow`	
	C: `float*` for `vsPow`	
	`double*` for `vdPow`	
	`MKL_Complex8*` for `vcPow`	
	`MKL_Complex16*` for `vzPow`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The real function v?Pow has certain limitations on the input range of *a* and *b* parameters. Specifically, if *a[i]* is positive, then *b[i]* may be arbitrary. For negative *a[i]*, the value of *b[i]* must be integer (either positive or negative).

The complex function v?Pow has no such input range limitations.

No specification for special values of the complex functions is defined.

v?Powx

Raises each element of a vector to the constant power.

Syntax

Fortran:

```
call vspowx( n, a, b, y )
call vdpowx( n, a, b, y )
call vcpowx( n, a, b, y )
call vzpowx( n, a, b, y )
```

C:

```
vsPowx( n, a, b, y );
vdPowx( n, a, b, y );
vcPowx( n, a, b, y );
vzPowx( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of elements to be calculated.
a	**FORTRAN 77:** REAL for vspowx DOUBLE PRECISION for vdpowx COMPLEX for vcpowx DOUBLE COMPLEX for vzpowx **Fortran 90:** REAL, INTENT(IN) for vspowx	**FORTRAN:** Array *a* that specifies the input vector **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	DOUBLE PRECISION, INTENT(IN) for vdpowx COMPLEX, INTENT(IN) for vcpowx DOUBLE COMPLEX, INTENT(IN) for vzpowx **C:** const float* for vsPowx const double* for vdPowx const MKL_Complex8* for vcPowx const MKL_Complex16* for vzPowx	
b	**FORTRAN 77:** REAL for vspowx DOUBLE PRECISION for vdpowx COMPLEX for vcpowx DOUBLE COMPLEX for vzpowx **Fortran 90:** REAL, INTENT(IN) for vspowx DOUBLE PRECISION, INTENT(IN) for vdpowx COMPLEX, INTENT(IN) for vcpowx DOUBLE COMPLEX, INTENT(IN) for vzpowx **C:** const float for vsPowx const double for vdPowx const MKL_Complex8* for vcPowx const MKL_Complex16* for vzPowx	**FORTRAN:** Scalar value *b* that is the constant power. **C:** Constant value for power *b*.

Table 9-6 Precision Overflow Thresholds for v?Powx Real Function

Data Type	Threshold Limitations on Input Parameters
single precision	abs(*a*[i]) < (FLT_MAX)$^{1/b}$
double precision	abs(*a*[i]) < (DBL_MAX)$^{1/b}$

NOTE. Overflow can occur also in v?Powx complex function, but the exact formula is beyond the scope of this document.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vspowx DOUBLE PRECISION for vdpowx COMPLEX for vcpowx DOUBLE COMPLEX for vzpowx **Fortran 90:** REAL, INTENT(OUT) for vspowx DOUBLE PRECISION, INTENT(OUT) for vdpowx COMPLEX, INTENT(OUT) for vcpowx DOUBLE COMPLEX, INTENT(OUT) for vzpowx **C:** float* for vsPowx double* for vdPowx MKL_Complex8* for vcPowx MKL_Complex16* for vzPowx	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The real function v?Powx has certain limitations on the input range of *a* and *b* parameters. Specifically, if *a[i]* is positive, then *b* may be arbitrary. For negative *a[i]*, the value of *b* must be integer (either positive or negative).

The complex function v?Powx has no such input range limitations.

Special values for real functions are the same as for the v?Pow function. See the respective table in the v?Pow description.

No specification for special values of the complex functions is defined.

v?Hypot

Computes a square root of sum of two squared elements.

Syntax

Fortran:

```
call vshypot( n, a, b, y )
call vdhypot( n, a, b, y )
```

C:

```
vsHypot( n, a, b, y );
vdHypot( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of elements to be calculated.
a,*b*	**FORTRAN 77:** REAL for vshypot DOUBLE PRECISION for vdhypot **Fortran 90:** REAL, INTENT(IN) for vshypot DOUBLE PRECISION, INTENT(IN) for vdhypot **C:** const float* for vsHypot const double* for vdHypot	**FORTRAN:** Arrays that specify the input vectors *a* and *b* **C:** Pointers to arrays that contain the input vectors *a* and *b*.

Table 9-7 Precision Overflow Thresholds for Hypot Function

Data Type	Threshold Limitations on Input Parameters
single precision	abs(*a*[i]) < sqrt(FLT_MAX) abs(*b*[i]) < sqrt(FLT_MAX)
double precision	abs(*a*[i]) < sqrt(DBL_MAX) abs(*b*[i]) < sqrt(DBL_MAX)

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vshypot DOUBLE PRECISION for vdhypot **Fortran 90:** REAL, INTENT(OUT) for vshypot DOUBLE PRECISION, INTENT(OUT) for vdhypot **C:** float* for vsHypot double* for vdHypot	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes a square root of sum of two squared elements.

Special values for Real Function v?Hypot(x)

Argument 1	Argument 2	Result	Exception
+0	+0	+0	
-0	-0	+0	
+∞	any value	+∞	
any value	+∞	+∞	
SNAN	any value	QNAN	INVALID
any value	SNAN	QNAN	INVALID
QNAN	any value	QNAN	
any value	QNAN	QNAN	

Exponential and Logarithmic Functions

v?Exp

Computes an exponential of vector elements.

Syntax

Fortran:

```
call vsexp( n, a, y )
call vdexp( n, a, y )
call vcexp( n, a, y )
call vzexp( n, a, y )
```

C:

```
vsExp( n, a, y );
vdExp( n, a, y );
vcExp( n, a, y );
vzExp( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsexp DOUBLE PRECISION for vdexp COMPLEX for vcexp DOUBLE COMPLEX for vzexp **Fortran 90:** REAL, INTENT(IN) for vsexp DOUBLE PRECISION, INTENT(IN) for vdexp COMPLEX, INTENT(IN) for vcexp DOUBLE COMPLEX, INTENT(IN) for vzexp **C:** const float* for vsExp const double* for vdExp const MKL_Complex8* for vcExp const MKL_Complex16* for vzExp	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Table 9-8 Precision Overflow Thresholds for Exp Real Function

Data Type	Threshold Limitations on Input Parameters
single precision	*a*[i] < Ln(FLT_MAX)
double precision	*a*[i] < Ln(DBL_MAX)

NOTE. Overflow can occur also in Exp complex function, but the exact formula is beyond the scope of this document.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsexp DOUBLE PRECISION for vdexp COMPLEX for vcexp DOUBLE COMPLEX for vzexp	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description

	Fortran 90: `REAL, INTENT(OUT)` for `vsexp`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdexp`
	`COMPLEX, INTENT(OUT)` for `vcexp`
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzexp`
	C: `float*` for `vsExp`
	`double*` for `vdExp`
	`MKL_Complex8*` for `vcExp`
	`MKL_Complex16*` for `vzExp`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes an exponential of vector elements.

Special Values for Real Function v?Exp(x)

Argument	Result	Error Code	Exception
+0	+1		
-0	+1		
X > overflow	+∞	VML_STATUS_OVERFLOW	OVERFLOW
X < underflow	+0	VML_STATUS_UNDERFLOW	UNDERFLOW
+∞	+∞		
-∞	+0		
QNAN	QNAN		
SNAN	QNAN		INVALID

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?Exp(z)

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
+i·∞	+0+i·0	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	+∞+i·QNAN INVALID	QNAN+i·QNAN INVALID
+i·Y	+0·CIS(Y)					+∞·CIS(Y)	QNAN+i·QNAN
+i·0	+0·CIS(0)		+1+i·0	+1+i·0		+∞+i·0	QNAN+i·0

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
-i·0	+0·CIS(0)		+1-i·0	+1-i·0		+∞-i·0	QNAN-i·0

+i·NAN	+0+i·0	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	+∞+i·QNAN	QNAN+i·QNAN

Notes:

- raises INVALID exception when real or imaginary part of the argument is SNAN
- raises INVALID exception on argument z=-∞+i·QNAN
- does not change ERROR CODE.

v?Expm1

Computes an exponential of vector elements decreased by 1.

Syntax

Fortran:

```
call vsexpm1( n, a, y )
call vdexpm1( n, a, y )
```

C:

```
vsExpm1( n, a, y );
vdExpm1( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsexpm1 DOUBLE PRECISION for vdexpm1	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	Fortran 90: REAL, INTENT(IN) for vs-expm1 DOUBLE PRECISION, INTENT(IN) for vdexpm1 **C:** const float* for vsExpm1 const double* for vdExpm1	

Table 9-9 Precision Overflow Thresholds for Expm1 Function

Data Type	Threshold Limitations on Input Parameters
single precision	*a*[i] < Ln(FLT_MAX)
double precision	*a*[i] < Ln(DBL_MAX)

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsexpm1 DOUBLE PRECISION for vdexpm1 **Fortran 90:** REAL, INTENT(OUT) for vsexpm1 DOUBLE PRECISION, INTENT(OUT) for vdexpm1 **C:** float* for vsExpm1 double* for vdExpm1	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes an exponential of vector elements decreased by 1.

Special Values for Real Function v?Expm1(x)

Argument	Result	Error Code	Exception
+0	+0		
-0	+0		
X > overflow	+∞	VML_STATUS_OVERFLOW	OVERFLOW
+∞	+∞		
-∞	-1		
QNAN	QNAN		
SNAN	QNAN		INVALID

v?Ln

Computes natural logarithm of vector elements.

Syntax

Fortran:

```
call vsln( n, a, y )
call vdln( n, a, y )
call vcln( n, a, y )
call vzln( n, a, y )
```

C:

```
vsLn( n, a, y );
vdLn( n, a, y );
vcLn( n, a, y );
vzLn( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsln DOUBLE PRECISION for vdln COMPLEX for vcln DOUBLE COMPLEX for vzln **Fortran 90:** REAL, INTENT(IN) for vsln DOUBLE PRECISION, INTENT(IN) for vdln COMPLEX, INTENT(IN) for vcln DOUBLE COMPLEX, INTENT(IN) for vzln **C:** const float* for vsLn const double* for vdLn const MKL_Complex8* for vcLn const MKL_Complex16* for vzLn	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsln DOUBLE PRECISION for vdln COMPLEX for vcln DOUBLE COMPLEX for vzln **Fortran 90:** REAL, INTENT(OUT) for vsln DOUBLE PRECISION, INTENT(OUT) for vdln COMPLEX, INTENT(OUT) for vcln DOUBLE COMPLEX, INTENT(OUT) for vzln **C:** float* for vsLn double* for vdLn MKL_Complex8* for vcLn MKL_Complex16* for vzLn	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes natural logarithm of vector elements.

Special Values for Real Function v?Ln(x)

Argument	Result	Error Code	Exception
+1	+0		
X < +0	QNAN	VML_STATUS_ERRDOM	INVALID
+0	-∞	VML_STATUS_SING	ZERODRIVE
-0	-∞	VML_STATUS_SING	ZERODRIVE
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
+∞	+∞		
QNAN	QNAN		
SNAN	QNAN		INVALID

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?Ln(z)

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
+i·∞	$+\infty + i \cdot \frac{3\pi}{4}$	+∞+i·π/2	+∞+i·π/2	+∞+i·π/2	+∞+i·π/2	+∞+i·π/4	+∞+i·QNAN

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is `SNAN`
- does not change `ERROR CODE`.

v?Log10

Computes denary logarithm of vector elements.

Syntax

Fortran:

```
call vslog10( n, a, y )
call vdlog10( n, a, y )
call vclog10( n, a, y )
call vzlog10( n, a, y )
```

C:

```
vsLog10( n, a, y );
vdLog10( n, a, y );
vcLog10( n, a, y );
vzLog10( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vslog10 DOUBLE PRECISION for vdlog10 COMPLEX for vclog10 DOUBLE COMPLEX for vzlog10 **Fortran 90:** REAL, INTENT(IN) for vslog10 DOUBLE PRECISION, INTENT(IN) for vdlog10 COMPLEX, INTENT(IN) for vclog10 DOUBLE COMPLEX, INTENT(IN) for vzlog10 **C:** const float* for vsLog10 const double* for vdLog10 const MKL_Complex8* for vcLog10 const MKL_Complex16* for vzLog10	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vslog10 DOUBLE PRECISION for vdlog10 COMPLEX for vclog10 DOUBLE COMPLEX for vzlog10 **Fortran 90:** REAL, INTENT(OUT) for vslog10 DOUBLE PRECISION, INTENT(OUT) for vdlog10 COMPLEX, INTENT(OUT) for vclog10 DOUBLE COMPLEX, INTENT(OUT) for vzlog10	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	C: `float*` for `vsLog10`	
	`double*` for `vdLog10`	
	`MKL_Complex8*` for `vcLog10`	
	`MKL_Complex16*` for `vzLog10`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes a denary logarithm of vector elements.

Special Values for Real Function v?Log10(x)

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is `SNAN`
- does not change `ERROR CODE`

v?Log1p

Computes a natural logarithm of vector elements that are increased by 1.

Syntax

Fortran:

```
call vslog1p( n, a, y )
call vdlog1p( n, a, y )
```

C:

```
vsLog1p( n, a, y );
vdLog1p( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.

a	**FORTRAN 77:** `REAL` for `vslog1p`
	`DOUBLE PRECISION` for `vdlog1p`
	Fortran 90: `REAL, INTENT(IN)` for `vslog1p`
	`DOUBLE PRECISION, INTENT(IN)` for `vdlog1p`
	C: `const float*` for `vsLog1p`
		FORTRAN: Array, specifies the input vector *a*.
		C: Pointer to an array that contains the input vector *a*.

Name	Type	Description
	`const double*` for `vdLog1p`	

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vslog1p`
	`DOUBLE PRECISION` for `vdlog1p`
	Fortran 90: `REAL, INTENT(OUT)` for `vslog1p`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdlog1p`
	C: `float*` for `vsLog1p`
	`double*` for `vdLog1p`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes a natural logarithm of vector elements that are increased by 1.

Special Values for Real Function v?Log1p(x)

Argument	Result	Error Code	Exception
-1	-∞	VML_STATUS_SING	ZERODIVIDE
X < -1	QNAN	VML_STATUS_ERRDOM	INVALID
+0	+0		
-0	-0		
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
+∞	+∞		
QNAN	QNAN		
SNAN	QNAN		INVALID

Trigonometric Functions

v?Cos

Computes cosine of vector elements.

Syntax

Fortran:

```
call vscos( n, a, y )
call vdcos( n, a, y )
call vccos( n, a, y )
call vzcos( n, a, y )
```

C:

```
vsCos( n, a, y );
vdCos( n, a, y );
vcCos( n, a, y );
vzCos( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vscos DOUBLE PRECISION for vdcos COMPLEX for vccos DOUBLE PRECISION for vzcos **Fortran 90:** REAL, INTENT(IN) for vscos DOUBLE PRECISION, INTENT(IN) for vdcos COMPLEX, INTENT(IN) for vccos DOUBLE PRECISION, INTENT(IN) for vzcos	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description

	C: `const float*` for `vsCos`
	`const double*` for `vdCos`
	`const MKL_Complex8*` for `vcCos`
	`const MKL_Complex16*` for `vzCos`	

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vscos`
	`DOUBLE PRECISION` for `vdcos`
	`COMPLEX` for `vccos`
	`DOUBLE COMPLEX` for `vzcos`
	Fortran 90: `REAL, INTENT(OUT)` for `vscos`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdcos`
	`COMPLEX, INTENT(OUT)` for `vccos`
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzcos`
	C: `float*` for `vsCos`
	`double*` for `vdCos`
	`MKL_Complex8*` for `vcCos`
	`MKL_Complex16*` for `vzCos`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes cosine of vector elements.

Note that arguments `abs(a[i])` $\leq 2^{13}$ and `abs(a[i])` $\leq 2^{16}$ for single and double precisions respectively are called fast computational path. These are trig function arguments for which VML provides the best possible performance. For performance reasons, avoid arguments that do not belong to the fast computational path in the VML High Accuracy (HA) and Low Accuracy (LA) functions. Alternatively, you can use VML Enhanced Performance (EP) functions that are fast on the entire function domain at the cost of accuracy.

Special Values for Real Function v?Cos(x)

Argument	Result	Error Code	Exception
+0	+1		

Argument	Result	Error Code	Exception
-0	+1		
+∞	QNAN	VML_STATUS_ERRDOM	INVALID
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
QNAN	QNAN		
SNAN	QNAN		INVALID

Specifications for special values of the complex functions are found according to the formula

`Cos(z) = Cosh(i*z)`.

v?Sin

Computes sine of vector elements.

Syntax

Fortran:

```
call vssin( n, a, y )
call vdsin( n, a, y )
call vcsin( n, a, y )
call vzsin( n, a, y )
```

C:

```
vsSin( n, a, y );
vdSin( n, a, y );
vcSin( n, a, y );
vzSin( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.

a	**FORTRAN 77:** `REAL` for `vssin`
	`DOUBLE PRECISION` for `vdsin`
	`COMPLEX` for `vcsin`
	`DOUBLE PRECISION` for `vzsin`
	Fortran 90: `REAL, INTENT(IN)` for `vssin`
		FORTRAN: Array, specifies the input vector *a*.
		C: Pointer to an array that contains the input vector *a*.

Name	Type	Description
	DOUBLE PRECISION, INTENT(IN) for vdsin COMPLEX, INTENT(IN) for vcsin DOUBLE PRECISION, INTENT(IN) for vzsin **C:** const float* for vsSin const double* for vdSin const MKL_Complex8* for vcSin const MKL_Complex16* for vzSin	

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vssin DOUBLE PRECISION for vdsin COMPLEX for vcsin DOUBLE COMPLEX for vzsin **Fortran 90:** REAL, INTENT(OUT) for vssin DOUBLE PRECISION, INTENT(OUT) for vdsin COMPLEX, INTENT(OUT) for vcsin DOUBLE COMPLEX, INTENT(OUT) for vzsin **C:** float* for vsSin double* for vdSin MKL_Complex8* for vcSin MKL_Complex16* for vzSin	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes sine of vector elements.

Note that arguments abs(*a*[i]) ≤ 2^{13} and abs(*a*[i]) ≤ 2^{16} for single and double precisions respectively are called fast computational path. These are trig function arguments for which VML provides the best possible performance. For performance reasons, avoid arguments that do not belong to the fast computational path in the VML High Accuracy (HA) and Low Accuracy (LA) functions. Alternatively, you can use VML Enhanced Performance (EP) functions that are fast on the entire function domain at the cost of accuracy.

Special Values for Real Function v?Sin(x)

Argument	Result	Error Code	Exception
+0	+0		
-0	-0		
+∞	QNAN	VML_STATUS_ERRDOM	INVALID
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
QNAN	QNAN		
SNAN	QNAN		INVALID

Specifications for special values of the complex functions are found according to the formula

`Sin(z) = -i*Sinh(i*z).`

v?SinCos

Computes sine and cosine of vector elements.

Syntax

Fortran:

```
call vssincos( n, a, y, z )
call vdsincos( n, a, y, z )
```

C:

```
vsSinCos( n, a, y, z );
vdSinCos( n, a, y, z );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vssincos DOUBLE PRECISION for vdsincos **Fortran 90:** REAL, INTENT(IN) for vssincos	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description

	`DOUBLE PRECISION`, `INTENT(IN)` for `vdsincos`
	C: `const float*` for `vsSinCos`
	`const double*` for `vdSinCos`	

Output Parameters

Name	Type	Description

y, *z*	**FORTRAN 77:** `REAL` for `vssincos`
	`DOUBLE PRECISION` for `vdsincos`
	Fortran 90: `REAL`, `INTENT(OUT)` for `vssincos`
	`DOUBLE PRECISION`, `INTENT(OUT)` for `vdsincos`
	C: `float*` for `vsSinCos`
	`double*` for `vdSinCos`
		FORTRAN: Arrays, specify the output vectors *y* (for sine values) and *z* (for cosine values).
		C: Pointers to arrays that contain the output vectors *y* (for sinevalues) and *z*(for cosine values).

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes sine and cosine of vector elements.

Note that arguments `abs(a[i])` $\leq 2^{13}$ and `abs(a[i])` $\leq 2^{16}$ for single and double precisions respectively are called fast computational path. These are trig function arguments for which VML provides the best possible performance. For performance reasons, avoid arguments that do not belong to the fast computational path in the VML High Accuracy (HA) and Low Accuracy (LA) functions. Alternatively, you can use VML Enhanced Performance (EP) functions that are fast on the entire function domain at the cost of accuracy.

Special Values for Real Function v?SinCos(x)

Argument	Result 1	Result 2	Error Code	Exception
+0	+0	+1		
-0	-0	+1		
+∞	QNAN	QNAN	VML_STATUS_ERRDOM	INVALID
-∞	QNAN	QNAN	VML_STATUS_ERRDOM	INVALID
QNAN	QNAN	QNAN		
SNAN	QNAN	QNAN		INVALID

Specifications for special values of the complex functions are found according to the formula

`Sin(z) = -i*Sinh(i*z).`

v?CIS

Computes complex exponent of real vector elements (cosine and sine of real vector elements combined to complex value).

Syntax

Fortran:

```
call vccis( n, a, y )
call vzcis( n, a, y )
```

C:

```
vcCIS( n, a, y );
vzCIS( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vccis DOUBLE PRECISION for vzcis **Fortran 90:** REAL, INTENT(IN) for vccis DOUBLE PRECISION, INTENT(IN) for vzcis **C:** const float* for vcCIS const double* for vzCIS	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** COMPLEX for vccis DOUBLE COMPLEX for vzcis **Fortran 90:** COMPLEX, INTENT(OUT) for vccis DOUBLE COMPLEX, INTENT(OUT) for vzcis	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	C: `MKL_Complex8*` for `vcCIS` `MKL_Complex16*` for `vzCIS`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes complex exponent of real vector elements (cosine and sine of real vector elements combined to complex value).

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?CIS(x)

x	CIS(x)
+ ∞	QNAN+i·QNAN INVALID
+ 0	+1+i·0
- 0	+1-i·0
- ∞	QNAN+i·QNAN INVALID
NAN	QNAN+i·QNAN

Notes:

- raises `INVALID` exception when the argument is `SNAN`
- raises `INVALID` exception and sets `ERROR CODE` to `VML_STATUS_ERRDOM` for `x=+∞`, `x=-∞`

v?Tan

Computes tangent of vector elements.

Syntax

Fortran:

```
call vstan( n, a, y )
call vdtan( n, a, y )
call vctan( n, a, y )
call vztan( n, a, y )
```

C:

```
vsTan( n, a, y );
vdTan( n, a, y );
vcTan( n, a, y );
vzTan( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL, INTENT(IN) for vstan DOUBLE PRECISION, INTENT(IN) for vdtan COMPLEX, INTENT(IN) for vctan DOUBLE COMPLEX, INTENT(IN) for vztan **Fortran 90:** REAL, INTENT(IN) for vstan DOUBLE PRECISION, INTENT(IN) for vdtan COMPLEX, INTENT(IN) for vctan DOUBLE COMPLEX, INTENT(IN) for vztan **C:** const float* for vsTan const double* for vdTan const MKL_Complex8* for vcTan const MKL_Complex16* for vzTan	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vstan DOUBLE PRECISION for vdtan COMPLEX for vctan	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`DOUBLE COMPLEX` for `vztan`	
	Fortran 90: `REAL, INTENT(OUT)` for `vstan`	
	`DOUBLE PRECISION, INTENT(OUT)` for `vdtan`	
	`COMPLEX, INTENT(OUT)` for `vctan`	
	`DOUBLE COMPLEX, INTENT(OUT)` for `vztan`	
	C: `float*` for `vsTan`	
	`double*` for `vdTan`	
	`MKL_Complex8*` for `vcTan`	
	`MKL_Complex16*` for `vzTan`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes tangent of vector elements.

Note that arguments `abs(a[i])` $\leq 2^{13}$ and `abs(a[i])` $\leq 2^{16}$ for single and double precisions respectively are called fast computational path. These are trig function arguments for which VML provides the best possible performance. For performance reasons, avoid arguments that do not belong to the fast computational path in the VML High Accuracy (HA) and Low Accuracy (LA) functions. Alternatively, you can use VML Enhanced Performance (EP) functions that are fast on the entire function domain at the cost of accuracy.

Special Values for Real Function v?Tan(x)

Argument	Result	Error Code	Exception
+0	+0		
-0	-0		
+∞	QNAN	VML_STATUS_ERRDOM	INVALID
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
QNAN	QNAN		
SNAN	QNAN		INVALID

Specifications for special values of the complex functions are found according to the formula

`Tan(z) = -i*Tanh(i*z)`.

v?Acos

Computes inverse cosine of vector elements.

Syntax

Fortran:

```
call vsacos( n, a, y )
call vdacos( n, a, y )
call vcacos( n, a, y )
call vzacos( n, a, y )
```

C:

```
vsAcos( n, a, y );
vdAcos( n, a, y );
vcAcos( n, a, y );
vzAcos( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsacos DOUBLE PRECISION for vdacos COMPLEX for vcacos DOUBLE COMPLEX for vzacos **Fortran 90:** REAL, INTENT(IN) for vsacos DOUBLE PRECISION, INTENT(IN) for vdacos COMPLEX, INTENT(IN) for vcacos DOUBLE COMPLEX, INTENT(IN) for vzacos **C:** const float* for vsAcos const double* for vdAcos const MKL_Complex8* for vcAcos	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	`const MKL_Complex16*` for `vzAcos`	

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vsacos`
	`DOUBLE PRECISION` for `vdacos`
	`COMPLEX` for `vcacos`
	`DOUBLE COMPLEX` for `vzacos`
	Fortran 90: `REAL, INTENT(OUT)` for `vsacos`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdacos`
	`COMPLEX, INTENT(OUT)` for `vcacos`
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzacos`
	C: `float*` for `vsAcos`
	`double*` for `vdAcos`
	`MKL_Complex8*` for `vcAcos`
	`MKL_Complex16*` for `vzAcos`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes inverse cosine of vector elements.

Special Values for Real Function v?Acos(x)

Argument	Result	Error Code	Exception
+0	+π/2		
-0	+π/2		
+1	+0		
-1	+π		
|X| > 1	QNAN	VML_STATUS_ERRDOM	INVALID
+∞	QNAN	VML_STATUS_ERRDOM	INVALID
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
QNAN	QNAN		
SNAN	QNAN		INVALID

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?Acos(z)

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
+i·∞	$+\frac{3\pi}{4} - i \cdot \infty$	$+\frac{\pi}{2} - i \cdot \infty$	$+\frac{\pi}{2} - i \cdot \infty$	$+\frac{\pi}{2} - i \cdot \infty$	$+\frac{\pi}{2} - i \cdot \infty$	$+\frac{\pi}{4} - i \cdot \infty$	QNAN-i·∞
+i·Y	+π-i·∞					+0-i·∞	QNAN+i·QNAN
+i·0	+π-i·∞		$+\frac{\pi}{2} - i \cdot 0$	$+\frac{\pi}{2} - i \cdot 0$		+0-i·∞	QNAN+i·QNAN
-i·0	+π+i·∞		$+\frac{\pi}{2} + i \cdot \infty$	$+\frac{\pi}{2} + i \cdot \infty$		+0+i·∞	QNAN+i·QNAN
-i·Y	+π+i·∞					+0+i·∞	QNAN+i·QNAN
-i·∞	$+\frac{3\pi}{4} + i \cdot \infty$	$+\frac{\pi}{2} + i \cdot \infty$	$+\frac{\pi}{2} + i \cdot \infty$	$+\frac{\pi}{2} + i \cdot \infty$	$+\frac{\pi}{2} + i \cdot \infty$	$+\frac{\pi}{4} + i \cdot \infty$	QNAN+i·∞
+i·NAN	QNAN+i·∞	QNAN+i·QNAN	$+\frac{\pi}{2} + i \cdot QNAN$	$+\frac{\pi}{2} + i \cdot QNAN$	QNAN+i·QNAN	QNAN+i·∞	QNAN+i·QNAN

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is SNAN
- does not change `ERROR CODE`
- `Acos(CONJ(z))=CONJ(Acos(z))`.

v?Asin

Computes inverse sine of vector elements.

Syntax

Fortran:

```
call vsasin( n, a, y )
call vdasin( n, a, y )
call vcasin( n, a, y )
call vzasin( n, a, y )
```

C:

```
vsAsin( n, a, y );
vdAsin( n, a, y );
vcAsin( n, a, y );
vzAsin( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsasin DOUBLE PRECISION for vdasin COMPLEX for vcasin DOUBLE COMPLEX for vzasin **Fortran 90:** REAL, INTENT(IN) for vsasin DOUBLE PRECISION, INTENT(IN) for vdasin COMPLEX, INTENT(IN) for vcasin DOUBLE COMPLEX, INTENT(IN) for vzasin **C:** const float* for vsAsin const double* for vdAsin const MKL_Complex8* for vcAsin const MKL_Complex16* for vzAsin	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsasin DOUBLE PRECISION for vdasin COMPLEX for vcasin DOUBLE COMPLEX for vzasin **Fortran 90:** REAL, INTENT(OUT) for vsasin DOUBLE PRECISION, INTENT(OUT) for vdasin COMPLEX, INTENT(OUT) for vcasin DOUBLE COMPLEX, INTENT(OUT) for vzasin	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	C: `float*` for `vsAsin`	
	`double*` for `vdAsin`	
	`MKL_Complex8*` for `vcAsin`	
	`MKL_Complex16*` for `vzAsin`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes inverse sine of vector elements.

Special Values for Real Function v?Asin(x)

Argument	Result	Error Code	Exception
+0	+0		
-0	-0		
+1	+π/2		
-1	-π/2		
|X| > 1	QNAN	VML_STATUS_ERRDOM	INVALID
+∞	QNAN	VML_STATUS_ERRDOM	INVALID
-∞	QNAN	VML_STATUS_ERRDOM	INVALID
QNAN	QNAN		
SNAN	QNAN		INVALID

Specifications for special values of the complex functions are found according to the formula `Asin(z) = -i*Asinh(i*z)`.

v?Atan

Computes inverse tangent of vector elements.

Syntax

Fortran:

```
call vsatan( n, a, y )
call vdatan( n, a, y )
call vcatan( n, a, y )
call vzatan( n, a, y )
```

C:

```
vsAtan( n, a, y );
vdAtan( n, a, y );
```

```
vcAtan( n, a, y );
vzAtan( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsatan DOUBLE PRECISION for vdatan COMPLEX for vcatan DOUBLE COMPLEX for vzatan **Fortran 90:** REAL, INTENT(IN) for vsatan DOUBLE PRECISION, INTENT(IN) for vdatan COMPLEX, INTENT(IN) for vcatan DOUBLE COMPLEX, INTENT(IN) for vzatan **C:** const float* for vsAtan const double* for vdAsin const MKL_Complex8* for vcAtan const MKL_Complex16* for vzAsin	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsatan DOUBLE PRECISION for vdatan COMPLEX for vcatan DOUBLE COMPLEX for vzatan **Fortran 90:** REAL, INTENT(OUT) for vsatan DOUBLE PRECISION, INTENT(OUT) for vdatan COMPLEX, INTENT(OUT) for vcatan	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description

	`DOUBLE COMPLEX`, `INTENT(OUT)` for `vzatan`
	C: `float*` for `vsAtan`
	`double*` for `vdAtan`
	`MKL_Complex8*` for `vcAtan`
	`MKL_Complex16*` for `vzAtan`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes inverse tangent of vector elements.

Special Values for Real Function v?Atan(x)

Argument	Result	Error Code	Exception
+0	+0		
-0	-0		
+∞	+π/2		
-∞	-π/2		
QNAN	QNAN		
SNAN	QNAN		INVALID

Specifications for special values of the complex functions are found according to the formula

`Atan(z) = -i*Atanh(i*z)`.

v?Atan2

Computes four-quadrant inverse tangent of elements of two vectors.

Syntax

Fortran:

```
call vsatan2( n, a, b, y )
call vdatan2( n, a, b, y )
```

C:

```
vsAtan2( n, a, b, y );
vdAtan2( n, a, b, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a, *b*	**FORTRAN 77:** REAL for vsatan2 DOUBLE PRECISION for vdatan2 **Fortran 90:** REAL, INTENT(IN) for vsatan2 DOUBLE PRECISION, INTENT(IN) for vdatan2 **C:** const float* for vsAtan2 const double* for vdAtan2	**FORTRAN:** Arrays, specify the input vectors *a* and *b*. **C:** Pointers to arrays that contain the input vectors *a* and *b*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsatan2 DOUBLE PRECISION for vdatan2 **Fortran 90:** REAL, INTENT(OUT) for vsatan2 DOUBLE PRECISION, INTENT(OUT) for vdatan2 **C:** float* for vsAtan2 double* for vdAtan2	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes four-quadrant inverse tangent of elements of two vectors.

The elements of the output vector*y* are computed as the four-quadrant arctangent of *a[i] / b[i]*.

Special values for Real Function v?Atan2(x)

Argument 1	Argument 2	Result	Exception
-∞	-∞	-3*π/4	
-∞	X < +0	-π/2	
-∞	-0	-π/2

Argument 1	Argument 2	Result	Exception
SNAN	SNAN	QNAN	INVALID

Hyperbolic Functions

v?Cosh

Computes hyperbolic cosine of vector elements.

Syntax

Fortran:

```
call vscosh( n, a, y )
call vdcosh( n, a, y )
call vccosh( n, a, y )
call vzcosh( n, a, y )
```

C:

```
vsCosh( n, a, y );
vdCosh( n, a, y );
vcCosh( n, a, y );
vzCosh( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vscosh DOUBLE PRECISION for vdcosh COMPLEX for vccosh DOUBLE COMPLEX for vzcosh **Fortran 90:** REAL, INTENT(IN) for vscosh DOUBLE PRECISION, INTENT(IN) for vdcosh COMPLEX, INTENT(IN) for vccosh	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	DOUBLE COMPLEX, INTENT(IN) for vz-cosh **C:** const float* for vsCosh const double* for vdCosh const MKL_Complex8* for vcCosh const MKL_Complex16* for vzCosh	

Table 9-10 Precision Overflow Thresholds for Cosh Real Function

Data Type	Threshold Limitations on Input Parameters
single precision	-Ln(FLT_MAX)-Ln2 <*a*[i] < Ln(FLT_MAX)+Ln2
double precision	-Ln(DBL_MAX)-Ln2 <*a*[i] < Ln(DBL_MAX)+Ln2

NOTE. Overflow can occur also in Cosh complex function, but the exact formula is beyond the scope of this document.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vscosh DOUBLE PRECISION for vdcosh COMPLEX for vccosh DOUBLE COMPLEX for vzcosh **Fortran 90:** REAL, INTENT(OUT) for vscosh DOUBLE PRECISION, INTENT(OUT) for vdcosh COMPLEX, INTENT(OUT) for vccosh DOUBLE COMPLEX, INTENT(OUT) for vz-cosh **C:** float* for vsCosh double* for vdCosh MKL_Complex8* for vcCosh MKL_Complex16* for vzCosh	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes hyperbolic cosine of vector elements.

Special Values for Real Function v?Cosh(x)

Argument	Result	Error Code	Exception
+0	+1		
-0	+1		
X > overflow	+∞	VML_STATUS_OVERFLOW	OVERFLOW
X < -overflow	+∞	VML_STATUS_OVERFLOW	OVERFLOW
+∞	+∞		
-∞	+∞		
QNAN	QNAN		
SNAN	QNAN		INVALID

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?Cosh(z)

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
+i·∞	+∞+i·QNAN INVALID	QNAN+i·QNAN INVALID	QNAN-i·0 INVALID	QNAN+i·0 INVALID	QNAN+i·QNAN INVALID	+∞+i·QNAN INVALID	QNAN+i·QNAN

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is SNAN
- does not change `ERROR CODE`
- `Cosh(CONJ(z))=CONJ(Cosh(z))`

- Cosh(-z)=Cosh(z).

v?Sinh

Computes hyperbolic sine of vector elements.

Syntax

Fortran:

```
call vssinh( n, a, y )
call vdsinh( n, a, y )
call vcsinh( n, a, y )
call vzsinh( n, a, y )
```

C:

```
vsSinh( n, a, y );
vdSinh( n, a, y );
vcSinh( n, a, y );
vzSinh( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vssinh DOUBLE PRECISION for vdsinh COMPLEX for vcsinh DOUBLE COMPLEX for vzsinh **Fortran 90:** REAL, INTENT(IN) for vssinh DOUBLE PRECISION, INTENT(IN) for vdsinh COMPLEX, INTENT(IN) for vcsinh DOUBLE COMPLEX, INTENT(IN) for vzsinh **C:** const float* for vsSinh	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	`const double*` for `vdSinh`	
	`const MKL_Complex8*` for `vcSinh`	
	`const MKL_Complex16*` for `vzSinh`	

Table 9-11 Precision Overflow Thresholds for Sinh Real Function

Data Type	Threshold Limitations on Input Parameters
single precision	`-Ln(FLT_MAX)-Ln2 <a[i] < Ln(FLT_MAX)+Ln2`
double precision	`-Ln(DBL_MAX)-Ln2 <a[i] < Ln(DBL_MAX)+Ln2`

NOTE. Overflow can occur also in `Sinh` complex function, but the exact formula is beyond the scope of this document.

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vssinh`
	`DOUBLE PRECISION` for `vdsinh`
	`COMPLEX` for `vcsinh`
	`DOUBLE COMPLEX` for `vzsinh`
	Fortran 90: `REAL, INTENT(OUT)` for `vssinh`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdsinh`
	`COMPLEX, INTENT(OUT)` for `vcsinh`
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzsinh`
	C: `float*` for `vsSinh`
	`double*` for `vdSinh`
	`MKL_Complex8*` for `vcSinh`
	`MKL_Complex16*` for `vzSinh`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes hyperbolic sine of vector elements.

Special Values for Real Function v?Sinh(x)

Argument	Result	Error Code	Exception
+0	+0		
-0	-0

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is SNAN
- does not change `ERROR CODE`
- `Sinh(CONJ(z))=CONJ(Sinh(z))`
- `Sinh(-z)=-Sinh(z)`.

v?Tanh

Computes hyperbolic tangent of vector elements.

Syntax

Fortran:

```
call vstanh( n, a, y )
call vdtanh( n, a, y )
call vctanh( n, a, y )
call vztanh( n, a, y )
```

C:

```
vsTanh( n, a, y );
vdTanh( n, a, y );
vcTanh( n, a, y );
vzTanh( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vstanh DOUBLE PRECISION for vdtanh COMPLEX for vctanh DOUBLE COMPLEX for vztanh **Fortran 90:** REAL, INTENT(IN) for vstanh DOUBLE PRECISION, INTENT(IN) for vdtanh COMPLEX, INTENT(IN) for vctanh DOUBLE COMPLEX, INTENT(IN) for vztanh **C:** const float* for vsTanh const double* for vdTanh const MKL_Complex8* for vcTanh	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	`const MKL_Complex16*` for `vzTanh`	

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vstanh`
	`DOUBLE PRECISION` for `vdtanh`
	`COMPLEX` for `cstanh`
	`DOUBLE COMPLEX` for `zdtanh`
	Fortran 90: `REAL, INTENT(OUT)` for `vstanh`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdtanh`
	`COMPLEX, INTENT(OUT)` for `cstanh`
	`DOUBLE COMPLEX, INTENT(OUT)` for `zdtanh`
	C: `float*` for `vsTanh`
	`double*` for `vdTanh`
	`MKL_Complex8*` for `vcTanh`
	`MKL_Complex16*` for `vzTanh`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes hyperbolic tangent of vector elements.

Special Values for Real Function v?Tanh(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+1	
-∞	-1	
QNAN	QNAN	
SNAN	QNAN	INVALID

See the Special Value Notations section for the conventions used in the table below.

Special Values for Complex Function v?Tanh(z)

RE(z) IM(z)	-∞	-X	-0	+0	+X	+∞	NAN
+i·∞	-1+i·0	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	QNAN+i·QNAN INVALID	+1+i·0	QNAN+i·QNAN
+i·Y	-1+i·0·Tan(Y)					+1+i·0·Tan(Y)	QNAN+i·QNAN

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is `SNAN`
- does not change `ERROR CODE`
- `Tanh(CONJ(z))=CONJ(Tanh(z))`
- `Tanh(-z)=-Tanh(z)`.

v?Acosh

Computes inverse hyperbolic cosine (nonnegative) of vector elements.

Syntax

Fortran:

```
call vsacosh( n, a, y )
call vdacosh( n, a, y )
call vcacosh( n, a, y )
call vzacosh( n, a, y )
```

C:

```
vsAcosh( n, a, y );
vdAcosh( n, a, y );
vcAcosh( n, a, y );
vzAcosh( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsacosh DOUBLE PRECISION for vdacosh COMPLEX for vcacosh DOUBLE COMPLEX for vzacosh **Fortran 90:** REAL, INTENT(IN) for vsacosh DOUBLE PRECISION, INTENT(IN) for vdacosh COMPLEX, INTENT(IN) for vcacosh DOUBLE COMPLEX, INTENT(IN) for vzacosh **C:** const float* for vsAcosh const double* for vdAcosh const MKL_Complex8* for vcAcosh const MKL_Complex16* for vzAcosh	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsacosh DOUBLE PRECISION for vdacosh COMPLEX for vcacosh DOUBLE COMPLEX for vzacosh **Fortran 90:** REAL, INTENT(OUT) for vsacosh DOUBLE PRECISION, INTENT(OUT) for vdacosh COMPLEX, INTENT(OUT) for vcacosh DOUBLE COMPLEX, INTENT(OUT) for vzacosh	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description

	C: `float*` for `vsAcosh`
	`double*` for `vdAcosh`
	`MKL_Complex8*` for `vcAcosh`
	`MKL_Complex16*` for `vzAcosh`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes inverse hyperbolic cosine (nonnegative) of vector elements.

Special Values for Real Function v?Acosh(x)

Argument	Result	Error Code	Exception
+1	+0		
X < +1	QNAN	VML_STATUS_ERRDOM	INVALID
-∞	QNAN	VML_STATUS_ERRDOM	INVALID

Notes:

- raises `INVALID` exception when real or imaginary part of the argument is `SNAN`
- does not change `ERROR CODE`

- Acosh(CONJ(z))=CONJ(Acosh(z)).

v?Asinh

Computes inverse hyperbolic sine of vector elements.

Syntax

Fortran:

```
call vsasinh( n, a, y )
call vdasinh( n, a, y )
call vcasinh( n, a, y )
call vzasinh( n, a, y )
```

C:

```
vsAsinh( n, a, y );
vdAsinh( n, a, y );
vcAsinh( n, a, y );
vzAsinh( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsasinh DOUBLE PRECISION for vdasinh COMPLEX for vcasinh DOUBLE COMPLEX for vzasinh **Fortran 90:** REAL, INTENT(IN) for vsasinh DOUBLE PRECISION, INTENT(IN) for vdasinh COMPLEX, INTENT(IN) for vcasinh DOUBLE COMPLEX, INTENT(IN) for vzasinh **C:** const float* for vsAsinh	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	`const double*` for `vdAsinh`	
	`const MKL_Complex8*` for `vcAsinh`	
	`const MKL_Complex16*` for `vzAsinh`	

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** `REAL` for `vsasinh`	**FORTRAN:** Array, specifies the output vector *y*.
	`DOUBLE PRECISION` for `vdasinh`	**C:** Pointer to an array that contains the output vector *y*.
	`COMPLEX` for `vcasinh`	
	`DOUBLE COMPLEX` for `vzasinh`	
	Fortran 90: `REAL, INTENT(OUT)` for `vsasinh`	
	`DOUBLE PRECISION, INTENT(OUT)` for `vdasinh`	
	`COMPLEX, INTENT(OUT)` for `vcasinh`	
	`DOUBLE COMPLEX, INTENT(OUT)` for `vzasinh`	
	C: `float*` for `vsAsinh`	
	`double*` for `vdAsinh`	
	`MKL_Complex8*` for `vcAsinh`	
	`MKL_Complex16*` for `vzAsinh`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes inverse hyperbolic sine of vector elements.

- `Asinh(CONJ(z))=CONJ(Asinh(z))`
- `Asinh(-z)=-Asinh(z)`.

v?Atanh

Computes inverse hyperbolic tangent of vector elements.

Syntax

Fortran:

```
call vsatanh( n, a, y )
call vdatanh( n, a, y )
call vcatanh( n, a, y )
call vzatanh( n, a, y )
```

C:

```
vsAtanh( n, a, y );
vdAtanh( n, a, y );
vcAtanh( n, a, y );
vzAtanh( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsatanh DOUBLE PRECISION for vdatanh COMPLEX for vcatanh DOUBLE COMPLEX for vzatanh **Fortran 90:** REAL, INTENT(IN) for vsatanh DOUBLE PRECISION, INTENT(IN) for vdatanh COMPLEX, INTENT(IN) for vcatanh DOUBLE COMPLEX, INTENT(IN) for vzatanh **C:** const float* for vsAtanh const double* for vdAtanh const MKL_Complex8* for vcAtanh const MKL_Complex16* for vzAtanh	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsatanh DOUBLE PRECISION for vdatanh COMPLEX for vcatanh DOUBLE COMPLEX for vzatanh **Fortran 90:** REAL, INTENT(OUT) for vsatanh DOUBLE PRECISION, INTENT(OUT) for vdatanh COMPLEX, INTENT(OUT) for vcatanh DOUBLE COMPLEX, INTENT(OUT) for vzatanh	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	C: `float*` for `vsAtanh`	
	`double*` for `vdAtanh`	
	`MKL_Complex8*` for `vcAtanh`	
	`MKL_Complex16*` for `vzAtanh`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes inverse hyperbolic tangent of vector elements.

Special Values for Real Function v?Atanh(x)

Argument	Result	Error Code	Exception

Notes:

- `Atanh(+-1+-i*0)=+-∞+-i*0`, and `ZERODIVIDE` exception is raised
- raises `INVALID` exception when real or imaginary part of the argument is `SNAN`

- does not change ERROR CODE
- Atanh(CONJ(z))=CONJ(Atanh(z))
- Atanh(-z)=-Atanh(z).

Special Functions

v?Erf

Computes the error function value of vector elements.

Syntax

Fortran:

```
call vserf( n, a, y )
call vderf( n, a, y )
```

C:

```
vsErf( n, a, y );
vdErf( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vserf DOUBLE PRECISION for vderf **Fortran 90:** REAL, INTENT(IN) for vserf DOUBLE PRECISION, INTENT(IN) for vderf **C:** const float* for vsErf const double* for vdErf	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vserf	**FORTRAN:** Array, specifies the output vector *y*.

Name	Type	Description

	`DOUBLE PRECISION` for `vderf`
	Fortran 90: `REAL, INTENT(OUT)` for `vserf`
	`DOUBLE PRECISION, INTENT(OUT)` for `vderf`
	C: `float*` for `vsErf`
	`double*` for `vdErf`
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function `Erf` computes the error function values for elements of the input vector *a* and writes them to the output vector *y*.

The error function is defined as given by:

$$\mathrm{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt \ .$$

Useful relations:

1. $\mathrm{erfc}(x) = 1 - \mathrm{erf}(x)$,

where `erfc` is the complementary error function.

2. $\Phi(x) = \frac{1}{2} \mathrm{erf}\,(x/\sqrt{2})$,

where

$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_0^x \exp\,(-t^2/2) dt$$

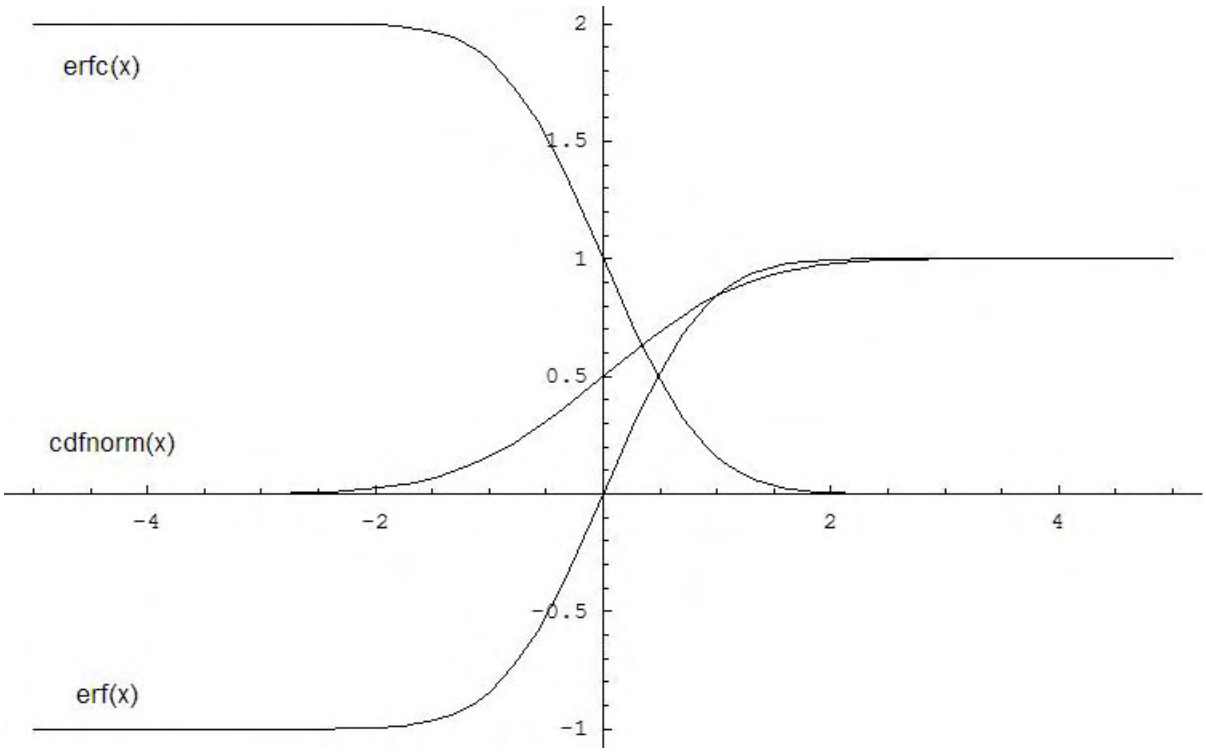
is the cumulative normal distribution function.

3. $\Phi^{-1}(x) = \sqrt{2}\,\mathrm{erf}^{-1}(2x - 1)$,

where $\Phi^{-1}(x)$ and $\mathrm{erf}^{-1}(x)$ are the inverses to $\Phi(x)$ and $\mathrm{erf}(x)$ respectively.

Figure 9-1 illustrates the relationships among `Erf` family functions (`Erf`, `Erfc`, `CdfNorm`).

Figure 9-1 Erf Family Functions Relationship



Useful relations for these functions:

$$\mathrm{erf}(x) + \mathrm{erfc}(x) = 1$$

$$\mathrm{cdfnorm}(x) = \frac{1}{2}\left(1 + \mathrm{erf}\left(\frac{x}{\sqrt{2}}\right)\right) = 1 - \frac{1}{2}\,\mathrm{erfc}\left(\frac{x}{\sqrt{2}}\right)$$

Special Values for Real Function v?Erf(x)

Argument	Result	Exception
+∞	+1	
-∞	-1	
QNAN	QNAN	
SNAN	QNAN	INVALID

- Erfc
- CdfNorm

v?Erfc

Computes the complementary error function value of vector elements.

Syntax

Fortran:

```
call vserfc( n, a, y )
call vderfc( n, a, y )
```

C:

```
vsErfc( n, a, y );
vdErfc( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vserfc DOUBLE PRECISION for vderfc **Fortran 90:** REAL, INTENT(IN) for vserfc DOUBLE PRECISION, INTENT(IN) for vderfc **C:** const float* for vsErfc const double* for vdErfc	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vserfc DOUBLE PRECISION for vderfc **Fortran 90:** REAL, INTENT(OUT) for vserfc DOUBLE PRECISION, INTENT(OUT) for vderfc **C:** float* for vsErfc	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`double*` for `vdErfc`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function `Erfc` computes the complementary error function values for elements of the input vector *a* and writes them to the output vector *y*.

The complementary error function is defined as given by:

$$\mathrm{erfc}(x) = \frac{2}{\sqrt{\pi}} \int_{x}^{\infty} e^{-t^2} dt \ .$$

Useful relations:

1. $\mathrm{erfc}(x) = 1 - \mathrm{erf}(x)$.

2. $\Phi(x) = \frac{1}{2} \mathrm{erf}\,(x/\sqrt{2})$,

where

$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{0}^{x} \exp\,(-t^2/2) dt$$

is the cumulative normal distribution function.

3. $\Phi^{-1}(x) = \sqrt{2}\,\mathrm{erf}^{-1}(2x - 1)$,

where $\Phi^{-1}(x)$ and $\mathrm{erf}^{-1}(x)$ are the inverses to $\Phi(x)$ and $\mathrm{erf}(x)$ respectively.

See also Figure 9-1 in `Erf` function description for `Erfc` function relationship with the other functions of `Erf` family.

Special Values for Real Function v?Erfc(x)

Argument	Result	Error Code	Exception
X > underflow	+0	VML_STATUS_UNDERFLOW	UNDERFLOW
+∞	+0		
-∞	+2		
QNAN	QNAN		
SNAN	QNAN		INVALID

v?CdfNorm

Computes the cumulative normal distribution function values of vector elements.

Syntax

Fortran:

```
call vscdfnorm( n, a, y )
call vdcdfnorm( n, a, y )
```

C:

```
vsCdfNorm( n, a, y );
vdCdfNorm( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vscdfnorm DOUBLE PRECISION for vdcdfnorm **Fortran 90:** REAL, INTENT(IN) for vscdfnorm DOUBLE PRECISION, INTENT(IN) for vdcdfnorm **C:** const float* for vsCdfNorm const double* for vdCdfNorm	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vscdfnorm DOUBLE PRECISION for vdcdfnorm **Fortran 90:** REAL, INTENT(OUT) for vscdfnorm DOUBLE PRECISION, INTENT(OUT) for vdcdfnorm **C:** float* for vsCdfNorm	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`double*` for `vdCdfNorm`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function `CdfNorm` computes the cumulative normal distribution function values for elements of the input vector *a* and writes them to the output vector *y*.

The cumulative normal distribution function is defined as given by:

$$\mathrm{CdfNorm}(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} e^{-\frac{t^2}{2}} dt \ .$$

Useful relations:

$$\mathrm{cdfnorm}(x) = \frac{1}{2}\left(1 + \mathrm{erf}\left(\frac{x}{\sqrt{2}}\right)\right) = 1 - \frac{1}{2}\,\mathrm{erfc}\left(\frac{x}{\sqrt{2}}\right)$$

where `Erf` and `Erfc` are the error and complementary error functions.

See also Figure 9-1 in `Erf` function description for `CdfNorm` function relationship with the other functions of `Erf` family.

Special Values for Real Function v?CdfNorm(x)

Argument	Result	Error Code	Exception
X < underflow	+0	VML_STATUS_UNDERFLOW	UNDERFLOW
+∞	+1		
-∞	+0		
QNAN	QNAN		
SNAN	QNAN		INVALID

v?Erfinv

Computes inverse error function value of vector elements.

Syntax

Fortran:

```
call vserfinv( n, a, y )
call vderfinv( n, a, y )
```

C:

```
vsErfInv( n, a, y );
vdErfInv( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vserfinv DOUBLE PRECISION for vderfinv **Fortran 90:** REAL, INTENT(IN) for vserfinv DOUBLE PRECISION, INTENT(IN) for vderfinv **C:** const float* for vsErfInv const double* for vdErfInv	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vserfinv DOUBLE PRECISION for vderfinv **Fortran 90:** REAL, INTENT(OUT) for vserfinv DOUBLE PRECISION, INTENT(OUT) for vderfinv **C:** float* for vsErfInv double* for vdErfInv	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function ErfInv computes the inverse error function values for elements of the input vector *a* and writes them to the output vector *y*

$y = \mathrm{erf}^{-1}(a)$,

where erf(x) is the error function defined as given by:

$$\mathrm{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt \ .$$

Useful relations:

1. $\mathrm{erf}^{-1}(x) = \mathrm{erfc}^{-1}(1 - x)$,

where erfc is the complementary error function.

2. $\Phi(x) = \frac{1}{2} \mathrm{erf}\,(x/\sqrt{2})$,

where

$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_0^x \exp\,(-t^2/2) dt$$

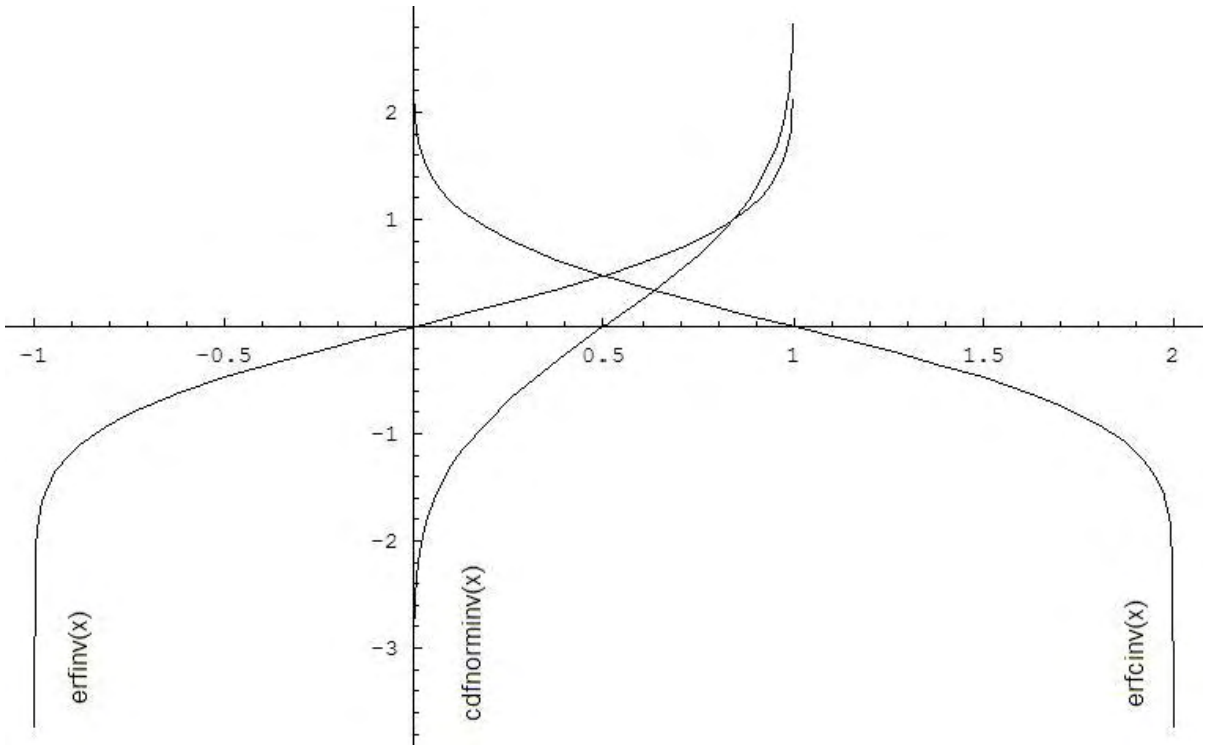
is the cumulative normal distribution function.

3. $\Phi^{-1}(x) = \sqrt{2}\,\mathrm{erf}^{-1}(2x - 1)$,

where $\Phi^{-1}(x)$ and $\mathrm{erf}^{-1}(x)$ are the inverses to $\Phi(x)$ and erf(x) respectively.

Figure 9-2 illustrates the relationships among ErfInv family functions (ErfInv, ErfcInv, CdfNormInv).

Figure 9-2 ErfInv Family Functions Relationship



Useful relations for these functions:

$$\mathrm{erfcinv}(x) = \mathrm{erfinv}(1 - x)$$

$$\mathrm{cdfnorminv}(x) = \sqrt{2}\mathrm{erfinv}(2x - 1) = \sqrt{2}\mathrm{erfcinv}(2 - 2x)$$

v?ErfcInv

Computes the inverse complementary error function value of vector elements.

Syntax

Fortran:

```
call vserfcinv( n, a, y )
call vderfcinv( n, a, y )
```

C:

```
vsErfcInv( n, a, y );
vdErfcInv( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vserfcinv DOUBLE PRECISION for vderfcinv **Fortran 90:** REAL, INTENT(IN) for vserfcinv DOUBLE PRECISION, INTENT(IN) for vderfcinv **C:** const float* for vsErfcInv const double* for vdErfcInv	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vserfcinv DOUBLE PRECISION for vderfcinv	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description

	Fortran 90: `REAL, INTENT(OUT)` for `vserfcinv`
	`DOUBLE PRECISION, INTENT(OUT)` for `vderfcinv`
	C: `float*` for `vsErfcInv`
	`double*` for `vdErfcInv`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function `ErfcInv` computes the inverse complimentary error function values for elements of the input vector *a* and writes them to the output vector *y*.

The inverse complementary error function is defined as given by:

$$\text{erfcinv}(x) = \text{erfinv}(1 - x)$$

$$\text{erfinv}(x) = \text{erf}^{-1}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt,$$

where `erf(x)`denotes the error function and `erfinv(x)` denotes the inverse error function.

See also Figure 9-2 in `ErfInv` function description for `ErfcInv` function relationship with the other functions of `ErfInv` family.

Special Values for Real Function v?ErfcInv(x)

Argument	Result	Error Code	Exception

-∞	QNAN	VML_STATUS_ERRDOM	INVALID
QNAN	QNAN		
SNAN	QNAN		INVALID

v?CdfNormInv

Computes the inverse cumulative normal distribution function values of vector elements.

Syntax

Fortran:

```
call vscdfnorminv( n, a, y )
call vdcdfnorminv( n, a, y )
```

C:

```
vsCdfNormInv( n, a, y );
vdCdfNormInv( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vscdfnorminv DOUBLE PRECISION for vdcdfnorminv **Fortran 90:** REAL, INTENT(IN) for vscdfnorminv DOUBLE PRECISION, INTENT(IN) for vdcdfnorminv **C:** const float* for vsCdfNormInv const double* for vdCdfNormInv	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vscdfnorm DOUBLE PRECISION for vdcdfnorminv **Fortran 90:** REAL, INTENT(OUT) for vscdfnorm DOUBLE PRECISION, INTENT(OUT) for vdcdfnorminv **C:** float* for vsCdfNormInv	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`double*` for `vdCdfNormInv`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function `CdfNormInv` computes the inverse cumulative normal distribution function values for elements of the input vector *a* and writes them to the output vector *y*.

The inverse cumulative normal distribution function is defined as given by:

$$\mathrm{CdfNormInv}(x) = \mathrm{CdfNorm}^{-1}(x) ,$$

where `CdfNorm(x)` denotes the cumulative normal distribution function.

Useful relations:

$$\mathrm{cdfnorminv}(x) = \sqrt{2}\,\mathrm{erfinv}(2x - 1) = \sqrt{2}\,\mathrm{erfcinv}(2 - 2x)$$

where `erfinv(x)` denotes the inverse error function and `erfcinv(x)` denotes the inverse complementary error functions.

See also Figure 9-2 in `ErfInv` function description for `CdfNormInv` function relationship with the other functions of `ErfInv` family.

Special Values for Real Function v?CdfNormInv(x)

Rounding Functions

v?Floor

Computes an integer value rounded towards minus infinity for each vector element.

Syntax

Fortran:

```
call vsfloor( n, a, y )
call vdfloor( n, a, y )
```

C:

```
vsFloor( n, a, y );
vdFloor( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsfloor DOUBLE PRECISION for vdfloor **Fortran 90:** REAL, INTENT(IN) for vsfloor DOUBLE PRECISION, INTENT(IN) for vdfloor **C:** const float* for vsFloor const double* for vdFloor	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsfloor DOUBLE PRECISION for vdfloor **Fortran 90:** REAL, INTENT(OUT) for vsfloor	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description

	`DOUBLE PRECISION`, `INTENT(OUT)` for `vdfloor`
	C: `float*` for `vsFloor`
	`double*` for `vdFloor`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes an integer value rounded towards minus infinity for each vector element.

Special Values for Real Function v?Floor(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+∞	
-∞	-∞	
SNAN	QNAN	INVALID
QNAN	QNAN	

v?Ceil

Computes an integer value rounded towards plus infinity for each vector element.

Syntax

Fortran:

```
call vsceil( n, a, y )
call vdceil( n, a, y )
```

C:

```
vsCeil( n, a, y );
vdCeil( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER`, `INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.

Name	Type	Description
a	**FORTRAN 77:** REAL for vsceil DOUBLE PRECISION for vdceil **Fortran 90:** REAL, INTENT(IN) for vsceil DOUBLE PRECISION, INTENT(IN) for vdceil **C:** const float* for vsCeil const double* for vdCeil	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsceil DOUBLE PRECISION for vdceil **Fortran 90:** REAL, INTENT(OUT) for vsceil DOUBLE PRECISION, INTENT(OUT) for vdceil **C:** float* for vsCeil double* for vdCeil	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes an integer value rounded towards plus infinity for each vector element.

Special Values for Real Function v?Ceil(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+∞	
-∞	-∞	
SNAN	QNAN	INVALID
QNAN	QNAN	

v?Trunc

Computes an integer value rounded towards zero for each vector element.

Syntax

Fortran:

```
call vstrunc( n, a, y )
call vdtrunc( n, a, y )
```

C:

```
vsTrunc( n, a, y );
vdTrunc( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vstrunc DOUBLE PRECISION for vdtrunc **Fortran 90:** REAL, INTENT(IN) for vstrunc DOUBLE PRECISION, INTENT(IN) for vdtrunc **C:** const float* for vsTrunc const double* for vdTrunc	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vstrunc DOUBLE PRECISION for vdtrunc **Fortran 90:** REAL, INTENT(OUT) for vstrunc DOUBLE PRECISION, INTENT(OUT) for vdtrunc **C:** float* for vsTrunc	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`double*` for `vdTrunc`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes an integer value rounded towards zero for each vector element.

Special Values for Real Function v?Trunc(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+∞	
-∞	-∞	
SNAN	QNAN	INVALID
QNAN	QNAN	

v?Round

Computes an integer value rounded to nearest for each vector element.

Syntax

Fortran:

```
call vsround( n, a, y )
call vdround( n, a, y )
```

C:

```
vsRound( n, a, y );
vdRound( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** `REAL` for `vsround` `DOUBLE PRECISION` for `vdround`	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Name	Type	Description
	Fortran 90: REAL, INTENT(IN) for vs-round DOUBLE PRECISION, INTENT(IN) for vdround **C:** const float* for vsRound const double* for vdRound	

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsround DOUBLE PRECISION for vdround **Fortran 90:** REAL, INTENT(OUT) for vsround DOUBLE PRECISION, INTENT(OUT) for vdround **C:** float* for vsRound double* for vdRound	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The function computes an integer value rounded to nearest for each vector element.

Halfway values, that is, 0.5, -1.5, and the like, are rounded off away from zero. That is, 0.5 -> 1, -1.5 -> -2, etc.

Special Values for Real Function v?Round(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+∞	
-∞	-∞	
SNAN	QNAN	INVALID
QNAN	QNAN	

v?NearbyInt

Computes a rounded integer value in a current rounding mode for each vector element.

Syntax

Fortran:

```
call vsnearbyint( n, a, y )
call vdnearbyint( n, a, y )
```

C:

```
vsNearbyInt( n, a, y );
vdNearbyInt( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsnearbyint DOUBLE PRECISION for vdnearbyint **Fortran 90:** REAL, INTENT(IN) for vsnearbyint DOUBLE PRECISION, INTENT(IN) for vdnearbyint **C:** const float* for vsNearbyInt const double* for vdNearbyInt	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vsnearbyint DOUBLE PRECISION for vdnearbyint **Fortran 90:** REAL, INTENT(OUT) for vsnearbyint DOUBLE PRECISION, INTENT(OUT) for vdnearbyint **C:** float* for vsNearbyInt	**FORTRAN:** Array, specifies the output vector *y*. **C:** Pointer to an array that contains the output vector *y*.

Name	Type	Description
	`double*` for `vdNearbyInt`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes a rounded integer value in a current rounding mode for each vector element.

Halfway values, that is, 0.5, -1.5, and the like, are rounded off towards even values.

Special Values for Real Function v?NearbyInt(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+∞	
-∞	-∞	
SNAN	QNAN	INVALID
QNAN	QNAN	

v?Rint

Computes a rounded integer value in a current rounding mode for each vector element with inexact result exception raised for each changed value.

Syntax

Fortran:

```
call vsrint( n, a, y )
call vdrint( n, a, y )
```

C:

```
vsRint( n, a, y );
vdRint( n, a, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** `REAL` for `vsrint`	**FORTRAN:** Array, specifies the input vector *a*.

Name	Type	Description

	`DOUBLE PRECISION` for `vdrint`
	Fortran 90: `REAL, INTENT(IN)` for `vsrint`
	`DOUBLE PRECISION, INTENT(IN)` for `vdrint`
	C: `const float*` for `vsRint`
	`const double*` for `vdRint`
		C: Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vsrint`
	`DOUBLE PRECISION` for `vdrint`
	Fortran 90: `REAL, INTENT(OUT)` for `vsrint`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdrint`
	C: `float*` for `vsRint`
	`double*` for `vdRint`
		FORTRAN: Array, specifies the output vector *y*.
		C: Pointer to an array that contains the output vector *y*.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes a rounded integer value in a current rounding mode for each vector element with inexact result exception raised for each changed value.

Halfway values, that is, 0.5, -1.5, and the like, are rounded off towards even values. For each changed value, inexact result exception is raised.

Special Values for Real Function v?Round(x)

Argument	Result	Exception
+0	+0	
-0	-0	
+∞	+∞	
-∞	-∞	
SNAN	QNAN	INVALID
QNAN	QNAN	

v?Modf

Computes a truncated integer value and remaining fraction part for each vector element.

Syntax

Fortran:

```
call vsmodf( n, a, y, z )
call vdmodf( n, a, y, z )
```

C:

```
vsModf( n, a, y, z );
vdModf( n, a, y, z );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsmodf DOUBLE PRECISION for vdmodf **Fortran 90:** REAL, INTENT(IN) for vsmodf DOUBLE PRECISION, INTENT(IN) for vdmodf **C:** const float* for vsModf const double* for vdModf	**FORTRAN:** Array, specifies the input vector *a*. **C:** Pointer to an array that contains the input vector *a*.

Output Parameters

Name	Type	Description
y, *z*	**FORTRAN 77:** REAL for vsmodf DOUBLE PRECISION for vdmodf **Fortran 90:** REAL, INTENT(OUT) for vsmodf DOUBLE PRECISION, INTENT(OUT) for vdmodf **C:** float* for vsModf	**FORTRAN:** Array, specifies the output vector *y* and *z*. **C:** Pointer to an array that contains the output vector *y* and *z*.

Name	Type	Description
	`double*` for `vdModf`	

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function computes a truncated integer value and remaining fraction part for each vector element.

Halfway values, that is, 0.5, -1.5, and the like, are rounded off towards even values. For each changed value, inexact result exception is raised.

Special Values for Real Function v?Modf(x)

Argument	Result 1	Result 2	Exception
+0	+0	+0	
-0	-0	-0	
+∞	+∞	+0	
-∞	-∞	-0	
SNAN	QNAN	QNAN	INVALID
QNAN	QNAN	QNAN	

VML Pack/Unpack Functions

This section describes VML functions which convert vectors with unit increment to and from vectors with positive increment indexing, vector indexing and mask indexing (see Appendix B for details on vector indexing methods).

Table 9-12 lists available VML Pack/Unpack functions, together with data types and indexing methods associated with them.

Table 9-12 VML Pack/Unpack Functions

Function Short Name	Data Types	Indexing Methods	Description
v?Pack	`s, d`	`I,V,M`	Gathers elements of arrays, indexed by different methods.
v?Unpack	`s, d`	`I,V,M`	Scatters vector elements to arrays with different indexing.

v?Pack

Copies elements of an array with specified indexing to a vector with unit increment.

Syntax

Fortran:

```
call vspacki( n, a, inca, y )
call vspackv( n, a, ia, y )
call vspackm( n, a, ma, y )
```

```
call vdpacki( n, a, inca, y )
call vdpackv( n, a, ia, y )
call vdpackm( n, a, ma, y )
```

C:

```
vsPackI( n, a, inca, y );
vsPackV( n, a, ia, y );
vsPackM( n, a, ma, y );
vdPackI( n, a, inca, y );
vdPackV( n, a, ia, y );
vdPackM( n, a, ma, y );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vspacki, vspackv, vspackm DOUBLE PRECISION for vdpacki, vdpackv, vdpackm **Fortran 90:** REAL, INTENT(IN) for vspacki, vspackv, vspackm DOUBLE PRECISION, INTENT(IN) for vdpacki, vdpackv, vdpackm **C:** const float* for vsPackI, vsPackV, vsPackM const double* for vdPackI, vdPackV, vdPackM	**FORTRAN:** Array, DIMENSION at least(1 + (*n*-1)**inca*) for vspacki/vdpacki, Array, DIMENSION at least max(*n*,max(*ia*[j])), j=0, …, *n*-1 for vspackv/vdpackv , Array, DIMENSION at least *n* for vspackm/vdpackm. Specifies the input vector *a*. **C:** Specifies pointer to an array that contains the input vector *a*. Size of the array must be: at least(1 + (*n*-1)**inca*) for vsPackI/vdPackI, at least max(*n*,max(*ia*[j])), j=0, …, *n*-1 for vsPackV/vdPackV , at least *n* for vsPackM/vdPackM.
inca	**FORTRAN 77:** INTEGER for vspacki, vdpacki **Fortran 90:** INTEGER, INTENT(IN) for vspacki, vdpacki **C:** const int for vsPackI, vdPackI	Specifies the increment for the elements of *a*.
ia	**FORTRAN 77:** INTEGER for vspackv, vdpackv	**FORTRAN:** Array, DIMENSION at least *n*.

Name	Type	Description
	Fortran 90: INTEGER, INTENT(IN) for vspackv, vdpackv **C:** const int* for vsPackV, vdPackV	Specifies the index vector for the elements of *a*. **C:** Specifies the pointer to an array of size at least *n* that contains the index vector for the elements of *a*.
ma	**FORTRAN 77:** INTEGER for vspackm, vdpackm **Fortran 90:** INTEGER, INTENT(IN) for vspackm, vdpackm **C:** const int* for vsPackM, vdPackM	**FORTRAN:** Array, DIMENSION at least *n*, Specifies the mask vector for the elements of *a*. **C:** Specifies the pointer to an array of size at least *n* that contains the mask vector for the elements of *a*.

Output Parameters

Name	Type	Description
y	**FORTRAN 77:** REAL for vspacki, vspackv, vspackm DOUBLE PRECISION for vdpacki, vdpackv, vdpackm **Fortran 90:** REAL, INTENT(OUT) for vspacki, vspackv, vspackm DOUBLE PRECISION, INTENT(OUT) for vdpacki, vdpackv, vdpackm **C:** float* for vsPackI, vsPackV, vsPackM double* for vdPackI, vdPackV, vdPackM	**FORTRAN:** Array, DIMENSION at least *n*. Specifies the output vector *y*. **C:** Pointer to an array of size at least *n* that contains the output vector *y*.

v?Unpack

Copies elements of a vector with unit increment to an array with specified indexing.

Syntax

Fortran:

```
call vsunpacki( n, a, y, incy )
call vsunpackv( n, a, y, iy )
call vsunpackm( n, a, y, my )
call vdunpacki( n, a, y, incy )
call vdunpackv( n, a, y, iy )
```

```
call vdunpackm( n, a, y, my )
```

C:

```
vsUnpackI( n, a, y, incy );
vsUnpackV( n, a, y, iy );
vsUnpackM( n, a, y, my );
vdUnpackI( n, a, y, incy );
vdUnpackV( n, a, y, iy );
vdUnpackM( n, a, y, my );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the number of elements to be calculated.
a	**FORTRAN 77:** REAL for vsunpacki, vsunpackv, vsunpackm DOUBLE PRECISION for vdunpacki, vdunpackv, vdunpackm. **Fortran 90:** REAL, INTENT(IN) for vsunpacki, vsunpackv, vsunpackm DOUBLE PRECISION, INTENT(IN) for vdunpacki, vdunpackv, vdunpackm. **C:** const float* for vsUnpackI, vsUnpackV, vsUnpackM const double* for vdUnpackI, vdUnpackV, vdUnpackM	**FORTRAN:** Array, DIMENSION at least *n*. Specifies the input vector *a*. **C:** Specifies the pointer to an array of size at least *n* that contains the input vector *a*.
incy	**FORTRAN 77:** INTEGER for vsunpacki, vdunpacki. **Fortran 90:** INTEGER, INTENT(IN) for vsunpacki, vdunpacki. **C:** const int for vsUnpackI, vdUnpackI.	Specifies the increment for the elements of *y*.
iy	**FORTRAN 77:** INTEGER for vsunpackv, vdunpackv **Fortran 90:** INTEGER, INTENT(IN) for vsunpackv, vdunpackv	**FORTRAN:** Array, DIMENSION at least *n*. Specifies the index vector for the elements of *y*.

Name	Type	Description
	C: `const int*` for `vsUnpackV`, `vdUnpackV`	**C:** Specifies the pointer to an array of size at least *n* that contains the index vector for the elements of *a*.
my	**FORTRAN 77:** `INTEGER` for `vsunpackm`, `vdunpackm` **Fortran 90:** `INTEGER, INTENT(IN)` for `vsunpackm, vdunpackm` **C:** `const int*` for `vsUnpackM, vdUnpackM`	**FORTRAN:** Array, `DIMENSION` at least *n*, Specifies the mask vector for the elements of *y*. **C:** Specifies the pointer to an array of size at least *n* that contains the mask vector for the elements of *a*.

Output Parameters

Name	Type	Description

y	**FORTRAN 77:** `REAL` for `vsunpacki, vsunpackv, vsunpackm`
	`DOUBLE PRECISION` for `vdunpacki, vdunpackv, vdunpackm`
	Fortran 90: `REAL, INTENT(OUT)` for `vsunpacki, vsunpackv, vsunpackm`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdunpacki, vdunpackv, vdunpackm`
	C: `float*` for `vsUnpackI, vsUnpackV, vsUnpackM`
	`double*` for `vdUnpackI, vdUnpackV, vdUnpackM`
		FORTRAN: Array, `DIMENSION`
		at least `(1 + (`*n*`-1)*`*incy*`)` for `vsunpacki`,
		at least `max( `*n*`,max(`*iy*`[j]) ),j=0,..., `*n*`-1`, for `vsunpackv`,
		at least *n* for `vsunpackm/vdunpackm`
		C: Specifies the pointer to an array that contains the output vector *y*.
		Size of the array must be:
		at least `(1 + (`*n*`-1)*`*incy*`)` for `vsUnPackI`,
		at least `max( `*n*`,max(`*ia*`[j]) ),j=0,..., `*n*`-1`, for `vsUnPackV`,
		at least *n* for `vsUnPackM`.

VML Service Functions

VML Service functions allow the user to set /get the accuracy mode, and set/get the error code. All these functions are available both in Fortran- and C- interfaces. Table 9-13 lists available VML Service functions and their short description.

Table 9-13 VML Service Functions

Function Short Name	Description
`SetMode`	Sets the VML mode
`GetMode`	Gets the VML mode
`SetErrStatus`	Sets the VML error status
`GetErrStatus`	Gets the VML error status
`ClearErrStatus`	Clears the VML error status

Function Short Name	Description
SetErrorCallBack	Sets the additional error handler callback function
GetErrorCallBack	Gets the additional error handler callback function
ClearErrorCallBack	Deletes the additional error handler callback function

SetMode

Sets a new mode for VML functions according to mode parameter and stores the previous VML mode to oldmode.

Syntax

Fortran:

```
oldmode = vmlsetmode( mode )
```

C:

```
oldmode = vmlSetMode( mode );
```

Input Parameters

Name	Type	Description
mode	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const unsigned int	Specifies the VML mode to be set.

Output Parameters

Name	Type	Description
oldmode	**FORTRAN:** INTEGER **C:** int	Specifies the former VML mode.

Description

This function is declared in mkl_vml.f77 for FORTRAN 77 interface, in mkl_vml.fi for Fortran 90 interface, and in mkl_vml_functions.h for C interface.

The *mode* parameter is designed to control accuracy, FPU, error handling and threading options. Table 9-14 lists values of the *mode* parameter. All other possible values of the *mode* parameter may be obtained from these values by using bitwise OR (|) operation to combine one value for accuracy, one for FPU, and one for error control options. The default value of the *mode* parameter is VML_HA | VML_ERRMODE_DEFAULT | VML_NUM_THREADES_OMP_AUTO. Thus, the current FPU control word (FPU precision and the rounding method) is used by default.

If any VML mathematical function requires different FPU precision, or rounding method, it changes these options automatically and then restores the former values. The *mode* parameter enables you to minimize switching the internal FPU mode inside each VML mathematical function that works with similar precision and accuracy settings.

To accomplish this, set the *mode* parameter to VML_FLOAT_CONSISTENT for single precision real and complex functions, or to VML_DOUBLE_CONSISTENT for double precision real and complex functions. These values of the *mode* parameter are the optimal choice for the respective function groups, as they are required for most of the VML mathematical functions. After the execution is over, set the *mode* to VML_RESTORE if you need to restore the previous FPU mode.

Table 9-14 Values of the *mode* Parameter

Value of *mode*	Description
Accuracy Control	
VML_HA	High accuracy versions of VML functions will be used.
VML_LA	Low accuracy versions of VML functions will be used.
VML_EP	Enhanced Performance accuracy versions of VML functions will be used.
Additional FPU Mode Control	
VML_FLOAT_CONSISTENT	The optimal FPU mode (control word) for single precision functions is set, and the previous FPU mode is saved.
VML_DOUBLE_CONSISTENT	The optimal FPU mode (control word) for double precision functions is set, and the previous FPU mode is saved.
VML_RESTORE	The previously saved FPU mode is restored.
Error Mode Control	
VML_ERRMODE_IGNORE	No action is set for computation errors.
VML_ERRMODE_ERRNO	On error, the *errno* variable is set.
VML_ERRMODE_STDERR	On error, the error text information is written to *stderr*.
VML_ERRMODE_EXCEPT	On error, an exception is raised.
VML_ERRMODE_CALLBACK	On error, an additional error handler function is called.
VML_ERRMODE_DEFAULT	On error, the *errno* variable is set, an exception is raised, and an additional error handler function is called.
Threading Mode Control	
VML_NUM_THREADS_OMP_AUTO	This is default behavior. Maximum number of threads is determined by environmental variable OMP_NUM_THREADS and can be overridden by OpenMP* function omp_set_num_threads(). For performance reasons VML threading logic can use fewer number of threads.
VML_NUM_THREADS_OMP_FIXED	Number of threads is determined by environmental variable OMP_NUM_THREADS and can be overridden by OpenMP* function omp_set_num_threads(). Use this mode to disable VML threading logic.

Examples

Several examples of calling the function vmlSetMode() with different values of the *mode* parameter are given below:

Fortran:

```
oldmode = vmlsetmode( VML_LA )
call vmlsetmode( IOR(VML_LA, IOR(VML_FLOAT_CONSISTENT, VML_ERRMODE_IGNORE
)))
call vmlsetmode( VML_RESTORE)
call vmlsetmode( VML_NUM_THREADS_OMP_FIXED)
```

C:

```
vmlSetMode( VML_LA );
vmlSetMode( VML_LA | VML_FLOAT_CONSISTENT | VML_ERRMODE_IGNORE );
vmlSetMode( VML_RESTORE);
vmlSetMode( VML_NUM_THREADS_OMP_FIXED);
```

GetMode

Gets the VML mode.

Syntax

Fortran:

```
mod = vmlgetmode()
```

C:

```
mod = vmlGetMode( void );
```

Output Parameters

Name	Type	Description
mod	**FORTRAN:** INTEGER **C:** int	Specifies the packed *mode* parameter.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

The function `vmlGetMode()` returns the VML *mode* parameter that controls accuracy, FPU, and error handling options. The *mod* variable value is some combination of the values listed in the Table 9-14. You can obtain some of these values using the respective mask from the Table 9-15.

Table 9-15 Values of Mask for the *mode* Parameter

Value of mask	Description
VML_ACCURACY_MASK	Specifies mask for accuracy *mode* selection.
VML_FPUMODE_MASK	Specifies mask for FPU *mode* selection.

Value of mask	Description
VML_ERRMODE_MASK	Specifies mask for error *mode* selection.

See example below:

Examples

Fortran:

```
mod = vmlgetmode()
accm = IAND(mod, VML_ACCURACY_MASK)
fpum = IAND(mod, VML_FPUMODE_MASK)
errm = IAND(mod, VML_ERRMODE_MASK)
```

C:

```
accm = vmlGetMode(void )& VML_ACCURACY_MASK;
fpum = vmlGetMode(void )& VML_FPUMODE_MASK;
errm = vmlGetMode(void )& VML_ERRMODE_MASK;
```

SetErrStatus

Sets the new VML error status according to `err` and stores the previous VML error status to `olderr`.

Syntax

Fortran:

```
olderr = vmlseterrstatus( err )
```

C:

```
olderr = vmlSetErrStatus( err );
```

Input Parameters

Name	Type	Description
err	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Specifies the VML error status to be set.

Output Parameters

Name	Type	Description
olderr	**FORTRAN:** INTEGER **C:** int	Specifies the former VML error status.

Description

This function is declared in `mkl_vml.f77` for FORTRAN 77 interface, in `mkl_vml.fi` for Fortran 90 interface, and in `mkl_vml_functions.h` for C interface.

Table 9-16 lists possible values of the *err* parameter.

Table 9-16 Values of the VML Error Status

Error Status	Description
VML_STATUS_OK	The execution was completed successfully.
VML_STATUS_BADSIZE	The array dimension is not positive.
VML_STATUS_BADMEM	NULL pointer is passed.
VML_STATUS_ERRDOM	At least one of array values is out of a range of definition.
VML_STATUS_SING	At least one of array values caused a singularity.
VML_STATUS_OVERFLOW	An overflow has happened during the calculation process.
VML_STATUS_UNDERFLOW	An underflow has happened during the calculation process.

Examples

```
vmlSetErrStatus( VML_STATUS_OK );
vmlSetErrStatus( VML_STATUS_ERRDOM );
vmlSetErrStatus( VML_STATUS_UNDERFLOW );
```

GetErrStatus

Gets the VML error status.

Syntax

Fortran:

```
err = vmlgeterrstatus( )
```

C:

```
err = vmlGetErrStatus( void );
```

Output Parameters

Name	Type	Description
err	**FORTRAN:** INTEGER **C:** int	Specifies the VML error status.

ClearErrStatus

Sets the VML error status to VML_STATUS_OK *and stores the previous VML error status to* olderr.

Syntax

Fortran:

```
olderr = vmlclearerrstatus( )
```

C:

```
olderr = vmlClearErrStatus( void );
```

Output Parameters

Name	Type	Description
olderr	**FORTRAN:** INTEGER **C:** int	Specifies the former VML error status.

SetErrorCallBack

Sets the additional error handler callback function and gets the old callback function.

Syntax

Fortran:

```
oldcallback = vmlseterrorcallback( callback )
```

C:

```
oldcallback = vmlSetErrorCallBack( callback );
```

Input Parameters

Name		Description

FORTRAN: *callback*	Address of the callback function.	The callback function has the following format:
		`INTEGER FUNCTION ERRFUNC(par)`
		` TYPE (ERROR_STRUCTURE) par`
		` ! ...`
		` ! user error processing`
		` ! ...`
		` ERRFUNC = 0`
		` ! if ERRFUNC= 0 - standard VML error handler`
		` ! is called after the callback`
		` ! if ERRFUNC != 0 - standard VML error handler`
		` ! is not called`
		`END`
		The passed error structure is defined as follows:
		`TYPE ERROR_STRUCTURE SEQUENCE`
		`INTEGER*4 ICODE`
		`INTEGER*4 IINDEX`
		`REAL*8 DBA1`
		`REAL*8 DBA2`
		`REAL*8 DBR1`
		`REAL*8 DBR2`
		`CHARACTER(64) CFUNCNAME`
		`INTEGER*4 IFUNCNAMELEN`
		` END TYPE ERROR_STRUCTURE`

C: *callback*	Pointer to the callback function.	The callback function has the following format:
		`static int __stdcall MyHandler(DefVmlErrorContext* pContext)`
		`{`
		`  /* Handler body */`
		`};`

Name	Description

	The passed error structure is defined as follows:
	`typedef struct _DefVmlErrorContext`
	`{`
	`int iCode;/* Error status value */`
	`int iIndex;/* Index for bad array`
	`element, or bad array`
	`dimension, or bad`
	`array pointer */`
	`double dbA1; /* Error argument 1 */`
	`double dbA2; /* Error argument 2 */`
	`double dbR1; /* Error result 1 */`
	`double dbR2; /* Error result 2 */`
	`char cFuncName[64]; /* Function name */`
	`int iFuncNameLen; /* Length of functionname*/`
	`} DefVmlErrorContext;`

Output Parameters

Name	Type	Description
oldcallback	**Fortran 90:** `INTEGER` **C:** `int`	**FORTRAN:** Address of the former callback function. **C:** Pointer to the former callback function.

NOTE. FORTRAN 77 support is unavailable for this function.

Description

This function is declared in `mkl_vml.fi` for Fortran 90 interface and in `mkl_vml_functions.h` for C interface.

The callback function is called on each VML mathematical function error if `VML_ERRMODE_CALLBACK` error mode is set (see Table 9-14).

Use the `vmlSetErrorCallBack()` function if you need to define your own callback function instead of default empty callback function.

The input structure for a callback function contains the following information about the error encountered:

- the input value that caused an error
- location (array index) of this value
- the computed result value

- error code
- name of the function in which the error occurred.

You can insert your own error processing into the callback function. This may include correcting the passed result values in order to pass them back and resume computation. The standard error handler is called after the callback function only if it returns *0*.

GetErrorCallBack

Gets the additional error handler callback function.

Syntax

Fortran:

```
callback = vmlgeterrorcallback( )
```

C:

```
callback = vmlGetErrorCallBack( void );
```

Output Parameters

Name	Description
callback	**Fortran 90:** Address of the callback function **C:** Pointer to the callback function

NOTE. FORTRAN 77 support is unavailable for this function.

ClearErrorCallBack

Deletes the additional error handler callback function and retrieves the former callback function.

Syntax

Fortran:

```
oldcallback = vmlclearerrorcallback( )
```

C:

```
oldcallback = vmlClearErrorCallBack( void );
```

Output Parameters

Name	Type	Description
oldcallback	**Fortran 90:** INTEGER	**FORTRAN:** Address of the former callback function

Name	Type	Description
	C: `int`	**C:** Pointer to the former callback function

NOTE. FORTRAN 77 support is unavailable for this function.

10 Statistical Functions

Statistical functions in Intel® MKL are known as Vector Statistical Library (VSL) that is designed for the purpose of

- generating vectors of pseudorandom and quasi-random numbers
- performing mathematical operations of convolution and correlation.

The corresponding functionality is described in the respective Random Number Generators and Convolution and Correlation sections.

Random Number Generators

VSL provides a set of routines implementing commonly used pseudo- or quasi-random number generators with continuous and discrete distribution. To improve performance, all these routines were developed using the calls to the highly optimized *Basic Random Number Generators* (BRNGs) and the library of vector mathematical functions (VML, see Chapter 9, "Vector Mathematical Functions").

VSL provides interfaces both for FORTRAN and C languages. For users of the C and C++ languages the `mkl_vsl.h` header file is provided. For users of the Fortran 90 or Fortran 95 language the `mkl_vsl.fi` header file is provided. For users of the FORTRAN 77 language the `mkl_vsl.f77` header file is provided. All header files are found in the following directory:

```
${MKL}/include
```

The `mkl_vsl.fi` header is intended for using via the Fortran `include` clause and is compatible with both standard forms of F90/F95 sources — the free and 72-columns fixed forms. If you need to use the VSL interface with 80- or 132-columns fixed form sources, you may add a new file to your project. That file is formatted as a 72-columns fixed-form source and consists of a single `include` clause as follows:

```
include 'mkl_vsl.fi'
```

This `include` clause causes the compiler to generate the module files `mkl_vsl.mod` and `mkl_vsl_type.mod`, which are used to process the Fortran use clauses referencing to the VSL interface:

```
use mkl_vsl_type
use mkl_vsl
```

Because of this specific feature, you do not need to include the `mkl_vsl.fi` header into each source of your project. You only need to include the header into some of the sources. In any case, make sure that the sources that depend on the VSL interface are compiled after those that include the header so that the module files `mkl_vsl.mod` and `mkl_vsl_type.mod` are generated prior to using them.

The `mkl_vsl.f77` header is intended for using via the Fortran `include` clause as follows:

```
include 'mkl_vsl.f77'
```

NOTE. For Fortran 90 interface, VSL provides both subroutine-style interface and function-style interface. Default interface in this case is a function-style interface. Function-style interface, unlike subroutine-style interface, allows the user to get error status of each routine. Subroutine-style interface is provided for backward compatibility only. To use subroutine-style interface, manually include `mkl_vsl_subroutine.fi` file instead of `mkl_vsl.fi` by changing the line `include 'mkl_vsl.fi'` in `include\mkl.fi` with the line `include 'mkl_vsl_subroutine.fi'`.

For FORTRAN 77 interface, VSL provides only function-style interface.

All VSL routines can be classified into three major categories:

- Transformation routines for different types of statistical distributions, for example, uniform, normal (Gaussian), binomial, etc. These routines indirectly call basic random number generators, which are either pseudorandom number generators or quasi-random number generators. Detailed description of the generators can be found in Distribution Generators section.
- Service routines to handle random number streams: create, initialize, delete, copy, save to a binary file, load from a binary file, get the index of a basic generator. The description of these routines can be found in Service Routines section.
- Registration routines for basic pseudorandom generators and routines that obtain properties of the registered generators (see Advanced Service Routines section).

The last two categories are referred to as service routines.

Conventions

This document makes no specific differentiation between random, pseudorandom, and quasi-random numbers, nor between random, pseudorandom, and quasi-random number generators unless the context requires otherwise. For details, refer to '*Random Numbers*' section in VSL Notes document provided with Intel® MKL.

All generators of nonuniform distributions, both discrete and continuous, are built on the basis of the uniform distribution generators, called Basic Random Number Generators (BRNGs). The pseudorandom numbers with nonuniform distribution are obtained through an appropriate transformation of the uniformly distributed pseudorandom numbers. Such transformations are referred to as *generation methods*. For a given distribution, several generation methods can be used. See VSL Notes for the description of methods available for each generator.

The *stream descriptor* specifies which BRNG should be used in a given transformation method. See '*Random Streams and RNGs in Parallel Computation*' section of VSL Notes.

The term *computational node* means a logical or physical unit that can process data in parallel.

Mathematical Notation

The following notation is used throughout the text:

N	The set of natural numbers $N = \{1, 2, 3 ...\}$.
Z	The set of integers $Z = \{... -3, -2, -1, 0, 1, 2, 3 ...\}$.
R	The set of real numbers.
$\lfloor a \rfloor$	The floor of a (the largest integer less than or equal to a).
$\oplus$ or **xor**	Bitwise exclusive OR.

C_α^κ or $\binom{\alpha}{\kappa}$

Binomial coefficient or combination ($\alpha \in R,\ \alpha \geq 0;\ k \in N \cup \{0\}$).

$$C_\alpha^0 = 1$$

For $\alpha \geq k$ binomial coefficient is defined as

$$C_\alpha^\kappa = \frac{\alpha(\alpha - 1) \ldots (\alpha - \kappa + 1)}{\kappa!}$$

If $\alpha < k$, then

$$C_\alpha^\kappa = 0$$

$\Phi(x)$

Cumulative Gaussian distribution function

$$\Phi(x) = \int_{-\infty}^{x} \frac{1}{\sqrt{2\pi}} \exp\left(-\frac{y^2}{2}\right) dy$$

defined over $-\infty < x < +\infty$.

$\Phi(-\infty) = 0,\ \Phi(+\infty) = 1$.

$\Gamma(\alpha)$

The complete gamma function

$$\Gamma(\alpha) = \int_0^\infty t^{\alpha-1}\, e^{-t}\, dt$$

where $\alpha > 0$.

$B(p, q)$

The complete beta function

$$B(p,q) = \int_0^1 t^{p-1}(1 - t)^{q-1} dt$$

where $p>0$ and $q>0$.

LCG(a,c, m)

Linear Congruential Generator $x_{n+1} = (ax_n + c) \bmod m$, where a is called the *multiplier*, c is called the *increment*, and m is called the *modulus* of the generator.

MCG(a,m)

Multiplicative Congruential Generator $x_{n+1} = (ax_n) \bmod m$ is a special case of Linear Congruential Generator, where the increment c is taken to be 0.

GFSR(p, q)

Generalized Feedback Shift Register Generator

$x_n = x_{n-p} \oplus x_{n-q}$.

Naming Conventions

The names of all VSL functions in FORTRAN are lowercase; names in C may contain both lowercase and uppercase letters.

The names of generator routines have the following structure:

v<*type of result*>rng<*distribution*> for FORTRAN-interface

v<*type of result*>Rng<*distribution*> for C-interface,

where v is the prefix of a VSL vector function, and the field <*type of result*> is either `s`, `d`, or `i` and specifies one of the following types:

`s`	`REAL` for FORTRAN-interface `float` for C-interface
`d`	`DOUBLE PRECISION` for FORTRAN-interface `double` for C-interface
`i`	`INTEGER` for FORTRAN-interface `int` for C-interface

Prefixes `s` and `d` apply to continuous distributions only, prefix `i` applies only to discrete case. The prefix `rng` indicates that the routine is a random generator, and the <*distribution*> field specifies the type of statistical distribution.

Names of service routines follow the template below:

`vsl`<*name*>,

where `vsl` is the prefix of a VSL service function. The field <*name*> contains a short function name. For a more detailed description of service routines refer to Service Routines and Advanced Service Routines sections.

Prototype of each generator routine corresponding to a given probability distribution fits the following structure:

`status = <function name>( method, stream, n, r, [<distribution parameters>] ),`

where

- *method* defines the method of generation. A detailed description of this parameter can be found in Table 10-1. See the next page, where the structure of the *method* parameter name is explained.
- *stream* defines the descriptor of the random stream and must have a non-zero value. Random streams, descriptors, and their usage are discussed further in Random Streams and Service Routines.
- *n* defines the number of random values to be generated. If *n* is less than or equal to zero, no values are generated. Furthermore, if *n* is negative, an error condition is set.
- *r* defines the destination array for the generated numbers. The dimension of the array must be large enough to store at least *n* random numbers.
- *status* defines the error status of a VSL routine. See Error Reporting section for a detailed description of error status values.

Additional parameters included into <*distribution parameters*> field are individual for each generator routine and are described in detail in Distribution Generators section.

To invoke a distribution generator, use a call to the respective VSL routine. For example, to obtain a vector *r*, composed of *n* independent and identically distributed random numbers with normal (Gaussian) distribution, that have the mean value *a* and standard deviation *sigma*, write the following:

for FORTRAN-interface

```
status = vsrnggaussian( method, stream, n, r, a, sigma )
```

for C-interface

```
status = vsRngGaussian( method,
stream, n, r, a, sigma )
```

The name of a *method* parameter has the following structure:

VSL_METHOD_<*precision*><*distribution*>_<*method*>,

VSL_METHOD_<*precision*><*distribution*>_<*method*>_ACCURATE,

where

<*precision*>	*S*	for single precision continuous distribution
	D	for double precision continuous distribution
	I	for discrete distribution
<*distribution*>	probability distribution	
<*method*>	method name.	

Type of name structure for *method* parameter corresponds to fast and accurate modes of random number generation (see "Distribution Generators" section and VSL Notes for details).

Method names VSL_METHOD_<*precision*><*distribution*>_<*method*> and VSL_METHOD_<*precision*><*distribution*>_<*method*>_ACCURATE should be used with vsl<*precision*>Rng<*distribution*> function only, where

<*precision*>	*s*	for single precision continuous distribution
	d	for double precision continuous distribution
	i	for discrete distribution
<*distribution*>	probability distribution.	

Table 10-1 provides specific predefined values of the *method* name. The third column contains names of the functions that use the given method.

Table 10-1 Values of <*method*> in *method* parameter

Method	Short Description	Functions
STD	Standard method. Currently there is only one method for these functions.	Uniform (continuous), Uniform (discrete), UniformBits
BOXMULLER	BOXMULLER generates normally distributed random number x thru the pair of uniformly distributed numbers u_1 and u_2 according to the formula: $x = \sqrt{-2 \ln u_1} \sin 2\pi u_2$	Gaussian, GaussianMV

Method	Short Description	Functions
BOXMULLER2	BOXMULLER2 generates normally distributed random numbers x_1 and x_2 thru the pair of uniformly distributed numbers u_1 and u_2 according to the formulas: $x_1 = \sqrt{-2 \ln u_1} \sin 2\pi u_2$ $x_2 = \sqrt{-2 \ln u_1} \cos 2\pi u_2$	Gaussian, GaussianMV, Lognormal
ICDF	Inverse cumulative distribution function method.	Exponential, Laplace, Weibull, Cauchy, Rayleigh, Gumbel, Bernoulli, Geometric, Gaussian, GaussianMV
GNORM	For $\alpha > 1$, a gamma distributed random number is generated as a cube of properly scaled normal random number; for $0.6 \le \alpha < 1$, a gamma distributed random number is generated using rejection from Weibull distribution; for $\alpha < 0.6$, a gamma distributed random number is obtained using transformation of exponential power distribution; for $\alpha = 1$, gamma distribution is reduced to exponential distribution.	Gamma
CJA	For $min(p, q) > 1$, Cheng method is used; for $min(p, q) < 1$, Jöhnk method is used, if $q + K \cdot p^2 + C \le 0$ (K= 0.852..., C=-0.956...) otherwise, Atkinson switching algorithm is used; for $max(p, q) < 1$, method of Jöhnk is used; for $min(p, q) < 1$, $max(p, q) > 1$, Atkinson switching algorithm is used (CJA stands for the first letters of Cheng, Jöhnk, Atkinson); for $p = 1$ or $q = 1$, inverse cumulative distribution function method is used;for $p = 1$ and $q = 1$, beta distribution is reduced to uniform distribution.	Beta
BTPE	Acceptance/rejection method for $ntrial \cdot min(p, 1 - p) \ge 30$ with decomposition into 4 regions: – 2 parallelograms – triangle – left exponential tail – right exponential tail	Binomial

Method	Short Description	Functions
H2PE	Acceptance/rejection method for large mode of distribution with decomposition into 3 regions: – rectangular – left exponential tail – right exponential tail	Hypergeometric
PTPE	Acceptance/rejection method for $\lambda \geq 27$ with decomposition into 4 regions: – 2 parallelograms – triangle – left exponential tail – right exponential tail; otherwise, table lookup method is used.	Poisson
POISNORM	for $\lambda \geq 1$, method based on Poisson inverse CDF approximation by Gaussian inverse CDF; for $\lambda < 1$, table lookup method is used.	Poisson, PoissonV
NBAR	Acceptance/rejection method for , $\frac{(a-1)\cdot(1-p)}{p} \geq 100$ with decomposition into 5 regions: – rectangular – 2 trapezoid – left exponential tail – right exponential tail	NegBinomial

Basic Generators

VSL provides the following BRNGs, which differ in speed and other properties:

- the 32-bit multiplicative congruential pseudorandom number generator *MCG(1132489760, 2^{31} -1)* [L'Ecuyer99]
- the 32-bit generalized feedback shift register pseudorandom number generator *GFSR(250,103)* [Kirkpatrick81]
- the combined multiple recursive pseudorandom number generator *MRG-32k3a* [L'Ecuyer99a]
- the 59-bit multiplicative congruential pseudorandom number generator *MCG(13^{13}, 2^{59})* from NAG Numerical Libraries [NAG]

- Wichmann-Hill pseudorandom number generator (a set of 273 basic generators) from NAG Numerical Libraries [NAG]
- Mersenne Twister pseudorandom number generator *MT19937* [Matsumoto98] with period length 2^{19937}-1 of the produced sequence
- Set of 1024 Mersenne Twister pseudorandom number generators *MT2203* [Matsumoto98], [Matsumoto00]. Each of them generates a sequence of period length equal to 2^{2203}-1. Parameters of the generators provide mutual independence of the corresponding sequences.

Besides these pseudorandom number generators, VSL provides two basic quasi-random number generators:

- Sobol quasi-random number generator [Sobol76], [Bratley88], which works in arbitrary dimension. For dimensions greater than 40 the user should supply initialization parameters (initial direction numbers and primitive polynomials or direction numbers) by using `vslNewStreamEx` function. See additional details on interface for registration of the parameters in the library in VSL Notes.
- Niederreiter quasi-random number generator [Bratley92], which works in arbitrary dimension. For dimensions greater than 318 the user should supply initialization parameters (irreducible polynomials or direction numbers) by using `vslNewStreamEx` function. See additional details on interface for registration of the parameters in the library in VSL Notes.

See some testing results for the generators in VSL Notes and comparative performance data at http://software.intel.com/sites/products/documentation/hpc/mkl/vsl/vsl_data/vsl_performance_data.htm.

VSL provides means of registration of such user-designed generators through the steps described in Advanced Service Routines section.

For some basic generators, VSL provides two methods of creating independent random streams in multiprocessor computations, which are the leapfrog method and the block-splitting method. These sequence splitting methods are also useful in sequential Monte Carlo.

In addition, MT2203 pseudorandom number generator is a set of 1024 generators designed to create up to 1024 independent random sequences, which might be used in parallel Monte Carlo simulations. Another generator that has the same feature is Wichmann-Hill. It allows creating up to 273 independent random streams. The properties of the generators designed for parallel computations are discussed in detail in [Coddington94].

You may want to design and use your own basic generators. VSL provides means of registration of such user-designed generators through the steps described in Advanced Service Routines section.

There is also an option to utilize externally generated random numbers in VSL distribution generator routines. For this purpose VSL provides three additional basic random number generators:

– for external random data packed in 32-bit integer array
– for external random data stored in double precision floating-point array; data is supposed to be uniformly distributed over (a,b) interval
– for external random data stored in single precision floating-point array; data is supposed to be uniformly distributed over (a,b) interval.

Such basic generators are called the abstract basic random number generators.

See VSL Notes for a more detailed description of the generator properties.

BRNG Parameter Definition

Predefined values for the *brng* input parameter are as follows:

Table 10-2 Values of *brng* parameter

Value	Short Description
VSL_BRNG_MCG31	A 31-bit multiplicative congruential generator.
VSL_BRNG_R250	A generalized feedback shift register generator.
VSL_BRNG_MRG32K3A	A combined multiple recursive generator with two components of order 3.
VSL_BRNG_MCG59	A 59-bit multiplicative congruential generator.
VSL_BRNG_WH	A set of 273 Wichmann-Hill combined multiplicative congruential generators.
VSL_BRNG_MT19937	A Mersenne Twister pseudorandom number generator.
VSL_BRNG_MT2203	A set of 1024 Mersenne Twister pseudorandom number generators.
VSL_BRNG_SOBOL	A 32-bit Gray code-based generator producing low-discrepancy sequences for dimensions $1 \le s \le 40$; user-defined dimensions are also available.
VSL_BRNG_NIEDERR	A 32-bit Gray code-based generator producing low-discrepancy sequences for dimensions $1 \le s \le 318$; user-defined dimensions are also available.
VSL_BRNG_IABSTRACT	An abstract random number generator for integer arrays.
VSL_BRNG_DABSTRACT	An abstract random number generator for double precision floating-point arrays.
VSL_BRNG_SABSTRACT	An abstract random number generator for single precision floating-point arrays.

See VSL Notes for detailed description.

Random Streams

Random stream (or *stream*) is an abstract source of pseudo- and quasi-random sequences of uniform distribution. Users have no direct access to these sequences and operate with stream state descriptors only. A stream state descriptor, which holds state descriptive information for a particular BRNG, is a necessary parameter in each routine of a distribution generator. Only the distribution generator routines operate with random streams directly. See VSL Notes for details.

NOTE. Random streams associated with abstract basic random number generator are called the abstract random streams. See VSL Notes for detailed description of abstract streams and their use.

User can create unlimited number of random streams by VSL Service Routines like `NewStream` and utilize them in any distribution generator to get the sequence of numbers of given probability distribution. When they are no longer needed, the streams should be deleted calling service routine `DeleteStream`.

VSL provides service functions `SaveStreamF` and `LoadStreamF` to save random stream descriptive data to a binary file and to read this data from a binary file respectively. See VSL Notes for detailed description.

Data Types

FORTRAN 77:

```
INTEGER*4 vslstreamstate(2)
```

Fortran 90:

```
TYPE
  VSL_STREAM_STATE

INTEGER*4 descriptor1

INTEGER*4 descriptor2

END
  TYPE VSL_STREAM_STATE
```

C:

```
typedef (void*) VSLStreamStatePtr;
```

See Advanced Service Routines for the format of the stream state structure for user-designed generators.

Error Reporting

VSL routines return status codes of the performed operation to report errors and warnings to the calling program. Thus, it is up to the application to perform error-related actions and/or recover from the error. The status codes are of integer type and have the following format:

VSL_ERROR_<*ERROR_NAME*> - indicates VSL errors

VSL_WARNING_<*WARNING_NAME*> - indicates VSL warnings.

VSL errors are of negative values while warnings are of positive values. The status code of zero value indicates that the operation is completed successfully: VSL_ERROR_OK (or synonymic VSL_STATUS_OK).

Table 10-3 Status Codes and Messages

Status Code	Message
VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_BAD_ARG	Input argument value is not valid.
VSL_ERROR_NULL_PTR	Input pointer argument is NULL.
VSL_ERROR_MEM_FAILURE	System cannot allocate memory.
VSL_ERROR_INVALID_BRNG_INDEX	BRNG index is not valid.
VSL_ERROR_BRNGS_INCOMPATIBLE	Two BRNGs are not compatible for the operation.

Status Code	Message
VSL_ERROR_LEAPFROG_UNSUPPORTED	BRNG does not support Leapfrog method.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	BRNG does not support Skip-Ahead method.
VSL_ERROR_BAD_STREAM	The random stream is invalid.
VSL_ERROR_FILE_OPEN	Indicates an error in opening the file.
VSL_ERROR_FILE_READ	Indicates an error in reading the file.
VSL_ERROR_FILE_WRITE	Indicates an error in writing the file.
VSL_ERROR_FILE_CLOSE	Indicates an error in closing the file.
VSL_ERROR_BAD_FILE_FORMAT	File format is unknown.
VSL_ERROR_UNSUPPORTED_FILE_VER	File format version is not supported.
VSL_ERROR_BRNG_TABLE_FULL	Registration cannot be completed due to lack of free entries in the table of registered BRNGs.
VSL_ERROR_BAD_STREAM_STATE_SIZE	The value in StreamStateSize field is bad.
VSL_ERROR_BAD_WORD_SIZE	The value in WordSize field is bad.
VSL_ERROR_BAD_NSEEDS	The value in NSeeds field is bad.
VSL_ERROR_BAD_NBITS	The value in NBits field is bad.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or >nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns zero as the number of updated entries in a buffer.
VSL_ERROR_INVALID_ABSTRACT_STREAM	The abstract random stream is invalid.

VSL Usage Model

A typical algorithm for VSL random number generators is as follows:

1. Create and initialize stream/streams. Functions vslNewStream, vslNewStreamEx, vslCopyStream, vslCopyStreamState, vslLeapfrogStream, vslSkipAheadStream.
2. Call one or more RNGs.
3. Process the output.
4. Delete the stream/streams. Function vslDeleteStream.

NOTE. *You may reiterate steps 2-3. Random number streams may be generated for different threads.*

The following C example demonstrates generation of a random stream that is output of basic generator MT19937. The seed is equal to 777. The stream is used to generate 10,000 normally distributed random numbers in blocks of 1,000 random numbers with parameters *a* = 5 and *sigma* = 2. Delete the streams after completing the generation. The purpose of the example is to calculate the sample mean for normal distribution with the given parameters.

C Example of VSL Usage

```
#include <stdio.h>
#include “mkl_vsl.h”

int main();
{
   double r[1000]; /* buffer for random numbers */
   double s; /* average */
   VSLStreamStatePtr stream;
   int i, j;

   /* Initializing */
   s = 0.0;
   vslNewStream( &stream, VSL_BRNG_MT19937, 777 );

   /* Generating */
   for ( i=0; i<10; i++ );
   {
      vdRngGaussian( VSL_METHOD_DGAUSSIAN_ICDF, stream, 1000, r, 5.0, 2.0 );
      for ( j=0; j<1000; j++ );
      {
         s += r[j];
      }
   }
   s /= 10000.0;

   /* Deleting the stream */
   vslDeleteStream( &stream );

   /* Printing results */
   printf( “Sample mean of normal distribution = %f\n”, s );

   return 0;
}
```

The Fortran version of the same example is below:

Fortran Example of VSL Usage

```
      include 'mkl_vsl.fi'

      program MKL_VSL_GAUSSIAN

      USE MKL_VSL_TYPE
      USE MKL_VSL

      real(kind=8) r(1000)  ! buffer for random numbers
      real(kind=8) s        ! average
      real(kind=8) a, sigma ! parameters of normal distribution
```

```
      TYPE (VSL_STREAM_STATE) :: stream

      integer(kind=4) errcode
      integer(kind=4) i,j
      integer brng,method,seed,n

      n = 1000
      s = 0.0
      a = 5.0
      sigma  = 2.0
      brng=VSL_BRNG_MT19937
      method=VSL_METHOD_DGAUSSIAN_ICDF
      seed=777

!     ***** Initializing *****
      errcode=vslnewstream( stream, brng,  seed )

!     ***** Generating *****
      do i = 1,10
          errcode=vdrnggaussian( method, stream, n, r, a, sigma )
          do j = 1, 1000
              s = s + r(j)
          end do
      end do

      s = s / 10000.0

!     ***** Deinitialize *****
      errcode=vsldeletestream( stream )

!     ***** Printing results *****
      print *,"Sample mean of normal distribution = ", s

      end
```

Additionally, examples that demonstrate usage of VSL random number generators are available in the following directories:

`${MKL}/examples/vslc/source`

`${MKL}/examples/vslf/source`.

Service Routines

Stream handling comprises routines for creating, deleting, or copying the streams and getting the index of a basic generator. A random stream can also be saved to and then read from a binary file. Table 10-4 lists all available service routines

Table 10-4 Service Routines

Routine	Short Description
NewStream	Creates and initializes a random stream.
NewStreamEx	Creates and initializes a random stream for the generators with multiple initial conditions.
iNewAbstractStream	Creates and initializes an abstract random stream for integer arrays.

Routine	Short Description
dNewAbstractStream	Creates and initializes an abstract random stream for double precision floating-point arrays.
sNewAbstractStream	Creates and initializes an abstract random stream for single precision floating-point arrays.
DeleteStream	Deletes previously created stream.
CopyStream	Copies a stream to another stream.
CopyStreamState	Creates a copy of a random stream state.
SaveStreamF	Writes a stream to a binary file.
LoadStreamF	Reads a stream from a binary file.
LeapfrogStream	Initializes the stream by the leapfrog method to generate a subsequence of the original sequence.
SkipAheadStream	Initializes the stream by the skip-ahead method.
GetStreamStateBrng	Obtains the index of the basic generator responsible for the generation of a given random stream.
GetNumRegBrngs	Obtains the number of currently registered basic generators.

NOTE. In the above table, the vsl prefix in the function names is omitted. In the function reference this prefix is always used in function prototypes and code examples.

Most of the generator-based work comprises three basic steps:

1. Creating and initializing a stream (NewStream, NewStreamEx, CopyStream, CopyStreamState, LeapfrogStream, SkipAheadStream).
2. Generating random numbers with given distribution, see Distribution Generators.
3. Deleting the stream (DeleteStream).

Note that you can concurrently create multiple streams and obtain random data from one or several generators by using the stream state. You must use the DeleteStream function to delete all the streams afterwards.

NewStream

Creates and initializes a random stream.

Syntax

Fortran:

```
status = vslnewstream( stream, brng, seed )
```

C:

```
status = vslNewStream( &stream, brng, seed );
```

Input Parameters

Name	Type	Description
brng	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Index of the basic generator to initialize the stream. See Table 10-2 for specific value.
seed	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const unsigned int`	Initial condition of the stream. In the case of a quasi-random number generator seed parameter is used to set the dimension. If the dimension is greater than the dimension that brng can support or is less than 1, then the dimension is assumed to be equal to 1.

Output Parameters

Name	Type	Description
stream	**FORTRAN 77:** `INTEGER*4 stream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), INTENT(OUT)` **C:** `VSLStreamStatePtr*`	Stream state descriptor

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

For a basic generator with number *brng*, this function creates a new stream and initializes it with a 32-bit seed. The seed is an initial value used to select a particular sequence generated by the basic generator *brng*. The function is also applicable for generators with multiple initial conditions. See VSL Notes for a more detailed description of stream initialization for different basic generators.

NOTE. This function is not applicable for abstract basic random number generators. Please use `vsliNewAbstractStream`, `vslsNewAbstractStream` or `vsldNewAbstractStream` to utilize integer, single-precision or double-precision external random data respectively.

Return Values

`VSL_ERROR_OK`, `VSL_STATUS_OK`	Indicates no error, execution is successful.

VSL_ERROR_INVALID_BRNG_INDEX	BRNG index is invalid.
VSL_ERROR_MEM_FAILURE	System cannot allocate memory for *stream*.

NewStreamEx

Creates and initializes a random stream for generators with multiple initial conditions.

Syntax

Fortran:

```
status = vslnewstreamex( stream, brng, n, params )
```

C:

```
status = vslNewStreamEx( &stream, brng, n, params );
```

Input Parameters

Name	Type	Description
brng	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Index of the basic generator to initialize the stream. See Table 10-2 for specific value.
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of initial conditions contained in *params*
params	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const unsigned int	Array of initial conditions necessary for the basic generator *brng* to initialize the stream. In the case of a quasi-random number generator only the first element in *params* parameter is used to set the dimension. If the dimension is greater than the dimension that *brng* can support or is less than 1, then the dimension is assumed to be equal to 1.

Output Parameters

Name	Type	Description
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE(VSL_STREAM_STATE), INTENT(OUT)	Stream state descriptor

Name	Type	Description
	C: VSLStreamStatePtr*	

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function provides an advanced tool to set the initial conditions for a basic generator if its input arguments imply several initialization parameters. Initial values are used to select a particular sequence generated by the basic generator *brng*. Whenever possible, use NewStream, which is analogous to vslNewStreamEx except that it takes only one 32-bit initial condition. In particular, vslNewStreamEx may be used to initialize the state table in Generalized Feedback Shift Register Generators (GFSRs). A more detailed description of this issue can be found in VSL Notes.

This function is also used to pass user-defined initialization parameters of quasi-random number generators into the library. See VSL Notes for the format for their passing and registration in VSL.

NOTE. This function is not applicable for abstract basic random number generators. Please use vsliNewAbstractStream, vslsNewAbstractStream or vsldNewAbstractStream to utilize integer, single-precision or double-precision external random data respectively.

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_INVALID_BRNG_INDEX	BRNG index is invalid.
VSL_ERROR_MEM_FAILURE	System cannot allocate memory for *stream*.

iNewAbstractStream

Creates and initializes an abstract random stream for integer arrays.

Syntax

Fortran:

```
status = vslinewabstractstream( stream, n, ibuf, icallback )
```

C:

```
status = vsliNewAbstractStream( &stream, n, ibuf, icallback );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Size of the array *ibuf*
ibuf	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const unsigned int	Array of *n* 32-bit integers
icallback	See *Note* below	**FORTRAN:** Address of the callback function used for *ibuf* update **C:** Pointer to the callback function used for *ibuf* update

NOTE. Format of the callback function in FORTRAN 77:

```
INTEGER FUNCTION IUPDATEFUNC( stream, n, ibuf, nmin, nmax, idx )
INTEGER*4 stream(2)
INTEGER n
INTEGER*4 ibuf(n)
INTEGER nmin
INTEGER nmax
INTEGER idx
```

Format of the callback function in Fortran 90:

```
INTEGER FUNCTION IUPDATEFUNC[C]( stream, n, ibuf, nmin, nmax, idx )
TYPE(VSL_STREAM_STATE),POINTER :: stream[reference]
INTEGER(KIND=4),INTENT(IN)     :: n[reference]
INTEGER(KIND=4),INTENT(OUT)    :: ibuf[reference](0:n-1)
INTEGER(KIND=4),INTENT(IN)     :: nmin[reference]
INTEGER(KIND=4),INTENT(IN)     :: nmax[reference]
INTEGER(KIND=4),INTENT(IN)     :: idx[reference]
```

Format of the callback function in C:

```
int iUpdateFunc( VSLStreamStatePtr stream, int* n, unsigned int ibuf[], int* nmin, int* nmax,
 int* idx );
```

The callback function returns the number of elements in the array actually updated by the function. Table 10-5 gives the description of the callback function parameters.

Table 10-5 icallback Callback Function Parameters

Parameters	Short Description
stream	Abstract stream descriptor
n	Size of *ibuf*
ibuf	Array of random numbers associated with the stream *stream*
nmin	Minimal quantity of numbers to update
nmax	Maximal quantity of numbers that can be updated
idx	Position in cyclic buffer *ibuf* to start update $0 \le idx < n$.

Output Parameters

Name	Type	Description
stream	**FORTRAN 77:** `INTEGER*4 stream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), TINTENT(OUT)` **C:** `VSLStreamStatePtr*`	Descriptor of the stream state structure

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function creates a new abstract stream and associates it with an integer array *ibuf* and user's callback function *icallback* that is intended for updating of *ibuf* content.

Return Values

`VSL_ERROR_OK`, `VSL_STATUS_OK`	Indicates no error, execution is successful.
`VSL_ERROR_BAD_ARG`	Parameter *n* is not positive.
`VSL_ERROR_MEM_FAILURE`	System cannot allocate memory for *stream*.
`VSL_ERROR_NULL_PTR`	Either buffer or callback function parameter is a `NULL` pointer.

dNewAbstractStream

Creates and initializes an abstract random stream for double precision floating-point arrays.

Syntax

Fortran:

```
status = vsldnewabstractstream( stream, n, dbuf, a, b, dcallback )
```

C:

```
status = vsldNewAbstractStream( &stream, n, dbuf, a, b, dcallback );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Size of the array *dbuf*
dbuf	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	Array of *n* double precision floating-point random numbers with uniform distribution over interval (a,b)
a	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	Left boundary a
b	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	Right boundary b
dcallback	See *Note* below	**FORTRAN:** Address of the callback function used for update of the array *dbuf* **C:** Pointer to the callback function used for update of the array *dbuf*

Output Parameters

Name	Type	Description
stream	**FORTRAN 77:** `INTEGER*4 stream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), INTENT(OUT)` **C:** `VSLStreamStatePtr*`	Descriptor of the stream state structure

NOTE. Format of the callback function in FORTRAN 77:

```
INTEGER FUNCTION DUPDATEFUNC( stream, n, dbuf, nmin, nmax, idx )
INTEGER*4 stream(2)
INTEGER n
DOUBLE PRECISION dbuf(n)
INTEGER nmin
INTEGER nmax
INTEGER idx
```

Format of the callback function in Fortran 90:

```
INTEGER FUNCTION DUPDATEFUNC[C]( stream, n, dbuf, nmin, nmax, idx )
TYPE(VSL_STREAM_STATE),POINTER   :: stream[reference]
INTEGER(KIND=4),INTENT(IN)       :: n[reference]
REAL(KIND=8),INTENT(OUT)         :: dbuf[reference](0:n-1)
INTEGER(KIND=4),INTENT(IN)       :: nmin[reference]
INTEGER(KIND=4),INTENT(IN)       :: nmax[reference]
INTEGER(KIND=4),INTENT(IN)       :: idx[reference]
```

Format of the callback function in C:

```
int dUpdateFunc( VSLStreamStatePtr stream, int* n, double dbuf[], int* nmin, int* nmax, int*
idx );
```

The callback function returns the number of elements in the array actually updated by the function. Table 10-6 gives the description of the callback function parameters.

dcallback Callback Function Parameters

Parameters	Short Description
stream	Abstract stream descriptor
n	Size of *dbuf*

Parameters	Short Description
dbuf	Array of random numbers associated with the stream *stream*
nmin	Minimal quantity of numbers to update
nmax	Maximal quantity of numbers that can be updated
idx	Position in cyclic buffer *dbuf* to start update 0≤*idx*<*n*.

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function creates a new abstract stream for double precision floating-point arrays with random numbers of the uniform distribution over interval (a,b). The function associates the stream with a double precision array *dbuf* and user's callback function *dcallback* that is intended for updating of *dbuf* content.

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_BAD_ARG	Parameter *n* is not positive.
VSL_ERROR_MEM_FAILURE	System cannot allocate memory for *stream*.
VSL_ERROR_NULL_PTR	Either buffer or callback function parameter is a NULL pointer.

sNewAbstractStream

Creates and initializes an abstract random stream for single precision floating-point arrays.

Syntax

Fortran:

```
status = vslsnewabstractstream( stream, n, sbuf, a, b, scallback )
```

C:

```
status = vslsNewAbstractStream( &stream, n, sbuf, a, b, scallback );
```

Input Parameters

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Size of the array *sbuf*

Name	Type	Description
sbuf	**FORTRAN 77:** REAL **Fortran 90:** REAL, INTENT(IN) **C:** const float	Array of *n* single precision floating-point random numbers with uniform distribution over interval (a,b)
a	**FORTRAN 77:** REAL **Fortran 90:** REAL, INTENT(IN) **C:** const float	Left boundary a
b	**FORTRAN 77:** REAL **Fortran 90:** REAL, INTENT(IN) **C:** const float	Right boundary b
scallback	See *Note* below	**FORTRAN:** Address of the callback function used for update of the array *sbuf* **C:** Pointer to the callback function used for update of the array *sbuf*

Output Parameters

Name	Type	Description
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE(VSL_STREAM_STATE), INTENT(OUT) **C:** VSLStreamStatePtr*	Descriptor of the stream state structure

NOTE. Format of the callback function in FORTRAN 77:

```
INTEGER FUNCTION SUPDATEFUNC( stream, n, ibuf, nmin, nmax, idx )
INTEGER*4 stream(2)
INTEGER n
REAL sbuf(n)
INTEGER nmin
INTEGER nmax
INTEGER idx
```

Format of the callback function in Fortran 90:

```
INTEGER FUNCTION SUPDATEFUNC[C]( stream, n, sbuf, nmin, nmax, idx )
TYPE(VSL_STREAM_STATE),POINTER :: stream[reference]
INTEGER(KIND=4),INTENT(IN)     :: n[reference]
REAL(KIND=4),   INTENT(OUT)    :: sbuf[reference](0:n-1)
INTEGER(KIND=4),INTENT(IN)     :: nmin[reference]
INTEGER(KIND=4),INTENT(IN)     :: nmax[reference]
INTEGER(KIND=4),INTENT(IN)     :: idx[reference]
```

Format of the callback function in C:

```
int sUpdateFunc( VSLStreamStatePtr stream, int* n, float sbuf[], int* nmin, int* nmax, int*
idx );
```

The callback function returns the number of elements in the array actually updated by the function. Table 10-7 gives the description of the callback function parameters.

Table 10-7 scallback Callback Function Parameters

Parameters	Short Description
stream	Abstract stream descriptor
n	Size of *sbuf*
sbuf	Array of random numbers associated with the stream *stream*
nmin	Minimal quantity of numbers to update
nmax	Maximal quantity of numbers that can be updated
idx	Position in cyclic buffer *sbuf* to start update $0 \le idx < n$.

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function creates a new abstract stream for single precision floating-point arrays with random numbers of the uniform distribution over interval (a,b). The function associates the stream with a single precision array *sbuf* and user's callback function *scallback* that is intended for updating of *sbuf* content.

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_BAD_ARG	Parameter *n* is not positive.
VSL_ERROR_MEM_FAILURE	System cannot allocate memory for *stream*.
VSL_ERROR_NULL_PTR	Either buffer or callback function parameter is a NULL pointer.

DeleteStream

Deletes a random stream.

Syntax

Fortran:

```
status = vsldeletestream( stream )
```

C:

```
status = vslDeleteStream( &stream );
```

Input/Output Parameters

Name	Type	Description
stream	**FORTRAN 77:** `INTEGER*4 stream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), INTENT(OUT)` **C:** `VSLStreamStatePtr*`	**FORTRAN:** Stream state descriptor. Must have non-zero value. After the stream is successfully deleted, the descriptor becomes invalid. **C:** Stream state descriptor. Must have non-zero value. After the stream is successfully deleted, the pointer is set to `NULL`.

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function deletes the random stream created by one of the initialization functions.

Return Values

`VSL_ERROR_OK, VSL_STATUS_OK`	Indicates no error, execution is successful.
`VSL_ERROR_NULL_PTR`	*srcstream* parameter is a `NULL` pointer.
`VSL_ERROR_BAD_STREAM`	*srcstream* is not a valid random stream.
`VSL_ERROR_MEM_FAILURE`	System cannot allocate memory for *newstream*.

CopyStream

Creates a copy of a random stream.

Syntax

Fortran:

```
status = vslcopystream( newstream, srcstream )
```

C:

```
status = vslCopyStream( &newstream, srcstream );
```

Input Parameters

Name	Type	Description
srcstream	**FORTRAN 77:** `INTEGER*4 srcstream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), INTENT(IN)` **C:** `const VSLStreamStatePtr`	**FORTRAN:** Descriptor of the stream to be copied **C:** Pointer to the stream state structure to be copied

Output Parameters

Name	Type	Description
newstream	**FORTRAN 77:** `INTEGER*4 newstream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), INTENT(OUT)` **C:** `VSLStreamStatePtr*`	Copied stream descriptor

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function creates an exact copy of *srcstream* and stores its descriptor to *newstream*.

Return Values

`VSL_ERROR_OK, VSL_STATUS_OK`	Indicates no error, execution is successful.
`VSL_ERROR_NULL_PTR`	*srcstream* parameter is a `NULL` pointer.
`VSL_ERROR_BAD_STREAM`	*srcstream* is not a valid random stream.
`VSL_ERROR_MEM_FAILURE`	System cannot allocate memory for *newstream*.

CopyStreamState

Creates a copy of a random stream state.

Syntax

Fortran:

```
status = vslcopystreamstate( deststream, srcstream )
```

C:

```
status = vslCopyStreamState( deststream, srcstream );
```

Input Parameters

Name	Type	Description
srcstream	**FORTRAN 77:** INTEGER*4 srcstream(2) **Fortran 90:** TYPE(VSL_STREAM_STATE), INTENT(IN) **C:** const VSLStreamStatePtr	**FORTRAN:** Descriptor of the destination stream where the state of *scrstream* stream is copied **C:** Pointer to the stream state structure, from which the state structure is copied

Output Parameters

Name	Type	Description
deststream	**FORTRAN 77:** INTEGER*4 deststream(2) **Fortran 90:** TYPE(VSL_STREAM_STATE), INTENT(OUT) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream with the state to be copied **C:** Pointer to the stream state structure where the stream state is copied

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function copies a stream state from *srcstream* to the existing *deststream* stream. Both the streams should be generated by the same basic generator. An error message is generated when the index of the BRNG that produced *deststream* stream differs from the index of the BRNG that generated *srcstream* stream.

Unlike CopyStream function, which creates a new stream and copies both the stream state and other data from *srcstream*, the function CopyStreamState copies only *srcstream* stream state data to the generated *deststream* stream.

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	Either *srcstream* or *deststream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	Either *srcstream* or *deststream* is not a valid random stream.
VSL_ERROR_BRNGS_INCOMPATIBLE	BRNG associated with *srcstream* is not compatible with BRNG associated with *deststream*.

SaveStreamF

Writes random stream descriptive data to binary file.

Syntax

Fortran:

```
errstatus = vslsavestreamf( stream, fname )
```

C:

```
errstatus = vslSaveStreamF( stream, fname );
```

Input Parameters

Name	Type	Description
stream	**FORTRAN 77:** `INTEGER*4 stream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), INTENT(IN)` **C:** `const VSLStreamStatePtr`	Random stream to be written to the file
fname	**FORTRAN 77:** `CHARACTER(*)` **Fortran 90:** `CHARACTER(*), INTENT(IN)` **C:** `const char*`	**FORTRAN:** File name specified as a C-style null-terminated string **C:** File name specified as a Fortran-style character string

Output Parameters

Name	Type	Description
errstatus	**FORTRAN:** `INTEGER` **C:** `int`	Error status of the operation

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function writes the random stream descriptive data to the binary file. Random stream descriptive data is saved to the binary file with the name *fname*. Random stream *stream* must be a valid stream created by `New-Stream`-like or `CopyStream`-like service routines. If the stream cannot be saved to the file, *errstatus* has a non-zero value. Random stream can be read from the binary file using `LoadStreamF` function.

Return Values

`VSL_ERROR_OK, VSL_STATUS_OK`	Indicates no error, execution is successful.

VSL_ERROR_NULL_PTR	Either *fname* or *stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_FILE_OPEN	Indicates an error in opening the file.
VSL_ERROR_FILE_WRITE	Indicates an error in writing the file.
VSL_ERROR_FILE_CLOSE	Indicates an error in closing the file.
VSL_ERROR_MEM_FAILURE	System cannot allocate memory for internal needs.

LoadStreamF

Creates new stream and reads stream descriptive data from binary file.

Syntax

Fortran:

```
errstatus = vslloadstreamf( stream, fname )
```

C:

```
errstatus = vslLoadStreamF( &stream, fname );
```

Input Parameters

Name	Type	Description
fname	**FORTRAN 77:** CHARACTER(*) **Fortran 90:** CHARACTER(*), INTENT(IN) **C:** const char*	**FORTRAN:** File name specified as a C-style null-terminated string **C:** File name specified as a Fortran-style character string

Output Parameters

Name	Type	Description
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE(VSL_STREAM_STATE), INTENT(OUT) **C:** VSLStreamStatePtr*	**FORTRAN:** Descriptor of a new random stream **C:** Pointer to a new random stream
errstatus	**FORTRAN:** INTEGER **C:** int	Error status of the operation

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function creates a new stream and reads stream descriptive data from the binary file. A new random stream is created using the stream descriptive data from the binary file with the name *fname*. If the stream cannot be read (for example, an I/O error occurs or the file format is invalid), *errstatus* has a non-zero value. To save random stream to the file, use `SaveStreamF` function.

Return Values

`VSL_ERROR_OK, VSL_STATUS_OK`	Indicates no error, execution is successful.
`VSL_ERROR_NULL_PTR`	*fname* is a `NULL` pointer.
`VSL_ERROR_FILE_OPEN`	Indicates an error in opening the file.
`VSL_ERROR_FILE_WRITE`	Indicates an error in writing the file.
`VSL_ERROR_FILE_CLOSE`	Indicates an error in closing the file.
`VSL_ERROR_MEM_FAILURE`	System cannot allocate memory for internal needs.
`VSL_ERROR_BAD_FILE_FORMAT`	Unknown file format.
`VSL_ERROR_UNSUPPORTED_FILE_VER`	File format version is unsupported.

LeapfrogStream

Initializes a stream using the leapfrog method.

Syntax

Fortran:

```
status = vslleapfrogstream( stream, k, nstreams )
```

C:

```
status = vslLeapfrogStream( stream, k, nstreams );
```

Input Parameters

Name	Type	Description
stream	**FORTRAN 77:** `INTEGER*4 stream(2)`	**FORTRAN:** Descriptor of the stream to which leapfrog method is applied
	Fortran 90: `TYPE(VSL_STREAM_STATE), INTENT(IN)`	**C:** Pointer to the stream state structure to which leapfrog method is applied
	C: `VSLStreamStatePtr`	
k	**FORTRAN 77:** `INTEGER`	Index of the computational node, or stream number
	Fortran 90: `INTEGER, INTENT(IN)`	

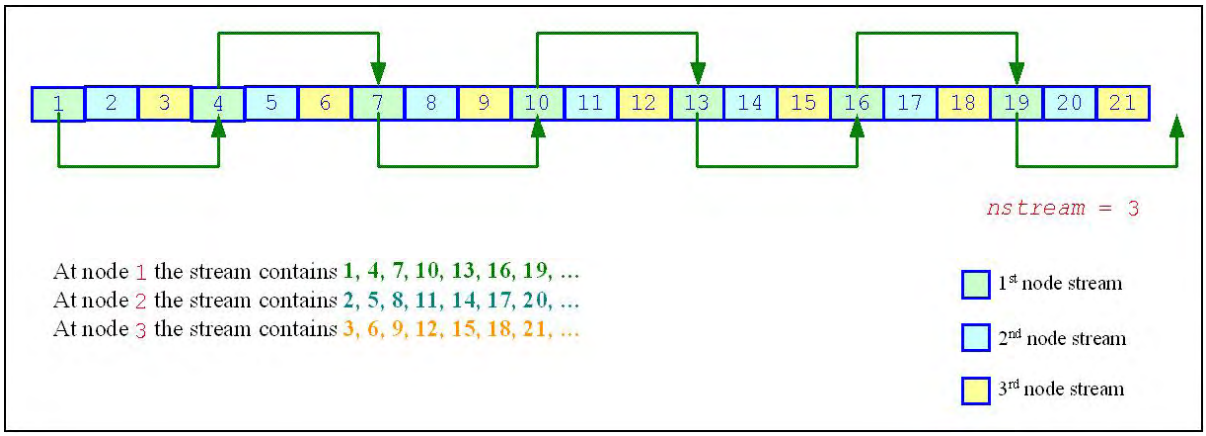
Name	Type	Description
	C: `const int`	
nstreams	**FORTRAN 77:** `INTEGER`	Largest number of computational nodes, or stride
	Fortran 90: `INTEGER, INTENT(IN)`	
	C: `const int`	

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function function allows generating random numbers in a random stream with non-unit stride. This feature is particularly useful in distributing random numbers from original stream across *nstreams* buffers without generating the original random sequence with subsequent manual distribution. One of the important applications of the leapfrog method is splitting the original sequence into non-overlapping subsequences across *nstreams* computational nodes. The function initializes the original random stream (see Figure 10-1) to generate random numbers for the computational node k, $0 \le k < nstreams$, where *nstreams* is the largest number of computational nodes used.

Figure 10-1 Leapfrog Method



The leapfrog method is supported only for those basic generators that allow splitting elements by the leapfrog method, which is more efficient than simply generating them by a generator with subsequent manual distribution across computational nodes. See VSL Notes for details.

For quasi-random basic generators the leapfrog method allows generating individual components of quasi-random vectors instead of whole quasi-random vectors. In this case *nstreams* parameter should be equal to the dimension of the quasi-random vector while *k* parameter should be the index of a component to be generated ($0 \le k < nstreams$). Other parameters values are not allowed.

The following code examples illustrate the initialization of three independent streams using the leapfrog method:

Example 10-1 Fortran 90 Code for Leapfrog Method

```
...
TYPE(VSL_STREAM_STATE)   ::stream1
TYPE(VSL_STREAM_STATE)   ::stream2
TYPE(VSL_STREAM_STATE)   ::stream3
! Creating 3 identical streams
status = vslnewstream(stream1, VSL_BRNG_MCG31, 174)
status = vslcopystream(stream2, stream1)
status = vslcopystream(stream3, stream1)
! Leapfrogging the streams

status = vslleapfrogstream(stream1, 0, 3)
status = vslleapfrogstream(stream2, 1, 3)
status = vslleapfrogstream(stream3, 2, 3)
! Generating random numbers

...
! Deleting the streams

status = vsldeletestream(stream1)
status = vsldeletestream(stream2)
status = vsldeletestream(stream3)
...
```

Example 10-2 C Code for Leapfrog Method

```
...
VSLStreamStatePtr stream1;
VSLStreamStatePtr stream2;
VSLStreamStatePtr stream3;
/* Creating 3 identical streams */
status = vslNewStream(&stream1, VSL_BRNG_MCG31, 174);
status = vslCopyStream(&stream2, stream1);
status = vslCopyStream(&stream3, stream1);
/* Leapfrogging the streams
*/
status = vslLeapfrogStream(stream1, 0, 3);
status = vslLeapfrogStream(stream2, 1, 3);
status = vslLeapfrogStream(stream3, 2, 3);
/* Generating random numbers
*/
...
/* Deleting the streams
*/
status = vslDeleteStream(&stream1);
status = vslDeleteStream(&stream2);
status = vslDeleteStream(&stream3);
...
```

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_LEAPFROG_UNSUPPORTED	BRNG does not support Leapfrog method.

SkipAheadStream

Initializes a stream using the block-splitting method.

Syntax

Fortran:

```
status = vslskipaheadstream( stream, nskip )
```

C:

```
status = vslSkipAheadStream( stream, nskip);
```

Input Parameters

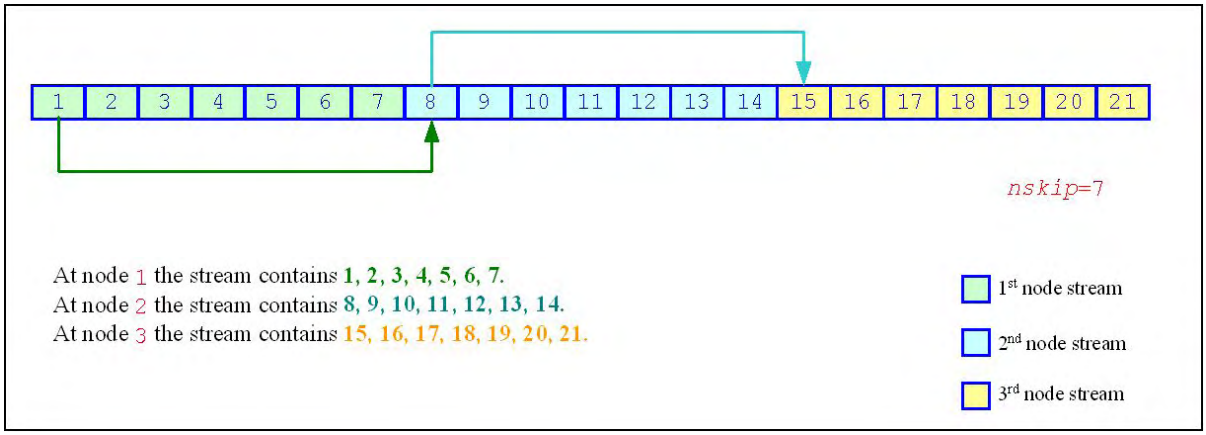
Name	Type	Description
stream	**FORTRAN 77:** `INTEGER*4 stream(2)` **Fortran 90:** `TYPE(VSL_STREAM_STATE), INTENT(IN)` **C:** `VSLStreamStatePtr`	**FORTRAN:** Descriptor of the stream to which block-splitting method is applied **C:** Pointer to the stream state structure to which block-splitting method is applied
nskip	**FORTRAN 77:** `INTEGER*4 nskip(2)` **Fortran 90:** `INTEGER(KIND=8), INTENT(IN)` **C:** `const long long int`	Number of skipped elements

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function skips a given number of elements in a random stream. This feature is particularly useful in distributing random numbers from original random stream across different computational nodes. If the largest number of random numbers used by a computational node is *nskip*, then the original random sequence may be split by `SkipAheadStream` into non-overlapping blocks of *nskip* size so that each block corresponds to the respective computational node. The number of computational nodes is unlimited. This method is known as the block-splitting method or as the skip-ahead method. (see Figure 10-2).

Figure 10-2 Block-Splitting Method



The skip-ahead method is supported only for those basic generators that allow skipping elements by the skip-ahead method, which is more efficient than simply generating them by generator with subsequent manual skipping. See VSL Notes for details.

Please note that for quasi-random basic generators the skip-ahead method works with components of quasi-random vectors rather than with whole quasi-random vectors. Therefore, to skip `NS` quasi-random vectors, set the *nskip* parameter equal to the `NS*DIMEN`, where `DIMEN` is the dimension of the quasi-random vector. If this operation results in exceeding the period of the quasi-random number generator, which is 2^{32}-1, the library returns the `VSL_ERROR_SKIPAHEAD_UNSUPPORTED` error code.

The following code examples illustrate how to initialize three independent streams using the `SkipAheadStream` function:

Example 10-3 Fortran 90 Code for Block-Splitting Method

```
...
type(VSL_STREAM_STATE)  ::stream1
type(VSL_STREAM_STATE)  ::stream2
type(VSL_STREAM_STATE)  ::stream3
! Creating the 1st stream
status = vslnewstream(stream1, VSL_BRNG_MCG31, 174)
! Skipping ahead by 7 elements the 2nd stream

status = vslcopystream(stream2, stream1);
status = vslskipaheadstream(stream2, 7);
! Skipping ahead by 7 elements the 3rd stream
```

```
status = vslcopystream(stream3, stream2);
status = vslskipaheadstream(stream3, 7);
! Generating random numbers

...
! Deleting the streams

status = vsldeletestream(stream1)
status = vsldeletestream(stream2)
status = vsldeletestream(stream3)
...
```

Example 10-4 C Code for Block-Splitting Method

```
VSLStreamStatePtr stream1;
VSLStreamStatePtr stream2;
VSLStreamStatePtr stream3;
/* Creating the 1st stream
*/
status = vslNewStream(&stream1, VSL_BRNG_MCG31, 174);
/* Skipping ahead by 7 elements the 2nd stream */
status = vslCopyStream(&stream2, stream1);
status = vslSkipAheadStream(stream2, 7);
/* Skipping ahead by 7 elements the 3rd stream */
status = vslCopyStream(&stream3, stream2);
status = vslSkipAheadStream(stream3, 7);
/* Generating random numbers
*/
...
/* Deleting the streams
*/
status = vslDeleteStream(&stream1);
status = vslDeleteStream(&stream2);
status = vslDeleteStream(&stream3);
...
```

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.

VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	BRNG does not support the Skip-Ahead method.

GetStreamStateBrng

Returns index of a basic generator used for generation of a given random stream.

Syntax

Fortran:

```
brng = vslgetstreamstatebrng( stream )
```

C:

```
brng = vslGetStreamStateBrng( stream );
```

Input Parameters

Name	Type	Description
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE(VSL_STREAM_STATE), TINTENT(IN) **C:** const VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state **C:** Pointer to the stream state structure

Output Parameters

Name	Type	Description
brng	**FORTRAN:** INTEGER **C:** int	Index of the basic generator assigned for the generation of *stream* ; negative in case of an error

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function retrieves the index of a basic generator used for generation of a given random stream.

Return Values

VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.

GetNumRegBrngs

Obtains the number of currently registered basic generators.

Syntax

Fortran:

```
nregbrngs = vslgetnumregbrngs( )
```

C:

```
nregbrngs = vslGetNumRegBrngs( void );
```

Output Parameters

Name	Type	Description
nregbrngs	**FORTRAN:** `INTEGER` **C:** `int`	Number of basic generators registered at the moment of the function call

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function obtains the number of currently registered basic generators. Whenever user registers a user-designed basic generator, the number of registered basic generators is incremented. The maximum number of basic generators that can be registered is determined by VSL_MAX_REG_BRNGS parameter.

Distribution Generators

VSL routines are used to generate random numbers with different types of distribution. Each function group is introduced below by the type of underlying distribution and contains a short description of its functionality, as well as specifications of the call sequence for both FORTRAN and C-interface and the explanation of input and output parameters. Table 10-8 and Table 10-9 list the random number generator routines, together with used data types, output distributions, and sets correspondence between data types of the generator routines and called basic random number generators.

Table 10-8 Continuous Distribution Generators

Type of Distribution	Data Types	BRNG Data Type	Description
Uniform	s, d	s, d	Uniform continuous distribution on the interval [*a*, *b*].
Gaussian	s, d	s, d	Normal (Gaussian) distribution.
GaussianMV	s, d	s, d	Multivariate normal (Gaussian) distribution.
Exponential	s, d	s, d	Exponential distribution.

Type of Distribution	Data Types	BRNG Data Type	Description
Laplace	s, d	s, d	Laplace distribution (double exponential distribution).
Weibull	s, d	s, d	Weibull distribution.
Cauchy	s, d	s, d	Cauchy distribution.
Rayleigh	s, d	s, d	Rayleigh distribution.
Lognormal	s, d	s, d	Lognormal distribution.
Gumbel	s, d	s, d	Gumbel (extreme value) distribution.
Gamma	s, d	s, d	Gamma distribution.
Beta	s, d	s, d	Beta distribution.

Table 10-9 Discrete Distribution Generators

Type of Distribution	Data Types	BRNG Data Type	Description
Uniform	i	d	Uniform discrete distribution on the interval $[a, b)$.
UniformBits	i	i	Generator of integer random values with uniform bit distribution.
Bernoulli	i	s	Bernoulli distribution.
Geometric	i	s	Geometric distribution.
Binomial	i	d	Binomial distribution.
Hypergeometric	i	d	Hypergeometric distribution.
Poisson	i	s (for VSL_METHOD_IPOISSON_POISNORM) s (for distribution parameter $\lambda \geq 27$) and d (for $\lambda < 27$) (for VSL_METHOD_IPOISSON_PTPE)	Poisson distribution.
PoissonV	i	s	Poisson distribution with varying mean.
NegBinomial	i	d	Negative binomial distribution, or Pascal distribution.

The library provides two modes of random number generation, accurate and fast. Accurate generation mode is intended for the applications that are highly demanding to accuracy of calculations. When used in this mode, the generators produce random numbers lying completely within definitional domain for all values of the distribution parameters. For example, random numbers obtained from the generator of continuous distribution that is uniform on interval [*a*,*b*] belong to this interval irrespective of what *a* and *b* values may be. Fast mode provides high performance of generation and also guaranties that generated random numbers belong to the definitional domain except for some specific values of distribution parameters. The generation mode is set by specifying relevant value of the method parameter in generator routines. List of distributions that support accurate mode of generation is given in the table below.

Table 10-10 Distribution Generators Supporting Accurate Mode

Type of Distribution	Data Types
Uniform	s, d
Exponential	s, d
Weibull	s, d
Rayleigh	s, d
Lognormal	s, d
Gamma	s, d
Beta	s, d

See additional details about accurate and fast mode of random number generation in VSL Notes.

Continuous Distributions

This section describes routines for generating random numbers with continuous distribution.

Uniform

Generates random numbers with uniform distribution.

Syntax

Fortran:

```
status = vsrnguniform( method, stream, n, r, a, b )
status = vdrnguniform( method, stream, n, r, a, b )
```

C:

```
status = vsRngUniform( method, stream, n, r, a, b );
status = vdRngUniform( method, stream, n, r, a, b );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method; the specific values are as follows: VSL_METHOD_SUNIFORM_STD VSL_METHOD_DUNIFORM_STD VSL_METHOD_SUNIFORM_STD_ACCURATE VSL_METHOD_DUNIFORM_STD_ACCURATE Standard method.
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
a	**FORTRAN 77:** REAL for vsrnguniform DOUBLE PRECISION for vdrnguniform **Fortran 90:** REAL, INTENT(IN) for vsrnguniform DOUBLE PRECISION, INTENT(IN) for vdrnguniform **C:** const float for vsRngUniform const double for vdRngUniform	Left bound a
b	**FORTRAN 77:** REAL for vsrnguniform DOUBLE PRECISION for vdrnguniform **Fortran 90:** REAL, INTENT(IN) for vsrnguniform	Right bound b

Name	Type	Description

	`DOUBLE PRECISION, INTENT(IN)` for `vdrnguniform`
	C: `const float` for `vsRngUniform`
	`const double` for `vdRngUniform`	

Output Parameters

Name	Type	Description

r	**FORTRAN 77:** `REAL` for `vsrnguniform`
	`DOUBLE PRECISION` for `vdrnguniform`
	Fortran 90: `REAL, INTENT(OUT)` for `vsrnguniform`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdrnguniform`
	C: `float*` for `vsRngUniform`
	`double*` for `vdRngUniform`
		Vector of n random numbers uniformly distributed over the interval $[a, b]$

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates random numbers uniformly distributed over the interval $[a, b]$, where a, b are the left and right bounds of the interval, respectively, and $a, b \in R$; $a < b$.

The probability density function is given by:

$$f_{a,b}(x) = \begin{cases} \frac{1}{b-a}, & x \in [a,b] \\ 0, & x \notin [a,b] \end{cases}, \quad -\infty < x < +\infty$$

The cumulative distribution function is as follows:

$$f_{a,b}(x) = \begin{cases} 0, & x < a \\ \dfrac{x-a}{b-a}, & a \le x \le b, -\infty < x < +\infty \\ 1, & x \ge b \end{cases}.$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Gaussian

Generates normally distributed random numbers.

Syntax

Fortran:

```
status = vsrnggaussian( method, stream, n, r, a, sigma )
status = vdrnggaussian( method, stream, n, r, a, sigma )
```

C:

```
status = vsRngGaussian( method, stream, n, r, a, sigma );
status = vdRngGaussian( method, stream, n, r, a, sigma );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SGAUSSIAN_BOXMULLER VSL_METHOD_SGAUSSIAN_BOXMULLER2 VSL_METHOD_SGAUSSIAN_ICDF VSL_METHOD_DGAUSSIAN_BOXMULLER VSL_METHOD_DGAUSSIAN_BOXMULLER2 VSL_METHOD_DGAUSSIAN_ICDF

Name	Type	Description
		See brief description of the methods BOXMULLER, BOXMULLER2, and ICDF in Table 10-1
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
a	**FORTRAN 77:** REAL for vsrnggaussian DOUBLE PRECISION for vdrnggaussian **Fortran 90:** REAL, INTENT(IN) for vsrnggaussian DOUBLE PRECISION, INTENT(IN) for vdrnggaussian **C:** const float for vsRngGaussian const double for vdRngGaussian	Mean value *a*.
sigma	**FORTRAN 77:** REAL for vsrnggaussian DOUBLE PRECISION for vdrnggaussian **Fortran 90:** REAL, INTENT(IN) for vsrnggaussian DOUBLE PRECISION, INTENT(IN) for vdrnggaussian **C:** const float for vsRngGaussian const double for vdRngGaussian	Standard deviation σ.

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** REAL for vsrnggaussian DOUBLE PRECISION for vdrnggaussian **Fortran 90:** REAL, INTENT(OUT) for vsrnggaussian DOUBLE PRECISION, INTENT(OUT) for vdrnggaussian **C:** float* for vsRngGaussian double* for vdRngGaussian	Vector of n normally distributed random numbers

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates random numbers with normal (Gaussian) distribution with mean value a and standard deviation σ, where

a, $\sigma \in R$; $\sigma > 0$.

The probability density function is given by:

$$f_{a,\sigma}(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp\left(-\frac{(x-a)^2}{2\sigma^2}\right), \quad -\infty < x < +\infty .$$

The cumulative distribution function is as follows:

$$F_{a,\sigma}(x) = \int_{-\infty}^{x} \frac{1}{\sigma\sqrt{2\pi}} \exp\left(-\frac{(y-a)^2}{2\sigma^2}\right) dy, \quad -\infty < x < +\infty .$$

The cumulative distribution function $F_{a,\sigma}(x)$ can be expressed in terms of standard normal distribution $\Phi(x)$ as

$F_{a,\sigma}(x) = \Phi((x - a)/\sigma)$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.

VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

GaussianMV

Generates random numbers from multivariate normal distribution.

Syntax

Fortran:

```
status = vsrnggaussianmv( method, stream, n, r, dimen, mstorage, a, t )
status = vdrnggaussianmv( method, stream, n, r, dimen, mstorage, a, t )
```

C:

```
status = vsRngGaussianMV( method, stream, n, r, dimen, mstorage, a, t );
status = vdRngGaussianMV( method, stream, n, r, dimen, mstorage, a, t );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SGAUSSIANMV_BOXMULLER VSL_METHOD_SGAUSSIANMV_BOXMULLER2 VSL_METHOD_SGAUSSIANMV_ICDF VSL_METHOD_DGAUSSIANMV_BOXMULLER VSL_METHOD_DGAUSSIANMV_BOXMULLER2 VSL_METHOD_DGAUSSIANMV_ICDF See brief description of the methods BOXMULLER, BOXMULLER2, and ICDF in Table 10-1
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated

	`DOUBLE PRECISION, INTENT(OUT)` for `vdrnggaussianmv`	
	C: `float*` for `vsRngGaussianMV`	
	`double*` for `vdRngGaussianMV`	

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates random numbers with *d*-variate normal (Gaussian) distribution with mean value a and variance-covariance matrix *C*, where $a \in R^d$; *C* is a $d \times d$ symmetric positive-definite matrix.

The probability density function is given by:

$$f_{a,C}(x) = \frac{1}{\sqrt{\det(2\pi C)}} \exp(-1/2(x-a)^T C^{-1}(x-a)),$$

where $x \in R^d$.

Matrix C can be represented as $C = TT^T$, where T is a lower triangular matrix - Cholesky factor of C.

Instead of variance-covariance matrix C the generation routines require Cholesky factor of C in input. To compute Cholesky factor of matrix C, the user may call MKL LAPACK routines for matrix factorization: `?potrf` or `?pptrf` for `v?RngGaussianMV`/`v?rnggaussianmv` routines (`?` means either `s` or `d` for single and double precision respectively). See Application Notes for more details.

Application Notes

Since matrices are stored in Fortran by columns, while in C they are stored by rows, the usage of MKL factorization routines (assuming Fortran matrices storage) in combination with multivariate normal RNG (assuming C matrix storage) is slightly different in C and Fortran. The following tables help in using these routines in C and Fortran. For further information please refer to the appropriate VSL example file.

Table 10-11 Using Cholesky Factorization Routines in Fortran

Matrix Storage Scheme	Variance-Covariance Matrix Argument	Factorization Routine	UPLO Parameter in Factorization Routine	Result of Factorization as Input Argument for RNG
`VSL_MATRIX_STORAGE_FULL`	C in Fortran two-dimensional array	`spotrf` for `vsrnggaussianmv` `dpotrf` for `vdrnggaussianmv`	'U'	Upper triangle of T^T. Lower triangle is not used.
`VSL_MATRIX_STORAGE_PACKED`	Lower triangle of C packed by columns into one-dimensional array	`spptrf` for `vsrnggaussianmv` `dpptrf` for `vdrnggaussianmv`	'L'	Upper triangle of T^T packed by rows into one-dimensional array.

Table 10-12 Using Cholesky Factorization Routines in C

Matrix Storage Scheme	Variance-Covariance Matrix Argument	Factorization Routine	UPLO Parameter in Factorization Routine	Result of Factorization as Input Argument for RNG
VSL_MATRIX_STORAGE_FULL	*c* in C two-dimensional array	spotrf for vsRngGaussianMV dpotrf for vdRngGaussianMV	'U'	Upper triangle of T^T. Lower triangle is not used.
VSL_MATRIX_STORAGE_PACKED	Lower triangle of *c* packed by columns into one-dimensional array	spptrf for vsRngGaussianMV dpptrf for vdRngGaussianMV	'L'	Upper triangle of T^T packed by rows into one-dimensional array.

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Exponential

Generates exponentially distributed random numbers.

Syntax

Fortran:

```
status = vsrngexponential( method, stream, n, r, a, beta )
status = vdrngexponential( method, stream, n, r, a, beta )
```

C:

```
status = vsRngExponential( method, stream, n, r, a, beta );
status = vdRngExponential( method, stream, n, r, a, beta );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SEXPONENTIAL_ICDF VSL_METHOD_DEXPONENTIAL_ICDF VSL_METHOD_SEXPONENTIAL_ICDF_ACCURATE VSL_METHOD_DEXPONENTIAL_ICDF_ACCURATE Inverse cumulative distribution function method
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure

Name	Type	Description

	`DOUBLE PRECISION, INTENT(IN)` for `vdrngexponential`
	C: `const float` for `vsRngExponential`
	`const double` for `vdRngExponential`	

Output Parameters

Name	Type	Description

r	**FORTRAN 77:** `REAL` for `vsrngexponential`
	`DOUBLE PRECISION` for `vdrngexponential`
	Fortran 90: `REAL, INTENT(OUT)` for `vsrngexponential`
	`DOUBLE PRECISION, INTENT(OUT)` for `vdrngexponential`
	C: `float*` for `vsRngExponential`
	`double*` for `vdRngExponential`
		Vector of *n* exponentially distributed random numbers

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates random numbers with exponential distribution that has displacement a and scalefactor β, where $a,\ \beta \in R\ ;\ \beta > 0$.

The probability density function is given by:

$$f_{a,\beta}(x) = \begin{cases} \frac{1}{\beta} \exp\left((-(x-a)) / \beta \right), & x \geq a \\ 0, & x < a \end{cases}, -\infty < x < +\infty.$$

The cumulative distribution function is as follows:

$$F_{a,\beta}(x) = \begin{cases} 1 - \exp\left(\left(-(x-a)\right)/\beta\right), & x \geq a \\ 0, & x < a \end{cases}, -\infty < x < +\infty.$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Laplace

Generates random numbers with Laplace distribution.

Syntax

Fortran:

```
status = vsrnglaplace( method, stream, n, r, a, beta )
status = vdrnglaplace( method, stream, n, r, a, beta )
```

C:

```
status = vsRngLaplace( method, stream, n, r, a, beta );
status = vdRngLaplace( method, stream, n, r, a, beta );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SLAPLACE_ICDF VSL_METHOD_DLAPLACE_ICDF Inverse cumulative distribution function method
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN)	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure

	Fortran 90: `REAL, INTENT(IN)` for `vsrnglaplace`	
	`DOUBLE PRECISION, INTENT(IN)` for `vdrnglaplace`	
	C: `const float` for `vsRngLaplace`	
	`const double` for `vdRngLaplace`	

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** `REAL` for `vsrnglaplace`	Vector of *n* Laplace distributed random numbers
	`DOUBLE PRECISION` for `vdrnglaplace`	
	Fortran 90: `REAL, INTENT(OUT)` for `vsrnglaplace`	

Name	Type	Description

	`DOUBLE PRECISION`, `INTENT(OUT)` for `vdrnglaplace`
	C: `float*` for `vsRngLaplace`
	`double*` for `vdRngLaplace`	

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates random numbers with Laplace distribution with mean value (or average) *a* and scalefactor β, where *a*, $\beta \in R$; $\beta > 0$. The scalefactor value determines the standard deviation as

$$\sigma = \beta\sqrt{2}$$

The probability density function is given by:

$$f_{a,\beta}(x) = \frac{1}{\sqrt{2}\beta} \exp\left(-\frac{|x-a|}{\beta}\right), -\infty < x < +\infty.$$

The cumulative distribution function is as follows:

$$f_{a,\beta}(x) = \begin{cases} \frac{1}{2}\exp\left(-\frac{|x-a|}{\beta}\right), & x \geq a \\ 1 - \frac{1}{2}\exp\left(-\frac{|x-a|}{\beta}\right), & x < a \end{cases}, -\infty < x < +\infty.$$

Return Values

`VSL_ERROR_OK, VSL_STATUS_OK`	Indicates no error, execution is successful.
`VSL_ERROR_NULL_PTR`	*`stream`* is a `NULL` pointer.
`VSL_ERROR_BAD_STREAM`	*`stream`* is not a valid random stream.
`VSL_ERROR_BAD_UPDATE`	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, `< 0` or `> nmax`.
`VSL_ERROR_NO_NUMBERS`	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
`VSL_ERROR_SKIPAHEAD_UNSUPPORTED`	Period of the generator has been exceeded.

Weibull

Generates Weibull distributed random numbers.

Syntax

Fortran:

```
status = vsrngweibull( method, stream, n, r, alpha, a, beta )
status = vdrngweibull( method, stream, n, r, alpha, a, beta )
```

C:

```
status = vsRngWeibull( method, stream, n, r, alpha, a, beta );
status = vdRngWeibull( method, stream, n, r, alpha, a, beta );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SWEIBULL_ICDF VSL_METHOD_DWEIBULL_ICDF VSL_METHOD_SWEIBULL_ICDF_ACCURATE VSL_METHOD_DWEIBULL_ICDF_ACCURATE Inverse cumulative distribution function method
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** REAL for vsrngweibull DOUBLE PRECISION for vdrngweibull **Fortran 90:** REAL, INTENT(OUT) for vsrngweibull	Vector of *n* Weibull distributed random numbers

Name	Type	Description

	`DOUBLE PRECISION`, `INTENT(OUT)` for `vdrngweibull`
	C: `float*` for `vsRngWeibull`
	`double*` for `vdRngWeibull`	

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates Weibull distributed random numbers with displacement *a*, scalefactor β, and shape α, where α, β, $a \in R$; $\alpha > 0$, $\beta > 0$.

The probability density function is given by:

$$f_{a,\alpha,\beta}(x) = \begin{cases} \frac{\alpha}{\beta^{\alpha}} (x-a)^{\alpha-1} \exp\left(-\left(\frac{x-a}{\beta}\right)^{\alpha}\right), & x \geq a \\ 0, & x < a \end{cases}$$

The cumulative distribution function is as follows:

$$F_{a,\alpha,\beta}(x) = \begin{cases} 1 - \exp\left(-\left(\frac{x-a}{\beta}\right)^{\alpha}\right), & x \geq a \\ 0, & x < a \end{cases}, -\infty < x < +\infty.$$

Return Values

`VSL_ERROR_OK, VSL_STATUS_OK`	Indicates no error, execution is successful.
`VSL_ERROR_NULL_PTR`	*`stream`* is a `NULL` pointer.
`VSL_ERROR_BAD_STREAM`	*`stream`* is not a valid random stream.
`VSL_ERROR_BAD_UPDATE`	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, `< 0` or `> nmax`.
`VSL_ERROR_NO_NUMBERS`	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
`VSL_ERROR_SKIPAHEAD_UNSUPPORTED`	Period of the generator has been exceeded.

Cauchy

Generates Cauchy distributed random values.

Syntax

Fortran:

```
status = vsrngcauchy( method, stream, n, r, a, beta )
status = vdrngcauchy( method, stream, n, r, a, beta )
```

C:

```
status = vsRngCauchy( method, stream, n, r, a, beta );
status = vdRngCauchy( method, stream, n, r, a, beta );
```

Input Parameters

	`DOUBLE PRECISION, INTENT(OUT)` for `vdrngcauchy`	
	C: `float*` for `vsRngCauchy`	
	`double*` for `vdRngCauchy`	

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi`

The function generates Cauchy distributed random numbers with displacement *a* and scalefactor β, where *a*, $\beta \in R$; $\beta > 0$.

The probability density function is given by:

$$f_{a,\beta}(x) = \frac{1}{\pi\beta\left(1+\left(\frac{x-a}{\beta}\right)^2\right)}, -\infty < x < +\infty.$$

The cumulative distribution function is as follows:

$$F_{a,\beta}(x) = \frac{1}{2} + \frac{1}{\pi}\arctan\left(\frac{x-a}{\beta}\right), -\infty < x < +\infty.$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Rayleigh

Generates Rayleigh distributed random values.

Syntax

Fortran:

```
status = vsrngrayleigh( method, stream, n, r, a, beta )
status = vdrngrayleigh( method, stream, n, r, a, beta )
```

C:

```
status = vsRngRayleigh( method, stream, n, r, a, beta );
status = vdRngRayleigh( method, stream, n, r, a, beta );
```

Input Parameters

r	**FORTRAN 77:** REAL for vsrngrayleigh DOUBLE PRECISION for vdrngrayleigh **Fortran 90:** REAL, INTENT(OUT) for vsrngrayleigh DOUBLE PRECISION, INTENT(OUT) for vdrngrayleigh **C:** float* for vsRngRayleigh double* for vdRngRayleigh	Vector of *n* Rayleigh distributed random numbers

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates Rayleigh distributed random numbers with displacement *a* and scalefactor β, where *a*, $\beta \in R$; $\beta > 0$.

Rayleigh distribution is a special case of Weibull distribution, where the shape parameter $\alpha = 2$.

The probability density function is given by:

$$f_{a,\beta}(x) = \begin{cases} \frac{2(x-a)}{\beta^2} \exp\left(-\frac{(x-a)^2}{\beta^2}\right), & x \geq a \\ 0, & x < a \end{cases}, -\infty < x < +\infty.$$

The cumulative distribution function is as follows:

$$F_{a,\beta}(x) = \begin{cases} 1 - \exp\left(-\frac{(x-a)^2}{\beta^2}\right), & x \geq a \\ 0, & x < a \end{cases}, -\infty < x < +\infty.$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Lognormal

Generates lognormally distributed random numbers.

Syntax

Fortran:

```
status = vsrnglognormal( method, stream, n, r, a, sigma, b, beta )
status = vdrnglognormal( method, stream, n, r, a, sigma, b, beta )
```

C:

```
status = vsRngLognormal( method, stream, n, r, a, sigma, b, beta );
status = vdRngLognormal( method, stream, n, r, a, sigma, b, beta );
```

Input Parameters

r	**FORTRAN 77:** REAL for vsrnglognormal DOUBLE PRECISION for vdrnglognormal **Fortran 90:** REAL, INTENT(OUT) for vsrnglognormal DOUBLE PRECISION, INTENT(OUT) for vdrnglognormal **C:** float* for vsRngLognormal double* for vdRngLognormal	Vector of *n* lognormally distributed random numbers

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates lognormally distributed random numbers with average of distribution *a* and standard deviation σ of subject normal distribution, displacement *b*, and scalefactor β, where $a,\ \sigma,\ b,\ \beta \in R\ ;\ \sigma > 0,\ \beta > 0$.

The probability density function is given by:

$$f_{a,\sigma,b,\beta}(x) = \begin{cases} \dfrac{1}{\sigma(x-b)\sqrt{2\pi}} \exp\left(-\dfrac{\left[\ln((x-b)/\beta) - a\right]^2}{2\sigma^2}\right), & x > b \\ 0, & x \le b \end{cases}$$

The cumulative distribution function is as follows:

$$F_{a,\sigma,b,\beta}(x) = \begin{cases} \Phi((\ln((x-b)/\beta) - a)/\sigma), & x > b \\ 0, & x \le b \end{cases}$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Gumbel

Generates Gumbel distributed random values.

Syntax

Fortran:

```
status = vsrnggumbel( method, stream, n, r, a, beta )
status = vdrnggumbel( method, stream, n, r, a, beta )
```

C:

```
status = vsRngGumbel( method, stream, n, r, a, beta );
status = vdRngGumbel( method, stream, n, r, a, beta );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SGUMBEL_ICDF VSL_METHOD_DGUMBEL_ICDF Inverse cumulative distribution function method
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
a	**FORTRAN 77:** REAL for vsrnggumbel DOUBLE PRECISION for vdrnggumbel **Fortran 90:** REAL, INTENT(IN) for vsrnggumbel DOUBLE PRECISION, INTENT(IN) for vdrnggumbel **C:** const float for vsRngGumbel const double for vdRngGumbel	Displacement *a*.
beta	**FORTRAN 77:** REAL for vsrnggumbel DOUBLE PRECISION for vdrnggumbel **Fortran 90:** REAL, INTENT(IN) for vsrnggumbel	Scalefactor β.

Name	Type	Description
	DOUBLE PRECISION, INTENT(IN) for vdrnggumbel **C:** const float for vsRngGumbel const double for vdRngGumbel	

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** REAL for vsrnggumbel DOUBLE PRECISION for vdrnggumbel **Fortran 90:** REAL, INTENT(OUT) for vsrnggumbel DOUBLE PRECISION, INTENT(OUT) for vdrnggumbel **C:** float* for vsRngGumbel double* for vdRngGumbel	Vector of *n* random numbers with Gumbel distribution

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates Gumbel distributed random numbers with displacement a and scalefactor β, where a, $\beta \in R$; $\beta > 0$.

The probability density function is given by:

$$f_{a,\beta}(x) = \left\{\frac{1}{\beta}\exp\left(\frac{x-a}{\beta}\right)\exp(-\exp((x-a)/\beta)), -\infty < x < +\infty\right.$$

The cumulative distribution function is as follows:

$$F_{a,\beta}(x) = 1 - \exp(-\exp((x-a)/\beta)), -\infty < x < +\infty$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.

VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Gamma

Generates gamma distributed random values.

Syntax

Fortran:

```
status = vsrnggamma( method, stream, n, r, alpha, a, beta )
status = vdrnggamma( method, stream, n, r, alpha, a, beta )
```

C:

```
status = vsRngGamma( method, stream, n, r, alpha, a, beta );
status = vdRngGamma( method, stream, n, r, alpha, a, beta );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SGAMMA_GNORM VSL_METHOD_DGAMMA_GNORM VSL_METHOD_SGAMMA_GNORM_ACCURATE VSL_METHOD_DGAMMA_GNORM_ACCURATE Acceptance/rejection method using random numbers with Gaussian distribution. See brief description of the method GNORM in Table 10-1
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure **C:** Pointer to the stream state structure

Name	Type	Description
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
alpha	**FORTRAN 77:** REAL for vsrnggamma DOUBLE PRECISION for vdrnggamma **Fortran 90:** REAL, INTENT(IN) for vsrnggamma DOUBLE PRECISION, INTENT(IN) for vdrnggamma **C:** const float for vsRngGamma const double for vdRngGamma	Shape α.
a	**FORTRAN 77:** REAL for vsrnggamma DOUBLE PRECISION for vdrnggamma **Fortran 90:** REAL, INTENT(IN) for vsrnggamma DOUBLE PRECISION, INTENT(IN) for vdrnggamma **C:** const float for vsRngGamma const double for vdRngGamma	Displacement *a*.
beta	**FORTRAN 77:** REAL for vsrnggamma DOUBLE PRECISION for vdrnggamma **Fortran 90:** REAL, INTENT(IN) for vsrnggamma DOUBLE PRECISION, INTENT(IN) for vdrnggamma **C:** const float for vsRngGamma const double for vdRngGamma	Scalefactor β.

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** REAL for vsrnggamma DOUBLE PRECISION for vdrnggamma **Fortran 90:** REAL, INTENT(OUT) for vsrnggamma DOUBLE PRECISION, INTENT(OUT) for vdrnggamma **C:** float* for vsRngGamma double* for vdRngGamma	Vector of *n* random numbers with gamma distribution

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates random numbers with gamma distribution that has shape parameter α, displacement a, and scale parameter β, where α, β, and $a \in R$; $\alpha > 0$, $\beta > 0$.

The probability density function is given by:

$$f_{\alpha,a,\beta}(x) = \begin{cases} \frac{1}{\Gamma(\alpha)\beta^{\alpha}}(x-a)^{\alpha-1}e^{-(x-a)/\beta}, & x \geq a \\ 0, & x < a \end{cases}, -\infty < x < +\infty$$

where $\Gamma(\alpha)$ is the complete gamma function.

The cumulative distribution function is as follows:

$$F_{\alpha,a,\beta}(x) = \begin{cases} \int_a^x \frac{1}{\Gamma(\alpha)\beta^{\alpha}}(y-a)^{\alpha-1}e^{-(y-a)/\beta}dy, & x \geq a \\ 0, & x < a \end{cases}, -\infty < x < +\infty$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.

VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Beta

Generates beta distributed random values.

Syntax

Fortran:

```
status = vsrngbeta( method, stream, n, r, p, q, a, beta )
status = vdrngbeta( method, stream, n, r, p, q, a, beta )
```

C:

```
status = vsRngBeta( method, stream, n, r, p, q, a, beta );
status = vdRngBeta( method, stream, n, r, p, q, a, beta );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_SBETA_CJA VSL_METHOD_DBETA_CJA VSL_METHOD_SBETA_CJA_ACCURATE VSL_METHOD_DBETA_CJA_ACCURATE See brief description of the method CJA in Table 10-1
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated

Name	Type	Description
p	**FORTRAN 77:** REAL for vsrngbeta DOUBLE PRECISION for vdrngbeta **Fortran 90:** REAL, INTENT(IN) for vsrngbeta DOUBLE PRECISION, INTENT(IN) for vdrngbeta **C:** const float for vsRngBeta const double for vdRngBeta	Shape *p*
q	**FORTRAN 77:** REAL for vsrngbeta DOUBLE PRECISION for vdrngbeta **Fortran 90:** REAL, INTENT(IN) for vsrngbeta DOUBLE PRECISION, INTENT(IN) for vdrngbeta **C:** const float for vsRngBeta const double for vdRngBeta	Shape *q*

beta	**FORTRAN 77:** REAL for vsrngbeta DOUBLE PRECISION for vdrngbeta **Fortran 90:** REAL, INTENT(IN) for vsrngbeta	Scalefactor β.

Name	Type	Description
	DOUBLE PRECISION, INTENT(IN) for vdrngbeta **C:** const float for vsRngBeta const double for vdRngBeta	

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** REAL for vsrngbeta DOUBLE PRECISION for vdrngbeta **Fortran 90:** REAL, INTENT(OUT) for vsrngbeta DOUBLE PRECISION, INTENT(OUT) for vdrngbeta **C:** float* for vsRngBeta double* for vdRngBeta	Vector of *n* random numbers with beta distribution

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi

The function generates random numbers with beta distribution that has shape parameters p and *q*, displacement *a*, and scale parameter β, where *p*, *q*, *a*, and β∈R ; $p > 0$, $q > 0$, $\beta > 0$.

The probability density function is given by:

$$f_{p,q,a,\beta}(x) = \begin{cases} \frac{1}{B(p,q)\beta^{p+q-1}}(x-a)^{p-1}(\beta+a-x)^{q-1}, & a \le x < a+\beta \\ 0, & x < a, x \ge a+\beta \end{cases}, -\infty < x < \infty,$$

where $B(p, q)$ is the complete beta function.

The cumulative distribution function is as follows:

$$F_{p,q,a,\beta}(x) = \begin{cases} 0, & x < a \\ \int_a^x \frac{1}{B(p,q)\beta^{p+q-1}}(y-a)^{p-1}(\beta+a-y)^{q-1}dy, & a \le x < a+\beta \\ 1, & x \ge a+\beta \end{cases}, -\infty < x < \infty.$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Discrete Distributions

This section describes routines for generating random numbers with discrete distribution.

Uniform

Generates random numbers uniformly distributed over the interval [a, b).

Syntax

Fortran:

```
status = virnguniform( method, stream, n, r, a, b )
```

C:

```
status = viRngUniform( method, stream, n, r, a, b );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method; dummy and set to 0 in case of uniform distribution. The specific value is as follows: VSL_METHOD_IUNIFORM_STD Standard method. Currently there is only one method for this distribution generator.
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure

Name	Type	Description
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Number of random values to be generated
a	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Left interval bound a
b	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Right interval bound b

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(OUT)` **C:** `int*`	Vector of *n* random numbers uniformly distributed over the interval $[a, b)$

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates random numbers uniformly distributed over the interval $[a, b)$, where a, b are the left and right bounds of the interval respectively, and $a, b \in Z$; $a < b$.

The probability distribution is given by:

$$P(X = k) = \frac{1}{b - a}, k \in \{a, a + 1, \ldots, b - 1\}.$$

The cumulative distribution function is as follows:

$$F_{a,b}(x) = \begin{cases} 0, & x < a \\ \dfrac{\lfloor x - a + 1 \rfloor}{b - a}, & a \le x < b, x \in R. \\ 1, & x \ge b \end{cases}$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

UniformBits

Generates integer random values with uniform bit distribution.

Syntax

Fortran:

```
status = virnguniformbits( method, stream, n, r )
```

C:

```
status = viRngUniformBits( method, stream, n, r );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method; dummy and set to 0. The specific value is as follows: VSL_METHOD_IUNIFORMBITS_STD Standard method. Currently there is only one method for this distribution generator.
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN)	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure

Name	Type	Description
	C: `VSLStreamStatePtr`	
n	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Number of random values to be generated

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(OUT)` **C:** `unsigned int*`	**FORTRAN:** Vector of *n* random integer numbers. If the *stream* was generated by a 64 or a 128-bit generator, each integer value is represented by two or four elements of *r* respectively. The number of bytes occupied by each integer is contained in the field *wordsize* of the structure VSL_BRNG_PROPERTIES. The total number of bits that are actually used to store the value are contained in the field *nbits* of the same structure. See Advanced Service Routines for a more detailed discussion of VSLBRngProperties. **C:** Vector of *n* random integer numbers. If the *stream* was generated by a 64 or a 128-bit generator, each integer value is represented by two or four elements of *r* respectively. The number of bytes occupied by each integer is contained in the field *WordSize* of the structure VSLBRngProperties. The total number of bits that are actually used to store the value are contained in the field *NBits* of the same structure.See Advanced Service Routines for a more detailed discussion of VSLBRngProperties.

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates integer random values with uniform bit distribution.The generators of uniformly distributed numbers can be represented as recurrence relations over integer values in modular arithmetic. Apparently, each integer can be treated as a vector of several bits. In a truly random generator, these bits are random, while in pseudorandom generators this randomness can be violated. For example, a well known drawback of linear congruential generators is that lower bits are less random than higher bits (for example, see [Knuth81]). For this reason, care should be taken when using this function. Typically, in a 32-bit *LCG* only 24 higher bits of an integer value can be considered random. See VSL Notes for details.

Return Values

`VSL_ERROR_OK, VSL_STATUS_OK`	Indicates no error, execution is successful.

VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Bernoulli

Generates Bernoulli distributed random values.

Syntax

Fortran:

```
status = virngbernoulli( method, stream, n, r, p )
```

C:

```
status = viRngBernoulli( method, stream, n, r, p );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific value is as follows: VSL_METHOD_IBERNOULLI_ICDF Inverse cumulative distribution function method.
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
p	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN)	Success probability *p* of a trial

Name	Type	Description
	C: `const double`	

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(OUT)` **C:** `int*`	Vector of *n* Bernoulli distributed random values

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates Bernoulli distributed random numbers with probability *p* of a single trial success, where

$p \in R;\ 0 \le p \le 1$.

A variate is called Bernoulli distributed, if after a trial it is equal to 1 with probability of success *p*, and to 0 with probability 1 — *p*.

The probability distribution is given by:

$P(X = 1) = p$

$P(X = 0) = 1 - p$

The cumulative distribution function is as follows:

$$F_p(x) = \begin{cases} 0, x < 0 \\ 1 - p, 0 \le x < 1, x \in R. \\ 1, x \ge 1 \end{cases}$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Geometric

Generates geometrically distributed random values.

Syntax

Fortran:

```
status = virnggeometric( method, stream, n, r, p )
```

C:

```
status = viRngGeometric( method, stream, n, r, p );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific value is as follows: VSL_METHOD_IGEOMETRIC_ICDF Inverse cumulative distribution function method.
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
p	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	Success probability *p* of a trial

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(OUT) **C:** int*	Vector of *n* geometrically distributed random values

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates geometrically distributed random numbers with probability *p* of a single trial success, where $p \in R$; $0 < p < 1$.

A geometrically distributed variate represents the number of independent Bernoulli trials preceding the first success. The probability of a single Bernoulli trial success is *p*.

The probability distribution is given by:

$P(X = k) = p \cdot (1 - p)^k$, $k \in \{0,1,2, \ldots\}$.

The cumulative distribution function is as follows:

$$F_p(x) = \begin{cases} 0, & x < 0 \\ 1 - (1 - p)^{\lfloor x+1 \rfloor}, & 0 \geq x \end{cases} \qquad x \in R.$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Binomial

Generates binomially distributed random numbers.

Syntax

Fortran:

```
status = virngbinomial( method, stream, n, r, ntrial, p )
```

C:

```
status = viRngBinomial( method, stream, n, r, ntrial, p );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific value is as follows: VSL_METHOD_IBINOMIAL_BTPE See brief description of the BTPE method in Table 10-1 .
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
ntrials	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of independent trials m
p	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	Success probability *p* of a single trial

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(OUT) **C:** int*	Vector of *n* binomially distributed random values

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates binomially distributed random numbers with number of independent Bernoulli trials m, and with probability p of a single trial success, where $p \in R;\ 0 \le p \le 1,\ m \in N$.

A binomially distributed variate represents the number of successes in m independent Bernoulli trials with probability of a single trial success p.

The probability distribution is given by:

$$P(X = k) = C_m^k p^k (1 - p)^{m-k}, k \in \{0, 1, \ldots, m\}.$$

The cumulative distribution function is as follows:

$$F_{m,p}(x) = \begin{cases} 0, & x < 0 \\ \sum_{k=0}^{\lfloor x \rfloor} C_m^k p^k (1 - p)^{m-k}, & 0 \le x < m, x \in R \\ 1, & x \ge m \end{cases}$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Hypergeometric

Generates hypergeometrically distributed random values.

Syntax

Fortran:

```
status = virnghypergeometric( method, stream, n, r, l, s, m )
```

C:

```
status = viRngHypergeometric( method, stream, n, r, l, s, m );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific value is as follows: VSL_METHOD_IHYPERGEOMETRIC_H2PE See brief description of the H2PE method in Table 10-1
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
l	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Lot size l
s	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Size of sampling without replacement s

Name	Type	Description
m	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(IN)` **C:** `const int`	Number of marked elements `m`

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, INTENT(OUT)` **C:** `int*`	Vector of *n* hypergeometrically distributed random values

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates hypergeometrically distributed random values with lot size l, size of sampling s, and number of marked elements in the lot m, where l, m, $s \in N \cup \{0\}$; $l \geq \max(s, m)$.

Consider a lot of l elements comprising m "marked" and $l-m$ "unmarked" elements. A trial sampling without replacement of exactly s elements from this lot helps to define the hypergeometric distribution, which is the probability that the group of s elements contains exactly k marked elements.

The probability distribution is given by:)

$$P(X = k) = \frac{C_m^k C_{l-m}^{s-k}}{C_l^s}$$

, $k \in$ {max(0, $s + m - l$), ..., min(s, m)}

The cumulative distribution function is as follows:

$$F_{l,s,m}(x) = \begin{cases} 0, & x < \max(0, s + m - l) \\ \sum_{k=\max(0,s+m-l)}^{\lfloor x \rfloor} \frac{C_m^k C_{l-m}^{s-k}}{C_l^s}, & \max(0, s + m - l) \leq x \leq \min(s, m) \\ 1, & x > \min(s, m) \end{cases}$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Poisson

Generates Poisson distributed random values.

Syntax

Fortran:

```
status = virngpoisson( method, stream, n, r, lambda )
```

C:

```
status = viRngPoisson( method, stream, n, r, lambda );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific values are as follows: VSL_METHOD_IPOISSON_PTPE VSL_METHOD_IPOISSON_POISNORM See brief description of the PTPE and POISNORM methods in Table 10-1 .
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated

Name	Type	Description
lambda	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	Distribution parameter λ.

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(OUT) **C:** int*	Vector of *n* Poisson distributed random values

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The function generates Poisson distributed random numbers with distribution parameter λ, where $\lambda \in R;\ \lambda > 0$.

The probability distribution is given by:

$$P(X = k) = \frac{\lambda^k e^{-\lambda}}{k!},$$

$k \in \{0, 1, 2, \ldots\}$.

The cumulative distribution function is as follows:

$$F_\lambda(x) = \begin{cases} \sum_{k=0}^{\lfloor x \rfloor} \frac{\lambda^k e^{-\lambda}}{k!}, & x \geq 0 \\ 0, & x < 0 \end{cases}, x \in R$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.

VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

PoissonV

Generates Poisson distributed random values with varying mean.

Syntax

Fortran:

```
status = virngpoissonv( method, stream, n, r, lambda )
```

C:

```
status = viRngPoissonV( method, stream, n, r, lambda );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific value is as follows: VSL_METHOD_IPOISSONV_POISNORM See brief description of the POISNORM method in Table 10-1
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** Descriptor of the stream state structure. **C:** Pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
lambda	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double*	Array of *n* distribution parameters λ_i.

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(OUT) **C:** int*	Vector of *n* Poisson distributed random values

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates *n* Poisson distributed random numbers $x_i (i = 1, ..., n)$ with distribution parameter λ_i, where $\lambda_i \in R$; $\lambda_i > 0$.

The probability distribution is given by:

$$P(X_i = k) = \frac{\lambda_i^k \exp(-\lambda_i)}{k!}, k \in \{0, 1, 2, ...\}.$$

The cumulative distribution function is as follows:

$$F_{\lambda_i}(x) = \begin{cases} \sum_{k=0}^{\lfloor x \rfloor} \frac{\lambda_i^k e^{-\lambda_i}}{k!}, & x \geq 0 \\ 0, & x < 0 \end{cases}, x \in R$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

NegBinomial

Generates random numbers with negative binomial distribution.

Syntax

Fortran:

```
status = virngnegbinomial( method, stream, n, r, a, p )
```

C:

```
status = viRngNegbinomial( method, stream, n, r, a, p );
```

Input Parameters

Name	Type	Description
method	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Generation method. The specific value is: VSL_METHOD_INEGBINOMIAL_NBAR See brief description of the NBAR method in Table 10-1
stream	**FORTRAN 77:** INTEGER*4 stream(2) **Fortran 90:** TYPE (VSL_STREAM_STATE), INTENT(IN) **C:** VSLStreamStatePtr	**FORTRAN:** descriptor of the stream state structure. **C:** pointer to the stream state structure
n	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(IN) **C:** const int	Number of random values to be generated
a	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	The first distribution parameter *a*
p	**FORTRAN 77:** DOUBLE PRECISION **Fortran 90:** DOUBLE PRECISION, INTENT(IN) **C:** const double	The second distribution parameter p

Output Parameters

Name	Type	Description
r	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, INTENT(OUT) **C:** int*	Vector of *n* random values with negative binomial distribution.

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function generates random numbers with negative binomial distribution and distribution parameters *a* and *p*, where *p*, $a \in R$; $0 < p < 1$; $a > 0$.

If the first distribution parameter $a \in N$, this distribution is the same as Pascal distribution. If $a \in N$, the distribution can be interpreted as the expected time of *a*-th success in a sequence of Bernoulli trials, when the probability of success is *p*.

The probability distribution is given by:

$$P(X = k) = C_{a+k-1}^{k} p^{a}(1-p)^{k}, k \in \{0, 1, 2, \ldots\}.$$

The cumulative distribution function is as follows:

$$F_{a,p}(x) = \begin{cases} \sum_{k=0}^{\lfloor x \rfloor} C_{a+k-1}^{k} p^{a}(1-p)^{k}, & x \geq 0 \\ 0, & x < 0 \end{cases}, x \in R$$

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_NULL_PTR	*stream* is a NULL pointer.
VSL_ERROR_BAD_STREAM	*stream* is not a valid random stream.
VSL_ERROR_BAD_UPDATE	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or > nmax.
VSL_ERROR_NO_NUMBERS	Callback function for an abstract BRNG returns 0 as the number of updated entries in a buffer.
VSL_ERROR_SKIPAHEAD_UNSUPPORTED	Period of the generator has been exceeded.

Advanced Service Routines

This section describes service routines for registering a user-designed basic generator (RegisterBrng) and for obtaining properties of the previously registered basic generators (GetBrngProperties). See VSL Notes ("Basic Generators" section of VSL Structure chapter) for substantiation of the need for several basic generators including user-defined BRNGs.

Data types

The Advanced Service routines refer to a structure defining the properties of the basic generator. This structure is described in Fortran 90 as follows:

```
TYPE VSL_BRNG_PROPERTIES
    INTEGER streamstatesize
    INTEGER nseeds
    INTEGER includeszero
    INTEGER wordsize
    INTEGER nbits
    INTEGER nitstream
    INTEGER sbrng
    INTEGER dbrng
    INTEGER ibrng
END TYPE VSL_BRNG_PROPERTIES
```

The C version is as follows:

```
typedef struct _VSLBRngProperties {
       int StreamStateSize;
       int NSeeds;
       int IncludesZero;
       int WordSize;
       int NBits;
       InitStreamPtr InitStream;
       sBRngPtr sBRng;
       dBRngPtr dBRng;
       iBRngPtr iBRng;
} VSLBRngProperties;
```

The following table provides brief descriptions of the fields engaged in the above structure:

Table 10-13 Field Descriptions

Field	Short Description
FORTRAN: `streamstatesize` **C:** `StreamStateSize`	The size, in bytes, of the stream state structure for a given basic generator.
FORTRAN: `nseeds` **C:** `NSeeds`	The number of 32-bit initial conditions (seeds) necessary to initialize the stream state structure for a given basic generator.
FORTRAN: `includeszero` **C:** `IncludesZero`	Flag value indicating whether the generator can produce a random 0.
FORTRAN: `wordsize` **C:** `WordSize`	Machine word size, in bytes, used in integer-value computations. Possible values: 4, 8, and 16 for 32, 64, and 128-bit generators, respectively.
FORTRAN: `nbits` **C:** `NBits`	The number of bits required to represent a random value in integer arithmetic. Note that, for instance, 48-bit random values are stored to 64-bit (8 byte) memory locations. In this case, `wordsize`/`WordSize` is equal to `8` (number of bytes used to store the random value), while `nbits`/`NBits` contains the actual number of bits occupied by the value (in this example, `48`).
FORTRAN: `initstream` **C:** `InitStream`	Contains the pointer to the initialization routine of a given basic generator.
FORTRAN: `sbrng` **C:** `sBRng`	Contains the pointer to the basic generator of single precision real numbers uniformly distributed over the interval (*a, b*) (`real` in FORTRAN and `float` in C).
FORTRAN: `dbrng` **C:** `dBRng`	Contains the pointer to the basic generator of double precision real numbers uniformly distributed over the interval (*a, b*) (`double PRECISION` in FORTRAN and `double` in C).
FORTRAN: `ibrng` **C:** `iBRng`	Contains the pointer to the basic generator of integer numbers with uniform bit distribution[1] (`INTEGER` in FORTRAN and `unsigned int` in C).

[1]A specific generator that permits operations over single bits and bit groups of random numbers.

RegisterBrng

Registers user-defined basic generator.

Syntax

Fortran:

```
brng = vslregisterbrng( properties )
```

C:

```
brng = vslRegisterBrng( &properties );
```

Input Parameters

Name	Type	Description
properties	**FORTRAN:** TYPE(VSL_BRNG_PROPERTIES), INTENT(IN) **C:** const VSLBRngProperties*	Pointer to the structure containing properties of the basic generator to be registered

NOTE. FORTRAN 77 support is unavailable for this function.

Output Parameters

Name	Type	Description
brng	**FORTRAN:** INTEGER, INTENT(OUT) **C:** int	Number (index) of the registered basic generator; used for identification. Negative values indicate the registration error.

Description

This function is declared in mkl_vsl.fi for Fortran 90 interface and in mkl_vsl_functions.h for C interface.

An example of a registration procedure can be found in the respective directory of VSL examples.

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_BRNG_TABLE_FULL	Registration cannot be completed due to lack of free entries in the table of registered BRNGs.
VSL_ERROR_BAD_STREAM_STATE_SIZE	Bad value in StreamStateSize field.
VSL_ERROR_BAD_WORD_SIZE	Bad value in WordSize field.
VSL_ERROR_BAD_NSEEDS	Bad value in NSeeds field.
VSL_ERROR_BAD_NBITS	Bad value in NBits field.
VSL_ERROR_NULL_PTR	At least one of the fields iBrng, dBrng, sBrng or InitStream is a NULL pointer.

GetBrngProperties

Returns structure with properties of a given basic generator.

Syntax

Fortran:

```
status = vslgetbrngproperties( brng, properties )
```

C:

```
status = vslGetBrngProperties( brng, &properties );
```

Input Parameters

Name	Type	Description
brng	**FORTRAN:** INTEGER, INTENT(IN) **C:** const int	Number (index) of the registered basic generator; used for identification. See specific values in Table 10-2 . Negative values indicate the registration error.

NOTE. FORTRAN 77 support is unavailable for this function.

Output Parameters

Name	Type	Description
properties	**FORTRAN:** TYPE(VSL_BRNG_PROPERTIES), INTENT(OUT) **C:** VSLBRngProperties*	Pointer to the structure containing properties of the generator with number *brng*

Description

This function is declared in mkl_vsl.fi for Fortran 90 interface and in mkl_vsl_functions.h for C interface.

The function returns a structure with properties of a given basic generator.

Return Values

VSL_ERROR_OK, VSL_STATUS_OK	Indicates no error, execution is successful.
VSL_ERROR_INVALID_BRNG_INDEX	BRNG index is invalid.

Formats for User-Designed Generators

To register a user-designed basic generator using RegisterBrng function, you need to pass the pointer iBrng to the integer-value implementation of the generator; the pointers sBrng and dBrng to the generator implementations for single and double precision values, respectively; and pass the pointer InitStream to the

stream initialization routine. See below recommendations on defining such functions with input and output arguments. An example of the registration procedure for a user-designed generator can be found in the respective directory of VSL examples.

The respective pointers are defined as follows:

```
typedef int(*InitStreamPtr)( int method, VSLStreamStatePtr stream, int n, const unsigned int params[] );
typedef int(*sBRngPtr)( VSLStreamStatePtr stream, int n, float r[], float a, float b );
typedef int(*dBRngPtr)( VSLStreamStatePtr stream, int n, double r[], double a, double b );
typedef int(*iBRngPtr)( VSLStreamStatePtr stream, int n, unsigned int r[] );
```

InitStream

C:

```
int MyBrngInitStream( int method, VSLStreamStatePtr stream, int n, const unsigned int params[] )
{
      /* Initialize the stream */
      ...
} /* MyBrngInitStream */
```

Description

The initialization routine of a user-designed generator must initialize *stream* according to the specified initialization *method*, initial conditions *params* and the argument *n*. The value of *method* determines the initialization method to be used.

- If *method* is equal to 1, the initialization is by the standard generation method, which must be supported by all basic generators. In this case the function assumes that the *stream* structure was not previously initialized. The value of *n* is used as the actual number of 32-bit values passed as initial conditions through *params*. Note, that the situation when the actual number of initial conditions passed to the function is not sufficient to initialize the generator is not an error. Whenever it occurs, the basic generator must initialize the missing conditions using default settings.
- If *method* is equal to 2, the generation is by the leapfrog method, where *n* specifies the number of computational nodes (independent streams). Here the function assumes that the *stream* was previously initialized by the standard generation method. In this case *params* contains only one element, which identifies the computational node. If the generator does not support the leapfrog method, the function must return the error code VSL_ERROR_LEAPFROG_UNSUPPORTED.
- If *method* is equal to 3, the generation is by the block-splitting method. Same as above, the *stream* is assumed to be previously initialized by the standard generation method; *params* is not used, *n* identifies the number of skipped elements. If the generator does not support the block-splitting method, the function must return the error code VSL_ERROR_SKIPAHEAD_UNSUPPORTED.

For a more detailed description of the leapfrog and the block-splitting methods, refer to the description of LeapfrogStream and SkipAheadStream, respectively.

Stream state structure is individual for every generator. However, each structure has a number of fields that are the same for all the generators:

C:

```
typedef struct
{
    unsigned int Reserved1[2];
    unsigned int Reserved2[2];
    [fields specific for the given generator]
} MyStreamState;
```

The fields *Reserved1* and *Reserved2* are reserved for private needs only, and must not be modified by the user. When including specific fields into the structure, follow the rules below:

- The fields must fully describe the current state of the generator. For example, the state of a linear congruential generator can be identified by only one initial condition;
- If the generator can use both the leapfrog and the block-splitting methods, additional fields should be introduced to identify the independent streams. For example, in *LCG*(*a*, *c*, *m*), apart from the initial conditions, two more fields should be specified: the value of the multiplier a^k and the value of the increment $(a^k-1)c/(a-1)$.

For a more detailed discussion, refer to [Knuth81], and [Gentle98]. An example of the registration procedure can be found in the respective directory of VSL examples.

iBRng

C:

```
int iMyBrng( VSLStreamStatePtr stream, int n, unsigned int r[] )
{
    int i; /* Loop variable */
    /* Generating integer random numbers */
    /* Pay attention to word size needed to
    store only random number */
    for( i = 0; i < n; i++)
    {
        r[i] = ...;
    }
    /* Update stream state */
    ...
    return errcode;
} /* iMyBrng */
```

NOTE. When using 64 and 128-bit generators, consider digit capacity to store the numbers to the random vector *r* correctly. For example, storing one 64-bit value requires two elements of *r*, the first to store the lower 32 bits and the second to store the higher 32 bits. Similarly, use 4 elements of *r* to store a 128-bit value.

sBRng

C:

```
int sMyBrng( VSLStreamStatePtr stream, int n, float r[], float a, float b )
{
    int   i;    /* Loop variable */
    /* Generating float (a,b) random numbers */
    for ( i = 0; i < n; i++ )
    {
        r[i] = ...;
    }
    /* Update stream state */
    ...
    return errcode;
} /* sMyBrng */
```

dBRng

C:

```
int dMyBrng( VSLStreamStatePtr stream, int n, double r[], double a, double b )
{
    int i;   /* Loop variable */
    /* Generating double (a,b) random numbers */
    for ( i = 0; i < n; i++ )
    {
        r[i] = ...;
    }
    /* Update stream state */
    ...
    return errcode;
} /* dMyBrng */
```

Convolution and Correlation

Overview

VSL provides a set of routines intended to perform linear convolution and correlation transformations for single and double precision real and complex data.

For correct definition of implemented operations, see Mathematical Notation and Definitions section.

The current implementation provides:

- Fourier algorithms for one-dimensional single and double precision real and complex data
- Fourier algorithms for multi-dimensional single and double precision real and complex data
- Direct algorithms for one-dimensional single and double precision real and complex data
- Direct algorithms for multi-dimensional single and double precision real and complex data

One-dimensional algorithms cover the following functions from the IBM* ESSL library:

`SCONF, SCORF`

`SCOND, SCORD`

`SDCON, SDCOR`

`DDCON, DDCOR`

`SDDCON, SDDCOR.`

Special wrappers are designed to simulate these ESSL functions. The wrappers are provided as sample sources for FORTRAN and C. To reuse them, use the following directories:

`${MKL}/examples/vslc/essl/vsl_wrappers`

`${MKL}/examples/vslf/essl/vsl_wrappers`

Additionally, you can browse the examples demonstrating the calculation of the ESSL functions through the wrappers. You can find the examples in the following directories:

`${MKL}/examples/vslc/essl`

`${MKL}/examples/vslf/essl`

Convolution and correlation API provides interfaces for FORTRAN 77, Fortran 90 and C/89 languages. You may use the C/89 interface also with later versions of C or C++, or Fortran 90 interface with programs written in Fortran 95.

For users of the C/C++ and FORTRAN languages, the `mkl_vsl.h`, `mkl_vsl.fi`, and `mkl_vsl.f77` headers are provided. All header files are found under the directory:

`${MKL}/include`

See more details about the FORTRAN header in Random Number Generators section of this chapter.

Convolution and correlation API is implemented through task objects, or tasks. Task object is a data structure, or descriptor, which holds parameters that determine the specific convolution or correlation operation. Such parameters may be precision, type, and number of dimensions of user data, an identifier of the computation algorithm to be used, shapes of data arrays, and so on.

All Intel MKL convolution and correlation routines process task objects in one way or another: either create a new task descriptor, change the parameter settings, compute mathematical results of the convolution or correlation using the stored parameters, or perform other operations. Accordingly, all routines are split into the following groups:

Task Constructors - routines that create a new task object descriptor and set up most common parameters.

Task Editors - routines that can set or modify some parameter settings in the existing task descriptor.

Task Execution Routines - compute results of the convolution or correlation operation over the actual input data, using the operation parameters held in the task descriptor.

Task Copy - routines used to make several copies of the task descriptor.

Task Destructors - routines that delete task objects and free the memory.

When the task is executed or copied for the first time, a special process runs which is called task commitment. During this process, consistency of task parameters is checked and the required work data are prepared. If the parameters are consistent, the task is tagged as committed successfully. The task remains committed until you edit its parameters. Hence, the task can be executed multiple times after a single commitment process. Since the task commitment process may include costly intermediate calculations such as preparation of Fourier transform of input data, launching the process only once can help speed up overall performance.

Naming Conventions

The names of FORTRAN routines in the convolution and correlation API are written in lowercase, while the names of FORTRAN types and constants are written in uppercase. The names are not case-sensitive.

In C, the names of routines, types, and constants are case-sensitive and can be lowercase and uppercase.

The names of routines have the following structure:

`vsl[`*`datatype`*`]{Conv|Corr}<base name>` for C-interface

`vsl[`*`datatype`*`]{conv|corr}<base name>` for FORTRAN-interface

where `vsl` is a prefix indicating that the routine belongs to Vector Statistical Library of Intel® MKL.

The field `[`*`datatype`*`]` is optional. If present, the symbol specifies the type of the input and output data and can be `s` (for single precision real type), `d` (for double precision real type), `c` (for single precision complex type), or `z` (for double precision complex type).

The prefix `Conv` or `Corr` specifies whether the routine refers to convolution or correlation task, respectively.

The `<base name>` field specifies a particular functionality that the routine is designed for, for example, `NewTask`, `DeleteTask`.

NOTE. In this document, routines are often referred to by their base name when this does not lead to ambiguity. In the routine reference, the full name is always used in prototypes and code examples.

Data Types

All convolution or correlation routines use the following types for specifying data objects:

Type	Data Object
FORTRAN 77: `INTEGER*4 task(2)` **Fortran 90:** `TYPE(VSL_CONV_TASK)` **C:** `VSLConvTaskPtr`	Pointer to a task descriptor for convolution
FORTRAN 77: `INTEGER*4 task(2)` **Fortran 90:** `TYPE(VSL_CORR_TASK)` **C:** `VSLCorrTaskPtr`	Pointer to a task descriptor for correlation
FORTRAN 77: `REAL*4` **Fortran 90:** `REAL(KIND=4)` **C:** `float`	Input/output user real data in single precision
FORTRAN 77: `REAL*8` **Fortran 90:** `REAL(KIND=8)` **C:** `double`	Input/output user real data in double precision
FORTRAN 77: `COMLEX*8` **Fortran 90:** `COMPLEX(KIND=4)` **C:** `MKL_Complex8`	Input/output user complex data in single precision
FORTRAN 77: `COMPLEX*16` **Fortran 90:** `COMPLEX(KIND=8)` **C:** `MKL_Complex16`	Input/output user complex data in double precision
FORTRAN 77: `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	All other data

Generic integer type (without specifying the byte size) is used for all integer data.

NOTE. The actual size of the generic integer type is platform-dependent. The appropriate byte size for integers must be chosen at the stage of compiling your software.

Parameters

Basic parameters held by the task descriptor are assigned values when the task object is created, copied, or modified by task editors. Parameters of the correlation or convolution task are initially set up by task constructors when the task object is created. Parameter changes or additional settings are made by task editors. More parameters which define location of the data being convolved need to be specified when the task execution routine is invoked.

According to how the parameters are passed or assigned values, all of them can be categorized as either explicit (directly passed as routine parameters when a task object is created or executed) or optional (assigned some default or implicit values during task construction).

The following table lists all applicable parameters used in the Intel MKL convolution and correlation API.

Table 10-14 Convolution and Correlation Task Parameters

Name	Category	Type	Default Value Label	Description
job	explicit	integer	Implied by the constructor name	Specifies whether the task relates to convolution or correlation
type	explicit	integer	Implied by the constructor name	Specifies the type (real or complex) of the input/output data. Set to real in the current version.
precision	explicit	integer	Implied by the constructor name	Specifies precision (single or double) of the input/output data to be provided in arrays *x*,*y*,*z*.
kind	optional	integer	"linear"	Specifies whether the task relates to computing linear or circular convolution/correlation. Note that currently only the linear type is supported.
mode	explicit	integer	None	Specifies whether the convolution/correlation computation should be done via Fourier transforms, or by a direct method, or by automatically choosing between the two. See SetMode for the list of named constants for this parameter.
method	optional	integer	"auto"	Hints at a particular computation method if several methods are available for the given *mode*. Setting this parameter to "auto" means that software will choose the best available method.
internal_precision	optional	integer	Set equal to the value of *precision*	Specifies precision of internal calculations. Can enforce double precision calculations even when input/output data are single precision. See SetInternalPrecision for the list of named constants for this parameter.

Name	Category	Type	Default Value Label	Description
dims	explicit	integer	None	Specifies the rank (number of dimensions) of the user data provided in arrays *x*,*y*,*z*. Can be in the range from 1 to 7.
x,*y*	explicit	real arrays	None	Specify input data arrays. See Data Allocation for more information.
z	explicit	real array	None	Specifies output data array. See Data Allocation for more information.
xshape, *yshape*, *zshape*	explicit	integer arrays	None	Define shapes of the arrays *x*, *y*, *z*. See Data Allocation for more information.
xstride, *ystride*, *zstride*	explicit	integer arrays	None	Define strides within arrays *x*, *y*, *z*, that is specify the physical location of the input and output data in these arrays. See Data Allocation for more information.
start	optional	integer array	Undefined	Defines the first element of the mathematical result that will be stored to output array *z*. See `SetStart` and Data Allocation for more information.
decimation	optional	integer array	Undefined	Defines how to thin out the mathematical result that will be stored to output array *z*. See `SetDecimation` and Data Allocation for more information.

Users of the C or C++ language may pass the NULL pointer instead of either or all of the parameters *xstride*, *ystride*, or *zstride* for multi-dimensional calculations. In this case, the software assumes the dense data allocation for the arrays *x*, *y*, or *z* due to the FORTRAN-style "by columns" representation of multi-dimensional arrays.

Task Status and Error Reporting

Task status is an integer value which is zero if no error has been detected while processing the task, or a specific non-zero error code otherwise. Negative status values are used for errors, and positive values are reserved for warnings.

An error can be caused by bad parameter values, system fault like memory allocation failure, or can be an internal error self-detected by the software.

Each task descriptor contains the current status of the task. When creating a task object, constructor assigns the VSL_STATUS_OK status to the task. When processing the task afterwards, other routines such as editors of executors can change the task status if an error occurs and write a corresponding error code into the task status field.

Note that at the stage of creating a task or editing its parameters, the set of parameters may be inconsistent. The parameter consistency check is only performed during the task commitment operation which is implicitly invoked before task execution or task copying. If an error is detected at this stage, task execution or task copying is terminated and the task descriptor saves the corresponding error code. Once an error occurs, any further attempts to process that task descriptor will be terminated and the task will keep the same error code.

Normally, every convolution or correlation function (except `DeleteTask`) returns the status assigned to the task while performing the function operation.

The status codes are given symbolic names defined in the respective header files. For C/C++, these names are defined as macros via `#define` statements, and for FORTRAN as integer constants via PARAMETER operators.

If there is no error, the VSL_STATUS_OK is returned, which is defined as zero:

```
C/C++:          #define VSL_STATUS_OK 0
F90/F95:        INTEGER(KIND=4) VSL_STATUS_OK
                PARAMETER(VSL_STATUS_OK = 0)
F77:            INTEGER*4 VSL_STATUS_OK
                PARAMETER(VSL_STATUS_OK = 0)
```

In case of an error, a non-zero error code is returned, which signals about the origin of the failure. The following status codes for the convolution/correlation error codes are pre-defined in the header files for both C/C++ and FORTRAN languages.

Table 10-15 Convolution/Correlation Status Codes and Messages

Status Code	Message
VSL_CC_ERROR_NOT_IMPLEMENTED,	Requested functionality is not implemented.
VSL_CC_ERROR_ALLOCATION_FAILURE	Memory allocation failure.
VSL_CC_ERROR_BAD_DESCRIPTOR	Task descriptor is corrupted.
VSL_CC_ERROR_SERVICE_FAILURE	A service function has failed.
VSL_CC_ERROR_EDIT_FAILURE	Failure while editing the task.
VSL_CC_ERROR_EDIT_PROHIBITED	You cannot edit this parameter.
VSL_CC_ERROR_COMMIT_FAILURE	Task commitment has failed.
VSL_CC_ERROR_COPY_FAILURE	Failure while copying the task.
VSL_CC_ERROR_DELETE_FAILURE	Failure while deleting the task.
VSL_CC_ERROR_BAD_ARGUMENT	Bad argument or task parameter.
VSL_CC_ERROR_JOB	Bad parameter: *job*.
SL_CC_ERROR_KIND	Bad parameter: *kind*.
VSL_CC_ERROR_MODE	Bad parameter: *mode*.
VSL_CC_ERROR_METHOD	Bad parameter: *method*.

Status Code	Message
VSL_CC_ERROR_TYPE	Bad parameter: *type*.
VSL_CC_ERROR_EXTERNAL_PRECISION	Bad parameter: *external_precision*.
VSL_CC_ERROR_INTERNAL_PRECISION	Bad parameter: *internal_precision*.
VSL_CC_ERROR_PRECISION	Incompatible external/internal precisions.
VSL_CC_ERROR_DIMS	Bad parameter: *dims*.
VSL_CC_ERROR_XSHAPE	Bad parameter: *xshape*.
VSL_CC_ERROR_YSHAPE	Bad parameter: *yshape*.
	Callback function for an abstract BRNG returns an invalid number of updated entries in a buffer, that is, < 0 or >nmax.
VSL_CC_ERROR_ZSHAPE	Bad parameter: *zshape*.
VSL_CC_ERROR_XSTRIDE	Bad parameter: *xstride*.
VSL_CC_ERROR_YSTRIDE	Bad parameter: *ystride*.
VSL_CC_ERROR_ZSTRIDE	Bad parameter: *zstride*.
VSL_CC_ERROR_X	Bad parameter: *x*.
VSL_CC_ERROR_Y	Bad parameter: *y*.
VSL_CC_ERROR_Z	Bad parameter: *z*.
VSL_CC_ERROR_START	Bad parameter: *start*.
VSL_CC_ERROR_DECIMATION	Bad parameter: *decimation*.
VSL_CC_ERROR_OTHER	Some other error.

Task Constructors

Task constructors are routines intended for creating a new task descriptor and setting up basic parameters. This means that no additional parameter adjustment is typically required and other routines can use the task object.

Intel® MKL implementation of the convolution and correlation API provides two different forms of constructors: a general form and an X-form. X-form constructors work in the same way as the general form but also assign particular data to the first operand vector used in convolution or correlation operation (stored in array *x*).

Using X-form constructors is recommended when you need to compute multiple convolutions or correlations with the same data vector held in array *x* against different vectors held in array *y*. This helps improve performance by eliminating unnecessary overhead in repeated computation of intermediate data required for the operation.

For each constructor routine there is also an associated one-dimensional version which exploits the algorithmic and computational benefits provided by the simplicity of the data structures for one-dimensional case.

NOTE. If constructor fails to create a task descriptor, it returns NULL task pointer.

The Table 10-16 lists available task constructors:

Table 10-16 Task Constructors

Routine	Description
NewTask	Creates a new convolution or correlation task descriptor for a multidimensional case.
NewTask1D	Creates a new convolution or correlation task descriptor for a one-dimensional case.
NewTaskX	Creates a new convolution or correlation task descriptor as an X-form for a multidimensional case.
NewTaskX1D	Creates a new convolution or correlation task descriptor as an X-form for a one-dimensional case.

NewTask

Creates a new convolution or correlation task descriptor for multidimensional case.

Syntax

Fortran:

```
status = vslsconvnewtask(task, mode, dims, xshape, yshape, zshape)
status = vsldconvnewtask(task, mode, dims, xshape, yshape, zshape)
status = vslcconvnewtask(task, mode, dims, xshape, yshape, zshape)
status = vslzconvnewtask(task, mode, dims, xshape, yshape, zshape)
status = vslscorrnewtask(task, mode, dims, xshape, yshape, zshape)
status = vsldcorrnewtask(task, mode, dims, xshape, yshape, zshape)
status = vslccorrnewtask(task, mode, dims, xshape, yshape, zshape)
status = vslzcorrnewtask(task, mode, dims, xshape, yshape, zshape)
```

C:

```
status = vslsConvNewTask(task, mode, dims, xshape, yshape, zshape);
status = vsldConvNewTask(task, mode, dims, xshape, yshape, zshape);
status = vslcConvNewTask(task, mode, dims, xshape, yshape, zshape);
status = vslzConvNewTask(task, mode, dims, xshape, yshape, zshape);
status = vslsCorrNewTask(task, mode, dims, xshape, yshape, zshape);
status = vsldCorrNewTask(task, mode, dims, xshape, yshape, zshape);
```

```
status = vslcCorrNewTask(task, mode, dims, xshape, yshape, zshape);
status = vslzCorrNewTask(task, mode, dims, xshape, yshape, zshape);
```

Input Parameters

Name	Type	Description
mode	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER **C:** const int	Specifies whether convolution/correlation calculation must be performed by using a direct algorithm or through Fourier transform of the input data. See Table 10-18 for a list of possible values.
dims	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER **C:** const int	Rank of user data. Specifies number of dimensions for the input and output arrays *x*, *y*, and *z* used during the execution stage. Must be in the range from 1 to 7. The value is explicitly assigned by the constructor.
xshape	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, DIMENSION(*) **C:** const int[]	Defines the shape of the input data for the source array *x*. See Data Allocation for more information.
yshape	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, DIMENSION(*) **C:** const int[]	Defines the shape of the input data for the source array *y*. See Data Allocation for more information.
zshape	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER, DIMENSION(*) **C:** const int[]	Defines the shape of the output data to be stored in array *z*. See Data Allocation for more information.

Output Parameters

Name	Type	Description
task	**FORTRAN 77:** INTEGER*4 task(2) for vslsconvnewtask, vsldconvnewtask, vslcconvnewtask, vslzconvnewtask INTEGER*4 task(2) for vslscorrnewtask, vsldcorrnewtask, vslccorrnewtask, vslzcorrnewtask	Pointer to the task descriptor if created successfully or NULL pointer otherwise.

Name	Type	Description

	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslsconvnewtask`, `vsldconvnewtask`, `vslcconvnewtask`, `vslzconvnewtask`
	`TYPE(VSL_CORR_TASK)` for `vslscorrnewtask`, `vsldcorrnewtask`, `vslccorrnewtask`, `vslzcorrnewtask`
	C: `VSLConvTaskPtr*` for `vslsConvNewTask`, `vsldConvNewTask`, `vslcConvNewTask`, `vslzConvNewTask`
	`VSLCorrTaskPtr*` for `vslsCorrNewTask`, `vsldCorrNewTask`, `vslcConvNewTask`, `vslzConvNewTask`	

status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is created successfully or set to non-zero error code otherwise.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each `NewTask` constructor creates a new convolution or correlation task descriptor with the user specified values for explicit parameters. The optional parameters are set to their default values (see Table 10-14).

The parameters *xshape*, *yshape*, and *zshape* define the shapes of the input and output data provided by the arrays *x*, *y*, and *z*, respectively. Each shape parameter is an array of integers with its length equal to the value of *dims*. You explicitly assign the shape parameters when calling the constructor. If the value of the parameter *dims* is 1, then *xshape*, *yshape*, *zshape* are equal to the number of elements read from the arrays *x* and *y* or stored to the array *z*. Note that values of shape parameters may differ from physical shapes of arrays *x*, *y*, and *z* if non-trivial strides are assigned.

If the constructor fails to create a task descriptor, it returns a `NULL` task pointer.

NewTask1D

Creates a new convolution or correlation task descriptor for one-dimensional case.

Syntax

Fortran:

```
status = vslsconvnewtask1d(task, mode, xshape, yshape, zshape)
status = vsldconvnewtask1d(task, mode, xshape, yshape, zshape)
status = vslcconvnewtask1d(task, mode, xshape, yshape, zshape)
status = vslzconvnewtask1d(task, mode, xshape, yshape, zshape)
status = vslscorrnewtask1d(task, mode, xshape, yshape, zshape)
status = vsldcorrnewtask1d(task, mode, xshape, yshape, zshape)
status = vslccorrnewtask1d(task, mode, xshape, yshape, zshape)
status = vslzcorrnewtask1d(task, mode, xshape, yshape, zshape)
```

C:

```
status = vslsConvNewTask1D(task, mode, xshape, yshape, zshape);
status = vsldConvNewTask1D(task, mode, xshape, yshape, zshape);
status = vslcConvNewTask1D(task, mode, xshape, yshape, zshape);
status = vslzConvNewTask1D(task, mode, xshape, yshape, zshape);
status = vslsCorrNewTask1D(task, mode, xshape, yshape, zshape);
status = vsldCorrNewTask1D(task, mode, xshape, yshape, zshape);
status = vslcCorrNewTask1D(task, mode, xshape, yshape, zshape);
status = vslzCorrNewTask1D(task, mode, xshape, yshape, zshape);
```

Input Parameters

Name	Type	Description
mode	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Specifies whether convolution/correlation calculation must be performed by using a direct algorithm or through Fourier transform of the input data. See Table 10-18 for a list of possible values.
xshape	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Defines the length of the input data sequence for the source array *x*. See Data Allocation for more information.

Name	Type	Description
yshape	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Defines the length of the input data sequence for the source array *y*. See Data Allocation for more information.
zshape	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Defines the length of the output data sequence to be stored in array *z*. See Data Allocation for more information.

Output Parameters

Name	Type	Description

task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslsconvnewtask1d`, `vsldconvnewtask1d`, `vslcconvnewtask1d`, `vslzconvnewtask1d`
	`INTEGER*4 task(2)` for `vslscorrnewtask1d`, `vsldcorrnewtask1d`, `vslccorrnewtask1d`, `vslzcorrnewtask1d`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslsconvnewtask1d`, `vsldconvnewtask1d`, `vslcconvnewtask1d`, `vslzconvnewtask1d`
	`TYPE(VSL_CORR_TASK)` for `vslscorrnewtask1d`, `vsldcorrnewtask1d`, `vslccorrnewtask1d`, `vslzcorrnewtask1d`
	C: `VSLConvTaskPtr*` for `vslsConvNewTask1D`, `vsldConvNewTask1D`, `vslcConvNewTask1D`, `vslzConvNewTask1D`
		Pointer to the task descriptor if created successfully or `NULL` pointer otherwise.

Name	Type	Description
	`VSLCorrTaskPtr*` for `vslsCorrNewTask1D`, `vsldCorrNewTask1D`, `vslcCorrNewTask1D`, `vslzCorrNewTask1D`	
status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is created successfully or set to non-zero error code otherwise.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each `NewTask1D` constructor creates a new convolution or correlation task descriptor with the user specified values for explicit parameters. The optional parameters are set to their default values (see Table 10-14). Unlike `NewTask`, these routines represent a special one-dimensional version of the constructor which assumes that the value of the parameter *dims* is 1. The parameters *xshape*, *yshape*, and *zshape* are equal to the number of elements read from the arrays *x* and *y* or stored to the array *z*. You explicitly assign the shape parameters when calling the constructor.

NewTaskX

Creates a new convolution or correlation task descriptor for multidimensional case and assigns source data to the first operand vector.

Syntax

Fortran:

```
status = vslsconvnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
status = vsldconvnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
status = vslcconvnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
status = vslzconvnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
status = vslscorrnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
status = vsldcorrnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
status = vslccorrnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
status = vslzcorrnewtaskx(task, mode, dims, xshape, yshape, zshape, x, xstride)
```

C:

```
status = vslsConvNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
status = vsldConvNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
```

```
status = vslcConvNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
status = vslzConvNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
status = vslsCorrNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
status = vsldCorrNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
status = vslcCorrNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
status = vslzCorrNewTaskX(task, mode, dims, xshape, yshape, zshape, x, xstride);
```

Input Parameters

Name	Type	Description
mode	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER **C:** const int	Specifies whether convolution/correlation calculation must be performed by using a direct algorithm or through Fourier transform of the input data. See Table 10-18 for a list of possible values.
dims	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER **C:** const int	Rank of user data. Specifies number of dimensions for the input and output arrays *x*, *y*, and *z* used during the execution stage. Must be in the range from 1 to 7. The value is explicitly assigned by the constructor.

x	**FORTRAN 77:** REAL*4 for real data in single precision flavors, REAL*8 for real data in double precision flavors, COMPLEX*8 for complex data in single precision flavors,	Pointer to the array containing input data for the first operand vector.See Data Allocation for more information.

Name	Type	Description
	`COMPLEX*16` for complex data in double precision flavors **Fortran 90:** `REAL(KIND=4), DIMENSION (*)` for real data in single precision flavors, `REAL(KIND=8), DIMENSION (*)` for real data in double precision flavors, `COMPLEX(KIND=4), DIMENSION (*)` for complex data in single precision flavors, `COMPLEX(KIND=8), DIMENSION (*)` for complex data in double precision flavors **C:** `const float[]` for real data in single precision flavors, `const double[]` for real data in double precision flavors, `const MKL_Complex8[]` for complex data in single precision flavors, `const MKL_Complex16[]` for complex data in double precision flavors	
xstride	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, DIMENSION(*)` **C:** `const int[]`	Strides for input data in the array *x*.

Output Parameters

Name	Type	Description
task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslsconvnewtaskx`, `vsldconvnewtaskx`, `vslcconvnewtaskx`, `vslzconvnewtaskx`	Pointer to the task descriptor if created successfully or `NULL` pointer otherwise.

Name	Type	Description

	`INTEGER*4 task(2)` for `vslscorrnewtaskx`, `vsldcorrnewtaskx`, `vslccorrnewtaskx`, `vslzcorrnewtaskx`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslsconvnewtaskx`, `vsldconvnewtaskx`, `vslcconvnewtaskx`, `vslzconvnewtaskx`
	`TYPE(VSL_CORR_TASK)` for `vslscorrnewtaskx`, `vsldcorrnewtaskx`, `vslccorrnewtaskx`, `vslzcorrnewtaskx`
	C: `VSLConvTaskPtr*` for `vslsConvNewTaskX`, `vsldConvNewTaskX`, `vslcConvNewTaskX`, `vslzConvNewTaskX`
	`VSLCorrTaskPtr*` for `vslsCorrNewTaskX`, `vsldCorrNewTaskX`, `vslcCorrNewTaskX`, `vslzCorrNewTaskX`	

status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is created successfully or set to non-zero error code otherwise.

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each `NewTaskX` constructor creates a new convolution or correlation task descriptor with the user specified values for explicit parameters. The optional parameters are set to their default values (see Table 10-14).

Unlike `NewTask`, these routines represent the so called X-form version of the constructor, which means that in addition to creating the task descriptor they assign particular data to the first operand vector in array *x* used in convolution or correlation operation. The task descriptor created by the `NewTaskX` constructor keeps the pointer to the array *x* all the time, that is, until the task object is deleted by one of the destructor routines (see `DeleteTask`).

Using this form of constructors is recommended when you need to compute multiple convolutions or correlations with the same data vector in array *x* against different vectors in array *y*. This helps improve performance by eliminating unnecessary overhead in repeated computation of intermediate data required for the operation.

The parameters *xshape*, *yshape*, and *zshape* define the shapes of the input and output data provided by the arrays *x*, *y*, and *z*, respectively. Each shape parameter is an array of integers with its length equal to the value of *dims*. You explicitly assign the shape parameters when calling the constructor. If the value of the parameter *dims* is 1, then *xshape*, *yshape*, and *zshape* are equal to the number of elements read from the arrays *x* and *y* or stored to the array *z*. Note that values of shape parameters may differ from physical shapes of arrays *x*, *y*, and *z* if non-trivial strides are assigned.

The stride parameter *xstride* specifies the physical location of the input data in the array *x*. In a one-dimensional case, stride is an interval between locations of consecutive elements of the array. For example, if the value of the parameter *xstride* is s, then only every s^{th} element of the array *x* will be used to form the input sequence. The stride value must be positive or negative but not zero.

NewTaskX1D

Creates a new convolution or correlation task descriptor for one-dimensional case and assigns source data to the first operand vector.

Syntax

Fortran:

```
status = vslsconvnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
status = vsldconvnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
status = vslcconvnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
status = vslzconvnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
status = vslscorrnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
status = vsldcorrnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
status = vslccorrnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
status = vslzcorrnewtaskx1d(task, mode, xshape, yshape, zshape, x, xstride)
```

C:

```
status = vslsConvNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
status = vsldConvNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
status = vslcConvNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
status = vslzConvNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
status = vslsCorrNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
status = vsldCorrNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
status = vslcCorrNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
status = vslzCorrNewTaskX1D(task, mode, xshape, yshape, zshape, x, xstride);
```

Input Parameters

Name	Type	Description
mode	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Specifies whether convolution/correlation calculation must be performed by using a direct algorithm or through Fourier transform of the input data. See Table 10-18 for a list of possible values.
xshape	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Defines the length of the input data sequence for the source array *x*. See Data Allocation for more information.
yshape	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Defines the length of the input data sequence for the source array *y*. See Data Allocation for more information.
zshape	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Defines the length of the output data sequence to be stored in array *z*. See Data Allocation for more information.
x	**FORTRAN 77:** `REAL*4` for real data in single precision flavors, `REAL*8` for real data in double precision flavors, `COMPLEX*8` for complex data in single precision flavors, `COMPLEX*16` for complex data in double precision flavors **Fortran 90:** `REAL(KIND=4), DIMENSION (*)` for real data in single precision flavors, `REAL(KIND=8), DIMENSION (*)` for real data in double precision flavors, `COMPLEX(KIND=4), DIMENSION (*)` for complex data in single precision flavors, `COMPLEX(KIND=8), DIMENSION (*)` for complex data in double precision flavors **C:** `const float[]` for real data in single precision flavors,	Pointer to the array containing input data for the first operand vector. See Data Allocation for more information.

Name	Type	Description
	`const double[]` for real data in double precision flavors, `const MKL_Complex8[]` for complex data in single precision flavors, `const MKL_Complex16[]` for complex data in double precision flavors	
xstride	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Stride for input data sequence in the array*x*.

Output Parameters

Name	Type	Description

task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslsconvnewtaskx1d`, `vsldconvnewtaskx1d`, `vslcconvnewtaskx1d`, `vslzconvnewtaskx1d`
	`INTEGER*4 task(2)` for `vslscorrnewtaskx1d`, `vsldcorrnewtaskx1d`, `vslccorrnewtaskx1d`, `vslzcorrnewtaskx1d`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslsconvnewtaskx1d`, `vsldconvnewtaskx1d`, `vslcconvnewtaskx1d`, `vslzconvnewtaskx1d`
	`TYPE(VSL_CORR_TASK)` for `vslscorrnewtaskx1d`, `vsldcorrnewtaskx1d`, `vslccorrnewtaskx1d`, `vslzcorrnewtaskx1d`
		Pointer to the task descriptor if created successfully or `NULL` pointer otherwise.

Name	Type	Description
	C: `VSLConvTaskPtr*` for `vslsConvNewTaskX1D`, `vsldConvNewTaskX1D`, `vslcConvNewTaskX1D`, `vslzConvNewTaskX1D` `VSLCorrTaskPtr*` for `vslsCorrNewTaskX1D`, `vsldCorrNewTaskX1D`, `vslcCorrNewTaskX1D`, `vslzCorrNewTaskX1D`	
status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is created successfully or set to non-zero error code otherwise.

Description

This function is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each `NewTaskX1D` constructor creates a new convolution or correlation task descriptor with the user specified values for explicit parameters. The optional parameters are set to their default values (see Table 10-14).

These routines represent a special one-dimensional version of the so called X-form of the constructor. This assumes that the value of the parameter *dims* is 1 and that in addition to creating the task descriptor, constructor routines assign particular data to the first operand vector in array *x* used in convolution or correlation operation. The task descriptor created by the `NewTaskX1D` constructor keeps the pointer to the array *x* all the time, that is, until the task object is deleted by one of the destructor routines (see `DeleteTask`).

Using this form of constructors is recommended when you need to compute multiple convolutions or correlations with the same data vector in array *x* against different vectors in array *y*. This helps improve performance by eliminating unnecessary overhead in repeated computation of intermediate data required for the operation.

The parameters *xshape*, *yshape*, and *zshape* are equal to the number of elements read from the arrays *x* and *y* or stored to the array *z*. You explicitly assign the shape parameters when calling the constructor.

The stride parameters *xstride* specifies the physical location of the input data in the array *x* and is an interval between locations of consecutive elements of the array. For example, if the value of the parameter *xstride* is s, then only every s^{th} element of the array *x* will be used to form the input sequence. The stride value must be positive or negative but not zero.

Task Editors

Task editors in convolution and correlation API of the Intel MKL are routines intended for setting up or changing the following task parameters (see Table 10-14):

- *mode*
- *internal_precision*

- *start*
- *decimation*.

For setting up or changing each of the above parameters, a separate routine exists.

NOTE. Fields of the task descriptor structure are accessible only through the set of task editor routines provided with the software.

After applying any of the editor routines to change the task descriptor settings, the task loses its commitment status and will go through the full commitment process again during the next execution or copy operation. This is motivated by the fact that the currently stored work data computed during the last commitment process may become invalid with respect to new parameter settings. For more information about task commitment, see Overview.

Table 10-17 lists available task editors.

Table 10-17 Task Editors

Routine	Description
SetMode	Changes the value of the parameter *mode* for the operation of convolution or correlation.
SetInternalPrecision	Changes the value of the parameter *internal_precision* for the operation of convolution or correlation.
SetStart	Sets the value of the parameter *start* for the operation of convolution or correlation.
SetDecimation	Sets the value of the parameter *decimation* for the operation of convolution or correlation.

NOTE. You can use the NULL task pointer in calls to editor routines. In this case, the routine will be terminated and no system crash will occur.

SetMode

Changes the value of the parameter mode in the convolution or correlation task descriptor.

Syntax

Fortran:

```
status = vslconvsetmode(task, newmode)
status = vslcorrsetmode(task, newmode)
```

C:

```
status = vslConvSetMode(task, newmode);
```

```
status = vslCorrSetMode(task, newmode);
```

Input Parameters

Name	Type	Description
task	**FORTRAN 77:** INTEGER*4 task(2) for vslconvsetmode INTEGER*4 task(2) for vslcorrsetmode **Fortran 90:** TYPE(VSL_CONV_TASK) for vslconvsetmode TYPE(VSL_CORR_TASK) for vslcorrsetmode **C:** VSLConvTaskPtr for vslConvSetMode VSLCorrTaskPtr for vslCorrSetMode	Pointer to the task descriptor.
newmode	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER **C:** const int	New value of the parameter mode.

Output Parameters

Name	Type	Description
status	**FORTRAN 77:** INTEGER **Fortran 90:** INTEGER **C:** int	Current status of the task.

Description

This function is declared in mkl_vsl.f77 for FORTRAN 77 interface, in mkl_vsl.fi for Fortran 90 interface, and in mkl_vsl_functions.h for C interface.

The function routine changes the value of the parameter mode for the operation of convolution or correlation. This parameter defines whether the computation should be done via Fourier transforms of the input/output data or using a direct algorithm. Initial value for mode is assigned by a task constructor.

Predefined values for the mode parameter are as follows:

Table 10-18 Values of *mode* parameter

Value	Purpose
VSL_CONV_MODE_FFT	Compute convolution by using fast Fourier transform.
VSL_CORR_MODE_FFT	Compute correlation by using fast Fourier transform.
VSL_CONV_MODE_DIRECT	Compute convolution directly.
VSL_CORR_MODE_DIRECT	Compute correlation directly.
VSL_CONV_MODE_AUTO	Automatically choose direct or Fourier mode for convolution.
VSL_CORR_MODE_AUTO	Automatically choose direct or Fourier mode for correlation.

SetInternalPrecision

Changes the value of the parameter `internal_precision` in the convolution or correlation task descriptor.

Syntax

Fortran:

```
status = vslconvsetinternalprecision(task, precision)
status = vslcorrsetinternalprecision(task, precision)
```

C:

```
status = vslConvSetInternalPrecision(task, precision);
status = vslCorrSetInternalPrecision(task, precision);
```

Input Parameters

Name	Type	Description
task	**FORTRAN 77:** INTEGER*4 task(2) for vslconvsetinternalprecision INTEGER*4 task(2) for vslcorrsetinternalprecision **Fortran 90:** TYPE(VSL_CONV_TASK) for vslconvsetinternalprecision TYPE(VSL_CORR_TASK) for vslcorrsetinternalprecision **C:** VSLConvTaskPtr for vslConvSetInternalPrecision	Pointer to the task descriptor.

Name	Type	Description
	`VSLCorrTaskPtr` for `vslCorrSetInternalPrecision`	
precision	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	New value of the parameter *internal_precision*.

Output Parameters

Name	Type	Description
status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Current status of the task.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The routine changes the value of the parameter *internal_precision* for the operation of convolution or correlation. This parameter defines whether the internal computations of the convolution or correlation result should be done in single or double precision. Initial value for *internal_precision* is assigned by a task constructor and set to either "single" or "double" according to the particular flavor of the constructor used.

Changing the *internal_precision* can be useful if the default setting of this parameter was "single" but you want to calculate the result with double precision even if input and output data are represented in single precision.

Predefined values for the *internal_precision* input parameter are as follows:

Table 10-19 Values of *internal_precision* Parameter

Value	Purpose
`VSL_CONV_PRECISION_SINGLE`	Compute convolution with single precision.
`VSL_CORR_PRECISION_SINGLE`	Compute correlation with single precision.
`VSL_CONV_PRECISION_DOUBLE`	Compute convolution with double precision.
`VSL_CORR_PRECISION_DOUBLE`	Compute correlation with double precision.

SetStart

Changes the value of the parameter `start` in the convolution or correlation task descriptor.

Syntax

Fortran:

```
status = vslconvsetstart(task, start)
status = vslcorrsetstart(task, start)
```

C:

```
status = vslConvSetStart(task, start);
status = vslCorrSetStart(task, start);
```

Input Parameters

Name	Type	Description

task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslconvsetstart`
	`INTEGER*4 task(2)` for `vslcorrsetstart`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslconvsetstart`
	`TYPE(VSL_CORR_TASK)` for `vslcorrsetstart`
	C: `VSLConvTaskPtr` for `vslConvSetStart`
	`VSLCorrTaskPtr` for `vslCorrSetStart`
		Pointer to the task descriptor.

start	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, DIMENSION (*)` **C:** `const int[]`	New value of the parameter *start*.

Output Parameters

Name	Type	Description
status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER`	Current status of the task.

Name	Type	Description
	C: `int`	

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The routine sets the value of the parameter *`start`* for the operation of convolution or correlation. In a one-dimensional case, this parameter points to the first element in the mathematical result that should be stored in the output array. In a multidimensional case, *`start`* is an array of indices and its length is equal to the number of dimensions specified by the parameter *`dims`*. For more information about the definition and effect of this parameter, see Data Allocation.

During the initial task descriptor construction, the default value for *`start`* is undefined and this parameter is not used. Therefore the only way to set and use the *`start`* parameter is via assigning it some value by one of the `SetStart` routines.

SetDecimation

Changes the value of the parameter `decimation` in the convolution or correlation task descriptor.

Syntax

Fortran:

```
status = vslconvsetdecimation(task, decimation)
status = vslcorrsetdecimation(task, decimation)
```

C:

```
status = vslConvSetDecimation(task, decimation);
status = vslCorrSetDecimation(task, decimation);
```

Input Parameters

Name	Type	Description

task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslconvsetdecimation`
	`INTEGER*4 task(2)` for `vslcorrsetdecimation`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslconvsetdecimation`
	`TYPE(VSL_CORR_TASK)` for `vslcorrsetdecimation`
		Pointer to the task descriptor.

Name	Type	Description
	C: `VSLConvTaskPtr` for `vslConvSetDecimation` `VSLCorrTaskPtr` for `vslCorrSetDecimation`	
decimation	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, DIMENSION (*)` **C:** `const int[]`	New value of the parameter *decimation*.

Output Parameters

Name	Type	Description
status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Current status of the task.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

The routine sets the value of the parameter *decimation* for the operation of convolution or correlation. This parameter determines how to thin out the mathematical result of convolution or correlation before writing it into the output data array. For example, in a one-dimensional case, if *decimation* = $d > 1$, only every d-th element of the mathematical result is written to the output array z. In a multidimensional case, *decimation* is an array of indices and its length is equal to the number of dimensions specified by the parameter *dims*. For more information about the definition and effect of this parameter, see Data Allocation.

During the initial task descriptor construction, the default value for *decimation* is undefined and this parameter is not used. Therefore the only way to set and use the *decimation* parameter is via assigning it some value by one of the `SetDecimation` routines.

Task Execution Routines

Task execution routines compute convolution or correlation results based on parameters held by the task descriptor and on the supplied user data for input vectors.

Once created and adjusted, the task can be executed multiple times by applying to different input/output data of the same type, precision, and shape.

Intel MKL implementation of the convolution and correlation API provides two different forms of execution routines: a general form and an X-form. General form executors use the task descriptor created by the general form constructor and expect to get two source data arrays x and y on input. Alternatively, X-form executors use the task descriptor created by the X-form constructor and expect to get only one source data array y on input because the first array x has been already specified on the construction stage.

When the task is executed for the first time, the execution routine includes task commitment operation, which involves two basic steps: parameters consistency check and preparation of auxiliary data (for example, this might be the calculation of Fourier transform for input data).

For each execution routine there is also an associated one-dimensional version which exploits the algorithmic and computational benefits provided by the simplicity of the data structures for one-dimensional case.

NOTE. You can use the NULL task pointer in calls to execution routines. In this case, the routine will be terminated and no system crash will occur.

If the task is executed successfully, the execution routine returns zero status code. If an error is detected, the execution routine returns an error code which signals that a specific error has occurred. In particular, an error status code is returned in the following cases:

- if the task pointer is NULL,
- if the task descriptor is corrupted,
- if calculation has failed for some other reason.

NOTE. Intel® MKL does not control floating-point errors, like overflow or gradual underflow, or operations with NaNs, etc.

If an error occurs, the task descriptor stores the error code.

The table below lists all task execution routines.

Table 10-20 Task Execution Routines

Routine	Description
Exec	Computes convolution or correlation for a multidimensional case.
Exec1D	Computes convolution or correlation for a one-dimensional case.
ExecX	Computes convolution or correlation as X-form for a multidimensional case.
ExecX1D	Computes convolution or correlation as X-form for a one-dimensional case.

Exec

Computes convolution or correlation for multidimensional case.

Syntax

Fortran:

```
status = vslsconvexec(task, x, xstride, y, ystride, z, zstride)
status = vsldconvexec(task, x, xstride, y, ystride, z, zstride)
status = vslcconvexec(task, x, xstride, y, ystride, z, zstride)
```

```
status = vslzconvexec(task, x, xstride, y, ystride, z, zstride)
status = vslscorrexec(task, x, xstride, y, ystride, z, zstride)
status = vsldcorrexec(task, x, xstride, y, ystride, z, zstride)
status = vslccorrexec(task, x, xstride, y, ystride, z, zstride)
status = vslzcorrexec(task, x, xstride, y, ystride, z, zstride)
```

C:

```
status = vslsConvExec(task, x, xstride, y, ystride, z, zstride);
status = vsldConvExec(task, x, xstride, y, ystride, z, zstride);
status = vslcConvExec(task, x, xstride, y, ystride, z, zstride);
status = vslzConvExec(task, x, xstride, y, ystride, z, zstride);
status = vslsCorrExec(task, x, xstride, y, ystride, z, zstride);
status = vsldCorrExec(task, x, xstride, y, ystride, z, zstride);
status = vslcCorrExec(task, x, xstride, y, ystride, z, zstride);
status = vslzCorrExec(task, x, xstride, y, ystride, z, zstride);
```

Input Parameters

Name	Type	Description

task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslsconvexec`, `vsldconvexec`, `vslcconvexec`, `vslzconvexec`
	`INTEGER*4 task(2)` for `vslscorrexec`, `vsldcorrexec`, `vslccorrexec`, `vslzcorrexec`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslsconvexec`, `vsldconvexec`, `vslcconvexec`, `vslzconvexec`
	`TYPE(VSL_CORR_TASK)` for `vslscorrexec`, `vsldcorrexec`, `vslccorrexec`, `vslzcorrexec`
	C: `VSLConvTaskPtr` for `vslsConvExec`, `vsldConvExec`, `vslcConvExec`, `vslzConvExec`
	`VSLCorrTaskPtr` for `vslsCorrExec`, `vsldCorrExec`, `vslcCorrExec`, `vslzCorrExec`
		Pointer to the task descriptor

Name	Type	Description

x, *y*	**FORTRAN 77:** `REAL*4` for `vslsconvexec` and `vslscorrexec`,
	`REAL*8` for `vsldconvexec` and `vsldcorrexec`,
	`COMPLEX*8` for`vslcconvexec` and `vslccorrexec`,
	`COMPLEX*16` for`vslzconvexec` and `vslzcorrexec`
	Fortran 90: `REAL(KIND=4), DIMENSION(*)` for `vslsconvexec` and `vslscorrexec`,
	`REAL(KIND=8), DIMENSION(*)` for `vsldconvexec` and `vsldcorrexec`,
	`COMPLEX(KIND=4), DIMENSION (*)` for`vslcconvexec` and `vslccorrexec`,
	`COMPLEX(KIND=8), DIMENSION (*)` for `vslzconvexec` and `vslzcorrexec`
	C: `const float[]` for `vslsConvExec` and `vslsCorrExec`,
	`const double[]` for `vsldConvExec` and `vsldCorrExec`,
	`const MKL_Complex8[]` for `vslcConvExec` and `vslcCorrExec`,
	`const MKL_Complex16[]` for `vslzConvExec` and `vslzCorrExec`
		Pointers to arrays containing input data. See Data Allocation for more information.

xstride, *ystride*, *zstride*	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, DIMENSION (*)` **C:** `const int[]`	Strides for input and output data. For more information, see stride parameters.

Output Parameters

Name	Type	Description

z	**FORTRAN 77:** `REAL*4` for `vslsconvexec` and `vslscorrexec`,
	`REAL*8` for `vsldconvexec` and `vsldcorrexec`,
	`COMPLEX*8` for`vslcconvexec` and `vslccorrexec`,
	`COMPLEX*16` for`vslzconvexec` and `vslzcorrexec`
	Fortran 90: `REAL(KIND=4), DIMENSION(*)` for `vslsconvexec` and `vslscorrexec`,
	`REAL(KIND=8), DIMENSION(*)` for `vsldconvexec` and `vsldcorrexec`,
	`COMPLEX(KIND=4), DIMENSION(*)` for`vslcconvexec` and `vslccorrexec`,
	`COMPLEX(KIND=8), DIMENSION(*)` for `vslzconvexec` and `vslzcorrexec`
	C: `const float[]` for `vslsConvExec` and `vslsCorrExec`,
	`const double[]` for `vsldConvExec` and `vsldCorrExec`,
	`const MKL_Complex8[]` for `vslcConvExec` and `vslcCorrExec`,
	`const MKL_Complex16[]` for `vslzConvExec` and `vslzCorrExec`
		Pointer to the array that stores output data. See Data Allocation for more information.

status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is executed successfully or set to non-zero error code otherwise.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each of the Exec routines computes convolution or correlation of the data provided by the arrays *x* and *y* and then stores the results in the array *z*. Parameters of the operation are read from the task descriptor created previously by a corresponding `NewTask` constructor and pointed to by *task*. If *task* is `NULL`, no operation is done.

The stride parameters *xstride*, *ystride*, and *zstride* specify the physical location of the input and output data in the arrays *x*, *y*, and *z*, respectively. In a one-dimensional case, stride is an interval between locations of consecutive elements of the array. For example, if the value of the parameter *zstride* is `s`, then only every s^{th} element of the array *z* will be used to store the output data. The stride value must be positive or negative but not zero.

Exec1D

Computes convolution or correlation for one-dimensional case.

Syntax

Fortran:

```
status = vslsconvexec1d(task, x, xstride, y, ystride, z, zstride)
status = vsldconvexec1d(task, x, xstride, y, ystride, z, zstride)
status = vslcconvexec1d(task, x, xstride, y, ystride, z, zstride)
status = vslzconvexec1d(task, x, xstride, y, ystride, z, zstride)
status = vslscorrexec1d(task, x, xstride, y, ystride, z, zstride)
status = vsldcorrexec1d(task, x, xstride, y, ystride, z, zstride)
status = vslccorrexec1d(task, x, xstride, y, ystride, z, zstride)
status = vslzcorrexec1d(task, x, xstride, y, ystride, z, zstride)
```

C:

```
status = vslsConvExec1D(task, x, xstride, y, ystride, z, zstride);
status = vsldConvExec1D(task, x, xstride, y, ystride, z, zstride);
status = vslcConvExec1D(task, x, xstride, y, ystride, z, zstride);
status = vslzConvExec1D(task, x, xstride, y, ystride, z, zstride);
status = vslsCorrExec1D(task, x, xstride, y, ystride, z, zstride);
status = vsldCorrExec1D(task, x, xstride, y, ystride, z, zstride);
status = vslcCorrExec1D(task, x, xstride, y, ystride, z, zstride);
status = vslzCorrExec1D(task, x, xstride, y, ystride, z, zstride);
```

Input Parameters

Name	Type	Description

status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is executed successfully or set to non-zero error code otherwise.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each of the `Exec1D` routines computes convolution or correlation of the data provided by the arrays *x* and *y* and then stores the results in the array *z*. These routines represent a special one-dimensional version of the operation, assuming that the value of the parameter *dims* is 1. Using this version of execution routines can help speed up performance in case of one-dimensional data.

Parameters of the operation are read from the task descriptor created previously by a corresponding NewTask1D constructor and pointed to by *task*. If *task* is NULL, no operation is done.

ExecX

Computes convolution or correlation for multidimensional case with the fixed first operand vector.

Syntax

Fortran:

```
status = vslsconvexecx(task, y, ystride, z, zstride)
status = vsldconvexecx(task, y, ystride, z, zstride)
status = vslcconvexecx(task, y, ystride, z, zstride)
status = vslzconvexecx(task, y, ystride, z, zstride)
status = vslscorrexecx(task, y, ystride, z, zstride)
status = vsldcorrexecx(task, y, ystride, z, zstride)
status = vslccorrexecx(task, y, ystride, z, zstride)
status = vslzcorrexecx(task, y, ystride, z, zstride)
```

C:

```
status = vslsConvExecX(task, y, ystride, z, zstride);
status = vsldConvExecX(task, y, ystride, z, zstride);
status = vslcConvExecX(task, y, ystride, z, zstride);
status = vslzConvExecX(task, y, ystride, z, zstride);
status = vslsCorrExecX(task, y, ystride, z, zstride);
status = vslcCorrExecX(task, y, ystride, z, zstride);
status = vslzCorrExecX(task, y, ystride, z, zstride);
status = vsldCorrExecX(task, y, ystride, z, zstride);
```

Input Parameters

Name	Type	Description
task	**FORTRAN 77:** INTEGER*4 task(2) for vslsconvexecx, vsldconvexecx, vslcconvexecx, vslzconvexecx INTEGER*4 task(2) for vslscorrexecx, vsldcorrexecx, vslccorrexecx, vslzcorrexecx	Pointer to the task descriptor.

Name	Type	Description

	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslsconvexecx`, `vsldconvexecx`, `vslcconvexecx`, `vslzconvexecx`
	`TYPE(VSL_CORR_TASK)` for `vslscorrexecx`, `vsldcorrexecx`, `vslccorrexecx`, `vslzcorrexecx`
	C: `VSLConvTaskPtr` for `vslsConvExecX`, `vsldConvExecX`, `vslcConvExecX`, `vslzConvExecX`
	`VSLCorrTaskPtr` for `vslsCorrExecX`, `vsldCorrExecX`, `vslcCorrExecX`, `vslzCorrExecX`	

x ,*y*	**FORTRAN 77:** `REAL*4` for `vslsconvexecx` and `vslscorrexecx`,
	`REAL*8` for `vsldconvexecx` and `vsldcorrexecx`,
	`COMPLEX*8` for`vslcconvexecx` and `vslccorrexecx`,
	`COMPLEX*16` for`vslzconvexecx` and `vslzcorrexecx`
	Fortran 90: `REAL(KIND=4), DIMENSION(*)` for `vslsconvexecx` and `vslscorrexecx`,
	`REAL(KIND=8), DIMENSION(*)` for `vsldconvexecx` and `vsldcorrexecx`,
	`COMPLEX(KIND=4), DIMENSION (*)` for`vslcconvexecx` and `vslccorrexecx`,
	`COMPLEX(KIND=8), DIMENSION (*)` for `vslzconvexecx` and `vslzcorrexecx`
	C: `const float[]` for `vslsConvExecX` and `vslsCorrExecX`,
		Pointer to array containing input data (for the second operand vector). See Data Allocation for more information.

Name	Type	Description
	`const double[]` for `vsldConvExecX` and `vsldCorrExecX`, `const MKL_Complex8[]` for `vslcConvExecX` and `vslcCorrExecX`, `const MKL_Complex16[]` for `vslzConvExecX` and `vslzCorrExecX`	
ystride ,*zstride*	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER, DIMENSION (*)` **C:** `const int[]`	Strides for input and output data. For more information, see stride parameters.

Output Parameters

Name	Type	Description

z	**FORTRAN 77:** `REAL*4` for `vslsconvexecx` and `vslscorrexecx`,
	`REAL*8` for `vsldconvexecx` and `vsldcorrexecx`,
	`COMPLEX*8` for`vslcconvexecx` and `vslccorrexecx`,
	`COMPLEX*16` for`vslzconvexecx` and `vslzcorrexecx`
	Fortran 90: `REAL(KIND=4), DIMENSION(*)` for `vslsconvexecx` and `vslscorrexecx`,
	`REAL(KIND=8), DIMENSION(*)` for `vsldconvexecx` and `vsldcorrexecx`,
	`COMPLEX(KIND=4), DIMENSION (*)` for`vslcconvexecx` and `vslccorrexecx`,
	`COMPLEX(KIND=8), DIMENSION (*)` for `vslzconvexecx` and `vslzcorrexecx`
		Pointer to the array that stores output data. See Data Allocation for more information.

Name	Type	Description
	C: `const float[]` for `vslsConvExecX` and `vslsCorrExecX`, `const double[]` for `vsldConvExecX` and `vsldCorrExecX`, `const MKL_Complex8[]` for `vslcConvExecX` and `vslcCorrExecX`, `const MKL_Complex16[]` for `vslzConvExecX` and `vslzCorrExecX`	
status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is executed successfully or set to non-zero error code otherwise.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each of the `ExecX` routines computes convolution or correlation of the data provided by the arrays *x* and *y* and then stores the results in the array *z*. These routines represent a special version of the operation, which assumes that the first operand vector was set on the task construction stage and the task object keeps the pointer to the array *x*.

Parameters of the operation are read from the task descriptor created previously by a corresponding `NewTaskX` constructor and pointed to by *task*. If *task* is `NULL`, no operation is done.

Using this form of execution routines is recommended when you need to compute multiple convolutions or correlations with the same data vector in array *x* against different vectors in array *y*. This helps improve performance by eliminating unnecessary overhead in repeated computation of intermediate data required for the operation.

ExecX1D

Computes convolution or correlation for one-dimensional case with the fixed first operand vector.

Syntax

Fortran:

```
status = vslsconvexecx1d(task, y, ystride, z, zstride)
status = vsldconvexecx1d(task, y, ystride, z, zstride)
```

```
status = vslcconvexecx1d(task, y, ystride, z, zstride)
status = vslzconvexecx1d(task, y, ystride, z, zstride)
status = vslscorrexecx1d(task, y, ystride, z, zstride)
status = vsldcorrexecx1d(task, y, ystride, z, zstride)
status = vslccorrexecx1d(task, y, ystride, z, zstride)
status = vslzcorrexecx1d(task, y, ystride, z, zstride)
```

C:

```
status = vslsConvExecX1D(task, y, ystride, z, zstride);
status = vsldConvExecX1D(task, y, ystride, z, zstride);
status = vslcConvExecX1D(task, y, ystride, z, zstride);
status = vslzConvExecX1D(task, y, ystride, z, zstride);
status = vslsCorrExecX1D(task, y, ystride, z, zstride);
status = vslcCorrExecX1D(task, y, ystride, z, zstride);
status = vslzCorrExecX1D(task, y, ystride, z, zstride);
status = vsldCorrExecX1D(task, y, ystride, z, zstride);
```

Input Parameters

Name	Type	Description
task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslsconvexecx1d`, `vsldconvexecx1d`, `vslcconvexecx1d`, `vslzconvexecx1d` `INTEGER*4 task(2)` for `vslscorrexecx1d`, `vsldcorrexecx1d`, `vslccorrexecx1d`, `vslzcorrexecx1d` **Fortran 90:** `TYPE(VSL_CONV_TASK)` for `vslsconvexecx1d`, `vsldconvexecx1d`, `vslcconvexecx1d`, `vslzconvexecx1d`	Pointer to the task descriptor.

Name	Type	Description
	`TYPE(VSL_CORR_TASK)` for `vslscorrexecx1d`, `vsldcorrexecx1d`, `vslccorrexecx1d`, `vslzcorrexecx1d`	
	C: `VSLConvTaskPtr` for `vslsConvExecX1D`, `vsldConvExecX1D`, `vslcConvExecX1D`, `vslzConvExecX1D`	
	`VSLCorrTaskPtr` for `vslsCorrExecX1D`, `vsldCorrExecX1D`, `vslcCorrExecX1D`, `vslzCorrExecX1D`	
x , *y*	**FORTRAN 77:** `REAL*4` for `vslsconvexecx1d` and `vslscorrexecx1d`,	Pointer to array containing input data (for the second operand vector). See Data Allocation for more information.
	`REAL*8` for `vsldconvexecx1d` and `vsldcorrexecx1d`,	
	`COMPLEX*8` for`vslcconvexecx1d` and `vslccorrexecx1d`,	
	`COMPLEX*16` for`vslzconvexecx1d` and `vslzcorrexecx1d`	
	Fortran 90: `REAL(KIND=4), DIMENSION(*)` for `vslsconvexecx1d` and `vslscorrexecx1d`,

	`COMPLEX(KIND=4), DIMENSION(*)` for`vslcconvexecx1d` and `vslccorrexecx1d`,	
	`COMPLEX(KIND=8), DIMENSION(*)` for `vslzconvexecx1d` and `vslzcorrexecx1d`	
	C: `const float[]` for `vslsConvExecX1D` and `vslsCorrExecX1D`,	

Name	Type	Description
	`const double[]` for `vsldConvExecX1D` and `vsldCorrExecX1D`, `const MKL_Complex8[]` for `vslcConvExecX1D` and `vslcCorrExecX1D`, `const MKL_Complex16[]` for `vslzConvExecX1D` and `vslzCorrExecX1D`	
ystride, *zstride*	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `const int`	Strides for input and output data. For more information, see stride parameters.

Output Parameters

Name	Type	Description

z	**FORTRAN 77:** `REAL*4` for `vslsconvexecx1d` and `vslscorrexecx1d`,
	`REAL*8` for `vsldconvexecx1d` and `vsldcorrexecx1d`,
	`COMPLEX*8` for `vslcconvexecx1d` and `vslccorrexecx1d`,
	`COMPLEX*16` for `vslzconvexecx1d` and `vslzcorrexecx1d`
	Fortran 90: `REAL(KIND=4), DIMENSION(*)` for `vslsconvexecx1d` and `vslscorrexecx1d`,
	`REAL(KIND=8), DIMENSION(*)` for `vsldconvexecx1d` and `vsldcorrexecx1d`,
	`COMPLEX(KIND=4), DIMENSION(*)` for `vslcconvexecx1d` and `vslccorrexecx1d`,
	`COMPLEX(KIND=8), DIMENSION(*)` for `vslzconvexecx1d` and `vslzcorrexecx1d`
		Pointer to the array that stores output data. See Data Allocation for more information.

Name	Type	Description
	C: `const float[]` for `vslsConvExecX1D` and `vslsCorrExecX1D`, `const double[]` for `vsldConvExecX1D` and `vsldCorrExecX1D`, `const MKL_Complex8[]` for `vslcConvExecX1D` and `vslcCorrExecX1D`, `const MKL_Complex16[]` for `vslzConvExecX1D` and `vslzCorrExecX1D`	
status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Set to `VSL_STATUS_OK` if the task is executed successfully or set to non-zero error code otherwise.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Each of the `ExecX1D` routines computes convolution or correlation of one-dimensional (assuming that *dims* =1)data provided by the arrays *x* and *y* and then stores the results in the array *z*. These routines represent a special version of the operation, which expects that the first operand vector was set on the task construction stage.

Parameters of the operation are read from the task descriptor created previously by a corresponding `NewTaskX1D` constructor and pointed to by *task*. If *task* is `NULL`, no operation is done.

Using this form of execution routines is recommended when you need to compute multiple one-dimensional convolutions or correlations with the same data vector in array *x* against different vectors in array *y*. This helps improve performance by eliminating unnecessary overhead in repeated computation of intermediate data required for the operation.

Task Destructors

Task destructors are routines designed for deleting task objects and deallocating memory.

DeleteTask

Destroys the task object and frees the memory.

Syntax

Fortran:

```
errcode = vslconvdeletetask(task)
errcode = vslcorrdeletetask(task)
```

C:

```
errcode = vslConvDeleteTask(task);
errcode = vslCorrDeleteTask(task);
```

Input Parameters

Name	Type	Description

task	**FORTRAN 77:** `INTEGER*4 task(2)` for `vslconvdeletetask`
	`INTEGER*4 task(2)` for `vslcorrdeletetask`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslconvdeletetask`
	`TYPE(VSL_CORR_TASK)` for `vslcorrdeletetask`
	C: `VSLConvTaskPtr*` for `vslConvDeleteTask`
	`VSLCorrTaskPtr*` for `vslCorrDeleteTask`
		Pointer to the task descriptor.

Output Parameters

Name	Type	Description
errcode	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Contains 0 if the task object is deleted successfully. Contains error code if an error occurred.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

Given a pointer to a task descriptor, this routine deletes the task descriptor object and frees the memory allocated for the data structure. If the task holds a work memory, the latter is also freed. The task pointer is set to NULL.

Note that if by some reason the task was not deleted successfully, the routine returns an error code. This error code has no relation to the task status code and does not change it.

NOTE. You can use the NULL task pointer in calls to destructor routines. In this case, the routine will be terminated and no system crash will occur.

Task Copy

The routines are designed for copying convolution and correlation task descriptors.

CopyTask

Copies a descriptor for convolution or correlation task.

Syntax

Fortran:

```
status = vslconvcopytask(newtask, srctask)
status = vslcorrcopytask(newtask, srctask)
```

C:

```
status = vslConvCopyTask(newtask, srctask);
status = vslCorrCopyTask(newtask, srctask);
```

Input Parameters

Name	Type	Description
srctask	**FORTRAN 77:** INTEGER*4 srctask(2) for vslconvcopytask INTEGER*4 srctask(2) for vslcorrcopytask **Fortran 90:** TYPE(VSL_CONV_TASK) for vslconvcopytask TYPE(VSL_CORR_TASK) for vslcorrcopytask **C:** const VSLConvTaskPtr for vslConvCopyTask	Pointer to the source task descriptor.

Name	Type	Description
	`const VSLCorrTaskPtr` for `vslCorrCopyTask`	

Output Parameters

Name	Type	Description

newtask	**FORTRAN 77:** `INTEGER*4 srctask(2)` for `vslconvcopytask`
	`INTEGER*4 srctask(2)` for `vslcorrcopytask`
	Fortran 90: `TYPE(VSL_CONV_TASK)` for `vslconvcopytask`
	`TYPE(VSL_CORR_TASK)` for `vslcorrcopytask`
	C: `VSLConvTaskPtr*` for `vslConvCopyTask`
	`VSLCorrTaskPtr*` for `vslCorrCopyTask`
		Pointer to the new task descriptor.

status	**FORTRAN 77:** `INTEGER` **Fortran 90:** `INTEGER` **C:** `int`	Current status of the source task.

Description

This routine is declared in `mkl_vsl.f77` for FORTRAN 77 interface, in `mkl_vsl.fi` for Fortran 90 interface, and in `mkl_vsl_functions.h` for C interface.

If a task object *srctask* already exists, you can use an appropriate `CopyTask` routine to make its copy in *newtask*. After the copy operation, both source and new task objects will become committed (see Overview for information about task commitment). If the source task was not previously committed, the commitment operation for this task is implicitly invoked before copying starts. If an error occurs during source task commitment, the task stores the error code in the status field. If an error occurs during copy operation, the routine returns a `NULL` pointer instead of a reference to a new task object.

Usage Examples

This section demonstrates how you can use the Intel MKL routines to perform some common convolution and correlation operations both for single threaded and multiple threaded calculations. The following two sample functions `scond1` and `sconf1` simulate the convolution and correlation functions `SCOND` and `SCONF` found in IBM ESSL* library. The functions assume single threaded calculations and can be used with C or C++ compilers.

Example 10-5 Function scond1 for Single Threaded Calculations

```
#include "mkl_vsl.h"
int scond1(
    float h[], int inch,
    float x[], int incx,
    float y[], int incy,
    int nh, int nx, int iy0, int ny)
{
    int status;
    VSLConvTaskPtr task;
    vslsConvNewTask1D(&task,VSL_CONV_MODE_DIRECT,nh,nx,ny);
    vslConvSetStart(task, &iy0);
    status = vslsConvExec1D(task, h,inch, x,incx, y,incy);
    vslConvDeleteTask(&task);
    return status;
}
```

Example 10-6 Function sconf1 for Single Threaded Calculations

```
#include "mkl_vsl.h"
int sconf1(
    int init,
    float h[], int inc1h,
    float x[], int inc1x, int inc2x,
    float y[], int inc1y, int inc2y,
    int nh, int nx, int m, int iy0, int ny,
    void* aux1, int naux1, void* aux2, int naux2)
{
    int status;
    /* assume that aux1!=0 and naux1 is big enough */
    VSLConvTaskPtr* task = (VSLConvTaskPtr*)aux1;
    if (init != 0)
        /* initialization: */
        status = vslsConvNewTaskX1D(task,VSL_CONV_MODE_FFT,
         nh,nx,ny, h,inc1h);
    if (init == 0) {
        /* calculations: */
```

```
        int i;
        vslConvSetStart(*task, &iy0);
        for (i=0; i<m; i++) {
         float* xi = &x[inc2x * i];
         float* yi = &y[inc2y * i];
         /* task is implicitly committed at i==0 */
         status = vslsConvExecX1D(*task, xi, inc1x, yi, inc1y);
        };
    };
    vslConvDeleteTask(task);
    return status;
}
```

Using Multiple Threads

For functions such as `sconf1` described in the previous example, parallel calculations may be more preferable instead of cycling. If `m>1`, you can use multiple threads for invoking the task execution against different data sequences. For such cases, use task copy routines to create `m` copies of the task object before the calculations stage and then run these copies with different threads. Ensure that you make all necessary parameter adjustments for the task (using Task Editors) before copying it.

The sample code for that can look like following:

```
if (init == 0) {
    int i, status, ss[M];
    VSLConvTaskPtr tasks[M];
    /* assume that M is big enough */
    . . .
    vslConvSetStart(*task, &iy0);
    . . .
    for (i=0; i<m; i++)
        /* implicit commitment at i==0 */
        vslConvCopyTask(&tasks[i],*task);
    . . .
```

Then, m threads may be started to execute different copies of the task:

```
. . .
        float* xi = &x[inc2x * i];
        float* yi = &y[inc2y * i];
        ss[i]=vslsConvExecX1D(tasks[i], xi,inc1x, yi,inc1y);
    . . .
```

And finally, after all threads have finished the calculations, overall status ought to be collected from all task objects. The following code assumes signaling the first error found, if any:

```
    . . .
    for (i=0; i<m; i++) {
        status = ss[i];
        if (status != 0) /* 0 means "OK" */
            break;
    };
    return status;
}; /* end if init==0 */
```

Execution routines modify the task internal state (fields of the task structure). Such modifications may conflict with each other if different threads work with the same task object simultaneously. This is the reason why different threads must use different copies of the task.

Mathematical Notation and Definitions

The following notation is necessary to explain the underlying mathematical definitions used in the text:

$\mathbf{R} = (-\infty, +\infty)$	The set of real numbers.
$\mathbf{Z} = \{0, \pm1, \pm2, \ldots\}$	The set of integer numbers.
$\mathbf{Z}^N = \mathbf{Z} \times \ldots \times \mathbf{Z}$	The set of N-dimensional series of integer numbers.
$p = (p_1, \ldots, p_N) \in \mathbf{Z}^N$	N-dimensional series of integers.
$u:\mathbf{Z}^N \to \mathbf{R}$	Function u with arguments from $\mathbf{Z}^N$ and values from $\mathbf{R}$.
$u(p) = u(p_1, \ldots, p_N)$	The value of the function u for the argument $(p_1, \ldots, p_N)$.
$w = u * v$	Function w is the convolution of the functions u, v.
$w = u \bullet v$	Function w is the correlation of the functions u, v.

Given series $p, q \in \mathbf{Z}^N$:

- series $r = p + q$ is defined as $r^n = p^n + q^n$ for every $n=1, \ldots, N$
- series $r = p - q$ is defined as $r^n = p^n - q^n$ for every $n=1, \ldots, N$
- series $r = \sup\{p, q\}$ is defines as $r^n = \max\{p^n, q^n\}$ for every $n=1, \ldots, N$
- series $r = \inf\{p, q\}$ is defined as $r^n = \min\{p^n, q^n\}$ for every $n=1, \ldots, N$
- inequality $p \le q$ means that $p^n \le q^n$ for every $n=1, \ldots, N$.

A function $u(p)$ is called a finite function if there exist series P^{min}, $P^{max} \in \mathbf{Z}^N$ such that:

$u(p) \neq 0$

implies

$P^{min} \leq p \leq P^{max}$.

Operations of convolution and correlation are only defined for finite functions.

Consider functions u, v and series P^{min}, $P^{max}Q^{min}$, $Q^{max} \in \mathbf{Z}^N$ such that:

$u(p) \neq 0$ implies $P^{min} \leq p \leq P^{max}$.
$v(q) \neq 0$ implies $Q^{min} \leq q \leq Q^{max}$.

Definitions of linear correlation and linear convolution for functions u and v are given below.

Linear Convolution

If function $w = u*v$ is the convolution of u and v, then:

$w(r) \neq 0$ implies $\mathbf{R}^{min} \leq r \leq \mathbf{R}^{max}$,
where $\mathbf{R}^{min} = P^{min} + Q^{min}$ and $\mathbf{R}^{max} = P^{max} + Q^{max}$.

If $\mathbf{R}^{min} \leq r \leq \mathbf{R}^{max}$, then:

$w(r) = \sum u(t) \cdot v(r-t)$ is the sum for all $t \in \mathbf{Z}^N$ such that $\mathbf{T}^{min} \leq t \leq \mathbf{T}^{max}$,
where $\mathbf{T}^{min} = \sup\{P^{min}, r - Q^{max}\}$ and $\mathbf{T}^{max} = \inf\{P^{max}, r - Q^{min}\}$.

Linear Correlation

If function $w = u \bullet v$ is the correlation of u and v, then:

$w(r) \neq 0$ implies $\mathbf{R}^{min} \leq r \leq \mathbf{R}^{max}$,
where $\mathbf{R}^{min} = Q^{min} - P^{max}$ and $\mathbf{R}^{max} = Q^{max} - P^{min}$.

If $\mathbf{R}^{min} \leq r \leq \mathbf{R}^{max}$, then:

$w(r) = \sum u(t) \cdot v(r+t)$ is the sum for all $t \in \mathbf{Z}^N$ such that $\mathbf{T}^{min} \leq t \leq \mathbf{T}^{max}$,
where $\mathbf{T}^{min} = \sup\{P^{min}, Q^{min} - r\}$ and $\mathbf{T}^{max} = \inf\{P^{max}, Q^{max} - r\}$.

Representation of the functions u, v, w as the input/output data for the Intel MKL convolution and correlation functions is described in the Data Allocation section below.

Data Allocation

This section explains the relation between:

- mathematical finite functions u, v, w introduced in the section Mathematical Notation and Definitions;
- multi-dimensional input and output data vectors representing the functions u, v, w;
- arrays u, v, w used to store the input and output data vectors in computer memory

The convolution and correlation routine parameters that determine the allocation of input and output data are the following:

- Data arrays *x*, *y*, *z*
- Shape arrays *xshape*, *yshape*, *zshape*
- Strides within arrays *xstride*, *ystride*, *zstride*
- Parameters *start*, *decimation*

Finite Functions and Data Vectors

The finite functions *u(p)*, *v(q)*, and *w(r)* introduced above are represented as multi-dimensional vectors of input and output data:

inputu($i_1,...,i_{dims}$) for $u(p_1,...,p_N)$

inputv($j_1,...,j_{dims}$) for $v(q_1,...,q_N)$

output($k_1,...,k_{dims}$) for $w(r_1,...,r_N)$.

Parameter *dims* represents the number of dimensions and is equal to N.

The parameters *xshape*, *yshape*, and *zshape* define the shapes of input/output vectors:

inputu($i_1,...,i_{dims}$) is defined if $1 \le i_n \le xshape(n)$ for every n=1,...,*dims*

inputv($j_1,...,j_{dims}$) is defined if $1 \le j_n \le yshape(n)$ for every n=1,...,*dims*

output($k_1,...,k_{dims}$) is defined if $1 \le k_n \le zshape(n)$ for every n=1,...,*dims*.

Relation between the input vectors and the functions *u* and *v* is defined by the following formulas:

inputu($i_1,...,i_{dims}$)= $u(p_1,...,p_N)$, where $p_n = P_n^{min} + (i_n-1)$ for every n

inputv($j_1,...,j_{dims}$)= $v(q_1,...,q_N)$, where $q_n=Q_n^{min} + (j_n-1)$ for every n.

Relation between the output vector and the function *w(r)* is similar (but only in the case when parameters *start* and *decimation* are not defined):

output($k_1,...,k_{dims}$)= $w(r_1,...,r_N)$, where $r_n=R_n^{min} + (k_n-1)$ for every n.

If the parameter *start* is defined, it must belong to the interval $R_n^{min} \le start(n) \le R_n^{max}$. If defined, the *start* parameter replaces R^{min} in the formula:

output($k_1,...,k_{dims}$)=$w(r_1,...,r_N)$, where r_n=start(n) + (k_n-1)

If the parameter *decimation* is defined, it changes the relation according to the following formula:

output($k_1,...,k_{dims}$)=$w(r_1,...,r_N)$, where $r_n= R_n^{min} + (k_n-1)$*decimation(n)

If both parameters *start* and *decimation* are defined, the formula is as follows:

output($k_1,...,k_{dims}$)=$w(r_1,...,r_N)$, where r_n=start(n) + (k_n-1)*decimation(n)

The convolution and correlation software checks the values of *zshape*, *start*, and *decimation* during task commitment. If r_n exceeds R_n^{max} for some k_n, n=1,...,dims, an error is raised.

Allocation of Data Vectors

Both parameter arrays *x* and *y* contain input data vectors in memory, while array *z* is intended for storing output data vector. To access the memory, the convolution and correlation software uses only pointers to these arrays and ignores the array shapes.

For parameters *x*, *y*, and *z*, you can provide one-dimensional arrays with the requirement that actual length of these arrays be sufficient to store the data vectors.

The allocation of the input and output data inside the arrays *x*, *y*, and *z* is described below assuming that the arrays are one-dimensional. Given multi-dimensional indices $i, j, k \in \mathbf{Z}^N$, one-dimensional indices $e, f, g \in \mathbf{Z}$ are defined such that:

$inputu(i_1,...,i_{dims})$ is allocated at *x(e)*

$inputv(j_1,...,j_{dims})$ is allocated at *y(f)*

$output(k_1,...,k_{dims})$ is allocated at *z(g)*.

The indices *e*, *f*, and *g* are defined as follows:

$e = 1 + \sum xstride(n)\cdot dx(n)$ (the sum is for all n=1,...,dims)

$f = 1 + \sum ystride(n)\cdot dy(n)$ (the sum is for all n=1,...,dims)

$g = 1 + \sum zstride(n)\cdot dz(n)$ (the sum is for all n=1,...,dims)

The distances dx(n), dy(n), and dz(n) depend on the signum of the stride:

$dx(n) = i_n\text{-}1$ if xstride(n)>0, or $dx(n) = i_n\text{-}xshape(n)$ if xstride(n)<0

$dy(n) = j_n\text{-}1$ if ystride(n)>0, or $dy(n) = j_n\text{-}yshape(n)$ if ystride(n)<0

$dz(n) = k_n\text{-}1$ if zstride(n)>0, or $dz(n) = k_n\text{-}zshape(n)$ if zstride(n)<0

The definitions of indices *e*, *f*, and *g* assume that indexes for arrays *x*, *y*, and *z* are started from unity:

x(e) is defined for e=1,...,length(x)

y(f) is defined for f=1,...,length(y)

z(g) is defined for g=1,...,length(z)

Below is a detailed explanation about how elements of the multi-dimensional output vector are stored in the array *z* for one-dimensional and two-dimensional cases.

One-dimensional case. If *dims*=1, then *zshape* is the number of the output values to be stored in the array *z*. The actual length of array *z* may be greater than *zshape* elements.

If zstride>1, output values are stored with the stride: output(1) is stored to z(1), output(2) is stored to z(1+zstride), and so on. Hence, the actual length of *z* must be at least 1+zstride*(zshape-1) elements or more.

If zstride<0, it still defines the stride between elements of array *z*. However, the order of the used elements is the opposite. For the *k*-th output value, output(k) is stored in z(1+|zstride|*(zshape-k)), where |zstride| is the absolute value of zstride. The actual length of the array *z* must be at least 1+|zstride|*(zshape - 1) elements.

Two-dimensional case. If *dims*=2, the output data is a two-dimensional matrix. The value `zstride(1)` defines the stride inside matrix columns, that is, the stride between the `output(`k_1`, `k_2`)` and `output(`k_1`+1, `k_2`)` for every pair of indices k_1, k_2. On the other hand, `zstride(2)` defines the stride between columns, that is, the stride between `output(`k_1`,`k_2`)` and `output(`k_1`,`k_2`+1)`.

If `zstride(2)` is greater than `zshape(1)`, this causes sparse allocation of columns. If the value of `zstride(2)` is smaller than `zshape(1)`, this may result in the transposition of the output matrix. For example, if `zshape = (2,3)`, you can define `zstride = (3,1)` to allocate output values like transposed matrix of the shape 3x2.

Whether `zstride` assumes this kind of transformations or not, you need to ensure that different elements output (`output(`k_1`, ..., `k_{dims}`)`) will be stored in different locations *z(g)*.

11 Fourier Transform Functions

This chapter describes the following implementations of the fast Fourier transform functions available in Intel® MKL:

- Fast Fourier transform (FFT) functions for single-processor or shared-memory systems (see FFT Functions below)
- Cluster FFT functions for distributed-memory architectures (available with Intel® MKL for the Linux* and Windows* operating systems only).

The general form of the discrete Fourier transform is

$$z_{k_1, k_2, \ldots, k_d} = \sigma \times \sum_{j_d=0}^{n_d-1} \ldots \sum_{j_2=0}^{n_2-1} \sum_{j_1=0}^{n_1-1} w_{j_1, j_2, \ldots, j_d} \exp\left(\delta i 2\pi \sum_{l=1}^{d} j_l k_l / n_l \right)$$

for $k_l = 0, \ldots n_l\text{-}1$ ($l = 1, \ldots, d$), where σ is an arbitrary real-valued scale factor, and the sign in the exponent is $\delta = -1$ for the forward transform and $\delta = +1$ for the backward transform. In most common situations, the domain of the forward transform, that is, the set where the input (periodic) sequence $\{w_{j_1, j_2, \ldots, j_d}\}$ belongs, can be the set of complex-valued sequences and real-valued sequences. Respective domains for the backward transform, or backward domains, are represented by complex-valued sequences and complex-valued conjugate-even sequences.

Both groups of FFT functions above present a uniform and easy-to-use application programmer interface providing fast computation of a discrete Fourier transform through the fast Fourier transform algorithm.

Both FFT and Cluster FFT functions support a five-stage usage model for computing an FFT:

1. Allocate a fresh descriptor for the problem with a call to the `DftiCreateDescriptor` or `DftiCreateDescriptorDM` function. The descriptor captures the configuration of the transform, namely, the dimensionality (or rank), sizes, number of transforms, memory layout of the input/output data (defined by strides), scaling factors, and so on. Many of the configuration settings are assigned default values in this call and may need modification depending on your application.
2. Optionally adjust the descriptor configuration with a call to the `DftiSetValue` or `DftiSetValueDM` function as needed. Typically, you must carefully define the data storage layout for an FFT or the data distribution among processes for a Cluster FFT. The configuration settings of the descriptor, such as the default values, can be obtained with the `DftiGetValue` or `DftiGetValueDM` function.

3. Commit the descriptor with a call to the DftiCommitDescriptor or DftiCommitDescriptorDM function, that is, make the descriptor ready for the transform computation. Once the descriptor is committed, the parameters of the transform, such as the type and number of transforms, strides and distances, the type and storage layout of the data, and so on, are "frozen" in the descriptor.
4. Compute the transform with a call to the DftiComputeForward/DftiComputeBackward or DftiComputeForwardDM/DftiComputeBackwardDM functions as many times as needed. With the committed descriptor, the compute functions only accept pointers to the input/output data and compute the transform as defined. To modify any configuration parameters later on, use DftiSetValue followed by DftiCommitDescriptor (DftiSetValueDM followed by DftiCommitDescriptorDM) or create and commit another descriptor.
5. Deallocate the descriptor with a call to the DftiFreeDescriptor or DftiFreeDescriptorDM function. This will return the memory internally consumed by the descriptor to the operating system.

All the above functions return an integer status value, which is zero upon successful completion of the operation. You can interpret a non-zero status with the help of the DftiErrorClass or DftiErrorMessage function.

The FFT functions support lengths with arbitrary factors. See the *Intel MKL User's Guide* for specific radices supported efficiently and the length constraints.

NOTE. The FFT functions assume the Cartesian representation of complex data (that is, the real and imaginary parts define a complex number). The Intel MKL Vector Mathematical Functions provide an efficient tool for conversion to and from the polar representation (see Example C-25 in Appendix C and Example C-26 in Appendix C).

FFT Functions

The fast Fourier transform function library of Intel MKL provides one-dimensional, two-dimensional, and multi-dimensional (up to rank 7) transforms and both Fortran and C interfaces for all transform functions.

Table 11-1 lists FFT functions implemented in Intel MKL:

Table 11-1 FFT Functions in Intel MKL

Function Name	Operation
Descriptor Manipulation Functions	
DftiCreateDescriptor	Allocates memory for the descriptor data structure and preliminarily initializes it.
DftiCommitDescriptor	Performs all initialization for the actual FFT computation.
DftiCopyDescriptor	Copies an existing descriptor.
DftiFreeDescriptor	Frees memory allocated for a descriptor.
FFT Computation Functions	
DftiComputeForward	Computes the forward FFT.
DftiComputeBackward	Computes the backward FFT.

Function Name	Operation
Descriptor Configuration Functions	
DftiSetValue	Sets one particular configuration parameter with the specified configuration value.
DftiGetValue	Gets the value of one particular configuration parameter.
Status Checking Functions	
DftiErrorClass	Checks if the status reflects an error of a predefined class.
DftiErrorMessage	Generates an error message.

Description of the FFT functions is followed by discussion of configuration settings (see Configuration Settings) and various configuration parameters used.

Computing FFT

The FFT functions described later in this chapter are provided with the Fortran and C interfaces. Fortran stands for Fortran 95. The FFT interface relies critically on many modern features offered in Fortran 95 that have no counterpart in FORTRAN 77.

NOTE. Following the explicit function interface in Fortran, data array must be defined as one-dimensional for any transformation type.

The materials presented in this chapter assume the availability of native complex types in C as they are specified in C9X.

You can find code examples that use FFT interface functions to compute transform results in Fourier Transform Functions Code Examples section in the Appendix C.

For most common situations, an FFT computation can be effected by four function calls. The approach adopted in Intel MKL for FFT computation uses one single data structure, the descriptor, to record flexible configuration whose parameters can be changed independently. This results in enhanced functionality and ease of use.

The descriptor data structure, when created, contains information about the length and domain of the FFT to be computed, as well as the setting of rather a large number of configuration parameters. The default settings for all of these parameters include, for example, the following:

- the FFT to be computed does not have a scale factor;
- there is only one set of data to be transformed;
- the data is stored contiguously in memory;
- the computed result overwrites (in place) the input data; etc.

Should any one of these many default settings be inappropriate, they can be changed one-at-a-time through the function DftiSetValue as illustrated in the Example C-12 and Example C-13.

FFT Interface

To use the FFT functions, you need to access the module MKL_DFTI through the "use" statement in Fortran; or access the header file mkl_dfti.h through "include" in C.

The Fortran interface provides a derived type DFTI_DESCRIPTOR; a number of named constants representing various names of configuration parameters and their possible values; and a number of overloaded functions through the generic functionality of Fortran 95.

The C interface provides the DFTI_DESCRIPTOR_HANDLE type, a number of named constants of two enumeration types DFTI_CONFIG_PARAM and DFTI_CONFIG_VALUE, and a number of functions, some of which accept different number of input arguments.

NOTE. Some of the FFT functions and/or functionality described in the subsequent sections of this chapter may not be supported by the currently available implementation of the library. You can find the complete list of the implementation-specific exceptions in the release notes to your version of the library.

There are four main categories of FFT functions in Intel MKL:

1. **Descriptor Manipulation.** There are four functions in this category. The first one, DftiCreateDescriptor, creates an FFT descriptor whose storage is allocated dynamically. This function configures the descriptor with default settings corresponding to a few input values supplied by the user.

   The second, DftiCommitDescriptor, "commits" the descriptor to all its setting. In practice, this usually means that all the necessary precomputation will be performed. This may include factorization of the input length and computation of all the required twiddle factors. The third function, DftiCopyDescriptor, makes an extra copy of a descriptor, and the fourth function, DftiFreeDescriptor, frees up all the memory allocated for the descriptor information.
2. **FFT Computation.** There are two functions in this category. The first, DftiComputeForward, performs the forward FFT computation, and the second function, DftiComputeBackward, performs a backward FFT computation.
3. **Descriptor configuration.** There are two functions in this category. One function, DftiSetValue, sets one specific value to one of the many configuration parameters that are changeable (a few are not); the other, DftiGetValue, gets the current value of any one of these configuration parameters (all are readable). These parameters, though many, are handled one-at-a-time.
4. **Status Checking.** The functions described in the three categories above return an integer value denoting the status of the operation. In particular, a non-zero return value always indicates a problem of some sort. Envisioned to be further enhanced in later releases of Intel MKL, FFT interface at present provides for one logical status class function, DftiErrorClass, and a simple status message generation function, DftiErrorMessage.

Status Checking Functions

All of the descriptor manipulation, FFT computation, and descriptor configuration functions return an integer value denoting the status of the operation. Two functions serve to check the status. The first function is a logical function that checks if the status reflects an error of a predefined class, and the second is an error message function that returns a character string.

ErrorClass

Checks if the status reflects an error of a predefined class.

Syntax

Fortran:

```
Predicate = DftiErrorClass( Status, Error_Class )
```

C:

```
predicate = DftiErrorClass( status, error_class );
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and `mkl_dfti.f90` header file for the Fortran interface. The FFT interface in Intel MKL provides a set of predefined error classes listed in Table 11-2. They are named constants and have the type `INTEGER` in Fortran and `MKL_LONG` in C.

Table 11-2 Predefined Error Classes

Named Constants	Comments
`DFTI_NO_ERROR`	No error. The zero status belongs to this class.
`DFTI_MEMORY_ERROR`	Usually associated with memory allocation
`DFTI_INVALID_CONFIGURATION`	Invalid settings of one or more configuration parameters
`DFTI_INCONSISTENT_CONFIGURATION`	Inconsistent configuration or input parameters
`DFTI_NUMBER_OF_THREADS_ERROR`	Number of OMP threads in the computation function is not equal to the number of OMP threads in the initialization stage (commit function)
`DFTI_MULTITHREADED_ERROR`	Usually associated with a value that OMP routines return in case of errors
`DFTI_BAD_DESCRIPTOR`	Descriptor is unusable for computation
`DFTI_UNIMPLEMENTED`	Unimplemented legitimate settings; implementation dependent
`DFTI_MKL_INTERNAL_ERROR`	Internal library error
`DFTI_1D_LENGTH_EXCEEDS_INT32`	Length of one of dimensions exceeds 2^{32} -1 (4 bytes).

Function `DftiErrorClass` returns a nonzero value (the value of `.TRUE.` in Fortran) if the status belongs to a predefined error class. Note that direct comparison of a status with a predefined class is an incorrect usage. The correct way to check if a function call was successful is through the use of `DftiErrorClass` with a specific error

class. However, the zero value of the status belongs to the DFTI_NO_ERROR class and thus the zero status indicates successful completion of an operation. See Example C-14 on a correct use of the status checking functions.

Interface and Prototype

```
//Fortran interface
INTERFACE DftiErrorClass
//Note that the body provided here is to illustrate the different
//argument list and types of dummy arguments. The interface
//does not guarantee what the actual function names are.
//Users can only rely on the function name following the
//keyword INTERFACE
 FUNCTION some_actual_function_8( Status, Error_Class )
 LOGICAL some_actual_function_8
 INTEGER, INTENT(IN) :: Status, Error_Class
 END FUNCTION some_actual_function_8
END INTERFACE DftiErrorClass
```

```
/* C prototype */
MKL_LONG DftiErrorClass( MKL_LONG , MKL_LONG );
```

ErrorMessage

Generates an error message.

Syntax

Fortran:

```
ERROR_MESSAGE = DftiErrorMessage( Status )
```

C:

```
error_message = DftiErrorMessage( status );
```

Description

The function is declared in the mkl_dfti.h header file for the C interface and mkl_dfti.f90 header file for the Fortran interface. The error message function generates an error message character string. The maximum length of the string in Fortran is given by the named constant DFTI_MAX_MESSAGE_LENGTH. The actual error message

is implementation dependent. In Fortran, the user needs to use a character string of length DFTI_MAX_MESSAGE_LENGTH as the target. In C, the function returns a pointer to a character string, that is, a character array with terminating '\0' character.

Example C-14 shows how this function can be used.

Interface and Prototype

```
//Fortran interface
INTERFACE DftiErrorMessage
//Note that the body provided here is to illustrate the different
//argument list and types of dummy arguments. The interface
//does not guarantee what the actual function names are.
//Users can only rely on the function name following the
//keyword INTERFACE
 FUNCTION some_actual_function_9( Status )
 CHARACTER(LEN=DFTI_MAX_MESSAGE_LENGTH) some_actual_function_9( Status )
 INTEGER, INTENT(IN) :: Status
 END FUNCTION some_actual_function_9
END INTERFACE DftiErrorMessage

/* C prototype */
char *DftiErrorMessage( MKL_LONG );
```

Descriptor Manipulation Functions

There are four functions in this category: create a descriptor, commit a descriptor, copy a descriptor, and free a descriptor.

CreateDescriptor

Allocates memory for the descriptor data structure and preliminarily initializes it.

Syntax

Fortran:

```
Status = DftiCreateDescriptor( Desc_Handle, Precision, Forward_Domain, &
    Dimension, Length )
```

C:

```
status = DftiCreateDescriptor( &desc_handle, precision, forward_domain, dimension, length
);
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and `mkl_dfti.f90` header file for the Fortran interface. This function allocates memory for the descriptor data structure and instantiates it with all the default configuration settings with respect to the precision, domain, dimension, and length of the desired transform. The domain is understood to be the domain of the forward transform. Since memory is allocated dynamically, the result is actually a pointer to the created descriptor. This function is slightly different from the "initialization" function in more traditional software packages or libraries used for computing FFT. This function does not perform any significant computational work such as twiddle factors computation. The function `DftiCommitDescriptor` does this work after the function `DftiSetValue` has set values of all needed parameters.

The precision and (forward) domain are specified through named constants provided in the FFT interface for the configuration values. The choices for precision are `DFTI_SINGLE` and `DFTI_DOUBLE`; and the choices for (forward) domain are `DFTI_COMPLEX` and `DFTI_REAL`. See Table 11-5 for the complete table of named constants for configuration values.

Dimension is a simple positive integer indicating the dimension of the transform. Length is either a simple positive integer for one-dimensional transform, or an integer array (pointer in C) containing the positive integers corresponding to the length dimensions for multi-dimensional transform.

The function returns the zero status when completes successfully. See Status Checking Functions for more information on the returned status.

Interface and Prototype

```
! Fortran interface.
! Note that the body provided below only illustrates the list of different
! parameters and the types of dummy parameters. You can rely only on the function
! name following keyword INTERFACE. For the precise definition of the
! interface, see the include/mkl_dfti.f90 file in the Intel MKL directory.

  INTERFACE DftiCreateDescriptor

     FUNCTION some_actual_function_1d(desc, precision, domain, dim, length)
       INTEGER :: some_actual_function_1d
       ...
       INTEGER, INTENT(IN) :: length
     END FUNCTION some_actual_function_1d

     FUNCTION some_actual_function_md(desc, precision, domain, dim, lengths)
       INTEGER :: some_actual_function_md
       ...
       INTEGER, INTENT(IN), DIMENSION(*) :: lengths
     END FUNCTION some_actual_function_md

     ...

  END INTERFACE DftiCreateDescriptor
```

Note that the function is overloaded, because the actual parameter for the formal parameter *length* can be a scalar or a rank-one array.

The function is also overloaded with respect to the type of the *precision* parameter to provide an option of using a precision-specific function for the generic name. Using more specific functions can reduce the size of statically linked executable for the applications using only single-precision FFTs or only double-precision FFTs. To use this option, change statement "USE MKL_DFTI" in your program unit to either of the following:

```
USE MKL_DFTI, FORGET=>DFTI_SINGLE, DFTI_SINGLE=>DFTI_SINGLE_R
```

```
USE MKL_DFTI, FORGET=>DFTI_DOUBLE, DFTI_DOUBLE=>DFTI_DOUBLE_R
```

where the name "FORGET" can be replaced with any name that is not used in the program unit.

```
/* C prototype.
 * Note that the preprocessor definition provided below only illustrates
 * that the actual function called may be determined at compile time.
 * You can rely only on the declaration of the function.
 * For precise definition of the preprocessor macro, see the include/mkl_dfti.h
 * file in the Intel MKL directory.
 */
MKL_LONG DftiCreateDescriptor(DFTI_DESCRIPTOR_HANDLE * pHandle,
     enum DFTI_CONFIG_VALUE precision,
     enum DFTI_CONFIG_VALUE domain,
     MKL_LONG dimension, ... /* length(s) */ );

#define DftiCreateDescriptor(desc,prec,domain,dim,sizes) \
     ((prec)==DFTI_SINGLE && (dim)==1) ? \
     some_actual_function_s1d((desc),(domain),(MKL_LONG)(sizes)) : \
     ...
```

Variable *length(s)* is interpreted as a scalar (MKL_LONG) or an array (MKL_LONG*), depending on the value of parameter *dimension*. If the value of parameter *precision* is known at compile time, then the compiler may retain, at a certain level of optimization, only the call to the respective specific function, thereby reducing the size of the statically linked application. Avoid direct calls to the specific functions used in the preprocessor macro definition, because their interface may change in future releases of the library. If the use of the macro is undesirable, you can safely undefine it after inclusion of the Intel MKL FFT header file, as follows:

```
#include “mkl_dfti.h”
#undef DftiCreateDescriptor
```

CommitDescriptor

Performs all initialization for the actual FFT computation.

Syntax

Fortran:

```
Status = DftiCommitDescriptor( Desc_Handle )
```

C:

```
status = DftiCommitDescriptor( desc_handle );
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and `mkl_dfti.f90` header file for the Fortran interface. The interface requires a function that completes initialization of a previously created descriptor before the descriptor can be used for FFT computations. Typically, this committal performs all initialization that facilitates the actual FFT computation. For a modern implementation, it may involve exploring many different factorizations of the input length to search for highly efficient computation method.

Any changes of configuration parameters of a committed descriptor via the set value function (see Descriptor Configuration) requires a re-committal of the descriptor before a computation function can be invoked. Typically, this committal function call is immediately followed by a computation function call (see FFT Computation).

The function returns the zero status when completes successfully. See Status Checking Functions for more information on the returned status.

Interface and Prototype

```
! Fortran interface
INTERFACE DftiCommitDescriptor
!Note that the body provided here is to illustrate the different
!argument list and types of dummy arguments. The interface
!does not guarantee what the actual function names are.
!Users can only rely on the function name following the
!keyword INTERFACE
 FUNCTION some_actual function_1 ( Desc_Handle )
 INTEGER :: some_actual function_1
 TYPE(DFTI_DESCRIPTOR), POINTER :: Desc_Handle
 END FUNCTION some_actual function_1
END INTERFACE DftiCommitDescriptor
```

```
/* C prototype */
MKL_LONG DftiCommitDescriptor( DFTI_DESCRIPTOR_HANDLE );
```

CopyDescriptor

Copies an existing descriptor.

Syntax

Fortran:

`Status = DftiCopyDescriptor( Desc_Handle_Original, Desc_Handle_Copy )`

C:

```
status = DftiCopyDescriptor( desc_handle_original, &desc_handle_copy );
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and `mkl_dfti.f90` header file for the Fortran interface. This function makes a copy of an existing descriptor and provides a pointer to it. The purpose is that all information of the original descriptor will be maintained even if the original is destroyed via the free descriptor function `DftiFreeDescriptor`.

The function returns the zero status when completes successfully. The function returns `DFTI_NO_ERROR` when completes successfully. See Status Checking Functions for more information on the returned status.

Interface and Prototype

```
! Fortran interface
INTERFACE DftiCopyDescriptor
! Note that the body provided here is to illustrate the different
!argument list and types of dummy arguments. The interface
!does not guarantee what the actual function names are.
!Users can only rely on the function name following the
!keyword INTERFACE
 FUNCTION some_actual_function_2( Desc_Handle_Original,
 Desc_Handle_Copy )
 INTEGER :: some_actual_function_2
 TYPE(DFTI_DESCRIPTOR), POINTER :: Desc_Handle_Original, Desc_Handle_Copy
 END FUNCTION some_actual_function_2
END INTERFACE DftiCopyDescriptor
```

```
/* C prototype */
MKL_LONG DftiCopyDescriptor( DFTI_DESCRIPTOR_HANLDE, DFTI_DESCRIPTOR_HANDLE * );
```

FreeDescriptor

Frees memory allocated for a descriptor.

Syntax

Fortran:

```
Status = DftiFreeDescriptor( Desc_Handle )
```

C:

```
status = DftiFreeDescriptor( &desc_handle );
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and `mkl_dfti.f90` header file for the Fortran interface. This function frees up all memory space allocated for a descriptor.

NOTE. Memory allocation/deallocation inside Intel MKL is managed by Intel MKL Memory Manager. So, even after successful completion of `FreeDescriptor`, the memory space may continue being allocated for the application because the Memory Manager sometimes does not return the memory space to the OS but considers the space free and can reuse it for future memory allocation. See Example "MKL_FreeBuffers Usage with FFT Functions" in the description of the service function `FreeBuffers` on how to use Intel MKL Memory Manager and actually release memory.

The function returns the zero status when completes successfully. See Status Checking Functions for more information on the returned status.

Interface and Prototype

```
! Fortran interface
INTERFACE DftiFreeDescriptor
//Note that the body provided here is to illustrate the different
//argument list and types of dummy arguments. The interface
//does not guarantee what the actual function names are.
//Users can only rely on the function name following the
//keyword INTERFACE
 FUNCTION some_actual_function_3( Desc_Handle )
 INTEGER :: some_actual_function_3
 TYPE(DFTI_DESCRIPTOR), POINTER :: Desc_Handle
 END FUNCTION some_actual_function_3
END INTERFACE DftiFreeDescriptor

/* C prototype */
MKL_LONG DftiFreeDescriptor( DFTI_DESCRIPTOR_HANDLE * );
```

FFT Computation Functions

There are two functions in this category: compute the forward transform, and compute the backward transform.

ComputeForward

Computes the forward FFT.

Syntax

Fortran:

```
status = DftiComputeForward( desc_handle, x_inout )
status = DftiComputeForward( desc_handle, x_in, y_out )
status = DftiComputeForward( desc_handle, xre_inout, xim_inout )
status = DftiComputeForward( desc_handle, xre_in, xim_in, yre_out, yim_out )
```

C:

```
status = DftiComputeForward( desc_handle, x_inout );
status = DftiComputeForward( desc_handle, x_in, y_out );
status = DftiComputeForward( desc_handle, xre_inout, xim_inout );
status = DftiComputeForward( desc_handle, xre_in, xim_in, yre_out, yim_out );
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and in the `mkl_dfti.f90` module file for the Fortran interface. The function accepts the descriptor handle parameter and one or more data parameters. Provided the descriptor is configured and committed successfully, actual computation of the FFT can be performed. Function `DftiComputeForward` computes the forward FFT, that is, the transform with the minus sign in the exponent, $\delta = -1$.

The number and types of the data parameters that the function requires may vary depending on the configuration of the descriptor. This variation is accommodated by the variable parameters in C and the generic interface in Fortran. The generic Fortran interface to the computation function is based on a set of specific functions. These functions can check for inconsistency between the required and actual number of parameters. However, the specific functions disregard the type of the actual parameters and instead use the interpretation defined in the descriptor by configuration parameters `FTI_FORWARD_DOMAIN`, `DFTI_INPUT_STRIDES`, `DFTI_INPUT_DISTANCE`, and so on.

The function returns the zero status when completes successfully. See Status Checking Functions for more information on the returned status.

Interface and Prototype

```
! Fortran interface.
! Note that the body provided below only illustrates the list of different
! parameters and the types of dummy parameters. You can rely only on the function
! name following keyword INTERFACE. For the precise definition of the
! interface, see the include/mkl_dfti.f90 file in the Intel MKL directory.
INTERFACE DftiComputeForward

  FUNCTION some_actual_function_1(desc,sSrcDst)
```

```
    INTEGER some_actual_function_1
    REAL(4), INTENT(INOUT), DIMENSION(*) :: sSrcDst
    ...
  END FUNCTION some_actual_function_1

  FUNCTION some_actual_function_2(desc,cSrcDst)
    INTEGER some_actual_function_2
    COMPLEX(8), INTENT(INOUT), DIMENSION(*) :: cSrcDst
    ...
  END FUNCTION some_actual_function_2

  FUNCTION some_actual_function_3(desc,sSrcDstRe,sSrcDstIm)
    INTEGER some_actual_function_3
    REAL(4), INTENT(INOUT), DIMENSION(*) :: sSrcDstRe
    REAL(4), INTENT(INOUT), DIMENSION(*) :: sSrcDstIm
    ...
  END FUNCTION some_actual_function_3
  ...
END INTERFACE DftiComputeForward
```

Fortran interface requires that the data parameters have the type of assumed-size rank-1 array, even for multidimensional transforms. The implementations of the FFT interface require the data stored linearly in memory with a regular "stride" pattern capable to describe multidimensional array layout (discussed more fully in Strides, see also [3]), and the function requires the data parameters refer to the first element of the data. Consequently, the data arrays should be specified with the `DIMENSION(*)` attribute and the storage associated with the actual multidimensional arrays via the `EQUIVALENCE` statement.

```
/* C prototype */
MKL_LONG DftiComputeForward( DFTI_DESCRIPTOR_HANDLE, void*, ... );
```

ComputeBackward

Computes the backward FFT.

Syntax

Fortran:

```
status = DftiComputeBackward( desc_handle, x_inout )
status = DftiComputeBackward( desc_handle, y_in, x_out )
status = DftiComputeBackward( desc_handle, xre_inout, xim_inout )
status = DftiComputeBackward( desc_handle, yre_in, yim_in, xre_out, xim_out )
```

C:

```
status = DftiComputeBackward( desc_handle, x_inout );
status = DftiComputeBackward( desc_handle, y_in, x_out );
status = DftiComputeBackward( desc_handle, xre_inout, xim_inout );
status = DftiComputeBackward( desc_handle, yre_in, yim_in, xre_out, xim_out );
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and `mkl_dfti.f90` module file for the Fortran interface. The function accepts the descriptor handle parameter and one or more data parameters. Provided the descriptor is configured and committed successfully, actual computation of the FFT can be performed. Function `DftiComputeBackward` computes the inverse FFT, that is, the transform with the plus sign in the exponent, $\delta = +1$.

The number and types of the data parameters that the function requires may vary depending on the configuration of the descriptor. This variation is accommodated by the variable parameters in C and the generic interface in Fortran. The generic Fortran interface to the computation function is based on a set of specific functions. These functions can check for inconsistency between the required and actual number of parameters. However, the specific functions disregard the type of the actual parameters and instead use the interpretation defined in the descriptor by configuration parameters `DFTI_FORWARD_DOMAIN`, `DFTI_INPUT_STRIDES`, `DFTI_INPUT_DISTANCE`, and so on.

The function returns the zero status when completes successfully. See Status Checking Functions for more information on the returned status.

Descriptor Configuration Functions

There are two functions in this category: the value setting function DftiSetValue sets one particular configuration parameter to an appropriate value, and the value getting function DftiGetValue reads the value of one particular configuration parameter. While all configuration parameters are readable, a few of them cannot be set by user. Some of these contain fixed information of a particular implementation such as version number, or dynamic information, but nevertheless are derived by the implementation during execution of one of the functions. See Configuration Settings for details.

SetValue

Sets one particular configuration parameter with the specified configuration value.

Syntax

Fortran:

```
Status = DftiSetValue( Desc_Handle, Config_Param, Config_Val )
```

C:

```
status = DftiSetValue( desc_handle, config_param, config_val );
```

Description

The function is declared in the mkl_dfti.h header file for the C interface and mkl_dfti.f90 header file for the Fortran interface. This function sets one particular configuration parameter with the specified configuration value. The configuration parameter is one of the named constants listed in Table 11-3, and the configuration value must have the corresponding type, which can be a named constant or a native type. See Configuration Settings for details of the meaning of the setting. Note that you can set configuration parameters DFTI_FORWARD_DOMAIN, DFTI_PRECISION, DFTI_DIMENSION, and DFTI_LENGTHS only through the DftiCreateDescriptor function. The DftiSetValue function does not change these parameters.

The function returns the zero status when completes successfully. See Status Checking Functions for more information on the returned status.

Interface and Prototype

```

 END FUNCTION some_actual_function_6_CHARS
END INTERFACE DftiSetValue
```

```
/* C prototype */
MKL_LONG DftiSetValue( DFTI_DESCRIPTOR_HANDLE, DFTI_CONFIG_PARAM , ... );
```

GetValue

Gets the configuration value of one particular configuration parameter.

Syntax

Fortran:

```
Status = DftiGetValue( Desc_Handle, Config_Param, Config_Val )
```

C:

```
status = DftiGetValue( desc_handle, config_param, &config_val );
```

Description

The function is declared in the `mkl_dfti.h` header file for the C interface and `mkl_dfti.f90` header file for the Fortran interface. This function gets the configuration value of one particular configuration parameter. The configuration parameter is one of the named constants listed in Table 11-3 and Table 11-4, and the configuration value is the corresponding appropriate type, which can be a named constant or a native type.

The function returns the zero status when completes successfully. See Status Checking Functions for more information on the returned status.

      ... );
```

Configuration Settings

Each of the configuration parameters is identified by a named constant in the MKL_DFTI module. In C, these named constants have the enumeration type DFTI_CONFIG_PARAM. The list of configuration parameters whose values can be set by user is given in Table 11-3; the list of configuration parameters that are read-only is given in Table 11-4. All parameters are readable. Most of these parameters are self-explanatory, while some others are discussed more fully in the description of the relevant functions.

Table 11-3 Settable Configuration Parameters

Named Constants	Value Type	Comments
Most common configurations, no default, must be set explicitly		
DFTI_FORWARD_DOMAIN	Named constant	Domain for the forward transform, settable by DftiCreateDescriptor only
DFTI_PRECISION	Named constant	Precision of computation, settable by DftiCreateDescriptor only
DFTI_DIMENSION	Integer scalar	Dimension of the transform, settable by DftiCreateDescriptor only
DFTI_LENGTHS	Integer scalar/array	Lengths of each dimension, settable by DftiCreateDescriptor only
Common configurations including multiple transform and data representation		
DFTI_NUMBER_OF_TRANSFORMS	Integer scalar	For multiple number of transforms
DFTI_FORWARD_SCALE	Floating-point scalar	Scale factor for forward transform
DFTI_BACKWARD_SCALE	Floating-point scalar	Scale factor for backward transform
DFTI_PLACEMENT	Named constant	Placement of the computation result
DFTI_COMPLEX_STORAGE	Named constant	Storage method, complex domain data
DFTI_REAL_STORAGE	Named constant	Storage method, real domain data
DFTI_CONJUGATE_EVEN_STORAGE	Named constant	Storage method, conjugate-even domain data
DFTI_DESCRIPTOR_NAME	Character string	No longer than DFTI_MAX_NAME_LENGTH
DFTI_PACKED_FORMAT	Named constant	Packed format, real domain data
DFTI_NUMBER_OF_USER_THREADS	Integer scalar	Number of user threads employing the same descriptor for FFT computation
Configurations regarding stride of data		
DFTI_INPUT_DISTANCE	Integer scalar	Multiple transforms, distance of first elements
DFTI_OUTPUT_DISTANCE	Integer scalar	Multiple transforms, distance of first elements
DFTI_INPUT_STRIDES	Integer array	Stride information of input data

Named Constants	Value Type	Comments
DFTI_OUTPUT_STRIDES	Integer array	Stride information of output data
Advanced configuration		
DFTI_ORDERING	Named constant	Scrambling of data order
DFTI_TRANSPOSE	Named constant	Scrambling of dimensions

Table 11-4 Read-Only Configuration Parameters

Named Constants	Value Type	Comments
DFTI_COMMIT_STATUS	Name constant	Whether descriptor has been committed
DFTI_VERSION	String	Intel MKL library version number

The configuration parameters are set by various values. Some of these values are specified by native data types such as an integer value (for example, number of simultaneous transforms requested), or a single-precision number (for example, the scale factor one would like to apply on a forward transform).

Other configuration values are discrete in nature (for example, the domain of the forward transform) and are thus provided in the DFTI module as named constants. In C, these named constants have the enumeration type DFTI_CONFIG_VALUE. The complete list of named constants used for this kind of configuration values is given in Table 11-5.

Table 11-5 Named Constant Configuration Values

Named Constant	Comments
DFTI_SINGLE	Single precision
DFTI_DOUBLE	Double precision
DFTI_COMPLEX	Complex domain
DFTI_REAL	Real domain
DFTI_INPLACE	Output overwrites input
DFTI_NOT_INPLACE	Output does not overwrite input
DFTI_COMPLEX_COMPLEX	Storage method (see Storage schemes)
DFTI_REAL_REAL	Storage method (see Storage schemes)
DFTI_COMPLEX_REAL	Storage method (see Storage schemes)
DFTI_REAL_COMPLEX	Storage method (see Storage schemes)
DFTI_COMMITTED	Committal status of a descriptor
DFTI_UNCOMMITTED	Committal status of a descriptor

Named Constant	Comments
DFTI_ORDERED	Data ordered in both forward and backward domains
DFTI_BACKWARD_SCRAMBLED	Data scrambled in backward domain (by forward transform)
DFTI_NONE	Used to specify no transposition
DFTI_ALLOW	Transposition of the result of a transform
DFTI_CCS_FORMAT	Packed format, real data (see Packed formats)
DFTI_PACKED_FORMAT	Packed format, real data (see Packed formats)
DFTI_PERM_FORMAT	Packed format, real data (see Packed formats)
DFTI_CCE_FORMAT	Packed format, real data (see Packed formats)
DFTI_VERSION_LENGTH	Number of characters for library version length
DFTI_MAX_NAME_LENGTH	Maximum descriptor name length
DFTI_MAX_MESSAGE_LENGTH	Maximum status message length

Table 11-6 lists the possible values for those configuration parameters that are discrete in nature.

Table 11-6 Settings for Discrete Configuration Parameters

Named Constant	Possible Values
DFTI_PRECISION	DFTI_SINGLE, or DFTI_DOUBLE (no default)
DFTI_FORWARD_DOMAIN	DFTI_COMPLEX, or DFTI_REAL
DFTI_PLACEMENT	DFTI_INPLACE (default), or DFTI_NOT_INPLACE
DFTI_COMPLEX_STORAGE	DFTI_COMPLEX_COMPLEX (default)
DFTI_REAL_STORAGE	DFTI_REAL_REAL (default), or DFTI_REAL_COMPLEX
DFTI_CONJUGATE_EVEN_STORAGE	DFTI_COMPLEX_COMPLEX, or DFTI_COMPLEX_REAL (default)
DFTI_PACKED_FORMAT	DFTI_CCS_FORMAT (default), or DFTI_PACK_FORMAT, or DFTI_PERM_FORMAT, or

Named Constant	Possible Values
	DFTI_CCE_FORMAT
DFTI_ORDERING	DFTI_ORDERED (default), or DFTI_BACKWARD_SCRAMBLED
DFTI_TRANSPOSE	DFTI_NONE (default), or DFTI_ALLOW

Table 11-7 lists the default values of the settable configuration parameters.

Table 11-7 Default Configuration Values of Settable Parameters

Named Constants	Default Value
DFTI_NUMBER_OF_TRANSFORMS	1
DFTI_NUMBER_OF_USER_THREADS	1
DFTI_FORWARD_SCALE	1.0
DFTI_BACKWARD_SCALE	1.0
DFTI_PLACEMENT	DFTI_INPLACE
DFTI_COMPLEX_STORAGE	DFTI_COMPLEX_COMPLEX
DFTI_REAL_STORAGE	DFTI_REAL_REAL
DFTI_CONJUGATE_EVEN_STORAGE	DFTI_COMPLEX_REAL
DFTI_PACKED_FORMAT	DFTI_CCS_FORMAT
DFTI_DESCRIPTOR_NAME	no name, string of zero length
DFTI_INPUT_DISTANCE	0
DFTI_OUTPUT_DISTANCE	0
DFTI_INPUT_STRIDES	Tightly packed according to dimension and FFT lengths
DFTI_OUTPUT_STRIDES	Same as above. see Strides for details
DFTI_ORDERING	DFTI_ORDERED
DFTI_TRANSPOSE	DFTI_NONE

Precision of transform

The configuration parameter DFTI_PRECISION denotes the floating-point precision in which the transform is to be carried out. A setting of DFTI_SINGLE stands for single precision, and a setting of DFTI_DOUBLE stands for double precision. The data is meant to be presented in this precision; the computation will be carried out in this

precision; and the result will be delivered in this precision. This is one of the four settable configuration parameters that do not have default values. The user must set them explicitly, most conveniently at the call to descriptor creation function `DftiCreateDescriptor`.

Fortran module `MKL_DFTI` also defines named constants `DFTI_SINGLE_R` and `DFTI_DOUBLE_R`, with the same semantics as `DFTI_SINGLE` and `DFTI_DOUBLE`, respectively. These constants are *not recommended for direct use*. They only facilitate access to precision-specific functions for the generic name `DftiCreateDescriptor` through the modification of the "`USE MKL_DFTI`" statement, as described in section `CreateDescriptor`.

Forward domain of transform

As already mentioned in the introduction to the Fourier Transform Functions chapter, the general form of the discrete Fourier transform is

$$z_{k_1, k_2, \ldots, k_d} = \sigma \times \sum_{j_d=0}^{n_d-1} \ldots \sum_{j_2=0}^{n_2-1} \sum_{j_1=0}^{n_1-1} w_{j_1, j_2, \ldots, j_d} \exp\left(\delta i 2\pi \sum_{l=1}^{d} j_l k_l / n_l \right)$$

where w is the input sequence, z is the output sequence, both indexed by $k_l = 0, \ldots n_l\text{-}1$, for $l = 1, \ldots, d$, scale factor σ is an arbitrary real number with the default value of 1.0, and the sign in the exponent is $\delta = -1$ for the forward transform and $\delta = +1$ for the backward transform.

The implementation of FFT supports forward transforms on input sequences of two domains, as specified by configuration parameter `DFTI_FORWARD_DOMAIN`: general complex-valued sequences (`DFTI_COMPLEX` domain) and general real-valued sequences (`DFTI_REAL` domain). The forward transform maps the forward domain to the corresponding backward domain, as shown in Table 11-8, where the conjugate-even domain covers complex-valued sequences with the symmetry property:

$$x_{k_1,k_2,\ldots,k_d} = \overline{x_{n_1-k_1,n_2-k_2,\ldots,n_d-k_d}}.$$

Here the overline denotes the complex conjugate, and it is assumed that

$$x_{\ldots,n_l,\ldots} \equiv x_{\ldots,0,\ldots}$$

Due to this property of conjugate-even sequences, only a part of such sequence is stored in the computer memory, as described in Storage schemes.

Table 11-8 Correspondence of Forward and Backward Domain

Forward Domain	Implied Backward Domain
Complex (`DFTI_COMPLEX`)	Complex (`DFTI_COMPLEX`)
Real (`DFTI_REAL`)	Conjugate-even

`DFTI_FORWARD_DOMAIN` is the second of four configuration parameters without a default value.

Transform dimension and lengths

The dimension of the transform is a positive integer value represented in an integer scalar of `Integer` data type in Fortran and `MKL_LONG` data type in C. For one-dimensional transform, the transform length is specified by a positive integer value represented in an integer scalar of `Integer` data type in Fortran and `MKL_LONG` data type in C. For multi-dimensional (≥ 2) transform, the lengths of each of the dimension is supplied in an integer array (`Integer` data type in Fortran and `MKL_LONG` data type in C). `DFTI_DIMENSION` and `DFTI_LENGTHS` are the remaining two of four configuration parameters without default.

As mentioned, these four configuration parameters do not have default value. They are most conveniently set at the descriptor creation function. They can only be set in the descriptor creation function, and not by the function `DftiSetValue`.

Number of transforms

In some situations, the user may need to perform a number of FFTs of the same dimension and lengths. The most common situation would be to transform a number of one-dimensional data of the same length. This parameter has the default value of 1, and can be set to positive integer value by an `Integer` data type in Fortran and `MKL_LONG` data type in C. Data sets have no common elements. The distance parameter is obligatory if multiple number is more than one.

Scale

The forward transform and backward transform are each associated with a scale factor σ of its own with default value of 1. The user can set one or both of them via the two configuration parameters `DFTI_FORWARD_SCALE` and `DFTI_BACKWARD_SCALE`. For example, for a one-dimensional transform of length *n*, one can use the default scale of 1 for the forward transform while setting the scale factor for backward transform to be 1/*n*, making the backward transform the inverse of the forward transform.

The scale factor configuration parameter should be set by a real floating-point data type of the same precision as the value for `DFTI_PRECISION`.

Placement of result

By default, the computational functions overwrite the input data with the output result. That is, the default setting of the configuration parameter `DFTI_PLACEMENT` is `DFTI_INPLACE`. The user can change that by setting it to `DFTI_NOT_INPLACE`. Data sets have no common elements.

Packed formats

The result of the forward transform (i.e. in the frequency-domain) of real data is represented in several possible packed formats: ***Pack***, ***Perm***, ***CCS***, or ***CCE***. The data can be packed due to the symmetry property of the FFT of a real data.

The ***CCE*** format stores the values of the first half of the output complex conjugate-even signal resulted from the forward FFT. Note that the one-dimensional signal stored in CCE format is one complex element longer. For multi-dimensional real transform, `n1 * n2 * n3 * ... * nk` the size of complex matrix in CCE format is `(n1/2+1)* n2 * n3 * ... * nk` for Fortran and `n1 * n2 * ... * (nk/2+1)` for C.

The ***CCS*** format looks like the CCE format. It is the same format as CCE for one-dimensional transform. The CCS format is slightly different for multi-dimensional real transform. In CCS format, the output samples of the FFT are arranged as shown in Table 11-9 for one-dimensional FFT and in Table 11-10 for two-dimensional FFT.

The ***Pack*** format is a compact representation of a complex conjugate-symmetric sequence. The disadvantage of this format is that it is not the natural format used by the real FFT algorithms ("natural" in the sense that array is natural for complex FFTs). In `Pack` format, the output samples of the FFT are arranged as shown in Table 11-9 for one-dimensional FFT and in Table 11-11 for two-dimensional FFT.

The ***Perm*** format is an arbitrary permutation of the `Pack` format for even lengths and one is the same as the `Pack` format for odd lengths. In `Perm` format, the output samples of the FFT are arranged as shown in Table 11-9 for one-dimensional FFT and in Table 11-12 for two-dimensional FFT.

Table 11-9 Packed Format Output Samples

For n = s*2

FFT Real	**0**	**1**	**2**	**3**	**...**	**n-2**	**n-1**	**n**	**n+1**
CCS	R_0	0	R_1	I_1	...	$R_{n/2-1}$	$I_{n/2-1}$	$R_{n/2}$	0
Pack	R_0	R_1	I_1	R_2	...	$I_{n/2-1}$	$R_{n/2}$		
Perm	R_0	$R_{n/2}$	R_1	I_1	...	$R_{n/2-1}$	$I_{n/2-1}$		

For n = s*2 + 1

FFT Real	**0**	**1**	**2**	**3**	**...**	**n-4**	**n-3**	**n-2**	**n-1**	**n**	**n+1**
CCS	R_0	0	R_1	I_1	...	I_{s-2}	R_{s-1}	I_{s-1}	R_s	I_s	
Pack	R_0	R_1	I_1	R_2	...	R_{s-1}	I_{s-1}	R_s	I_s		
Perm	R_0	R_1	I_1	R_2	...	R_{s-1}	I_{s-1}	R_s	I_s		

Note that Table 11-9 uses the following notation for complex data entries:

R_j = Re z_j

I_j = Im z_j

See also Table 11-13 and Table 11-14.

```

The tables for two-dimensional FFT use Fortran-interface conventions. For C-interface specifics in storing packed data, see Storage schemes section below. See also Table 11-15 and Table 11-16 for examples of Fortran-interface and C-interface formats.

Storage Schemes

Depending on the value of configuration parameter DFTI_FORWARD_DOMAIN, the implementation of FFT supports several storage schemes for input and output data (see document [3] for the rationale behind the definition of the storage schemes). The data elements are placed within contiguous memory blocks, defined with generalized strides (see Strides). For multiple transforms an nth set of data (nth begins with zero) should be located within the same memory block, and the data sets are placed at a distance from each other (see Number of transforms and Input and output distances).

NOTE. In C/C++, avoid setting up multidimensional arrays with lists of pointers to one-dimensional arrays. Instead use a one-dimensional array with the explicit indexing to access the data elements.

The C/C++ notation is used to precisely describe association of mathematical entities with the data elements stored in memory. FFT Examples demonstrate the usage of storage formats in C and Fortran.

Storage schemes for complex domain. For the DFTI_COMPLEX forward domain, both input and output sequences belong to the complex domain. In this case, configuration parameter DFTI_COMPLEX_STORAGE can have one of the two values: DFTI_COMPLEX_COMPLEX (default) or DFTI_REAL_REAL.

NOTE. In the Intel MKL FFT implementation, storage schemes for a forward complex domain and the respective backward complex domain are the same.

With **DFTI_COMPLEX_COMPLEX** storage, the complex-valued data sequence is referenced by a single data parameter Z associated with the complex type so that complex-valued element $z_{k_1, k_2, \ldots, k_d}$ of the sequence is located at Z[nth*distance + $stride_0$ + k_1*$stride_1$ + k_2*$stride_2$+ ... k_d*$stride_d$] as a structure consisting of the real and imaginary parts.

The following example illustrates a typical usage of the DFTI_COMPLEX_COMPLEX storage:

```
complex :: x(n)
...
! on input, for i=1,...,N: x(i) = w_{i-1}
status = DftiComputeForward( desc_handle, x )
! on output, for i=1,...,N: x(i) = z_{i-1}
```

With the **DFTI_REAL_REAL** storage, the complex-valued data sequence is referenced by two data parameters ZRe and ZIm , both associated with the real type so that complex-valued element $z_{k_1, k_2, \ldots, k_d}$ of the sequence is computed as ZRe[nth*distance + $stride_0$ + k_1*$stride_1$ + k_2*$stride_2$+ ... k_d*$stride_d$] + √(-1) × ZIm[nth*distance + $stride_0$ + k_1*$stride_1$ + k_2*$stride_2$+ ... k_d*$stride_d$].

A typical usage of the DFTI_REAL_REAL storage is illustrated by the following example:

```
real :: xre(n), xim(n)
...
status = DftiSetValue( desc_handle, DFTI_COMPLEX_STORAGE, DFTI_REAL_REAL)
! on input, for i=1,...,N: cmplx(xre(i),xim(i)) = w_{i-1}
status = DftiComputeForward( desc_handle, xre, xim )
! on output, for i=1,...,N: cmplx(xre(i),xim(i)) = z_{i-1}
```

Storage scheme for the real and conjugate-even domains. This setting for the storage schemes for these domains is recorded in the configuration parameters DFTI_REAL_STORAGE and DFTI_CONJUGATE_EVEN_STORAGE. Since a forward real domain corresponds to a conjugate-even backward domain, they are considered together. The example uses one-, two- and three-dimensional real to conjugate-even transforms. In-place computation is assumed whenever possible (that is, when the input data type matches the output data type).

One-Dimensional Transform

Consider a one-dimensional *n*-length transform of the form

$$z_k = \sum_{j=0}^{n-1} w_j e^{-i2\pi jk/n}, \qquad w_j \in R, z_k \in C.$$

There is a symmetry:

For even `n`: `z(n/2+i) = conjg(z(n/2-i))`, $1 \le i \le n/2-1$, and moreover `z(0)` and `z(n/2)` are real values.

For odd `n`: `z(m+i) = conjg(z(m-i+1))`, $1 \le i \le m$, and moreover `z(0)` is real value.

m = `floor(`$n/2$`)`.

Assume that the stride has the default value (unit stride).

This complex conjugate-symmetric vector can be stored in the complex array of size m+1 or in the real array of size 2m+2 or 2m depending on packed format.

Two-Dimensional Transform

Each of the real-to-complex functions computes the forward FFT of a two-dimensional real matrix according to the mathematical equation

$$z_{i,j} = \sum_{k=0}^{m-1} \sum_{l=0}^{n-1} t_{k,l} * w_m^{-i*k} * w_n^{-j*l},$$
$$0 \le i \le m\text{-}1, 0 \le j \le n\text{-}1$$

$t_{k,l}$ = cmplx($r_{k,l}$,0), where $r_{k,l}$ is a real input matrix, 0≤k≤m-1, 0 ≤l≤n-1. The mathematical result $z_{i,j}$, 0≤i≤m-1, 0≤j≤n-1, is the complex matrix of size (m,n). Each column is the complex conjugate-symmetric vector as follows:

For even m:

for 0 ≤j≤n-1,

z(m/2+i,j) = conjg(z(m/2-i,j)),1≤i≤m/2-1.

Moreover, z(0,j) and z(m/2,j) are real values for j=0 and j=n/2.

For odd m:

for 0≤j≤n-1,

z(s+i,j) = conjg(z(s-i,j)), 1≤i≤s-1,

where s = floor(m/2).

Moreover, z(0,j) are real values for j=0 and j=n/2.

This mathematical result can be stored in the real two-dimensional array of size:

(m+2,n+2) (CCS format), or

(m,n) (Pack or Perm formats), or

(2*(m/1+1), n) (CCE format, Fortran-interface),

((m, 2*(n/2+1)) (CCE format, C-interface)

or in the complex two-dimensional array of size:

(m/2+1, n) (CCE format, Fortran-interface),

(m, n/2+1) (CCE format, C-interface)

Since the multidimensional array data are arranged differently in Fortran and C (see Strides), the output array that holds the computational result contains complex conjugate-symmetric columns (for Fortran) or complex conjugate-symmetric rows (for C).

The following tables give examples of output data layout in Pack format for a forward two-dimensional real-to-complex FFT of a 6-by-4 real matrix. Note that the same layout is used for the input data of the corresponding backward complex-to-real FFT.

Table 11-15 Fortran-interface Data Layout for a 6-by-4 Matrix

z(1,1)	Re z(1,2)	Im z(1,2)	z(1,3)
Re z(2,1)	Re z(2,2)	Re z(2,3)	Re z(2,4)
Im z(2,1)	Im z(2,2)	Im z(2,3)	Im z(2,4)
Re z(3,1)	Re z(3,2)	Re z(3,3)	Re z(3,4)
Im z(3,1)	Im z(3,2)	Im z(3,3)	Im z(3,4)

z(4,1)	Re z(4,2)	Im z(4,2)	z(4,3)

For the above example, the stride array is taken to be (0, 1, 6).

Table 11-16 C-interface Data Layout for a 6-by-4 Matrix

z(1,1)	Re z(1,2)	Im z(1,2)	z(1,3)
Re z(2,1)	Re z(2,2)	Im z(2,2)	Re z(2,3)
Im z(2,1)	Re z(3,2)	Im z(3,2)	Im z(2,3)
Re z(3,1)	Re z(4,2)	Im z(4,2)	Re z(3,3)
Im z(3,1)	Re z(5,2)	Im z(5,2)	Im z(3,3)
z(4,1)	Re z(6,2)	Im z(6,2)	z(4,3)

For the second example, the stride array is taken to be (0, 4, 1).

See also Packed formats.

Three-Dimensional Transform

Each of the real-to-complex functions computes the forward FFT of a three-dimensional real matrix according to the mathematical equation

$$z_{i,j,q} = \sum_{k=0}^{m-1} \sum_{l=0}^{n-1} \sum_{s=0}^{k-1} t_{p,l,s} * W_m^{-i*p} * W_n^{-j*l} * W_k^{-q*s},$$

$$0 \le i \le m\text{-}1, 0 \le j \le n\text{-}1, 0 \le s \le k\text{-}1$$

$t_{p,l,s}$ = cmplx($r_{p,l,s}$,0), where $r_{p,l,s}$ is a real input matrix, $0 \le k \le m\text{-}1$, $0 \le l \le n\text{-}1$, $0 \le s \le k\text{-}1$.

The mathematical result $z_{i,j,q}$, $0 \le i \le m\text{-}1$, $0 \le j \le n\text{-}1$, $0 \le q \le k\text{-}1$ is the complex matrix of size (m,n,k), which is a complex conjugate-symmetric, or conjugate-even, matrix as follows:

$z_{m1,n1,k1}$ = conjg($z_{m-m1,n-n1,k-k1}$), where each dimension is periodic.

This mathematical result can be stored in the real three-dimensional array of size:

(m/2+1,n,k) (CCE format, Fortran-interface),

(m,n,k/2+1) (CCE format, C-interface).

Since the multidimensional array data are arranged differently in Fortran and C (see Strides), the output array that holds the computational result contains complex conjugate-symmetric columns (for Fortran) or complex conjugate-symmetric rows (for C).

NOTE. There is one packed format for 3D REAL FFT - CCE format. In both in-place and out-of-place REAL FFT, for real data, the stride and distance parameters are in REAL units and for complex data, they are in COMPLEX units. So, elements of input and output data can be placed in different elements of input-output array of the in-place FFT.

1. **DFTI_REAL_REAL** for real domain, **DFTI_COMPLEX_REAL** for conjugate-even domain (by default). It is used for 1D and 2D REAL FFT.

   - A typical usage of in-place transform is as follows:

     ```
     // m = floor( n/2 )
     REAL :: X(0:2*m+1)
     ...some other code...
     ...assuming inplace transform...
     Status = DftiComputeForward( Desc_Handle, X )
     ```

     On input,

     $X(j) = w_j$, $j = 0,1,...,n-1$.

     On output,

     Output data stored in one of formats: Pack, Perm or CCS (see Packed formats).

     CCS format: $X(2*k) = Re(z_k)$, $X(2*k+1) = Im(z_k)$, $k = 0,1,...,m$.

     Pack format:

     even n: $X(0) = Re(z_0)$, $X(2*k-1) = Re(z_k)$, $X(2*k) = Im(z_k)$, $k = 1,...,m-1$, and $X(n-1) = Re(z_m)$

     odd n: $X(0) = Re(z_0)$, $X(2*k-1) = Re(z_k)$, $X(2*k) = Im(z_k)$, $k = 1,...,m$

     Perm format:

     even n: $X(0) = Re(z_0)$, $X(1) = Re(z_m)$, $X(2*k) = Re(z_k)$, $X(2*k+1) = Im(z_k)$, $k = 1,...,m-1$,

     odd n: $X(0) = Re(z_0)$, $X(2*k-1) = Re(z_k)$, $X(2*k) = Im(z_k)$, $k = 1,...,m$.

     See Example C-6, Example C-8, Example C-10, and Example C-11.

     Input and output data exchange the roles in the backward transform.

   - A typical usage of out-of-place transform is as follows:

     ```
     // m = floor( n/2 )
     REAL :: X(0:n-1)
     REAL :: Y(0:2*m+1)
     ...some other code...
     ...assuming out-of-place transform...
     Status = DftiComputeForward( Desc_Handle, X, Y )
     ```

     On input, $X(j) = w_j$, $j = 0,1,...,n-1$.

On output,

Output data stored in one of formats: `Pack`, `Perm` or `CCS` (see Packed formats).

CCS format: $Y(2*k) = Re(z_k),\ Y(2*k+1) = Im(z_k),\ k = 0,1,...,m.$

Pack format:

even n: $Y(0) = Re(z_0),\ Y(2*k-1) = Re(z_k),\ Y(2*k) = Im(z_k),\ k = 1,...,m-1,$ and $Y(n-1) = Re(z_m)$

odd n: $Y(0) = Re(z_0),\ Y(2*k-1) = Re(z_k),\ Y(2*k) = Im(z_k),\ k = 1,...,m$

Perm format:

even n: $Y(0) = Re(z_0),\ Y(1) = Re(z_m),\ Y(2*k) = Re(z_k)\ ,\ Y(2*k+1) = Im(z_k),\ k = 1,...,m-1,$

odd n: $Y(0) = Re(z_0),\ Y(2*k-1) = Re(z_k),\ Y(2*k) = Im(z_k),\ k = 1,...,m.$

Notice that if the stride of the output array is not set to the default value unit stride, the real and imaginary parts of one complex element will be placed with this stride.

For example:

CCS format: $Y(2*k*s) = Re(z_k),\ Y((2*k+1)*s) = Im(z_k),\ k = 0,1,\ ...,\ m,$ *s* - stride.

See Example C-7 and Example C-9.

Input and output data exchange the roles in the backward transform.

2. **DFTI_REAL_REAL** for real domain, **DFTI_COMPLEX_COMPLEX** for conjugate-even domain. It is used for 1D, 2D and 3D REAL FFT. The CCE format is set by default. You must explicitly set the storage scheme in this case, because its value is not the default one.

   - A typical usage of in-place transform is as follows:

     ```
     // m = floor( n/2 )
     REAL :: X(0:m*2)
     ...some other code...
     ...assuming in-place transform...
     Status = DftiSetValue( Desc_Handle,  DFTI_CONJUGATE_EVEN_STORAGE, DFTI_COMPLEX_COMPLEX)
     ...
     Status = DftiComputeForward( Desc_Handle, X)
     ```

     On input,

     $X(j) = w_j,\ j = 0,1,...,n-1.$

     On output,

     $X(2*k) = Re(z_k),\ X(2*k+1) = Im(z_k),\ k = 0,1,...,m.$

     See Example C-16.

     Input and output data exchange the roles in the backward transform.

- A typical usage of out-of-place transform is as follows:

```
// m = floor( n/2 )
REAL :: X(0:n-1)
COMPLEX :: Y(0:m)
...some other code...
...assuming out-of-place transform...
Status = DftiSetValue( Desc_Handle,  DFTI_CONJUGATE_EVEN_STORAGE, DFTI_COMPLEX_COMPLEX)
...
Status = DftiComputeForward( Desc_Handle, X, Y )
```

  On input,

  $X(j) = w_j,\ j = 0,1,\ldots,n-1.$

  On output,

  $Y(k) = z_k,\ k = 0,1,\ldots,m.$

  See Example C-17 and Example C-18

  Input and output data exchange the roles in the backward transform.

3. **DFTI_REAL_COMPLEX** for real domain, **DFTI_COMPLEX_COMPLEX** for conjugate-even domain. It is not used in the current version. See Note in the "FFT Interface" section for details. A typical usage is as follows:

```
// m = floor( n/2 )
COMPLEX :: X(0:m)
...some other code...
...inplace transform...
Status = DftiComputeForward( Desc_Handle, X )
```

   On input,

   $X(j) = w_j,\ j = 0,1,\ldots,n-1.$

   That is, the imaginary parts of `X(j)` are zero.

   On output,

   $Y(k) = z_k,\ k = 0,1,\ldots,m,$

   where `m` is `floor( n/2 )`.

Number of user threads

Customer application can be parallelized by using the following techniques:

a. You do not create threads in your application but specify the parallel mode within the FFT module of Intel MKL. See *Intel MKL User's Guide* for more information on how to do this. See also Example C-19 in Appendix C.

b. You create threads in the application yourself and have each thread perform all stages of FFT implementation, including descriptor initialization, FFT computation, and descriptor deallocation. In this case, each descriptor is used only within its corresponding thread. It is recommended to set single-threaded mode for Intel MKL. See Example C-20 in Appendix C.

c. You create threads in the application yourself after initializing all FFT descriptors. This implies that threading is employed for parallel FFT computation only, and the descriptors are released upon return from the parallel region. In this case, each descriptor is used only within its corresponding thread. It is obligatory to explicitly set the single-threaded mode for Intel MKL, otherwise, the actual number of threads may differ from one, because the `DftiCommitDescriptor` function is not in a parallel region. See Example C-21 in Appendix C.

d. You create threads in the application yourself after initializing the only FFT descriptor. This implies that threading is employed for parallel FFT computation only, and the descriptor is released upon return from the parallel region. In this case, each thread uses the same descriptor. See Example C-22 in Appendix C.

In cases "a", "b", and "c", listed above, set the parameter `DFTI_NUMBER_OF_USER_THREADS` to 1 (its default value), since each particular descriptor instance is used only in a single thread.

In case "d", you must use the `DftiSetValue()` function to set the `DFTI_NUMBER_OF_USER_THREADS` to the actual number of FFT computation threads, because multiple threads will be using the same descriptor. If this setting is not done, your program will work incorrectly or fail, since the descriptor contains individual data for each thread.

WARNING.

- It is not recommended to simultaneously parallelize your program and employ the Intel MKL internal threading because this will slow down the performance. Note that in case "d" above, FFT computation is automatically initiated in a single-threading mode.
- You must not change the number of threads after the `DftiCommitDescriptor()` function completed FFT initialization.

Input and output distances

FFT interface in Intel MKL allows the computation of multiple number of transforms. Consequently, the user needs to be able to specify the data distribution of these multiple sets of data. This is accomplished by the distance between the first data element of the consecutive data sets. This parameter is obligatory if multiple number is more than one. The parameter is a value of `Integer` data type in Fortran and `MKL_LONG` data type in C. Data sets don't have any common elements. The following example illustrates the specification. Consider computing the forward FFT on three 32-length complex sequences stored in `X(0:31, 1)`, `X(0:31, 2)`, and `X(0:31, 3)`. Suppose the results are to be stored in the locations `Y(0:31, k)`, k = 1, 2, 3, of the array `Y(0:63, 3)`. Thus the input distance is 32, while the output distance is 64. Notice that the data and result parameters in computation functions are all declared as assumed-size rank-1 array `DIMENSION(0:*)`. Therefore two-dimensional array must be transformed to one-dimensional array by `EQUIVALENCE` statement or other facilities of Fortran. Here is the code fragment:

```
Complex :: X_2D(0:31,3), Y_2D(0:63, 3)
```

```
Complex :: X(96), Y(192)
Equivalence (X_2D, X)
Equivalence (Y_2D, Y)
...................
Status = DftiCreateDescriptor(Desc_Handle, DFTI_SINGLE,

 DFTI_COMPLEX, 1, 32)
Status = DftiSetValue(Desc_Handle, DFTI_NUMBER_OF_TRANSFORMS, 3)
Status = DftiSetValue(Desc_Handle, DFTI_INPUT_DISTANCE, 32)
Status = DftiSetValue(Desc_Handle, DFTI_OUTPUT_DISTANCE, 64)
Status = DftiSetValue(Desc_Handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE)
Status = DftiCommitDescriptor(Desc_Handle)
Status = DftiComputeForward(Desc_Handle, X, Y)
Status = DftiFreeDescriptor(Desc_Handle)
```

Strides

In addition to supporting transforms of multiple number of datasets, FFT interface supports non-unit stride distribution of data within each data set. The parameter is an array of values of `Integer` data type in Fortran and `MKL_LONG` data type in C.

The stride values determine the memory layout of the input and output data.

An input data element $X(n_1, n_2, ..., n_D)$ of a D-dimensional transform is located at offset $nth*idistance + istride[0] + n_1*istride[1] + ... + n_D*istride[D]$ from the first element (the element pointed to by X). Here $nth = 0, ..., M - 1$ with M being the number of transforms defined by the `DFTI_NUMBER_OF_TRANSFORMS` configuration parameter, *idistance* is the spacing between the first elements of the data for the multiple transforms, as defined by the `DFTI_INPUT_DISTANCE` configuration parameter, and *istride* is the array of strides defined by the `DFTI_INPUT_STRIDES` configuration parameter.

Provide positive stride values, except the first value of the stride arrays, which is an offset and therefore is not constrained.

The offset is counted in sizes of the respective data type rather than bytes. The type of the elements is defined by the descriptor configuration rather than by the type of the variable passed to the computation functions.

The `DFTI_FORWARD_DOMAIN`, `DFTI_COMPLEX_STORAGE`, `DFTI_CONJUGATE_EVEN_STORAGE`, and `DFTI_PACKED_FORMAT` configuration parameters define the type of the elements as shown in Table 11-16a.

The output data layout depends on the `DFTI_PLACEMENT` configuration parameter:

- For out-of-place transforms, the output data is stored similarly to the input data, with the distance and stride defined by the `DFTI_OUTPUT_DISTANCE` and `DFTI_OUTPUT_STRIDES` configuration parameters, respectively.
- For in-place transforms, `DFTI_OUTPUT_STRIDES` is disregarded unless it is a real to CCE transform, where forward and backward domains are associated with different element types. For a real to CCE transform, you must set the output strides explicitly.

Table 11-16a Assumed Element Types of the Input/Output Data

Descriptor Configuration	Element Type in the Forward Domain	Element Type in the Backward Domain
DFTI_FORWARD_DOMAIN=DFTI_COMPLEX DFTI_COMPLEX_STORAGE=DFTI_COMPLEX_COMPLEX	Complex	Complex
DFTI_FORWARD_DOMAIN=DFTI_COMPLEX DFTI_COMPLEX_STORAGE=DFTI_REAL_REAL	Real	Real
DFTI_FORWARD_DOMAIN=DFTI_REAL DFTI_CONJUGATE_EVEN_STORAGE=DFTI_COMPLEX_REAL DFTI_PACKED_FORMAT={DFTI_CCS_FORMAT, DFTI_PACK_FORMAT, DFTI_PERM_FORMAT}	Real	Real
DFTI_FORWARD_DOMAIN=DFTI_REAL DFTI_CONJUGATE_EVEN_STORAGE=DFTI_COMPLEX_COMPLEX DFTI_PACKED_FORMAT=DFTI_CCE_FORMAT	Real	Complex

Consider the following situation where a 32-length FFT is to be computed on the sequence `xj, 0≤j<32`. The actual location of these values are in `X(5), X(7), ..., X(67)` of an array `X(1:68)`. The stride accommodated by the FFT interface consists of a displacement from the first element of the data array *L0*, (4 in this case), and a constant distance of consecutive elements *L1* (2 in this case). Thus for the Fortran array `X`

`x`*`j`* `= X(1 +` *`L0`* `+` *`L1`* `*` *`j`*`) = X(5 +` *`L1`* `*` *`j`*`).`

This stride vector (4,2) is provided by a length-2 rank-1 integer array:

```
COMPLEX :: X(68)
INTEGER :: Stride(2)
.................
Status = DftiCreateDescriptor(Desc_Handle, DFTI_SINGLE,
 DFTI_COMPLEX, 1, 32)
Stride = (/ 4, 2 /)
Status = DftiSetValue(Desc_Handle, DFTI_INPUT_STRIDES, Stride)
Status = DftiSetValue(Desc_Handle, DFTI_OUTPUT_STRIDES, Stride)
Status = DftiCommitDescriptor(Desc_Handle)
Status = DftiComputeForward(Desc_Handle, X)
Status = DftiFreeDescriptor(Desc_Handle)
```

In general, for a *d*-dimensional transform, the stride is provided by a *d*+1-length integer vector (*L0*, *L1*, *L2*, ..., *Ld*) with the meaning:

L0 = displacement from the first array element

L1 = distance between consecutive data elements in the first dimension

L2 = distance between consecutive data elements in the second dimension

... = ...

Ld = distance between consecutive data elements in the *d*-th dimension.

A *d*-dimensional data sequence

$X_{j_1, j_2, \dots, j_d}$, $0 \le j_i \le J_i$, $1 \le i \le d$

will be stored in the rank-1 array *X* by the mapping

$X_{j_1, j_2, \dots, j_d} = X$ (first index + $L0 + j_1\ L1 + j_2\ L2 + \dots + j_d\ Ld$) .

For multiple transforms, the value *L0* applies to the first data sequence, and *Lj*, *j* = 1, 2,..., *d* apply to all the data sequences.

In the case of a single one-dimensional sequence, *L1* is simply the usual stride. The default setting of strides in the general multi-dimensional situation corresponds to the case where the sequences are distributed tightly into the array:

$$L_1 = 1, L_2 = J_1, L_3 = J_1 J_2, \dots, L_d = \prod_{i=1}^{d-1} J_i$$

Both the input data and output data have a stride associated with it. The default is set in accordance with the data to be stored contiguously in memory in a way that is natural to the language.

Note that in case of a real FFT, where different formats are available, the default value is not the one that seems most natural for certain formats. For example, with the *CCE* format, strides are set by default to *L1* = 1, *L2* = *J1* for a real transform regardless. However, for a complex matrix, slightly over half of the matrix is actually stored, and you should set strides to *L1* = 1, *L2* = *J1*/2+1. In case of an *in-place* transform with the *CCE* data format, even for a real array, you should set strides explicitly: *L1* = 1, *L2* = (*J1*/2+1)*2.

See Example C-15 as an illustration of how to use the configuration parameters discussed above. See Storage schemes and Packed formats on how to define arrays for different formats.

Ordering

It is well known that a number of FFT algorithms apply an explicit permutation stage that is time consuming [4]. The exclusion of this step is similar to applying FFT to input data whose order is scrambled, or allowing a scrambled order of the FFT results. In applications such as convolution and power spectrum calculation, the order of result or data is unimportant and thus permission of scrambled order is attractive if it leads to higher performance. The following options are available in Intel MKL:

- `DFTI_ORDERED`: Forward transform data ordered, backward transform data ordered (default option).
- `DFTI_BACKWARD_SCRAMBLED`: Forward transform data ordered, backward transform data scrambled.

Table 11-17 tabulates the effect on this configuration setting.

Table 11-17 Scrambled Order Transform

	`DftiComputeForward`	`DftiComputeBackward`
`DFTI_ORDERING`	Input → Output	Input → Output

	DftiComputeForward	DftiComputeBackward
DFTI_ORDERED	ordered → ordered	ordered → ordered
DFTI_BACKWARD_SCRAMBLED	ordered → scrambled	scrambled → ordered

Note that meaning of the latter two options are "allow scrambled order if practical." There are situations where in fact allowing out of order data gives no performance advantage, and thus an implementation may choose to ignore the suggestion. Strictly speaking, the normal order is also a scrambled order, the trivial one.

Transposition

This is an option that allows for the result of a high-dimensional transform to be presented in a transposed manner. The default setting is DFTI_NONE and can be set to DFTI_ALLOW. Similar to that of scrambled order, sometimes in higher dimension transform, performance can be gained if the result is delivered in a transposed manner. FFT interface offers an option for the output be returned in a transposed form if performance gain is possible. Since the generic stride specification is naturally suited for representation of transposition, this option allows the strides for the output to be possibly different from those originally specified by the user. Consider an example where a two-dimensional result

$Y_{j_1,j_2},\ 0 \le j_i < n_i,$

is expected. Originally the user specified that the result be distributed in the (flat) array Y in with generic strides $L_1 = 1$ and $L_2 = n_1$. With the transposition option, the computation may actually return the result into Y with stride $L_1 = n_2$ and $L_2 = 1$. These strides can be obtained from an appropriate inquiry function. Note also that in dimension 3 and above, transposition means an arbitrary permutation of the dimension.

Cluster FFT Functions

This section describes the cluster Fast Fourier Transform (FFT) functions implemented in Intel® MKL.

NOTE. These functions are available only for the Linux* and Windows* operating systems.

The cluster FFT function library was designed to perform fast Fourier transforms on a cluster, that is, a group of computers interconnected via a network. Each computer (node) in the cluster has its own memory and processor(s). Data interchanges between the nodes are provided by the network.

One or more processes may be running in parallel on each cluster node. To organize communication between different processes, the cluster FFT function library uses the Message Passing Interface (MPI). To avoid dependence on a specific MPI implementation (for example, MPICH, Intel® MPI, and others), the library works with MPI via a message-passing library for linear algebra called BLACS.

Cluster FFT functions of Intel MKL provide one-dimensional, two-dimensional, and multi-dimensional (up to the order of 7) functions and both Fortran and C interfaces for all transform functions.

To develop applications using the cluster FFT functions, you should have basic skills in MPI programming.

The interfaces for the Intel MKL cluster FFT functions are similar to the corresponding interfaces for the conventional Intel MKL FFT functions, described earlier in this chapter. Refer there for details not explained in this section.

Table 11-18 lists cluster FFT functions implemented in Intel MKL:

Table 11-18 Cluster FFT Functions in Intel MKL

Function Name	Operation
Descriptor Manipulation Functions	
DftiCreateDescriptorDM	Allocates memory for the descriptor data structure and preliminarily initializes it.
DftiCommitDescriptorDM	Performs all initialization for the actual FFT computation.
DftiFreeDescriptorDM	Frees memory allocated for a descriptor.
FFT Computation Functions	
DftiComputeForwardDM	Computes the forward FFT.
DftiComputeBackwardDM	Computes the backward FFT.
Descriptor Configuration Functions	
DftiSetValueDM	Sets one particular configuration parameter with the specified configuration value.
DftiGetValueDM	Gets the value of one particular configuration parameter.

Computing Cluster FFT

The cluster FFT functions described later in this section are provided with Fortran and C interfaces. Fortran stands for Fortran 95.

Cluster FFT computation is performed by DftiComputeForwardDM and DftiComputeBackwardDM functions, called in a program using MPI, which will be referred to as MPI program. After an MPI program starts, a number of processes are created. MPI identifies each process by its rank. The processes are independent of one another and communicate via MPI. A function called in an MPI program is invoked in all the processes. Each process manipulates data according to its rank. Input or output data for a cluster FFT transform is a sequence of real or complex values. A cluster FFT computation function operates local part of the input data, i.e. some part of the data to be operated in a particular process, as well as generates local part of the output data. While each process performs its part of computations, running in parallel and communicating through MPI, the processes perform the entire FFT computation. FFT computations using the Intel MKL cluster FFT functions are typically effected by a number of steps listed below:

1. Initiate MPI by calling `MPI_Init` in C/C++ or `MPI_INIT` in Fortran (the function must be called prior to calling any FFT function and any MPI function).
2. Allocate memory for the descriptor and create it by calling DftiCreateDescriptorDM.
3. Specify one of several values of configuration parameters by one or more calls to DftiSetValueDM.
4. Obtain values of configuration parameters needed to create local data arrays; the values are retrieved by calling DftiGetValueDM.
5. Initialize the descriptor for the FFT computation by calling DftiCommitDescriptorDM.
6. Create arrays for local parts of input and output data and fill the local part of input data with values. (For more information, see Distributing Data among Processes.)
7. Compute the transform by calling DftiComputeForwardDM or DftiComputeBackwardDM.

8. Gather local output data into the global array using MPI functions. (This step is optional because you may need to immediately employ the data differently.)
9. Release memory allocated for the descriptor by calling DftiFreeDescriptorDM.
10. Finalize communication through MPI by calling MPI_Finalize in C/C++ or MPI_FINALIZE in Fortran (the function must be called after the last call to a cluster FFT function and the last call to an MPI function).

Several code examples in the "Examples for Cluster FFT Functions" section in Appendix C illustrate cluster FFT computations.

Distributing Data among Processes

The Intel MKL cluster FFT functions store all input and output multi-dimensional arrays (matrices) in one-dimensional arrays (vectors). The arrays are stored in the row-major order in C/C++ and in the column-major order in Fortran. For example, a two-dimensional matrix A of size (*m, n*) is stored in a vector B of size *m*n* so that

- B[i*n+j]=A[i][j] in C/C++ (*i=0, ..., m-1, j=0, ..., n-1*)
- B(j*m+i)=A(i,j) in Fortran (*i=1, ..., m, j=1, ..., n*).

NOTE. Order of FFT dimensions is the same as the order of array dimensions in the programming language. For example, a 3-dimensional FFT with Lengths=(*m, n, l*) can be computed over an array Ar[m][n][l] in C/C++ or AR(m,n,l) in Fortran.

All MPI processes involved in cluster FFT computation operate their own portions of data. These local arrays make up the virtual global array that the fast Fourier transform is applied to. It is your responsibility to properly allocate local arrays (if needed), fill them with initial data and gather resulting data into an actual global array or process the resulting data differently. To be able do this, see sections below on how the virtual global array is composed of the local ones.

Multi-dimensional transforms

If the dimension of transform is greater than one, the cluster FFT function library splits data in the dimension whose index changes most slowly, so that the parts contain all elements with several consecutive values of this index. It is the first dimension in C and the last one in Fortran. If the global array is two-dimensional, in C, it gives each process several consecutive rows. The term "rows" will be used regardless of the array dimension and programming language. Local arrays are placed in memory allocated for the virtual global array consecutively, in the order determined by process ranks. For example, in case of two processes, during the computation of a three-dimensional transform whose matrix has size (11,15,12), the processes may store local arrays of sizes (6,15,12) and (5,15,12), respectively.

If *p* is the number of MPI processes and the matrix of a transform to be computed has size (*m, n, l*), in C, each MPI process works with local data array of size (m_q , *n, l*), where $\Sigma m_q=m$, *q=0, ... , p-1*. Local input arrays must contain appropriate parts of the actual global input array, and then local output arrays will contain appropriate parts of the actual global output array. You can figure out which particular rows of the global array the local array must contain from the following configuration parameters of the cluster FFT interface: CDFT_LOCAL_NX, CDFT_LOCAL_START_X, and CDFT_LOCAL_SIZE. To retrieve values of the parameters, use the DftiGetValueDM function:

- CDFT_LOCAL_NX specifies how many rows of the global array the current process receives.
- CDFT_LOCAL_START_X specifies which row of the global input or output array corresponds to the first row of the local input or output array. If A is a global array and L is the appropriate local array, then

- L[i][j][k]=A[i+cdft_local_start_x][j][k], where *i=0, ..., m_q-1, j=0, ..., n-1, k=0, ..., l-1* for C/C++
- L(i,j,k)=A(i,j,k+cdft_local_start_x-1), where *i=1, ..., m, j=1, ..., n, k=1, ..., l_q* for Fortran.

Example C-23 in Appendix C shows how the data is distributed among processes for a two-dimensional cluster FFT computation.

One-dimensional transforms

In this case, input and output data are distributed among processes differently and even the numbers of elements stored in a particular process before and after the transform may be different. Each local array stores a segment of consecutive elements of the appropriate global array. Such segment is determined by the number of elements and a shift with respect to the first array element. So, to specify segments of the global input and output arrays that a particular process receives, *four* configuration parameters are needed: CDFT_LOCAL_NX, CDFT_LOCAL_START_X, CDFT_LOCAL_OUT_NX, and CDFT_LOCAL_OUT_START_X. Use the DftiGetValueDM function to retrieve their values. The meaning of the four configuration parameters depends upon the type of the transform, as shown in Table 11-19:

Table 11-19 Data Distribution Configuration Parameters for 1D Transforms

Meaning of the Parameter	Forward Transform	Backward Transform
Number of elements in input array	CDFT_LOCAL_NX	CDFT_LOCAL_OUT_NX
Elements shift in input array	CDFT_LOCAL_START_X	CDFT_LOCAL_OUT_START_X
Number of elements in output array	CDFT_LOCAL_OUT_NX	CDFT_LOCAL_NX
Elements shift in output array	CDFT_LOCAL_OUT_START_X	CDFT_LOCAL_START_X

Memory size for local data

The memory size needed for local arrays cannot be just calculated from CDFT_LOCAL_NX (CDFT_LOCAL_OUT_NX), because the cluster FFT functions sometimes require allocating a little bit more memory for local data than just the size of the appropriate sub-array. The configuration parameter CDFT_LOCAL_SIZE specifies the size of the local input and output array in data elements. Each local input and output arrays must have size not less than CDFT_LOCAL_SIZE*size_of_element. Note that in the current implementation of the cluster FFT interface, data elements can be real or complex values, each complex value consisting of the real and imaginary parts. If you employ a user-defined workspace for in-place transforms (for more information, refer to Table 11-20), it must have the same size as the local arrays. Example C-24 in Appendix C illustrates how the cluster FFT functions distribute data among processes in case of a one-dimensional FFT computation effected with a user-defined workspace.

Available Auxiliary Functions

If a global input array is located on one MPI process and you want to obtain its local parts or you want to gather the global output array on one MPI process, you can use functions MKL_CDFT_ScatterData and MKL_CDFT_GatherData to distribute or gather data among processes, respectively. These functions are defined

in a file that is delivered with Intel MKL and located in the following subdirectory of the Intel MKL installation directory: `examples/cdftc/examples_support.c` for C/C++ and `examples/cdftf/examples_support.f90` for Fortran.

Restriction on Lengths of Transforms

The algorithm that the Intel MKL cluster FFT functions use to distribute data among processes imposes a restriction on lengths of transforms with respect to the number of MPI processes used for the FFT computation:

- For a multi-dimensional transform, lengths of the first two dimensions in C/C++ or of the last two dimensions in Fortran must be not less than the number of MPI processes.
- Length of a one-dimensional transform must be the product of two integers each of which is not less than the number of MPI processes.

Non-compliance with the restriction causes an error `CDFT_SPREAD_ERROR` (refer to Error Codes for details). To achieve the compliance, you can change the transform lengths and/or the number of MPI processes, which is specified at start of an MPI program. MPI-2 enables changing the number of processes during execution of an MPI program.

Cluster FFT Interface

To use the cluster FFT functions, you need to access the module `MKL_CDFT` through the "`use`" statement in Fortran; or access the header file `mkl_cdft.h` through "`include`" in C/C++.

The Fortran interface provides a derived type `DFTI_DESCRIPTOR_DM`; a number of named constants representing various names of configuration parameters and their possible values; and a number of overloaded functions through the generic functionality of Fortran 95.

The C interface provides a structure type `DFTI_DESCRIPTOR_DM_HANDLE` and a number of functions, some of which accept a different number of input arguments.

To provide communication between parallel processes through MPI, the following include statement must be present in your code:

- Fortran:

  ```
  INCLUDE "mpif.h"
  ```

  (for some MPI versions, "`mpif90.h`" header may be used instead).
- C/C++:

  ```
  #include "mpi.h"
  ```

There are three main categories of the cluster FFT functions in Intel MKL:

1. **Descriptor Manipulation**. There are three functions in this category. The `DftiCreateDescriptorDM` function creates an FFT descriptor whose storage is allocated dynamically. The `DftiCommitDescriptorDM` function "commits" the descriptor to all its settings. The `DftiFreeDescriptorDM` function frees up the memory allocated for the descriptor.
2. **FFT Computation**. There are two functions in this category. The `DftiComputeForwardDM` function performs the forward FFT computation, and the `DftiComputeBackwardDM` function performs the backward FFT computation.

3. **Descriptor Configuration**. There are two functions in this category. The `DftiSetValueDM` function sets one specific configuration value to one of the many configuration parameters. The `DftiGetValueDM` function gets the current value of any of these configuration parameters, all of which are readable. These parameters, though many, are handled one at a time.

Descriptor Manipulation Functions

There are three functions in this category: create a descriptor, commit a descriptor, and free a descriptor.

CreateDescriptorDM

Allocates memory for the descriptor data structure and preliminarily initializes it.

Syntax

Fortran:

```
Status = DftiCreateDescriptorDM(comm, handle, v1, v2, dim, size)
Status = DftiCreateDescriptorDM(comm, handle, v1, v2, dim, sizes)
```

C/C++:

```
status = DftiCreateDescriptorDM(comm, &handle, v1, v2, dim, size );
status = DftiCreateDescriptorDM(comm, &handle, v1, v2, dim, sizes );
```

Input Parameters

comm	MPI communicator, e.g. `MPI_COMM_WORLD`.
v1	Precision of the transform.
v2	Type of the forward domain. Must be `DFTI_COMPLEX` for complex-to-complex transforms or `DFTI_REAL` for real-to-complex transforms.
dim	Dimension of the transform.
size	Length of the transform in a one-dimensional case.
sizes	Lengths of the transform in a multi-dimensional case.

Output Parameters

handle	Pointer to the descriptor handle of transform. If the function completes successfully, the pointer to the created handle is stored in the variable.

Description

The function is declared in the `mkl_cdft.h` header file for the C interface and `mkl_cdft.f90` header file for the Fortran interface. This function allocates memory in a particular MPI process for the descriptor data structure and instantiates it with default configuration settings with respect to the precision, domain, dimension, and length of the desired transform. The domain is understood to be the domain of the forward transform. The result is a

pointer to the created descriptor. This function is slightly different from the "initialization" function DftiCommitDescriptorDM in a more traditional software packages or libraries used for computing the FFT. This function does not perform any significant computation work, such as twiddle factors computation, because the default configuration settings can still be changed using the function DftiSetValueDM.

The value of the parameter *v1* is specified through named constants DFTI_SINGLE and DFTI_DOUBLE. It corresponds to precision of input data, output data, and computation. A setting of DFTI_SINGLE indicates single-precision floating-point data type and a setting of DFTI_DOUBLE indicates double-precision floating-point data type.

The parameter *dim* is a simple positive integer indicating the dimension of the transform.

In C/C++, for one-dimensional transforms, length is a single integer value of the parameter *size* having type MKL_LONG; for multi-dimensional transforms, length is supplied with the parameter *sizes*, which is an array of integers having type MKL_LONG. In Fortran, length is an integer or an array of integers.

Return Values

The function returns DFTI_NO_ERROR when completes successfully. In this case, the pointer to the created descriptor handle is stored in *handle*. If the function fails, it returns a value of another error class constant (for the list of constants, refer to the Error Codes section).

Interface and Prototype

```
! Fortran Interface
INTERFACE DftiCreateDescriptorDM
    INTEGER(4) FUNCTION DftiCreateDescriptorDMn(C,H,P1,P2,D,L)
        TYPE(DFTI_DESCRIPTOR_DM), POINTER :: H
        INTEGER(4) C,P1,P2,D,L(*)
    END FUNCTION
    INTEGER(4) FUNCTION DftiCreateDescriptorDM1(C,H,P1,P2,D,L)
        TYPE(DFTI_DESCRIPTOR_DM), POINTER :: H
        INTEGER(4) C,P1,P2,D,L
    END FUNCTION
END INTERFACE

/* C/C++ prototype */
MKL_LONG DftiCreateDescriptorDM(MPI_Comm,DFTI_DESCRIPTOR_DM_HANDLE*,
   enum DFTI_CONFIG_VALUE,enum DFTI_CONFIG_VALUE,MKL_LONG,...);
```

CommitDescriptorDM

Performs all initialization for the actual FFT computation.

Syntax

Fortran:

```
Status = DftiCommitDescriptorDM(handle)
```

C/C++:

```
status = DftiCommitDescriptorDM(handle);
```

Input Parameters

handle	The descriptor handle. Must be valid, that is, created in a call to `DftiCreateDescriptorDM`.

Description

The function is declared in the `mkl_cdft.h` header file for the C interface and `mkl_cdft.f90` header file for the Fortran interface. The cluster FFT interface requires a function that completes initialization of a previously created descriptor before the descriptor can be used for FFT computations in a particular MPI process. The `DftiCommitDescriptorDM` function performs all initialization that facilitates the actual FFT computation. For the current implementation, it may involve exploring many different factorizations of the input length to search for highly efficient computation method.

Any changes of configuration parameters of a committed descriptor via the set value function (see Descriptor Configuration) requires a re-committal of the descriptor before a computation function can be invoked. Typically, this committal function is called right before a computation function call (see FFT Computation).

Return Values

The function returns `DFTI_NO_ERROR` when completes successfully. If the function fails, it returns a value of another error class constant (for the list of constants, refer to the Error Codes section).

Interface and Prototype

```
! Fortran Interface
INTERFACE DftiCommitDescriptorDM
   INTEGER(4) FUNCTION DftiCommitDescriptorDM(handle);
     TYPE(DFTI_DESCRIPTOR_DM), POINTER :: handle
 END FUNCTION
END INTERFACE

/* C/C++ prototype */
```

```
MKL_LONG DftiCommitDescriptorDM(DFTI_DESCRIPTOR_DM_HANDLE handle);
```

FreeDescriptorDM

Frees memory allocated for a descriptor.

Syntax

Fortran:

```
Status = DftiFreeDescriptorDM(handle)
```

C/C++:

```
status = DftiFreeDescriptorDM(&handle);
```

Input Parameters

handle	The descriptor handle. Must be valid, that is, created in a call to `DftiCreateDescriptorDM`.

Output Parameters

handle	The descriptor handle. Memory allocated for the handle is released on output.

Description

The function is declared in the `mkl_cdft.h` header file for the C interface and `mkl_cdft.f90` header file for the Fortran interface. This function frees up all memory allocated for a descriptor in a particular MPI process. Call the `DftiFreeDescriptorDM` function to delete the descriptor handle. Upon successful completion of `DftiFreeDescriptorDM` the descriptor handle is no longer valid.

Return Values

The function returns `DFTI_NO_ERROR` when completes successfully. If the function fails, it returns a value of another error class constant (for the list of constants, refer to the Error Codes section).

Interface and Prototype

```
! Fortran Interface
INTERFACE DftiFreeDescriptorDM
 INTEGER(4) FUNCTION DftiFreeDescriptorDM(handle)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: handle
   END FUNCTION
END INTERFACE

/* C/C++ prototype */

MKL_LONG DftiFreeDescriptorDM(DFTI_DESCRIPTOR_DM_HANDLE *handle);
```

FFT Computation Functions

There are two functions in this category: compute the forward transform and compute the backward transform.

ComputeForwardDM

Computes the forward FFT.

Syntax

Fortran:

`Status = DftiComputeForwardDM(handle, in_X, out_X)`

`Status = DftiComputeForwardDM(handle, in_out_X)`

C/C++:

`status = DftiComputeForwardDM(handle, in_X, out_X);`

`status = DftiComputeForwardDM(handle, in_out_X);`

Input Parameters

handle	The descriptor handle.
in_X, in_out_X	Local part of input data. Array of complex values. Refer to the Distributing Data among Processes section on how to allocate and initialize the array.

Output Parameters

out_X, in_out_X	Local part of output data. Array of complex values. Refer to the Distributing Data among Processes section on how to allocate the array.

Description

The function is declared in the `mkl_cdft.h` header file for the C interface and `mkl_cdft.f90` header file for the Fortran interface. The `DftiComputeForwardDM` function computes the forward FFT. Forward FFT is the transform using the factor $e^{-i2\pi/n}$.

Before you call the function, the valid descriptor, created by `DftiCreateDescriptorDM`, must be configured and committed using the `DftiCommitDescriptorDM` function.

The computation is carried out by calling the `DftiComputeForward` function. So, the functions have very much in common, and details not explicitly mentioned below can be found in the description of `DftiComputeForward`.

Local part of input data, as well as local part of the output data, is an appropriate sequence of complex values (each complex value consists of two real numbers: real part and imaginary part) that a particular process stores. See the Distributing Data among Processes section for details.

Refer to the Configuration Settings section for the list of configuration parameters that the descriptor passes to the function.

The configuration parameter `DFTI_PRECISION` determines the precision of input data, output data, and transform: a setting of `DFTI_SINGLE` indicates single-precision floating-point data type and a setting of `DFTI_DOUBLE` indicates double-precision floating-point data type.

The configuration parameter `DFTI_PLACEMENT` informs the function whether the computation should be in-place. If the value of this parameter is `DFTI_INPLACE` (default), you must call the function with two parameters, otherwise you must supply three parameters. If `DFTI_PLACEMENT = DFTI_INPLACE` and three parameters are supplied, then the third parameter is ignored.

CAUTION. Even in case of an out-of-place transform, local array of input data *in_X* may be changed. To save data, make its copy before calling `DftiComputeForwardDM`.

In case of an in-place transform, `DftiComputeForwardDM` dynamically allocates and deallocates a work buffer of the same size as the local input/output array requires.

NOTE. You can specify your own workspace of the same size through the configuration parameter `CDFT_WORKSPACE` to avoid redundant memory allocation.

Return Values

The function returns `DFTI_NO_ERROR` when completes successfully. If the function fails, it returns a value of another error class constant (for the list of constants, refer to the Error Codes section).

Interface and Prototype

```
! Fortran Interface
INTERFACE DftiComputeForwardDM
   INTEGER(4) FUNCTION DftiComputeForwardDM(h, in_X, out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
   COMPLEX(8), DIMENSION(*) :: in_x, out_X
   END FUNCTION DftiComputeForwardDM
   INTEGER(4) FUNCTION DftiComputeForwardDMi(h, in_out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      COMPLEX(8), DIMENSION(*) :: in_out_X
   END FUNCTION DftiComputeForwardDMi
   INTEGER(4) FUNCTION DftiComputeForwardDMs(h, in_X, out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      COMPLEX(4), DIMENSION(*) :: in_x, out_X
   END FUNCTION DftiComputeForwardDMs
   INTEGER(4) FUNCTION DftiComputeForwardDMis(h, in_out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      COMPLEX(4), DIMENSION(*) :: in_out_X
   END FUNCTION DftiComputeForwardDMis
END INTERFACE

/*   C/C++ prototype */
MKL_LONG DftiComputeForwardDM(DFTI_DESCRIPTOR_DM_HANDLE handle, void *in_X,...);
```

ComputeBackwardDM

Computes the backward FFT.

Syntax

Fortran:

`Status = DftiComputeBackwardDM(`*`handle`*`, `*`in_X`*`, `*`out_X`*`)`

`Status = DftiComputeBackwardDM(`*`handle`*`, `*`in_out_X`*`)`

C/C++:

```
status = DftiComputeBackwardDM(handle, in_X, out_X);
status = DftiComputeBackwardDM(handle, in_out_X);
```

Input Parameters

handle	The descriptor handle.
in_X, in_out_X	Local part of input data. Array of complex values. Refer to the Distributing Data among Processes section on how to allocate and initialize the array.

Output Parameters

out_X, in_out_X	Local part of output data. Array of complex values. Refer to the Distributing Data among Processes section on how to allocate the array.

Description

The function is declared in the `mkl_cdft.h` header file for the C interface and `mkl_cdft.f90` header file for the Fortran interface. The `DftiComputeBackwardDM` function computes the backward FFT. Backward FFT is the transform using the factor $e^{i2\pi/n}$.

Before you call the function, the valid descriptor, created by `DftiCreateDescriptorDM`, must be configured and committed using the `DftiCommitDescriptorDM` function.

The computation is carried out by calling the `DftiComputeBackward` function. So, the functions have very much in common, and details not explicitly mentioned below can be found in the description of `DftiComputeBackward`.

Local part of input data, as well as local part of the output data, is an appropriate sequence of complex values (each complex value consists of two real numbers: real part and imaginary part) that a particular process stores. See the Distributing Data among Processes section for details.

Refer to the Configuration Settings section for the list of configuration parameters that the descriptor passes to the function.

The configuration parameter `DFTI_PRECISION` determines the precision of input data, output data, and transform: a setting of `DFTI_SINGLE` indicates single-precision floating-point data type and a setting of `DFTI_DOUBLE` indicates double-precision floating-point data type.

The configuration parameter `DFTI_PLACEMENT` informs the function whether the computation should be in-place. If the value of this parameter is `DFTI_INPLACE` (default), you must call the function with two parameters, otherwise you must supply three parameters. If `DFTI_PLACEMENT = DFTI_INPLACE` and three parameters are supplied, then the third parameter is ignored.

CAUTION. Even in case of an out-of-place transform, local array of input data *in_X* may be changed. To save data, make its copy before calling `DftiComputeBackwardDM`.

In case of an in-place transform, `DftiComputeBackwardDM` dynamically allocates and deallocates a work buffer of the same size as the local input/output array requires.

NOTE. You can specify your own workspace of the same size through the configuration parameter CDFT_WORKSPACE to avoid redundant memory allocation.

Return Values

The function returns DFTI_NO_ERROR when completes successfully. If the function fails, it returns a value of another error class constant (for the list of constants, refer to the Error Codes section).

Interface and Prototype

```
! Fortran Interface
INTERFACE DftiComputeBackwardDM
   INTEGER(4) FUNCTION DftiComputeBackwardDM(h, in_X, out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      COMPLEX(8), DIMENSION(*) :: in_x, out_X
   END FUNCTION DftiComputeBackwardDM
   INTEGER(4) FUNCTION DftiComputeBackwardDMi(h, in_out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      COMPLEX(8), DIMENSION(*) :: in_out_X
   END FUNCTION DftiComputeBackwardDMi
   INTEGER(4) FUNCTION DftiComputeBackwardDMs(h, in_X, out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      COMPLEX(4), DIMENSION(*) :: in_x, out_X
   END FUNCTION DftiComputeBackwardDMs
   INTEGER(4) FUNCTION DftiComputeBackwardDMis(h, in_out_X)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      COMPLEX(4), DIMENSION(*) :: in_out_X
   END FUNCTION DftiComputeBackwardDMis
END INTERFACE

/* C/C++ prototype */
MKL_LONG DftiComputeBackwardDM(DFTI_DESCRIPTOR_DM_HANDLE handle, void *in_X,...);
```

Descriptor Configuration Functions

There are two functions in this category: the value setting function DftiSetValueDM sets one particular configuration parameter to an appropriate value, the value getting function DftiGetValueDM reads the value of one particular configuration parameter.

Some configuration parameters used by cluster FFT functions originate from the conventional FFT interface (see Configuration Settings subsection in the "FFT Functions" section for details).

Other configuration parameters are specific to the cluster FFT. Integer values of these parameters have type MKL_LONG in C/C++ and INTEGER(4) in Fortran. The exact type of the configuration parameters being floating-point scalars is float or double in C/C++ and REAL(4) or REAL(8) in Fortran. The configuration parameters whose values are named constants have the enum type in C/C++ and INTEGER in Fortran. They are defined in the mkl_cdft.h header file in C/C++ and MKL_CDFT module in Fortran.

Names of the configuration parameters specific to the cluster FFT interface have prefix CDFT.

SetValueDM

Sets one particular configuration parameter with the specified configuration value.

Syntax

Fortran:

```
Status = DftiSetValueDM (handle, param, value)
```

C/C++:

```
status = DftiSetValueDM (handle, param, value);
```

Input Parameters

handle	The descriptor handle. Must be valid, that is, created in a call to DftiCreateDescriptorDM.
param	Name of a parameter to be set up in the descriptor handle. See Table 11-20 for the list of available parameters.
value	Value of the parameter.

Description

The function is declared in the mkl_cdft.h header file for the C interface and mkl_cdft.f90 header file for the Fortran interface. This function sets one particular configuration parameter with the specified configuration value. The configuration parameter is one of the named constants listed in the table below, and the configuration value must have the corresponding type. See Configuration Settings for details of the meaning of the setting. See Table 11-6 for possible values of the parameters that are named constants.

Table 11-20 Settable Configuration Parameters

Parameter Name	Data Type	Description	Default Value
DFTI_FORWARD_SCALE	Floating-point scalar	Scale factor of forward transform.	1.0
DFTI_BACKWARD_SCALE	Floating-point scalar	Scale factor of backward transform.	1.0
DFTI_PLACEMENT	Named constant	Placement of the computation result.	DFTI_INPLACE
DFTI_ORDERING	Named constant	Scrambling of data order.	DFTI_ORDERED
DFTI_WORKSPACE	Array of an appropriate type	Auxiliary buffer, a user-defined workspace. Enables saving memory during in-place computations.	NULL (allocate workspace dynamically).
DFTI_PACKED_FORMAT	Named constant	Packed format, real data.	• DFTI_PERM_FORMAT — default and the only available value for one-dimensional transforms • DFTI_CCE_FORMAT — default and the only available value for multi-dimensional transforms
DFTI_TRANSPOSE	Named constant	This parameter determines how the output data is located for multi-dimensional transforms. If the parameter value is DFTI_NONE, the data is located in a usual manner described in this manual. If the value is DFTI_ALLOW, the last (first) global transposition is not performed for a forward (backward) transform.	DFTI_NONE

Return Values

The function returns DFTI_NO_ERROR when completes successfully. If the function fails, it returns a value of another error class constant (for the list of constants, refer to the Error Codes section).

Interface and Prototype

```
! Fortran Interface
INTERFACE DftiSetValueDM
   INTEGER(4) FUNCTION DftiSetValueDM(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p, v
   END FUNCTION
   INTEGER(4) FUNCTION DftiSetValueDMd(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p
      REAL(8) :: v
   END FUNCTION
   INTEGER(4) FUNCTION DftiSetValueDMs(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p
      REAL(4) :: v
   END FUNCTION
   INTEGER(4) FUNCTION DftiSetValueDMsw(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p
      COMPLEX(4) :: v(*)
   END FUNCTION
   INTEGER(4) FUNCTION DftiSetValueDMdw(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p
      COMPLEX(8) :: v(*)
   END FUNCTION
END INTERFACE

/* C/C++ prototype */
MKL_LONG DftiSetValueDM(DFTI_DESCRIPTOR_DM_HANDLE handle, int param,...);
```

GetValueDM

Gets the value of one particular configuration parameter.

Syntax

Fortran:

```
Status = DftiGetValueDM(handle, param, value)
```

C/C++:

```
status = DftiGetValueDM(handle, param, &value);
```

Input Parameters

handle	The descriptor handle. Must be valid, that is, created in a call to `DftiCreateDescriptorDM`.
param	Name of a parameter to be retrieved from the descriptor. See Table 11-21 for the list of available parameters.

Output Parameters

value	Value of the parameter.

Description

The function is declared in the `mkl_cdft.h` header file for the C interface and `mkl_cdft.f90` header file for the Fortran interface. This function gets the configuration value of one particular configuration parameter. The configuration parameter is one of the named constants listed in the table below, and the configuration value is the corresponding appropriate type, which can be a named constant or a native type. Possible values of the named constants can be found in Table 11-6.

Table 11-21 Retrievable Configuration Parameters

Parameter Name	Data Type	Description
DFTI_PRECISION	Named constant	Precision of computation, input data and output data.
DFTI_DIMENSION	Integer scalar	Dimension of the transform
DFTI_LENGTHS	Array of integer values	Array of lengths of the transform. Number of lengths corresponds to the dimension of the transform.
DFTI_FORWARD_SCALE	Floating-point scalar	Scale factor of forward transform.
DFTI_BACKWARD_SCALE	Floating-point scalar	Scale factor of backward transform.
DFTI_PLACEMENT	Named constant	Placement of the computation result.
DFTI_COMMIT_STATUS	Named constant	Shows whether descriptor has been committed.

Parameter Name	Data Type	Description
DFTI_FORWARD_DOMAIN	Named constant	Forward domain of transforms, has the value of DFTI_COMPLEX or DFTI_REAL.
DFTI_ORDERING	Named constant	Scrambling of data order.
CDFT_MPI_COMM	Type of MPI communicator	MPI communicator used for transforms.
CDFT_LOCAL_SIZE	Integer scalar	Necessary size of input, output, and buffer arrays in data elements.
CDFT_LOCAL_X_START	Integer scalar	Row/element number of the global array that corresponds to the first row/element of the local array. For more information, see Distributing Data among Processes.
CDFT_LOCAL_NX	Integer scalar	The number of rows/elements of the global array stored in the local array. For more information, see Distributing Data among Processes.
CDFT_LOCAL_OUT_X_START	Integer scalar	Element number of the appropriate global array that corresponds to the first element of the input or output local array in a 1D case. For details, see Distributing Data among Processes.
CDFT_LOCAL_OUT_NX	Integer scalar	The number of elements of the appropriate global array that are stored in the input or output local array in a 1D case. For details, see Distributing Data among Processes.

Return Values

The function returns DFTI_NO_ERROR when completes successfully. If the function fails, it returns a value of another error class constant (for the list of constants, refer to the Error Codes section).

Interface and Prototype

```
! Fortran Interface
INTERFACE DftiGetValueDM
   INTEGER(4) FUNCTION DftiGetValueDM(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p, v
   END FUNCTION
   INTEGER(4) FUNCTION DftiGetValueDMar(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p, v(*)
   END FUNCTION
   INTEGER(4) FUNCTION DftiGetValueDMd(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p
      REAL(8) :: v
   END FUNCTION
   INTEGER(4) FUNCTION DftiGetValueDMs(h, p, v)
      TYPE(DFTI_DESCRIPTOR_DM), POINTER :: h
      INTEGER(4) :: p
      REAL(4) :: v
   END FUNCTION
END INTERFACE

/* C/C++ prototype */
MKL_LONG DftiGetValueDM(DFTI_DESCRIPTOR_DM_HANDLE handle, int param,...);
```

Error Codes

All the cluster FFT functions return an integer value denoting the status of the operation. These values are identified by named constants. Each function returns DFTI_NO_ERROR if no errors were encountered during execution. Otherwise, a function generates an error code. In addition to FFT error codes, the cluster FFT interface has its own ones. Named constants specific to the cluster FFT interface have prefix "CDFT" in names. Table 11-22 lists error codes that the cluster FFT functions may return.

Table 11-22 Error Codes that Cluster FFT Functions Return

Named Constants	Comments
DFTI_NO_ERROR	No error.
DFTI_MEMORY_ERROR	Usually associated with memory allocation.
DFTI_INVALID_CONFIGURATION	Invalid settings of one or more configuration parameters.
DFTI_INCONSISTENT_CONFIGURATION	Inconsistent configuration or input parameters.
DFTI_NUMBER_OF_THREADS_ERROR	Number of OMP threads in the computation function is not equal to the number of OMP threads in the initialization stage (commit function).
DFTI_MULTITHREADED_ERROR	Usually associated with a value that OMP routines return in case of errors.
DFTI_BAD_DESCRIPTOR	Descriptor is unusable for computation.
DFTI_UNIMPLEMENTED	Unimplemented legitimate settings; implementation dependent.
DFTI_MKL_INTERNAL_ERROR	Internal library error.
DFTI_1D_LENGTH_EXCEEDS_INT32	Length of one of dimensions exceeds 2^{32} -1 (4 bytes).
CDFT_SPREAD_ERROR	Data cannot be distributed (For more information, see Distributing Data among Processes.)
CDFT_MPI_ERROR	MPI error. Occurs when calling MPI.

12 PBLAS Routines

This chapter describes the Intel® Math Kernel Library implementation of the PBLAS (Parallel Basic Algebra Subprograms) routines from the ScaLAPACK package for distributed-memory architecture. PBLAS is intended for using for vector-vector, matrix-vector and matrix-matrix operations with the aim of simplifying the parallelization of linear codes. The design of PBLAS is as consistent as possible with that of the BLAS. The routine descriptions are arranged in several sections according to the PBLAS level of operation:

- PBLAS Level 1 Routines (distributed vector-vector operations)
- PBLAS Level 2 Routines (distributed matrix-vector operations)
- PBLAS Level 3 Routines (distributed matrix-matrix operations)

Each section presents the routine and function group descriptions in alphabetical order by routine group name; for example, the `p?asum` group, the `p?axpy` group. The question mark in the group name corresponds to different character indicating the data type (`s`, `d`, `c`, and `z` or their combination); see *Routine Naming Conventions*.

NOTE. PBLAS routines are provided only with Intel® MKL versions for Linux* and Windows* OSs.

Generally, PBLAS runs on a network of computers using MPI as a message-passing layer and a set of prebuilt communication subprograms (BLACS), as well as a set of PBLAS optimized for the target architecture. Intel MKL version of PBLAS is optimized for Intel® processors. For the detailed system and environment requirements see *Intel® MKL Release Notes* and *Intel® MKL User's Guide*.

For full reference on PBLAS routines and related information see http://www.netlib.org/scalapack/html/pblas_qref.html.

Overview

The model of the computing environment for PBLAS is represented as a one-dimensional array of processes or also a two-dimensional process grid. To use PBLAS, all global matrices or vectors must be distributed on this array or grid prior to calling the PBLAS routines.

PBLAS uses the two-dimensional block-cyclic data distribution as a layout for dense matrix computations. This distribution provides good work balance between available processors, as well as gives the opportunity to use PBLAS Level 3 routines for optimal local computations. Information about the data distribution that is required to establish the mapping between each global array and its corresponding process and memory location is contained in the so called *array descriptor* associated with each global array. An example of an array descriptor structure is given in Table 12-1 .

Table 12-1 Content of the array descriptor for dense matrices

Array Element #	Name	Definition
1	*dtype*	Descriptor type (=1 for dense matrices)

Array Element #	Name	Definition
2	*ctxt*	BLACS context handle for the process grid
3	*m*	Number of rows in the global array
4	*n*	Number of columns in the global array
5	*mb*	Row blocking factor
6	*nb*	Column blocking factor
7	*rsrc*	Process row over which the first row of the global array is distributed
8	*csrc*	Process column over which the first column of the global array is distributed
9	*lld*	Leading dimension of the local array

The number of rows and columns of a global dense matrix that a particular process in a grid receives after data distributing is denoted by *LOCr*( ) and *LOCc*( ), respectively. To compute these numbers, you can use the ScaLAPACK tool routine numroc.

After the block-cyclic distribution of global data is done, you may choose to perform an operation on a submatrix of the global matrix *A*, which is contained in the global subarray sub(*A*), defined by the following 6 values (for dense matrices):

m	The number of rows of sub(*A*)
n	The number of columns of sub(*A*)
a	A pointer to the local array containing the entire global array *A*
ia	The row index of sub(*A*) in the global array
ja	The column index of sub(*A*) in the global array
desca	The array descriptor for the global array *A*

Intel MKL provides the PBLAS routines with interface similar to the interface used in the Netlib PBLAS (see http://www.netlib.org/scalapack/html/pblas_qref.html).

Routine Naming Conventions

The naming convention for PBLAS routines is similar to that used for PBLAS routines (see Routine Naming Conventions in Chapter 2). A general rule is that each routine name in PBLAS, which has a BLAS equivalent, is simply the BLAS name prefixed by initial letter p that stands for "parallel".

PBLAS routine names have the following structure:

p <*character*> <*name*> <*mod*> ( )

The <*character*> field indicates the Fortran data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

Some routines and functions can have combined character codes, such as sc or dz.

For example, the function pscasum uses a complex input array and returns a real value.

The <*name*> field, in PBLAS level 1, indicates the operation type. For example, the PBLAS level 1 routines p?dot, p?swap, p?copy compute a vector dot product, vector swap, and copy vector, respectively.

In PBLAS level 2 and 3, <*name*> reflects the matrix argument type:

ge	general matrix
sy	symmetric matrix
he	Hermitian matrix
tr	triangular matrix

In PBLAS level 3, the <*name*>=tran indicates the transposition of the matrix.

The <*mod*> field, if present, provides additional details of the operation. PBLAS level 1 names can have the following characters in the <*mod*> field:

c	conjugated vector
u	unconjugated vector

PBLAS level 2 names can have the following additional characters in the <*mod*> field:

mv	matrix-vector product
sv	solving a system of linear equations with matrix-vector operations
r	rank-1 update of a matrix
r2	rank-2 update of a matrix.

PBLAS level 3 names can have the following additional characters in the <*mod*> field:

mm	matrix-matrix product
sm	solving a system of linear equations with matrix-matrix operations
rk	rank-*k* update of a matrix
r2k	rank-2*k* update of a matrix.

The examples below illustrate how to interpret PBLAS routine names:

pddot	<p> <d> <dot>: double-precision real distributed vector-vector dot product
pcdotc	<p> <c> <dot> <c>: complex distributed vector-vector dot product, conjugated
pscasum	<p> <sc> <asum>: sum of magnitudes of distributed vector elements, single precision real output and single precision complex input
pcdotu	<p> <c> <dot> <u>: distributed vector-vector dot product, unconjugated, complex
psgemv	<p> <s> <ge> <mv>: distributed matrix-vector product, general matrix, single precision
pztrmm	<p> <z> <tr> <mm>: distributed matrix-matrix product, triangular matrix, double-precision complex.

PBLAS Level 1 Routines

PBLAS Level 1 includes routines and functions, which perform distributed vector-vector operations. Table 12-1 lists the PBLAS Level 1 routine groups and the data types associated with them.

Table 12-1 PBLAS Level 1 Routine Groups and Their Data Types

Routine or Function Group	Data Types	Description
p?amax	s, d, c, z	Calculates an index of the distributed vector element with maximum absolute value

Routine or Function Group	Data Types	Description
p?asum	s, d, sc, dz	Calculates sum of magnitudes of a distributed vector
p?axpy	s, d, c, z	Calculates distributed vector-scalar product
p?copy	s, d, c, z	Copies a distributed vector
p?dot	s, d	Calculates a dot product of two distributed real vectors
p?dotc	c, z	Calculates a dot product of two distributed complex vectors, one of them is conjugated
p?dotu	c, z	Calculates a dot product of two distributed complex vectors
p?nrm2	s, d, sc, dz	Calculates the 2-norm (Euclidean norm) of a distributed vector
p?scal	s, d, c, z, cs, zd	Calculates a product of a distributed vector by a scalar
p?swap	s, d, c, z	Swaps two distributed vectors

p?amax

Computes the global index of the element of a distributed vector with maximum absolute value.

Syntax

```
call psamax(n, amax, indx, x, ix, jx, descx, incx)
call pdamax(n, amax, indx, x, ix, jx, descx, incx)
call pcamax(n, amax, indx, x, ix, jx, descx, incx)
call pzamax(n, amax, indx, x, ix, jx, descx, incx)
```

Description

The functions p?amax compute global index of the maximum element in absolute value of a distributed vector sub(*x*),

where sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1.

Input Parameters

n (global) INTEGER. The length of distributed vector sub(*x*), *n*≥0.

x (local) REAL for psamax
DOUBLE PRECISION for pdamax
COMPLEX for pcamax
DOUBLE COMPLEX for pzamax
Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)).

This array contains the entries of the distributed vector sub(*x*).

ix, *jx* (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.

descx (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

amax (global) REAL for psamax.
DOUBLE PRECISION for pdamax.
COMPLEX for pcamax.
DOUBLE COMPLEX for pzamax.
Maximum absolute value (magnitude) of elements of the distributed vector only in its scope.

indx (global) INTEGER. The global index of the maximum element in absolute value of the distributed vector sub(*x*) only in its scope.

p?asum

Computes the sum of magnitudes of elements of a distributed vector.

Syntax

```
call psasum(n, asum, x, ix, jx, descx, incx)
call pscasum(n, asum, x, ix, jx, descx, incx)
call pdasum(n, asum, x, ix, jx, descx, incx)
call pdzasum(n, asum, x, ix, jx, descx, incx)
```

Description

The functions p?asum compute the sum of the magnitudes of elements of a distributed vector sub(*x*), where sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1.

Input Parameters

n (global) INTEGER. The length of distributed vector sub(*x*), *n*≥0.

x (local) REAL for psasum
DOUBLE PRECISION for pdasum
COMPLEX for pscasum
DOUBLE COMPLEX for pdzasum
Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)).
This array contains the entries of the distributed vector sub(*x*).

ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

asum	(local) REAL for psasum and pscasum. DOUBLE PRECISION for pdasum and pdzasum Contains the sum of magnitudes of elements of the distributed vector only in its scope.

p?axpy

Computes a distributed vector-scalar product and adds the result to a distributed vector.

Syntax

```
call psaxpy(n, a, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pdaxpy(n, a, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pcaxpy(n, a, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pzaxpy(n, a, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
```

Description

The p?axpy routines perform the following operation with distributed vectors:

sub(*y*) := sub(*y*) + *a**sub(*x*)

where:

a is a scalar;

sub(*x*) and sub(*y*) are *n*-element distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1;

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy*=*m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy*= 1.

Input Parameters

n	(global) INTEGER. The length of distributed vectors, *n*≥0.
a	(local) REAL for psaxpy DOUBLE PRECISION for pdaxpy COMPLEX for pcaxpy DOUBLE COMPLEX for pzaxpy

	Specifies the scalar *a*.
x	(local) REAL for psaxpy DOUBLE PRECISION for pdaxpy COMPLEX for pcaxpy DOUBLE COMPLEX for pzaxpy Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) REAL for psaxpy DOUBLE PRECISION for pdaxpy COMPLEX for pcaxpy DOUBLE COMPLEX for pzaxpy Array, DIMENSION (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global)INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

y	Overwritten by sub(*y*) := sub(*y*) + *a**sub(*x*).

p?copy

Copies one distributed vector to another vector.

Syntax

```
call pscopy(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pdcopy(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pccopy(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pzcopy(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
```

Description

The p?copy routines perform a copy operation with distributed vectors defined as
sub(*y*) = sub(*x*),

where sub(*x*) and sub(*y*) are *n*-element distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1;

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy*=*m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy*= 1.

Input Parameters

n	(global) INTEGER. The length of distributed vectors, *n*≥0.
x	(local) REAL for pscopy DOUBLE PRECISION for pdcopy COMPLEX for pccopy DOUBLE COMPLEX for pzcopy Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) REAL for pscopy DOUBLE PRECISION for pdcopy COMPLEX for pccopy DOUBLE COMPLEX for pzcopy Array, DIMENSION (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global)INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

y	Overwritten by the distributed vector sub(*x*).

p?dot

Computes the dot product of two distributed real vectors.

Syntax

```
call psdot(n, dot, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pddot(n, dot, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
```

Description

The ?dot functions compute the dot product *dot* of two distributed real vectors defined as

dot = sub(*x*)'*sub(*y*)

where sub(*x*) and sub(*y*) are *n*-element distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1;

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy*=*m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy*= 1.

Input Parameters

n	(global) INTEGER. The length of distributed vectors, *n*≥0.
x	(local) REAL for psdot DOUBLE PRECISION for pddot Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) REAL for psdot DOUBLE PRECISION for pddot Array, DIMENSION (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

dot	(local) REAL for psdot DOUBLE PRECISION for pddot Dot product of sub(*x*) and sub(*y*) only in their scope.

p?dotc

Computes the dot product of two distributed complex vectors, one of them is conjugated.

Syntax

```
call pcdotc(n, dotu, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pzdotc(n, dotu, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
```

Description

The p?dotu functions compute the dot product *dotc* of two distributed vectors one of them is conjugated:

```
dotc  = conjg(sub(x)')*sub(y)
```

where sub(*x*) and sub(*y*) are *n*-element distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1;

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy*=*m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy*= 1.

Input Parameters

n	(global) INTEGER. The length of distributed vectors, *n*≥0.
x	(local) COMPLEX for pcdotc DOUBLE COMPLEX for pzdotc Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) COMPLEX for pcdotc DOUBLE COMPLEX for pzdotc Array, DIMENSION (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.

descy (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.

incy (global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

dotc (local) COMPLEX for pcdotc
DOUBLE COMPLEX for pzdotc
Dot product of sub(*x*) and sub(*y*) only in their scope.

p?dotu

Computes the dot product of two distributed complex vectors.

Syntax

```
call pcdotu(n, dotu, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pzdotu(n, dotu, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
```

Description

The p?dotu functions compute the dot product *dotu* of two distributed vectors defined as

dotu = sub(*x*)'*sub(*y*)

where sub(*x*) and sub(*y*) are *n*-element distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1;

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy*=*m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy*= 1.

Input Parameters

n (global) INTEGER. The length of distributed vectors, *n*≥0.

x (local) COMPLEX for pcdotu
DOUBLE COMPLEX for pzdotu
Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)).
This array contains the entries of the distributed vector sub(*x*).

ix, *jx* (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.

descx (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

y (local) COMPLEX for pcdotu

	DOUBLE COMPLEX for pzdotu Array, DIMENSION (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

dotu	(local) COMPLEX for pcdotu DOUBLE COMPLEX for pzdotu Dot product of sub(*x*) and sub(*y*) only in their scope.

p?nrm2

Computes the Euclidean norm of a distributed vector.

Syntax

```
call psnrm2(n, norm2, x, ix, jx, descx, incx)
call pdnrm2(n, norm2, x, ix, jx, descx, incx)
call pscnrm2(n, norm2, x, ix, jx, descx, incx)
call pdznrm2(n, norm2, x, ix, jx, descx, incx)
```

Description

The p?nrm2 functions compute the Euclidean norm of a distributed vector sub(*x*),

where sub(*x*) is an *n*-element distributed vector.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1.

Input Parameters

n	(global) INTEGER. The length of distributed vector sub(*x*), *n*≥0.
x	(local) REAL for psnrm2 DOUBLE PRECISION for pdnrm2 COMPLEX for pscnrm2 DOUBLE COMPLEX for pdznrm2 Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).

ix, *jx* (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.

descx (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

norm2 (local) REAL for psnrm2 and pscnrm2.
DOUBLE PRECISION for pdnrm2 and pdznrm2
Contains the Euclidean norm of a distributed vector only in its scope.

p?scal

Computes a product of a distributed vector by a scalar.

Syntax

```
call psscal(n, a, x, ix, jx, descx, incx)
call pdscal(n, a, x, ix, jx, descx, incx)
call pcscal(n, a, x, ix, jx, descx, incx)
call pzscal(n, a, x, ix, jx, descx, incx)
call pcsscal(n, a, x, ix, jx, descx, incx)
call pzdscal(n, a, x, ix, jx, descx, incx)
```

Description

The p?scal routines multiplies a *n*-element distributed vector sub(*x*) by the scalar *a*:

sub(*x*) = *a**sub(*x*),

where sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1.

Input Parameters

n (global) INTEGER. The length of distributed vector sub(*x*), *n*≥0.

a (global) REAL for psscal and pcsscal
DOUBLE PRECISION for pdscal and pzdscal
COMPLEX for pcscal
DOUBLE COMPLEX for pzscal
Specifies the scalar *a*.

x (local) REAL for psscal
DOUBLE PRECISION for pdscal
COMPLEX for pcscal and pcsscal
DOUBLE COMPLEX for pzscal and pzdscal

	Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

x	Overwritten by the updated distributed vector sub(*x*)

p?swap

Swaps two distributed vectors.

Syntax

```
call psswap(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pdswap(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pcswap(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
call pzswap(n, x, ix, jx, descx, incx, y, iy, jy, descy, incy)
```

Description

Given two distributed vectors sub(*x*) and sub(*y*), the p?swap routines return vectors sub(*y*) and sub(*x*) swapped, each replacing the other.

Here sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx*=*m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx*= 1;

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy*=*m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy*= 1.

Input Parameters

n	(global) INTEGER. The length of distributed vectors, *n*≥0.
x	(local) REAL for psswap DOUBLE PRECISION for pdswap COMPLEX for pcswap DOUBLE COMPLEX for pzswap Array, DIMENSION (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*X*), respectively.

descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) REAL for psswap DOUBLE PRECISION for pdswap COMPLEX for pcswap DOUBLE COMPLEX for pzswap Array, DIMENSION (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*Y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

x	Overwritten by distributed vector sub(*y*).
y	Overwritten by distributed vector sub(*x*).

PBLAS Level 2 Routines

This section describes PBLAS Level 2 routines, which perform distributed matrix-vector operations. Table 12-2 lists the PBLAS Level 2 routine groups and the data types associated with them.

Table 12-2 PBLAS Level 2 Routine Groups and Their Data Types

Routine Groups	Data Types	Description
p?gemv	s, d, c, z	Matrix-vector product using a distributed general matrix
p?ger	s, d	Rank-1 update of a distributed general matrix
p?gerc	c, z	Rank-1 update (conjugated) of a distributed general matrix
p?geru	c, z	Rank-1 update (unconjugated) of a distributed general matrix
p?hemv	c, z	Matrix-vector product using a distributed Hermitian matrix
p?her	c, z	Rank-1 update of a distributed Hermitian matrix
p?her2	c, z	Rank-2 update of a distributed Hermitian matrix
p?symv	s, d	Matrix-vector product using a distributed symmetric matrix

Routine Groups	Data Types	Description
p?syr	s, d	Rank-1 update of a distributed symmetric matrix
p?syr2	s, d	Rank-2 update of a distributed symmetric matrix
p?trmv	s, d, c, z	Distributed matrix-vector product using a triangular matrix
p?trsv	s, d, c, z	Solves a system of linear equations whose coefficients are in a distributed triangular matrix

p?gemv

Computes a distributed matrix-vector product using a general matrix

Syntax

call psgemv(*trans*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

call pdgemv(*trans*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

call pcgemv(*trans*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

call pzgemv(*trans*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

Description

The p?gemv routines perform a distributed matrix-vector operation defined as

sub(*y*) := *alpha**sub(*A*)*sub(*x*) + *beta**sub(*y*),

or

sub(*y*) := *alpha**sub(*A*)'*sub(*x*) + *beta**sub(*y*),

or

sub(*y*) := *alpha**conjg(sub(*A*)')*sub(*x*) + *beta**sub(*y*),

where

alpha and *beta* are scalars,

sub(*A*) is a *m*-by-*n* submatrix, sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1),

sub(*x*) and sub(*y*) are subvectors.

When *trans* = 'N' or 'n', sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1, sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*m*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*m*-1, *jy*) if *incy* = 1.

When *trans* = 'T' or 't', or 'C', or 'c', sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*m*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*m*-1, *jx*) if *incx* = 1, sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*m*-1, *jy*) if *incy* = 1.

Input Parameters

trans (global) CHARACTER*1. Specifies the operation:
if *trans*= 'N' or 'n', then sub(*y*) := *alpha**sub(*A*)'*sub(*x*) + *beta**sub(*y*);
if *trans*= 'T' or 't', then sub(*y*) := *alpha**sub(*A*)'*sub(*x*) + *beta**sub(*y*);
if *trans*= 'C' or 'c', then sub(*y*) := *alpha**conjg(sub*A*)')*sub(*x*) + *beta**sub(*y*).

m (global) INTEGER. Specifies the number of rows of the distributed matrix sub(*A*), $m \geq 0$.

n (global) INTEGER. Specifies the number of columns of the distributed matrix sub(*A*), $n \geq 0$.

alpha (global) REAL for psgemv
DOUBLE PRECISION for pdgemv
COMPLEX for pcgemv
DOUBLE COMPLEX for pzgemv
Specifies the scalar *alpha*.

a (local) REAL for psgemv
DOUBLE PRECISION for pdgemv
COMPLEX for pcgemv
DOUBLE COMPLEX for pzgemv
Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). Before entry this array must contain the local pieces of the distributed matrix sub(*A*).

ia, *ja* (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

x (local) REAL for psgemv
DOUBLE PRECISION for pdgemv
COMPLEX for pcgemv
DOUBLE COMPLEX for pzgemv
Array, DIMENSION (*jx*-1)**m_x* + *ix*+(*n*-1)*abs(*incx*)) when *trans* = 'N' or 'n', and (*jx*-1)**m_x* + *ix*+(*m*-1)*abs(*incx*)) otherwise. This array contains the entries of the distributed vector sub(*x*).

ix, *jx* (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.

descx (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

beta (global) REAL for psgemv

	DOUBLE PRECISION for pdgemv COMPLEX for pcgemv DOUBLE COMPLEX for pzgemv Specifies the scalar *beta*. When *beta* is set to zero, then sub(*y*) need not be set on input.
y	(local) REAL for psgemv DOUBLE PRECISION for pdgemv COMPLEX for pcgemv DOUBLE COMPLEX for pzgemv Array, DIMENSION (*jy*-1)**m_y* + *iy*+(*m*-1)*abs(*incy*)) when *trans* = 'N' or 'n', and (*jy*-1)**m_y* + *iy*+(*n*-1)*abs(*incy*)) otherwise. This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

y	Overwritten by the updated distributed vector sub(*y*).

p?ger

Performs a rank-1 update of a distributed general matrix.

Syntax

```
call psger(m, n, alpha, x, ix, jx, descx, incx, y, iy, jy, descy, incy, a, ia, ja, desca)
call pdger(m, n, alpha, x, ix, jx, descx, incx, y, iy, jy, descy, incy, a, ia, ja, desca)
```

Description

The p?ger routines perform a distributed matrix-vector operation defined as

sub(*A*) := *alpha**sub(*x*)*sub(*y*)' + sub(*A*),

where:

alpha is a scalar,

sub(*A*) is a *m*-by-*n* distributed general matrix, sub(*A*)=*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1),

sub(*x*) is an *m*-element distributed vector, sub(*y*) is an *n*-element distributed vector,

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*m*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*m*-1, *jx*) if *incx* = 1,

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy* = 1.

Input Parameters

m	(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*A*), *m*≥0.
n	(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*A*), *n*≥0.
alpha	(global) REAL for psger DOUBLE REAL for pdger Specifies the scalar *alpha*.
x	(local) REAL for psger DOUBLE REAL for pdger Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*m*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) REAL for psger DOUBLE REAL for pdger Array, DIMENSION at least (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.
a	(local) REAL for psger DOUBLE REAL for pdger Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). Before entry this array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

Output Parameters

a	Overwritten by the updated distributed matrix sub(*A*).

p?gerc

Performs a rank-1 update (conjugated) of a distributed general matrix.

Syntax

call pcgerc(*m*, *n*, *alpha*, *x*, *ix*, *jx*, *descx*, *incx*, *y*, *iy*, *jy*, *descy*, *incy*, *a*, *ia*, *ja*, *desca*)

call pzgerc(*m*, *n*, *alpha*, *x*, *ix*, *jx*, *descx*, *incx*, *y*, *iy*, *jy*, *descy*, *incy*, *a*, *ia*, *ja*, *desca*)

Description

The p?gerc routines perform a distributed matrix-vector operation defined as

sub(*A*) := *alpha**sub(*x*)*conjg(sub(*y*)') + sub(*A*),

where:

alpha is a scalar,

sub(*A*) is a *m*-by-*n* distributed general matrix, sub(*A*) = *A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1),

sub(*x*) is an *m*-element distributed vector, sub(*y*) is an*n*-element distributed vector,

sub(*x*)denotes *X*(*ix*, *jx*:*jx*+*m*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*m*-1, *jx*) if *incx* = 1,

sub(*y*)denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy* = 1.

Input Parameters

m	(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*A*), *m* ≥ 0.
n	(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*A*), *n* ≥ 0.
alpha	(global) COMPLEX for pcgerc DOUBLE COMPLEX for pzgerc Specifies the scalar *alpha*.
x	(local) COMPLEX for pcgerc DOUBLE COMPLEX for pzgerc Array, DIMENSION at least (*jx*-1)**m_x* + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) COMPLEX for pcgerc DOUBLE COMPLEX for pzgerc Array, DIMENSION at least (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.
a	(local) COMPLEX for pcgerc DOUBLE COMPLEX for pzgerc Array, DIMENSION at least (*lld_a*, LOCq(*ja*+*n*-1)). Before entry this array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

Output Parameters

a	Overwritten by the updated distributed matrix sub(*A*).

p?geru

Performs a rank-1 update (unconjugated) of a distributed general matrix.

Syntax

```
call pcgeru(m, n, alpha, x, ix, jx, descx, incx, y, iy, jy, descy, incy, a, ia, ja, desca)
```

```
call pzgeru(m, n, alpha, x, ix, jx, descx, incx, y, iy, jy, descy, incy, a, ia, ja, desca)
```

Description

The p?geru routines perform a matrix-vector operation defined as

sub(*A*) := *alpha**sub(*x*)*sub(*y*)' + sub(*A*),

where:

alpha is a scalar,

sub(*A*) is a *m*-by-*n* distributed general matrix, sub(*A*)=*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*n*-1),

sub(*x*) is an *m*-element distributed vector, sub(*y*) is an *n*-element distributed vector,

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*m*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*m*-1, *jx*) if *incx* = 1,

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy* = 1.

Input Parameters

m	(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*A*), *m* ≥ 0.
n	(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*A*), *n* ≥ 0.
alpha	(global) COMPLEX for pcgeru DOUBLE COMPLEX for pzgeru Specifies the scalar *alpha*.
x	(local) COMPLEX for pcgeru DOUBLE COMPLEX for pzgeru Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
y	(local) COMPLEX for pcgeru DOUBLE COMPLEX for pzgeru Array, DIMENSION at least (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.
a	(local) COMPLEX for pcgeru DOUBLE COMPLEX for pzgeru Array, DIMENSION at least (*lld_a*, LOCq(*ja*+*n*-1)). Before entry this array contains the local pieces of the distributed matrix sub(*A*).

ia, *ja* (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

Output Parameters

a Overwritten by the updated distributed matrix sub(*A*).

p?hemv

Computes a distributed matrix-vector product using a Hermitian matrix.

Syntax

call pchemv(*uplo*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

call pzhemv(*uplo*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

Description

The p?hemv routines perform a distributed matrix-vector operation defined as

sub(*y*) := *alpha**sub(*A*)*sub(*x*) + *beta**sub(*y*),

where:

alpha and *beta* are scalars,

sub(*A*) is a *n*-by-*n* Hermitian distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) ,

sub(*x*) and sub(*y*) are distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1,

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy* = 1.

Input Parameters

uplo (global) CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian distributed matrix sub(*A*) is used:
If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*A*) is used.
If *uplo* = 'L' or 'l', then the low triangular part of the sub(*A*) is used.

n (global) INTEGER. Specifies the order of the distributed matrix sub(*A*), *n* ≥ 0.

alpha (global) COMPLEX for pchemv
DOUBLE COMPLEX for pzhemv
Specifies the scalar *alpha*.

a	(local) COMPLEX for pchemv DOUBLE COMPLEX for pzhemv Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*A*). Before entry when *uplo* = 'U' or 'u', the *n*-by-*n* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the Hermitian distributed matrix and the strictly lower triangular part of sub(*A*) is not referenced, and when *uplo* = 'L' or 'l', the *n*-by-*n* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the Hermitian distributed matrix and the strictly upper triangular part of sub(*A*) is not referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local)INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
x	(local) COMPLEX for pchemv DOUBLE COMPLEX for pzhemv Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
beta	(global) COMPLEX for pchemv DOUBLE COMPLEX for pzhemv Specifies the scalar *beta*. When *beta* is set to zero, then sub(*y*) need not be set on input.
y	(local) COMPLEX for pchemv DOUBLE COMPLEX for pzhemv Array, DIMENSION at least (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

y	Overwritten by the updated distributed vector sub(*y*).

p?her

Performs a rank-1 update of a distributed Hermitian matrix.

Syntax

```
call pcher(uplo, n, alpha, x, ix, jx, descx, incx, a, ia, ja, desca)
call pzher(uplo, n, alpha, x, ix, jx, descx, incx, a, ia, ja, desca)
```

Description

The p?her routines perform a distributed matrix-vector operation defined as

sub(*A*) := *alpha**sub(*x*)*conjg(sub(*x*)') + sub(*A*),

where:

alpha is a real scalar,

sub(*A*) is a *n*-by-*n* distributed Hermitian matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1),

sub(*x*) is distributed vector.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1.

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian distributed matrix sub(*A*) is used: If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*A*) is used. If *uplo* = 'L' or 'l', then the low triangular part of the sub(*A*) is used.
n	(global) INTEGER. Specifies the order of the distributed matrix sub(*A*), $n \geq 0$.
alpha	(global) REAL for pcher DOUBLE REAL for pzher Specifies the scalar *alpha*.
x	(local) COMPLEX for pcher DOUBLE COMPLEX for pzher Array, DIMENSION at least (*jx*-1)**m_x* + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.

descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.
a	(local) COMPLEX for pcher DOUBLE COMPLEX for pzher Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*A*). Before entry with *uplo* = 'U' or 'u', the *n*-by-*n* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the Hermitian distributed matrix and the strictly lower triangular part of sub(*A*) is not referenced, and with *uplo* = 'L' or 'l', the *n*-by-*n* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the Hermitian distributed matrix and the strictly upper triangular part of sub(*A*) is not referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated distributed matrix sub(*A*). With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated distributed matrix sub(*A*).

p?her2

Performs a rank-2 update of a distributed Hermitian matrix.

Syntax

call pcher2(*uplo*, *n*, *alpha*, *x*, *ix*, *jx*, *descx*, *incx*, *y*, *iy*, *jy*, *descy*, *incy*, *a*, *ia*, *ja*, *desca*)

call pzher2(*uplo*, *n*, *alpha*, *x*, *ix*, *jx*, *descx*, *incx*, *y*, *iy*, *jy*, *descy*, *incy*, *a*, *ia*, *ja*, *desca*)

Description

The p?her2 routines perform a distributed matrix-vector operation defined as

sub(*A*) := *alpha**sub(*x*)*conj(sub(*y*)')+ conj(*alpha*)*sub(*y*)*conj(sub(*x*)') + sub(*A*),

where:

alpha is a scalar,

sub(*A*) is a *n*-by-*n* distributed Hermitian matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1),

sub(*x*) and sub(*y*) are distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1,

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy* = 1.

Input Parameters

uplo (global) CHARACTER*1. Specifies whether the upper or lower triangular part of the distributed Hermitian matrix sub(*A*) is used:
If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*A*) is used.
If *uplo* = 'L' or 'l', then the low triangular part of the sub(*A*) is used.

n (global) INTEGER. Specifies the order of the distributed matrix sub(*A*), $n \geq 0$.

alpha (global) COMPLEX for pcher2
DOUBLE COMPLEX for pzher2
Specifies the scalar *alpha*.

x (local) COMPLEX for pcher2
DOUBLE COMPLEX for pzher2
Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).

ix, *jx* (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.

descx (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

y (local) COMPLEX for pcher2
DOUBLE COMPLEX for pzher2
Array, DIMENSION at least (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).

iy, *jy* (global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.

descy (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.

incy (global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

a	(local) COMPLEX for pcher2 DOUBLE COMPLEX for pzher2 Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*A*). Before entry with *uplo* = 'U' or 'u', the *n*-by-*n* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the Hermitian distributed matrix and the strictly lower triangular part of sub(*A*) is not referenced, and with *uplo* = 'L' or 'l', the *n*-by-*n* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the Hermitian distributed matrix and the strictly upper triangular part of sub(*A*) is not referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated distributed matrix sub(*A*). With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated distributed matrix sub(*A*).

p?symv

Computes a distributed matrix-vector product using a symmetric matrix.

Syntax

call pssymv(*uplo*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

call pdsymv(*uplo*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*, *beta*, *y*, *iy*, *jy*, *descy*, *incy*)

Description

The p?symv routines perform a distributed matrix-vector operation defined as

sub(*y*) := *alpha**sub(*A*)*sub(*x*) + *beta**sub(*y*),

where:

alpha and *beta* are scalars,

sub(*A*) is a *n*-by-*n* symmetric distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) ,

sub(*x*) and sub(*y*) are distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1,

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy* = 1.

Input Parameters

uplo (global) CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric distributed matrix sub(*A*) is used:
If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*A*) is used.
If *uplo* = 'L' or 'l', then the low triangular part of the sub(*A*) is used.

n (global) INTEGER. Specifies the order of the distributed matrix sub(*A*), $n \geq 0$.

alpha (global) REAL for pssymv
DOUBLE REAL for pdsymv
Specifies the scalar *alpha*.

a (local) REAL for pssymv
DOUBLE REAL for pdsymv
Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*A*).
Before entry when *uplo* = 'U' or 'u', the *n*-by-*n* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the symmetric distributed matrix and the strictly lower triangular part of sub(*A*) is not referenced, and when *uplo* = 'L' or 'l', the *n*-by-*n* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the symmetric distributed matrix and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja* (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local)INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

x (local) REAL for pssymv
DOUBLE REAL for pdsymv
Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).

ix, *jx* (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.

descx (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

beta (global) REAL for pssymv

	DOUBLE REAL for pdsymv Specifies the scalar *beta*. When *beta* is set to zero, then sub(*y*) need not be set on input.
y	(local) REAL for pssymv DOUBLE REAL for pdsymv Array, DIMENSION at least (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).
iy, *jy*	(global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.
descy	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.
incy	(global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

Output Parameters

y	Overwritten by the updated distributed vector sub(*y*).

p?syr

Performs a rank-1 update of a distributed symmetric matrix.

Syntax

```
call pssyr(uplo, n, alpha, x, ix, jx, descx, incx, a, ia, ja, desca)
call pdsyr(uplo, n, alpha, x, ix, jx, descx, incx, a, ia, ja, desca)
```

Description

The p?syr routines perform a distributed matrix-vector operation defined as

sub(*A*) := *alpha**sub(*x*)*sub(*x*)' + sub(*A*),

where:

alpha is a scalar,

sub(*A*) is a *n*-by-*n* distributed symmetric matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) ,

sub(*x*) is distributed vector.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1,

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric distributed matrix sub(*A*) is used: If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*A*) is used.

If *uplo* = 'L' or 'l', then the low triangular part of the sub(*A*) is used.

n (global) INTEGER. Specifies the order of the distributed matrix sub(*A*), $n \geq 0$.

alpha (global) REAL for pssyr
DOUBLE REAL for pdsyr
Specifies the scalar *alpha*.

x (local) REAL for pssyr
DOUBLE REAL for pdsyr
Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).

ix, *jx* (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.

descx (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

a (local) REAL for pssyr
DOUBLE REAL for pdsyr
Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*A*).
Before entry with *uplo* = 'U' or 'u', the *n*-by-*n* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the symmetric distributed matrix and the strictly lower triangular part of sub(*A*) is not referenced, and with *uplo* = 'L' or 'l', the *n*-by-*n* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the symmetric distributed matrix and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja* (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

Output Parameters

a With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated distributed matrix sub(*A*).
With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated distributed matrix sub(*A*).

p?syr2

Performs a rank-2 update of a distributed symmetric matrix.

Syntax

call pssyr2(*uplo*, *n*, *alpha*, *x*, *ix*, *jx*, *descx*, *incx*, *y*, *iy*, *jy*, *descy*, *incy*, *a*, *ia*, *ja*, *desca*)

call pdsyr2(*uplo*, *n*, *alpha*, *x*, *ix*, *jx*, *descx*, *incx*, *y*, *iy*, *jy*, *descy*, *incy*, *a*, *ia*, *ja*, *desca*)

Description

The p?syr2 routines perform a distributed matrix-vector operation defined as

sub(*A*) := *alpha**sub(*x*)*sub(*y*)'+ *alpha**sub(*y*)*sub(*x*)' + sub(*A*),

where:

alpha is a scalar,

sub(*A*) is a *n*-by-*n* distributed symmetric matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1) ,

sub(*x*) and sub(*y*) are distributed vectors.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1,

sub(*y*) denotes *Y*(*iy*, *jy*:*jy*+*n*-1) if *incy* = *m_y*, and *Y*(*iy*: *iy*+*n*-1, *jy*) if *incy* = 1.

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the upper or lower triangular part of the distributed symmetric matrix sub(*A*) is used: If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*A*) is used. If *uplo* = 'L' or 'l', then the low triangular part of the sub(*A*) is used.
n	(global) INTEGER. Specifies the order of the distributed matrix sub(*A*), $n \geq 0$.
alpha	(global) REAL for pssyr2 DOUBLE REAL for pdsyr2 Specifies the scalar *alpha*.
x	(local) REAL for pssyr2 DOUBLE REAL for pdsyr2 Array, DIMENSION at least (*jx*-1)**m_x* + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

y (local) REAL for pssyr2
DOUBLE REAL for pdsyr2
Array, DIMENSION at least (*jy*-1)*m_y + *iy*+(*n*-1)*abs(*incy*)). This array contains the entries of the distributed vector sub(*y*).

iy, *jy* (global) INTEGER. The row and column indices in the distributed matrix *Y* indicating the first row and the first column of the submatrix sub(*y*), respectively.

descy (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *Y*.

incy (global) INTEGER. Specifies the increment for the elements of sub(*y*). Only two values are supported, namely 1 and *m_y*. *incy* must not be zero.

a (local) REAL for pssyr2
DOUBLE REAL for pdsyr2
Array, DIMENSION (*lld_a*, LOCq(*ja*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*A*).
Before entry with *uplo* = 'U' or 'u', the *n*-by-*n* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the distributed symmetric matrix and the strictly lower triangular part of sub(*A*) is not referenced, and with *uplo* = 'L' or 'l', the *n*-by-*n* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the distributed symmetric matrix and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja* (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local)INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

Output Parameters

a With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated distributed matrix sub(*A*).
With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated distributed matrix sub(*A*).

p?trmv

Computes a distributed matrix-vector product using a triangular matrix.

Syntax

```
call pstrmv(uplo, trans, diag, n, a, ia, ja, desca, x, ix, jx, descx, incx)
call pdtrmv(uplo, trans, diag, n, a, ia, ja, desca, x, ix, jx, descx, incx)
call pctrmv(uplo, trans, diag, n, a, ia, ja, desca, x, ix, jx, descx, incx)
call pztrmv(uplo, trans, diag, n, a, ia, ja, desca, x, ix, jx, descx, incx)
```

Description

The p?trmv routines perform one of the following distributed matrix-vector operations defined as

sub(*x*) := sub(*A*)*sub(*x*), or sub(*x*) :=sub(*A*)'*sub(*x*), or sub(*x*) := conjg(sub(*A*)')*sub(*x*),

where:

sub(*A*) is a *n*-by-*n* unit, or non-unit, upper or lower triangular distributed matrix, sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1),

sub(*x*) is an *n*-element distributed vector.

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1,

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the distributed matrix sub(*A*) is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.

trans	(global) CHARACTER*1. Specifies the form of op(sub(*A*)) used in the matrix equation:
	if *transa* = 'N' or 'n', then sub(*x*) := sub(*A*)*sub(*x*);
	if *transa* = 'T' or 't', then sub(*x*) :=sub(*A*)'*sub(*x*);
	if *transa* = 'C' or 'c', then sub(*x*) := conjg(sub(*A*)')*sub(*x*).

diag	(global) CHARACTER*1. Specifies whether the matrix sub(*A*) is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	(global) INTEGER. Specifies the order of the distributed matrix sub(*A*), *n*≥0.
a	(local) REAL for pstrmv DOUBLE PRECISION for pdtrmv COMPLEX for pctrmv DOUBLE COMPLEX for pztrmv Array, DIMENSION at least (*lld_a*, LOCq(1, *ja*+*n*-1)).

Before entry with *uplo* = 'U' or 'u', this array contains the local entries corresponding to the entries of the upper triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly lower triangular part of the distributed matrix sub(*A*) is not referenced.
Before entry with *uplo* = 'L' or 'l', this array contains the local entries corresponding to the entries of the lower triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly upper triangular part of the distributed matrix sub(*A*) is not referenced .
When *diag* = 'U' or 'u', the local entries corresponding to the diagonal elements of the submatrix sub(*A*) are not referenced either, but are assumed to be unity.

ia, *ja* — (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca — (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

x — (local) REAL for pstrmv
DOUBLE PRECISION for pdtrmv
COMPLEX for pctrmv
DOUBLE COMPLEX for pztrmv
Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*).

ix, *jx* — (global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.

descx — (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.

incx — (global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

x — Overwritten by the transformed distributed vector sub(*x*).

p?trsv

Solves a system of linear equations whose coefficients are in a distributed triangular matrix.

Syntax

```
call pstrsv(uplo, trans, diag, n, a, ia, ja, desca, x, ix, jx, descx, incx)
call pdtrsv(uplo, trans, diag, n, a, ia, ja, desca, x, ix, jx, descx, incx)
```

call pctrsv(*uplo*, *trans*, *diag*, *n*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*)

call pztrsv(*uplo*, *trans*, *diag*, *n*, *a*, *ia*, *ja*, *desca*, *x*, *ix*, *jx*, *descx*, *incx*)

Description

The p?trsv routines solve one of the systems of equations:

sub(*A*)*sub(*x*) = *b*, or sub(*A*)'*sub(*x*) = *b*, or conjg(sub(*A*)')*sub(*x*) = *b*,

where:

sub(*A*) is a *n*-by-*n* unit, or non-unit, upper or lower triangular distributed matrix, sub(*A*) = *A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1),

b and sub(*x*) are *n*-element distributed vectors,

sub(*x*) denotes *X*(*ix*, *jx*:*jx*+*n*-1) if *incx* = *m_x*, and *X*(*ix*: *ix*+*n*-1, *jx*) if *incx* = 1,.

The routine does not test for singularity or near-singularity. Such tests must be performed before calling this routine.

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the distributed matrix sub(*A*) is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
trans	(global) CHARACTER*1. Specifies the form of the system of equations: if *transa* = 'N' or 'n', then sub(*A*)*sub(*x*) = *b*; if *transa* = 'T' or 't', then sub(*A*)'*sub(*x*) = *b*; if *transa* = 'C' or 'c', then conjg(sub(*A*)')*sub(*x*) = *b*.
diag	(global) CHARACTER*1. Specifies whether the matrix sub(*A*) is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	(global) INTEGER. Specifies the order of the distributed matrix sub(*A*), *n* ≥ 0.
a	(local) REAL for pstrsv DOUBLE PRECISION for pdtrsv COMPLEX for pctrsv DOUBLE COMPLEX for pztrsv Array, DIMENSION at least (*lld_a*, LOCq(1, *ja*+*n*-1)). Before entry with *uplo* = 'U' or 'u', this array contains the local entries corresponding to the entries of the upper triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly lower triangular part of the distributed matrix sub(*A*) is not referenced.

	Before entry with *uplo* = 'L' or 'l', this array contains the local entries corresponding to the entries of the lower triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly upper triangular part of the distributed matrix sub(*A*) is not referenced . When *diag* = 'U' or 'u', the local entries corresponding to the diagonal elements of the submatrix sub(*A*) are not referenced either, but are assumed to be unity.
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
x	(local) REAL for pstrsv DOUBLE PRECISION for pdtrsv COMPLEX for pctrsv DOUBLE COMPLEX for pztrsv Array, DIMENSION at least (*jx*-1)*m_x + *ix*+(*n*-1)*abs(*incx*)). This array contains the entries of the distributed vector sub(*x*). Before entry, sub(*x*) must contain the *n*-element right-hand side distributed vector *b*.
ix, *jx*	(global) INTEGER. The row and column indices in the distributed matrix *X* indicating the first row and the first column of the submatrix sub(*x*), respectively.
descx	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *X*.
incx	(global) INTEGER. Specifies the increment for the elements of sub(*x*). Only two values are supported, namely 1 and *m_x*. *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector.

PBLAS Level 3 Routines

PBLAS Level 3 routines perform distributed matrix-matrix operations. Table 2-3 lists the PBLAS Level 3 routine groups and the data types associated with them.

Table 12-3 PBLAS Level 3 Routine Groups and Their Data Types

Routine Group	Data Types	Description
p?gemm	s, d, c, z	Distributed matrix-matrix product of general matrices
p?hemm	c, z	Distributed matrix-matrix product, one matrix is Hermitian
p?herk	c, z	Rank-k update of a distributed Hermitian matrix

Routine Group	Data Types	Description
p?her2k	c, z	Rank-2k update of a distributed Hermitian matrix
p?symm	s, d, c, z	Matrix-matrix product of distributed symmetric matrices
p?syrk	s, d, c, z	Rank-k update of a distributed symmetric matrix
p?syr2k	s, d, c, z	Rank-2k update of a distributed symmetric matrix
p?tran	s, d	Transposition of a real distributed matrix
p?tranc	c, z	Transposition of a complex distributed matrix (conjugated)
p?tranu	c, z	Transposition of a complex distributed matrix
p?trmm	s, d, c, z	Distributed matrix-matrix product, one matrix is triangular
p?trsm	s, d, c, z	Solution of a distributed matrix equation, one matrix is triangular

p?gemm

Computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product for distributed matrices.

Syntax

```
call psgemm(transa, transb, m, n, k, alpha, a, ia, ja, desca, b, ib, jb, descb, beta, c, ic, jc, descc)
call pdgemm(transa, transb, m, n, k, alpha, a, ia, ja, desca, b, ib, jb, descb, beta, c, ic, jc, descc)
call pcgemm(transa, transb, m, n, k, alpha, a, ia, ja, desca, b, ib, jb, descb, beta, c, ic, jc, descc)
call pzgemm(transa, transb, m, n, k, alpha, a, ia, ja, desca, b, ib, jb, descb, beta, c, ic, jc, descc)
```

Description

The p?gemm routines perform a matrix-matrix operation with general distributed matrices. The operation is defined as

sub(*C*) := *alpha**op(sub(*A*))*op(sub(*B*)) + *beta**sub(*C*),

where:

op(*x*) is one of op(*x*) = *x*, or op(*x*) = *x*',

alpha and *beta* are scalars,

sub(*A*)=*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*k*-1), sub(*B*)=*B*(*ib*:*ib*+*k*-1, *jb*:*jb*+*n*-1), and sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1), are distributed matrices.

Input Parameters

transa (global) CHARACTER*1. Specifies the form of op(sub(*A*)) used in the matrix multiplication:
if *transa* = 'N' or 'n', then op(sub(*A*)) = sub(*A*);
if *transa* = 'T' or 't', then op(sub(*A*)) = sub(*A*)';
if *transa* = 'C' or 'c', then op(sub(*A*)) = sub(*A*)'.

transb (global) CHARACTER*1. Specifies the form of op(sub(*B*)) used in the matrix multiplication:
if *transb* = 'N' or 'n', then op(sub(*B*)) = sub(*B*);
if *transb* = 'T' or 't', then op(sub(*B*)) = sub(*B*)';
if *transb* = 'C' or 'c', then op(sub(*B*)) = sub(*B*)'.

m (global) INTEGER. Specifies the number of rows of the distributed matrices op(sub(*A*)) and sub(*C*), $m \geq 0$.

n (global) INTEGER. Specifies the number of columns of the distributed matrices op(sub(*B*)) and sub(*C*), $n \geq 0$.
The value of *n* must be at least zero.

k (global) INTEGER. Specifies the number of columns of the distributed matrix op(sub(*A*)) and the number of rows of the distributed matrix op(sub(*B*)).
The value of *k* must be greater than or equal to 0.

alpha (global) REAL for psgemm
DOUBLE PRECISION for pdgemm
COMPLEX for pcgemm
DOUBLE COMPLEX for pzgemm
Specifies the scalar *alpha*.
When *alpha* is equal to zero, then the local entries of the arrays *a* and *b* corresponding to the entries of the submatrices sub(*A*) and sub(*B*) respectively need not be set on input.

a (local) REAL for psgemm
DOUBLE PRECISION for pdgemm
COMPLEX for pcgemm
DOUBLE COMPLEX for pzgemm
Array, DIMENSION (*lld_a*, *kla*), where *kla* is LOCc(*ja*+*k*-1) when *transa* = 'N' or 'n', and is LOCq(*ja*+*m*-1) otherwise. Before entry this array must contain the local pieces of the distributed matrix sub(*A*).

ia, *ja* (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively

desca (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

b (local)REAL for psgemm
DOUBLE PRECISION for pdgemm
COMPLEX for pcgemm

	DOUBLE COMPLEX for pzgemm Array, DIMENSION (*lld_b*, *klb*), where *klb* is LOCc(*jb*+*n*-1) when *transb* = 'N' or 'n', and is LOCq(*jb*+*k*-1) otherwise. Before entry this array must contain the local pieces of the distributed matrix sub(*B*).
ib, *jb*	(global) INTEGER. The row and column indices in the distributed matrix *B* indicating the first row and the first column of the submatrix sub(*B*), respectively
descb	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *B*.
beta	(global) REAL for psgemm DOUBLE PRECISION for pdgemm COMPLEX for pcgemm DOUBLE COMPLEX for pzgemm Specifies the scalar *beta*. When *beta* is equal to zero, then sub(*C*) need not be set on input.
c	(local)REAL for psgemm DOUBLE PRECISION for pdgemm COMPLEX for pcgemm DOUBLE COMPLEX for pzgemm Array, DIMENSION (*lld_a*, LOCq(*jc*+*n*-1)). Before entry this array must contain the local pieces of the distributed matrix sub(*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	Overwritten by the *m*-by-*n* distributed matrix *alpha**op(sub(*A*))*op(sub(*B*)) + *beta**sub(*C*).

p?hemm

Performs a scalar-matrix-matrix product (one matrix operand is Hermitian) and adds the result to a scalar-matrix product.

Syntax

call pchemm(*side*, *uplo*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

call pzhemm(*side*, *uplo*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

Description

The p?hemm routines perform a matrix-matrix operation with distributed matrices. The operation is defined as

sub(*C*):=*alpha**sub(*A*)*sub(*B*)+ *beta**sub(*C*),

or

sub(*C*):=*alpha**sub(*B*)*sub(*A*)+ *beta**sub(*C*),

where:

alpha and *beta* are scalars,

sub(*A*) is a Hermitian distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*m*-1), if *side* = 'L', and sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), if *side* = 'R'.

sub(*B*) and sub(*C*) are *m*-by-*n* distributed matrices.

sub(*B*)=*B*(*ib*:*ib*+*m*-1, *jb*:*jb*+*n*-1), sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1).

Input Parameters

side (global) CHARACTER*1. Specifies whether the Hermitian distributed matrix sub(*A*) appears on the left or right in the operation:
if *side* = 'L' or 'l', then sub(*C*) := *alpha**sub(*A*) *sub(*B*) + *beta**sub(*C*);
if *side* = 'R' or 'r', then sub(*C*) := *alpha**sub(*B*) *sub(*A*) + *beta**sub(*C*).

uplo (global) CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian distributed matrix sub(*A*) is used:
if *uplo* = 'U' or 'u', then the upper triangular part is used;
if *uplo* = 'L' or 'l', then the lower triangular part is used.

m (global) INTEGER. Specifies the number of rows of the distribute submatrix sub(*C*), $m \geq 0$.

n (global) INTEGER. Specifies the number of columns of the distribute submatrix sub(*C*), $n \geq 0$.

alpha (global) COMPLEX for pchemm
DOUBLE COMPLEX for pzhemm
Specifies the scalar *alpha*.

a (local) COMPLEX for pchemm
DOUBLE COMPLEX for pzhemm
Array, DIMENSION (*lld_a*, LOCq(*ja*+*na*-1)).
Before entry this array must contain the local pieces of the symmetric distributed matrix sub(*A*), such that when *uplo* = 'U' or 'u', the *na*-by-*na* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the Hermitian distributed matrix and the strictly lower triangular part of sub(*A*) is not referenced, and when *uplo* = 'L' or 'l', the *na*-by-*na* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the Hermitian distributed matrix and the strictly upper triangular part of sub(*A*) is not referenced.

ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
b	(local) COMPLEX for pchemm DOUBLE COMPLEX for pzhemm Array, DIMENSION (*lld_b*, LOCq(*jb*+*n*-1)). Before entry this array must contain the local pieces of the distributed matrix sub(*B*).
ib, *jb*	(global) INTEGER. The row and column indices in the distributed matrix *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *B*.
beta	(global) COMPLEX for pchemm DOUBLE COMPLEX for pzhemm Specifies the scalar *beta*. When *beta* is set to zero, then sub(*C*) need not be set on input.
c	(local) COMPLEX for pchemm DOUBLE COMPLEX for pzhemm Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). Before entry this array must contain the local pieces of the distributed matrix sub(*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively
descc	(global and local)INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	Overwritten by the *m*-by-*n* updated distributed matrix.

p?herk

Performs a rank-k update of a distributed Hermitian matrix.

Syntax

```
call pcherk(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pzherk(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
```

Description

The p?herk routines perform a distributed matrix-matrix operation defined as

sub(*C*):=*alpha**sub(*A*)*conjg(sub(*A*)')+ *beta**sub(*C*),

or

sub(*C*):=*alpha**conjg(sub(*A*)')*sub(*A*)+ *beta**sub(*C*),

where:

alpha and *beta* are scalars,

sub(*C*) is an *n*-by-*n* Hermitian distributed matrix, sub(*C*)=C(*ic*:*ic*+*n*-1, *jc*:*jc*+*n*-1).

sub(*A*) is a distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*k*-1), if *trans* = 'N' or 'n', and sub(*A*)=*A*(*ia*:*ia*+*k*-1, *ja*:*ja*+*n*-1) otherwise.

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian distributed matrix sub(*C*) is used: If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*C*) is used. If *uplo* = 'L' or 'l', then the low triangular part of the sub(*C*) is used.
trans	(global) CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then sub(*C*) := *alpha**sub(*A*)*conjg(sub(*A*)') + *beta**sub(*C*); if *trans* = 'C' or 'c', then sub(*C*) := *alpha**conjg(sub(*A*)')*sub(*A*) + *beta**sub(*C*).
n	(global) INTEGER. Specifies the order of the distributed matrix sub(*C*), $n \geq 0$.
k	(global) INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the distributed matrix sub(*A*) , and on entry with *trans* = 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the distributed matrix sub(*A*), $k \geq 0$.
alpha	(global) REAL for pcherk DOUBLE PRECISION for pzherk Specifies the scalar *alpha*.
a	(local) COMPLEX for pcherk DOUBLE COMPLEX for pzherk Array, DIMENSION (*lld_a*, *kla*), where *kla* is LOCq(*ja*+*k*-1) when *trans* = 'N' or 'n', and is LOCq(*ja*+*n*-1) otherwise. Before entry with *trans* = 'N' or 'n', this array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
beta	(global) REAL for pcherk DOUBLE PRECISION for pzherk Specifies the scalar *beta*.

c	(local) COMPLEX for pcherk DOUBLE COMPLEX for pzherk Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). Before entry with *uplo* = 'U' or 'u', this array contains *n*-by-*n* upper triangular part of the symmetric distributed matrix sub(*C*) and its strictly lower triangular part is not referenced. Before entry with *uplo* = 'L' or 'l', this array contains *n*-by-*n* lower triangular part of the symmetric distributed matrix sub(*C*) and its strictly upper triangular part is not referenced.
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix. With *uplo* = 'L' or 'l', the lower triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix.

p?her2k

Performs a rank-2k update of a Hermitian distributed matrix.

Syntax

FORTRAN 77:

```
call pcher2k(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pzher2k(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
```

Description

The p?her2k routines perform a distributed matrix-matrix operation defined as

sub(*C*):=*alpha**sub(*A*)*conjg(sub(*B*)')+ conjg(*alpha*)*sub(*B*)*conjg(sub(*A*)')+*beta**sub(*C*),

or

sub(*C*):=*alpha**conjg(sub(*A*)')*sub(*A*)+ conjg(*alpha*)*conjg(sub(*B*)')*sub(*A*) + *beta**sub(*C*),

where:

alpha and *beta* are scalars,

sub(*C*) is an *n*-by-*n* Hermitian distributed matrix, sub(*C*) = C(*ic*:*ic*+*n*-1, *jc*:*jc*+*n*-1).

sub(*A*) is a distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*k*-1), if *trans* = 'N' or 'n', and sub(*A*) = *A*(*ia*:*ia*+*k*-1, *ja*:*ja*+*n*-1) otherwise.

sub(*B*) is a distributed matrix, sub(*B*) = *B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*k*-1), if *trans* = 'N' or 'n', and sub(*B*)=*B*(*ib*:*ib*+*k*-1, *jb*:*jb*+*n*-1) otherwise.

Input Parameters

uplo (global) CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian distributed matrix sub(*C*) is used:
If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*C*) is used.
If *uplo* = 'L' or 'l', then the low triangular part of the sub(*C*) is used.

trans (global) CHARACTER*1. Specifies the operation:
if *trans* = 'N' or 'n', then sub(*C*) := *alpha**sub(*A*)*conjg(sub(*B*)')+ conjg(*alpha*)*sub(*B*)*conjg(sub(*A*)') + *beta**sub(*C*);
if *trans* = 'C' or 'c', then sub(*C*) := *alpha**conjg(sub(*A*)')*sub(*A*)+ conjg(*alpha*)*conjg(sub(*B*)')*sub(*A*) + *beta**sub(*C*).

n (global) INTEGER. Specifies the order of the distributed matrix sub(*C*), $n \geq 0$.

k (global) INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the distributed matrices sub(*A*) and sub(*B*), and on entry with *trans* = 'C' or 'c' , *k* specifies the number of rows of the distributed matrices sub(*A*) and sub(*B*), $k \geq 0$.

alpha (global) COMPLEX for pcher2k
DOUBLE COMPLEX for pzher2k
Specifies the scalar *alpha*.

a (local) COMPLEX for pcher2k
DOUBLE COMPLEX for pzher2k
Array, DIMENSION (*lld_a*, *kla*), where *kla* is LOCq(*ja*+*k*-1) when *trans* = 'N' or 'n', and is LOCq(*ja*+*n*-1) otherwise. Before entry with *trans* = 'N' or 'n', this array contains the local pieces of the distributed matrix sub(*A*).

ia, *ja* (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

b (local) COMPLEX for pcher2k
DOUBLE COMPLEX for pzher2k
Array, DIMENSION (*lld_b*, *klb*), where *klb* is LOCq(*jb*+*k*-1) when *trans* = 'N' or 'n', and is LOCq(*jb*+*n*-1) otherwise. Before entry with *trans* = 'N' or 'n', this array contains the local pieces of the distributed matrix sub(*B*).

ib, *jb*	(global) INTEGER. The row and column indices in the distributed matrix *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *B*.
beta	(global) REAL for pcher2k DOUBLE PRECISION for pzher2k Specifies the scalar *beta*.
c	(local) COMPLEX for pcher2k DOUBLE COMPLEX for pzher2k Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). Before entry with *uplo* = 'U' or 'u', this array contains *n*-by-*n* upper triangular part of the symmetric distributed matrix sub(*C*) and its strictly lower triangular part is not referenced. Before entry with *uplo* = 'L' or 'l', this array contains *n*-by-*n* lower triangular part of the symmetric distributed matrix sub(*C*) and its strictly upper triangular part is not referenced.
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix. With *uplo* = 'L' or 'l', the lower triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix.

p?symm

Performs a scalar-matrix-matrix product (one matrix operand is symmetric) and adds the result to a scalar-matrix product for distribute matrices.

Syntax

FORTRAN 77:

call pssymm(*side*, *uplo*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

call pdsymm(*side*, *uplo*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

call pcsymm(*side*, *uplo*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

call pzsymm(*side*, *uplo*, *m*, *n*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

Description

The p?symm routines perform a matrix-matrix operation with distributed matrices. The operation is defined as

sub(*C*):=*alpha**sub(*A*)*sub(*B*)+ *beta**sub(*C*),

or

sub(*C*):=*alpha**sub(*B*)*sub(*A*)+ *beta**sub(*C*),

where:

alpha and *beta* are scalars,

sub(*A*) is a symmetric distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*m*-1), if *side* ='L', and sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), if *side* ='R'.

sub(*B*) and sub(*C*) are *m*-by-*n* distributed matrices.

sub(*B*)=*B*(*ib*:*ib*+*m*-1, *jb*:*jb*+*n*-1), sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1).

Input Parameters

side — (global) CHARACTER*1. Specifies whether the symmetric distributed matrix sub(*A*) appears on the left or right in the operation:
if *side* = 'L' or 'l', then sub(*C*) := *alpha**sub(*A*) *sub(*B*) + *beta**sub(*C*);
if *side* = 'R' or 'r', then sub(*C*) := *alpha**sub(*B*) *sub(*A*) + *beta**sub(*C*).

uplo — (global) CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric distributed matrix sub(*A*) is used:
if *uplo* = 'U' or 'u', then the upper triangular part is used;
if *uplo* = 'L' or 'l', then the lower triangular part is used.

m — (global) INTEGER. Specifies the number of rows of the distribute submatrix sub(*C*), $m \geq 0$.

n — (global) INTEGER. Specifies the number of columns of the distribute submatrix sub(*C*), $m \geq 0$.

alpha — (global) REAL for pssymm
DOUBLE PRECISION for pdsymm
COMPLEX for pcsymm
DOUBLE COMPLEX for pzsymm
Specifies the scalar *alpha*.

a — (local) REAL for pssymm
DOUBLE PRECISION for pdsymm
COMPLEX for pcsymm
DOUBLE COMPLEX for pzsymm
Array, DIMENSION (*lld_a*, LOCq(*ja*+*na*-1)).

	Before entry this array must contain the local pieces of the symmetric distributed matrix sub(*A*), such that when *uplo* = 'U' or 'u', the *na*-by-*na* upper triangular part of the distributed matrix sub(*A*) must contain the upper triangular part of the symmetric distributed matrix and the strictly lower triangular part of sub(*A*) is not referenced, and when *uplo* = 'L' or 'l', the *na*-by-*na* lower triangular part of the distributed matrix sub(*A*) must contain the lower triangular part of the symmetric distributed matrix and the strictly upper triangular part of sub(*A*) is not referenced.
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
b	(local) REAL for pssymm DOUBLE PRECISION for pdsymm COMPLEX for pcsymm DOUBLE COMPLEX for pzsymm Array, DIMENSION (*lld_b*, LOCq(*jb*+*n*-1)). Before entry this array must contain the local pieces of the distributed matrix sub(*B*).
ib, *jb*	(global) INTEGER. The row and column indices in the distributed matrix *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *B*.
beta	(global) REAL for pssymm DOUBLE PRECISION for pdsymm COMPLEX for pcsymm DOUBLE COMPLEX for pzsymm Specifies the scalar *beta*. When *beta* is set to zero, then sub(*C*) need not be set on input.
c	(local) REAL for pssymm DOUBLE PRECISION for pdsymm COMPLEX for pcsymm DOUBLE COMPLEX for pzsymm Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). Before entry this array must contain the local pieces of the distributed matrix sub(*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	Overwritten by the *m*-by-*n* updated matrix.

p?syrk

Performs a rank-k update of a symmetric distributed matrix.

Syntax

```
call pssyrk(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pdsyrk(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pcsyrk(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pzsyrk(uplo, trans, n, k, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
```

Description

The p?syrk routines perform a distributed matrix-matrix operation defined as

sub(*C*):=*alpha**sub(*A*)*sub(*A*)'+ *beta**sub(*C*),

or

sub(*C*):=*alpha**sub(*A*)'*sub(*A*)+ *beta**sub(*C*),

where:

alpha and *beta* are scalars,

sub(*C*) is an *n*-by-*n* symmetric distributed matrix, sub(*C*)=C(*ic*:*ic*+*n*-1, *jc*:*jc*+*n*-1).

sub(*A*) is a distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*k*-1), if *trans* = 'N' or 'n', and sub(*A*)=*A*(*ia*:*ia*+*k*-1, *ja*:*ja*+*n*-1) otherwise.

Input Parameters

uplo	(global) CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric distributed matrix sub(*C*) is used: If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*C*) is used. If *uplo* = 'L' or 'l', then the low triangular part of the sub(*C*) is used.
trans	(global) CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then sub(*C*) := *alpha**sub(*A*)*sub(*A*)' + *beta**sub(*C*); if *trans* = 'T' or 't', then sub(*C*) := *alpha**sub(*A*)'*sub(*A*) + *beta**sub(*C*).
n	(global) INTEGER. Specifies the order of the distributed matrix sub(*C*), $n \geq 0$.
k	(global) INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the distributed matrix sub(*A*) , and on entry with *trans* = 'T' or 't' , *k* specifies the number of rows of the distributed matrix sub(*A*), $k \geq 0$.
alpha	(global) REAL for pssyrk

	DOUBLE PRECISION for pdsyrk COMPLEX for pcsyrk DOUBLE COMPLEX for pzsyrk Specifies the scalar *alpha*.
a	(local) REAL for pssyrk DOUBLE PRECISION for pdsyrk COMPLEX for pcsyrk DOUBLE COMPLEX for pzsyrk Array, DIMENSION (*lld_a*, *kla*), where *kla* is LOCq(*ja*+*k*-1) when *trans* = 'N' or 'n', and is LOCq(*ja*+*n*-1) otherwise. Before entry with *trans* = 'N' or 'n', this array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
beta	(global) REAL for pssyrk DOUBLE PRECISION for pdsyrk COMPLEX for pcsyrk DOUBLE COMPLEX for pzsyrk Specifies the scalar *beta*.
c	(local) REAL for pssyrk DOUBLE PRECISION for pdsyrk COMPLEX for pcsyrk DOUBLE COMPLEX for pzsyrk Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). Before entry with *uplo* = 'U' or 'u', this array contains *n*-by-*n* upper triangular part of the symmetric distributed matrix sub(*C*) and its strictly lower triangular part is not referenced. Before entry with *uplo* = 'L' or 'l', this array contains *n*-by-*n* lower triangular part of the symmetric distributed matrix sub(*C*) and its strictly upper triangular part is not referenced.
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix.

With *uplo* = 'L' or 'l', the lower triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix.

p?syr2k

Performs a rank-2k update of a symmetric distributed matrix.

Syntax

call pssyr2k(*uplo*, *trans*, *n*, *k*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

call pdsyr2k(*uplo*, *trans*, *n*, *k*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

call pcsyr2k(*uplo*, *trans*, *n*, *k*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

call pzsyr2k(*uplo*, *trans*, *n*, *k*, *alpha*, *a*, *ia*, *ja*, *desca*, *b*, *ib*, *jb*, *descb*, *beta*, *c*, *ic*, *jc*, *descc*)

Description

The p?syr2k routines perform a distributed matrix-matrix operation defined as

sub(*C*):=*alpha**sub(*A*)*sub(*B*)'+*alpha**sub(*B*)*sub(*A*)'+ *beta**sub(*C*),

or

sub(*C*):=*alpha**sub(*A*)'*sub(*B*) +*alpha**sub(*B*)'*sub(*A*) + *beta**sub(*C*),

where:

alpha and *beta* are scalars,

sub(*C*) is an *n*-by-*n* symmetric distributed matrix, sub(*C*)=C(*ic*:*ic*+*n*-1, *jc*:*jc*+*n*-1).

sub(*A*) is a distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*k*-1), if *trans* = 'N' or 'n', and sub(*A*)=*A*(*ia*:*ia*+*k*-1, *ja*:*ja*+*n*-1) otherwise.

sub(*B*) is a distributed matrix, sub(*B*)=*B*(*ib*:*ib*+*n*-1, *jb*:*jb*+*k*-1), if *trans* = 'N' or 'n', and sub(*B*)=*B*(*ib*:*ib*+*k*-1, *jb*:*jb*+*n*-1) otherwise.

Input Parameters

uplo — (global) CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric distributed matrix sub(*C*) is used:
If *uplo* = 'U' or 'u', then the upper triangular part of the sub(*C*) is used.
If *uplo* = 'L' or 'l', then the low triangular part of the sub(*C*) is used.

trans — (global) CHARACTER*1. Specifies the operation:
if *trans* = 'N' or 'n', then sub(*C*) := *alpha**sub(*A*)*sub(*B*)' + *alpha**sub(*B*)*sub(*A*)' + *beta**sub(*C*);

	if *trans* = 'T' or 't', then sub(*C*) := *alpha**sub(*B*)'*sub(*A*) + *alpha**sub(*A*)'*sub(*B*) + *beta**sub(*C*).
n	(global) INTEGER. Specifies the order of the distributed matrix sub(*C*), $n \geq 0$.
k	(global) INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the distributed matrices sub(*A*) and sub(*B*), and on entry with *trans* = 'T' or 't' , *k* specifies the number of rows of the distributed matrices sub(*A*) and sub(*B*), $k \geq 0$.
alpha	(global) REAL for pssyr2k DOUBLE PRECISION for pdsyr2k COMPLEX for pcsyr2k DOUBLE COMPLEX for pzsyr2k Specifies the scalar *alpha*.
a	(local) REAL for pssyr2k DOUBLE PRECISION for pdsyr2k COMPLEX for pcsyr2k DOUBLE COMPLEX for pzsyr2k Array, DIMENSION (*lld_a*, *kla*), where *kla* is LOCq(*ja*+*k*-1) when *trans* = 'N' or 'n', and is LOCq(*ja*+*n*-1) otherwise. Before entry with *trans* = 'N' or 'n', this array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
b	(local) REAL for pssyr2k DOUBLE PRECISION for pdsyr2k COMPLEX for pcsyr2k DOUBLE COMPLEX for pzsyr2k Array, DIMENSION (*lld_b*, *klb*), where *klb* is LOCq(*jb*+*k*-1) when *trans* = 'N' or 'n', and is LOCq(*jb*+*n*-1) otherwise. Before entry with *trans* = 'N' or 'n', this array contains the local pieces of the distributed matrix sub(*B*).
ib, *jb*	(global) INTEGER. The row and column indices in the distributed matrix *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *B*.
beta	(global) REAL for pssyr2k DOUBLE PRECISION for pdsyr2k COMPLEX for pcsyr2k DOUBLE COMPLEX for pzsyr2k Specifies the scalar *beta*.

c	(local) REAL for pssyr2k DOUBLE PRECISION for pdsyr2k COMPLEX for pcsyr2k DOUBLE COMPLEX for pzsyr2k Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). Before entry with *uplo* = 'U' or 'u', this array contains *n*-by-*n* upper triangular part of the symmetric distributed matrix sub(*C*) and its strictly lower triangular part is not referenced. Before entry with *uplo* = 'L' or 'l', this array contains *n*-by-*n* lower triangular part of the symmetric distributed matrix sub(*C*) and its strictly upper triangular part is not referenced.
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix. With *uplo* = 'L' or 'l', the lower triangular part of sub(*C*) is overwritten by the upper triangular part of the updated distributed matrix.

p?tran

Transposes a real distributed matrix.

Syntax

```
call pstran(m, n, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pdtran(m, n, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
```

Description

The p?tran routines transpose a real distributed matrix. The operation is defined as

sub(*C*):=*beta**sub(*C*) + *alpha**sub(*A*)',

where:

alpha and *beta* are scalars,

sub(*C*) is an *m*-by-*n* distributed matrix, sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1).

sub(*A*) is a distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*m*-1).

Input Parameters

m	(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*C*), $m \geq 0$.
n	(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*C*) , $n \geq 0$.
alpha	(global) REAL for pstran DOUBLE PRECISION for pdtran Specifies the scalar *alpha*.
a	(local) REAL for pstran DOUBLE PRECISION for pdtran Array, DIMENSION (*lld_a*, LOCq(*ja*+*m*-1)). This array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
beta	(global) REAL for pstran DOUBLE PRECISION for pdtran Specifies the scalar *beta*. When *beta* is equal to zero, then sub(*C*) need not be set on input.
c	(local) REAL for pstran DOUBLE PRECISION for pdtran Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	Overwritten by the updated submatrix.

p?tranu

Transposes a distributed complex matrix.

Syntax

```
call pctranu(m, n, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pztranu(m, n, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
```

Description

The p?tranu routines transpose a complex distributed matrix. The operation is defined as

sub(*C*):=*beta**sub(*C*) + *alpha**sub(*A*)',

where:

alpha and *beta* are scalars,

sub(*C*) is an *m*-by-*n* distributed matrix, sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1).

sub(*A*) is a distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*m*-1).

Input Parameters

m	(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*C*), $m \geq 0$.
n	(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*C*) , $n \geq 0$.
alpha	(global) COMPLEX for pctranu DOUBLE COMPLEX for pztranu Specifies the scalar *alpha*.
a	(local) COMPLEX for pctranu DOUBLE COMPLEX for pztranu Array, DIMENSION (*lld_a*, LOCq(*ja*+*m*-1)). This array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
beta	(global) COMPLEX for pctranu DOUBLE COMPLEX for pztranu Specifies the scalar *beta*. When *beta* is equal to zero, then sub(*C*) need not be set on input.
c	(local) COMPLEX for pctranu DOUBLE COMPLEX for pztranu Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*C*).
ic, *jc*	(global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.
descc	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c	Overwritten by the updated submatrix.

p?tranc

Transposes a complex distributed matrix, conjugated.

Syntax

```
call pctranc(m, n, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
call pztranc(m, n, alpha, a, ia, ja, desca, beta, c, ic, jc, descc)
```

Description

The p?tranc routines transpose a complex distributed matrix. The operation is defined as

sub(*C*):=*beta**sub(*C*) + *alpha**conjg(sub(*A*)'),

where:

alpha and *beta* are scalars,

sub(*C*) is an *m*-by-*n* distributed matrix, sub(*C*)=*C*(*ic*:*ic*+*m*-1, *jc*:*jc*+*n*-1).

sub(*A*) is a distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*m*-1).

Input Parameters

m	(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*C*), $m \geq 0$.
n	(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*C*) , $n \geq 0$.
alpha	(global) COMPLEX for pctranc DOUBLE COMPLEX for pztranc Specifies the scalar *alpha*.
a	(local) COMPLEX for pctranc DOUBLE COMPLEX for pztranc Array, DIMENSION (*lld_a*, LOCq(*ja*+*m*-1)). This array contains the local pieces of the distributed matrix sub(*A*).
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
beta	(global) COMPLEX for pctranc DOUBLE COMPLEX for pztranc Specifies the scalar *beta*. When *beta* is equal to zero, then sub(*C*) need not be set on input.
c	(local) COMPLEX for pctranc DOUBLE COMPLEX for pztranc Array, DIMENSION (*lld_c*, LOCq(*jc*+*n*-1)). This array contains the local pieces of the distributed matrix sub(*C*).

ic, *jc* (global) INTEGER. The row and column indices in the distributed matrix *C* indicating the first row and the first column of the submatrix sub(*C*), respectively.

descc (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *C*.

Output Parameters

c Overwritten by the updated submatrix.

p?trmm

Computes a scalar-matrix-matrix product (one matrix operand is triangular) for distributed matrices.

Syntax

```
call pstrmm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
call pdtrmm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
call pctrmm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
call pztrmm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
```

Description

The p?trmm routines perform a matrix-matrix operation using triangular matrices. The operation is defined as

sub(*B*) := *alpha**op(sub(*A*))*sub(*B*)

or

sub(*B*) := *alpha**sub(*B*)*op(sub(*A*))

where:

alpha is a scalar,

sub(*B*) is an *m*-by-*n* distributed matrix, sub(*B*)=*B*(*ib*:*ib*+*m*-1, *jb*:*jb*+*n*-1).

A is a unit, or non-unit, upper or lower triangular distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*m*-1), if *side* = 'L' or 'l', and sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), if *side* = 'R' or 'r'.

op(sub(*A*)) is one of op(sub(*A*)) = sub(*A*), or op(sub(*A*)) = sub(*A*)', or op(sub(*A*)) = conjg(sub(*A*)').

Input Parameters

side (global)CHARACTER*1. Specifies whether op(sub(*A*)) appears on the left or right of sub(*B*) in the operation:
if *side* = 'L' or 'l', then sub(*B*) := *alpha**op(sub(*A*))*sub(*B*);
if *side* = 'R' or 'r', then sub(*B*) := *alpha**sub(*B*)*op(sub(*A*)).

uplo (global) CHARACTER*1. Specifies whether the distributed matrix sub(*A*) is upper or lower triangular:
if *uplo* = 'U' or 'u', then the matrix is upper triangular;
if *uplo* = 'L' or 'l', then the matrix is low triangular.

transa	(global) CHARACTER*1. Specifies the form of op(sub(*A*)) used in the matrix multiplication: if *transa* = 'N' or 'n', then op(sub(*A*)) = sub(*A*); if *transa* = 'T' or 't', then op(sub(*A*)) = sub(*A*)' ; if *transa* = 'C' or 'c', then op(sub(*A*)) = conjg(sub(*A*)').
diag	(global) CHARACTER*1. Specifies whether the matrix sub(*A*) is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
m	(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*B*), $m \geq 0$.
n	(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*B*), $n \geq 0$.
alpha	(global) REAL for pstrmm DOUBLE PRECISION for pdtrmm COMPLEX for pctrmm DOUBLE COMPLEX for pztrmm Specifies the scalar *alpha*. When *alpha* is zero, then the array*b* need not be set before entry.
a	(local) REAL for pstrmm DOUBLE PRECISION for pdtrmm COMPLEX for pctrmm DOUBLE COMPLEX for pztrmm Array, DIMENSION (*lld_a*,*ka*), where *ka* is at least LOCq(1, *ja*+*m*-1) when *side* = 'L' or 'l' and is at least LOCq(1, *ja*+*n*-1) when *side* = 'R' or 'r'. Before entry with *uplo* = 'U' or 'u', this array contains the local entries corresponding to the entries of the upper triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly lower triangular part of the distributed matrix sub(*A*) is not referenced. Before entry with *uplo* = 'L' or 'l', this array contains the local entries corresponding to the entries of the lower triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly upper triangular part of the distributed matrix sub(*A*) is not referenced . When *diag* = 'U' or 'u', the local entries corresponding to the diagonal elements of the submatrix sub(*A*) are not referenced either, but are assumed to be unity.
ia, *ja*	(global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.
desca	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.
b	(local) REAL for pstrmm

	DOUBLE PRECISION for pdtrmm COMPLEX for pctrmm DOUBLE COMPLEX for pztrmm Array, DIMENSION (*lld_b*, LOCq(1, *jb*+*n*-1)). Before entry, this array contains the local pieces of the distributed matrix sub(*B*).
ib, *jb*	(global) INTEGER. The row and column indices in the distributed matrix *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.
descb	(global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *B*.

Output Parameters

b	Overwritten by the transformed distributed matrix.

p?trsm

Solves a distributed matrix equation (one matrix operand is triangular).

Syntax

```
call pstrsm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
call pdtrsm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
call pctrsm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
call pztrsm(side, uplo, transa, diag, m, n, alpha, a, ia, ja, desca, b, ib, jb, descb)
```

Description

The p?trsm routines solve one of the following distributed matrix equations:

op(sub(*A*))***X* = *alpha**sub(*B*),

or

*X**op(sub(*A*)) = *alpha**sub(*B*),

where:

alpha is a scalar,

X and sub(*B*) are *m*-by-*n* distributed matrices, sub(*B*)=*B*(*ib*:*ib*+*m*-1, *jb*:*jb*+*n*-1);

A is a unit, or non-unit, upper or lower triangular distributed matrix, sub(*A*)=*A*(*ia*:*ia*+*m*-1, *ja*:*ja*+*m*-1), if *side* = 'L' or 'l', and sub(*A*)=*A*(*ia*:*ia*+*n*-1, *ja*:*ja*+*n*-1), if *side* = 'R' or 'r';

op(sub(*A*)) is one of op(sub(*A*)) = sub(*A*), or op(sub(*A*)) = sub(*A*)', or op(sub(*A*)) = conjg(sub(*A*)').

The distributed matrix sub(*B*) is overwritten by the solution matrix *X*.

Input Parameters

side
(global)CHARACTER*1. Specifies whether op(sub(*A*)) appears on the left or right of *X* in the equation:
if *side* = 'L' or 'l', then op(sub(*A*))*X = *alpha**sub(*B*);
if *side* = 'R' or 'r', then *X**op(sub(*A*)) = *alpha**sub(*B*).

uplo
(global) CHARACTER*1. Specifies whether the distributed matrix sub(*A*) is upper or lower triangular:
if *uplo* = 'U' or 'u', then the matrix is upper triangular;
if *uplo* = 'L' or 'l', then the matrix is low triangular.

transa
(global) CHARACTER*1. Specifies the form of op(sub(*A*)) used in the matrix equation:
if *transa* = 'N' or 'n', then op(sub(*A*)) = sub(*A*);
if *transa* = 'T' or 't', then op(sub(*A*)) = sub(*A*)';
if *transa* = 'C' or 'c', then op(sub(*A*)) = conjg(sub(*A*)').

diag
(global) CHARACTER*1. Specifies whether the matrix sub(*A*) is unit triangular:
if *diag* = 'U' or 'u' then the matrix is unit triangular;
if *diag* = 'N' or 'n', then the matrix is not unit triangular.

m
(global) INTEGER. Specifies the number of rows of the distributed matrix sub(*B*), $m \geq 0$.

n
(global) INTEGER. Specifies the number of columns of the distributed matrix sub(*B*), $n \geq 0$.

alpha
(global) REAL for pstrsm
DOUBLE PRECISION for pdtrsm
COMPLEX for pctrsm
DOUBLE COMPLEX for pztrsm
Specifies the scalar *alpha*.
When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.

a
(local) REAL for pstrsm
DOUBLE PRECISION for pdtrsm
COMPLEX for pctrsm
DOUBLE COMPLEX for pztrsm
Array, DIMENSION (*lld_a*, *ka*), where *ka* is at least LOCq(1, *ja*+*m*-1) when *side* = 'L' or 'l' and is at least LOCq(1, *ja*+*n*-1) when *side* = 'R' or 'r'.
Before entry with *uplo* = 'U' or 'u', this array contains the local entries corresponding to the entries of the upper triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly lower triangular part of the distributed matrix sub(*A*) is not referenced.

Before entry with *uplo* = 'L' or 'l', this array contains the local entries corresponding to the entries of the lower triangular distributed matrix sub(*A*), and the local entries corresponding to the entries of the strictly upper triangular part of the distributed matrix sub(*A*) is not referenced .
When *diag* = 'U' or 'u', the local entries corresponding to the diagonal elements of the submatrix sub(*A*) are not referenced either, but are assumed to be unity.

ia, *ja* — (global) INTEGER. The row and column indices in the distributed matrix *A* indicating the first row and the first column of the submatrix sub(*A*), respectively.

desca — (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *A*.

b — (local) REAL for pstrsm
DOUBLE PRECISION for pdtrsm
COMPLEX for pctrsm
DOUBLE COMPLEX for pztrsm
Array, DIMENSION (*lld_b*, LOCq(1, *jb*+*n*-1)).
Before entry, this array contains the local pieces of the distributed matrix sub(*B*).

ib, *jb* — (global) INTEGER. The row and column indices in the distributed matrix *B* indicating the first row and the first column of the submatrix sub(*B*), respectively.

descb — (global and local) INTEGER array of dimension 8. The array descriptor of the distributed matrix *B*.

Output Parameters

b — Overwritten by the solution distributed matrix *X*.

Partial Differential Equations Support 13

The Intel® Math Kernel Library (Intel® MKL) provides tools for solving Partial Differential Equations (PDE). These tools are Trigonometric Transform interface routines (see Trigonometric Transform Routines) and Poisson Library (see Poisson Library Routines).

Poisson Library is designed for fast solving of simple Helmholtz, Poisson, and Laplace problems. The solver is based on the Trigonometric Transform interface, which is, in turn, based on the Intel MKL Fast Fourier Transform (FFT) interface (refer to Fourier Transform Functions), optimized for Intel® processors.

Direct use of the Trigonometric Transform routines may be helpful to those who have already implemented their own solvers similar to the one that the Poisson Library provides. As it may be hard enough to modify the original code so as to make it work with Poisson Library, you are encouraged to use fast (staggered) sine/cosine transforms implemented in the Trigonometric Transform interface to improve performance of your solver.

Both Trigonometric Transform and Poisson Library routines can be called from C and Fortran 90, although the interfaces description uses C convention. Fortran 90 users can find routine calls specifics in the "Calling PDE Support Routines from Fortran 90" section.

Trigonometric Transform Routines

In addition to the Fast Fourier Transform (FFT) interface, described in chapter "Fast Fourier Transforms", Intel® MKL supports the Real Discrete Trigonometric Transforms (sometimes called real-to-real Discrete Fourier Transforms) interface. In this manual, the interface is referred to as TT interface. It implements a group of routines (TT routines) used to compute sine/cosine, staggered sine/cosine, and twice staggered sine/cosine transforms (referred to as staggered2 sine/cosine transforms, for brevity). The TT interface provides much flexibility of use: you can adjust routines to your particular needs at the cost of manual tuning routine parameters or just call routines with default parameter values. The current Intel MKL implementation of the TT interface can be used in solving partial differential equations and contains routines that are helpful for Fast Poisson and similar solvers.

To describe the Intel MKL TT interface, the C convention is used. Fortran users should refer to Calling PDE Support Routines from Fortran 90.

For the list of Trigonometric Transforms currently implemented in Intel MKL TT interface, see Transforms Implemented.

If you have got used to the FFTW interface (www.fftw.org), you can call the TT interface functions through real-to-real FFTW to Intel MKL wrappers without changing FFTW function calls in your code (refer to the "FFTW to Intel® MKL Wrappers for FFTW 3.x" section in Appendix F for details). However, you are strongly encouraged to use the native TT interface for better performance. Another reason why you should use the wrappers cautiously is that TT and the real-to-real FFTW interfaces are not fully compatible and some features of the real-to-real FFTW, such as strides and multidimensional transforms, are not available through wrappers.

Transforms Implemented

TT routines allow computing the following transforms:

Forward sine transform

$$F(k)=\frac{2}{n}\sum_{i=1}^{n-1}f(i)\sin\frac{ki\pi}{n},\ k=1,\ldots,n-1$$

Backward sine transform

$$f(i)=\sum_{k=1}^{n-1}F(k)\sin\frac{ki\pi}{n},\ i=1,\ldots,n-1$$

Forward staggered sine transform

$$F(k)=\frac{1}{n}\sin\frac{(2k-1)\pi}{2}f(n)+\frac{2}{n}\sum_{i=1}^{n-1}f(i)\sin\frac{(2k-1)i\pi}{2n},\ k=1,\ldots,n$$

Backward staggered sine transform

$$f(i)=\sum_{k=1}^{n}F(k)\sin\frac{(2k-1)i\pi}{2n},\ i=1,\ldots,n$$

Forward staggered2 sine transform

$$F(k)=\frac{2}{n}\sum_{i=1}^{n}f(i)\sin\frac{(2k-1)(2i-1)\pi}{4n},\ k=1,\ldots,n$$

Backward staggered2 sine transform

$$f(i)=\sum_{k=1}^{n}F(k)\sin\frac{(2k-1)(2i-1)\pi}{4n},\ i=1,\ldots,n$$

Forward cosine transform

$$F(k)=\frac{1}{n}\left[f(0)+f(n)\cos k\pi\right]+\frac{2}{n}\sum_{i=1}^{n-1}f(i)\cos\frac{ki\pi}{n},\ k=0,\ldots,n$$

Backward cosine transform

$$f(i)=\frac{1}{2}\left[F(0)+F(n)\cos i\pi\right]+\sum_{k=1}^{n-1}F(k)\cos\frac{ki\pi}{n},\ i=0,\ldots,n$$

Forward staggered cosine transform

$$F(k)=\frac{1}{n}f(0)+\frac{2}{n}\sum_{i=1}^{n-1}f(i)\cos\frac{(2k+1)i\pi}{2n},\ k=0,\ldots,n-1$$

Backward staggered cosine transform

$$f(i)=\sum_{k=0}^{n-1}F(k)\cos\frac{(2k+1)i\pi}{2n},\ i=0,\ldots,n-1$$

Forward staggered2 cosine transform

$$F(k)=\frac{2}{n}\sum_{i=1}^{n}f(i)\cos\frac{(2k-1)(2i-1)\pi}{4n},\ k=1,\ldots,n$$

Backward staggered2 cosine transform

$$f(i) = \sum_{k=1}^{n} F(k) \cos \frac{(2k-1)(2i-1)\pi}{4n}, \; i = 1,\ldots,n$$

NOTE. The size of the transform *n* can be any integer greater or equal to 2.

Sequence of Invoking TT Routines

Computation of a transform using TT interface is conceptually divided into four steps, each of which is performed via a dedicated routine. Table 13-1 lists the routines and briefly describes their purpose and use.

Most TT routines have versions operating with single-precision and double-precision data. Names of such routines begin respectively with "s" and "d". The wildcard "?" stands for either of these symbols in routine names.

Table 13-1 TT Interface Routines

Routine	Description
`?_init_trig_transform`	Initializes basic data structures of Trigonometric Transforms.
`?_commit_trig_transform`	Checks consistency and correctness of user-defined data as well as creates a data structure to be used by Intel MKL FFT interface[1].
`?_forward_trig_transform` `?_backward_trig_transform`	Computes a forward/backward Trigonometric Transform of a specified type using the appropriate formula (see Transforms Implemented).
`free_trig_transform`	Cleans the memory used by a data structure needed for calling FFT interface[1].

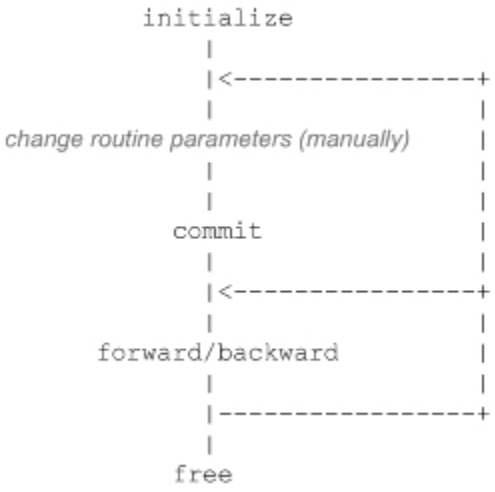
[1]TT routines call Intel MKL FFT interface for better performance.

To find a transformed vector for a particular input vector only once, the Intel MKL TT interface routines are normally invoked in the order in which they are listed in Table 13-1.

NOTE. Though the order of invoking TT routines may be changed, it is highly recommended to follow the above order of routine calls.

The diagram in Figure 13-1 indicates the typical order in which TT interface routines can be invoked in a general case (prefixes and suffixes in routine names are omitted).

Figure 13-1 Typical Order of Invoking TT Interface Routines



A general scheme of using TT routines for double-precision computations is shown below. A similar scheme holds for single-precision computations with the only difference in the initial letter of routine names.

```
...
    d_init_trig_transform(&n, &tt_type, ipar, dpar, &ir);
/* Change parameters in ipar if necessary. */
/* Note that the result of the Transform will be in f ! If you want to preserve the data stored in f,
save them before this place in your code */
    d_commit_trig_transform(f, &handle, ipar, dpar, &ir);
    d_forward_trig_transform(f, &handle, ipar, dpar, &ir);
    d_backward_trig_transform(f, &handle, ipar, dpar, &ir);
    free_trig_transform(&handle, ipar, &ir);
/* here the user may clean the memory used by f, dpar, ipar */
...
```

You can find examples of Fortran 90 and C code that use TT interface routines to solve one-dimensional Helmholtz problem in the `examples\pdettf\source` and `examples\pdettc\source` folders of your Intel MKL directory.

Interface Description

All types in this documentation are standard C types: `int`, `float`, and `double`. Fortran 90 users can call the routines with `INTEGER`, `REAL`, and `DOUBLE PRECISION` Fortran types, respectively (see examples in the `examples\pdettf\source` and `examples\pdettc\source` folders of your Intel MKL directory).

The interface description uses the built-in type `int` for integer values. If you employ the ILP64 interface, read this type as `long long int` (or `INTEGER*8` for Fortran). For more information, refer to the *Intel MKL User's Guide*.

Routine Options

All TT routines use parameters to pass various options to one another. These parameters are arrays *ipar*, *dpar* and *spar*. Values for these parameters should be specified very carefully (see Common Parameters). You can change these values during computations to meet your needs.

WARNING. To avoid failure or wrong results, you must provide correct and consistent parameters to the routines.

User Data Arrays

TT routines take arrays of user data as input. For example, user arrays are passed to the routine `d_forward_trig_transform` to compute a forward Trigonometric Transform. To minimize storage requirements and improve the overall run-time efficiency, Intel MKL TT routines do not make copies of user input arrays.

NOTE. If you need a copy of your input data arrays, save them yourself.

TT Routines

The section gives detailed description of TT routines, their syntax, parameters and values they return. Double-precision and single-precision versions of the same routine are described together.

TT routines call Intel MKL FFT interface (described in section "FFT Functions" in chapter "Fast Fourier Transforms"), which enhances performance of the routines.

?_init_trig_transform

Initializes basic data structures of a Trigonometric Transform.

Syntax

```
void d_init_trig_transform (int *n, int *tt_type, int ipar[], double dpar[], int *stat);
void s_init_trig_transform (int *n, int *tt_type, int ipar[], float spar[], int *stat);
```

Input Parameters

n `int*`. Contains the size of the problem, which should be a positive integer greater than 1. Note that data vector of the transform, which other TT routines will use, must have size *n*+1 for all but staggered2 transforms. Staggered2 transforms require the vector of size *n*.

tt_type	int*. Contains the type of transform to compute, defined via a set of named constants. The following constants are available in the current implementation of TT interface: MKL_SINE_TRANSFORM, MKL_STAGGERED_SINE_TRANSFORM, MKL_STAGGERED2_SINE_TRANSFORM; MKL_COSINE_TRANSFORM, MKL_STAGGERED_COSINE_TRANSFORM, MKL_STAGGERED2_COSINE_TRANSFORM.

Output Parameters

ipar	int array of size 128. Contains integer data needed for Trigonometric Transform computations.
dpar	double array of size 5*n*/2+2. Contains double-precision data needed for Trigonometric Transform computations.
spar	float array of size 5*n*/2+2. Contains single-precision data needed for Trigonometric Transform computations.
stat	int*. Contains the routine completion status, which is also written to *ipar[6]*. The status should be 0 to proceed to other TT routines.

Description

The routine is declared in the mkl_trig_transforms.h header file for the C interface and mkl_trig_transforms.f90 header file for the Fortran interface. The routine initializes basic data structures for Trigonometric Transforms of appropriate precision. After a call to ?_init_trig_transform, all subsequently invoked TT routines use values of *ipar* and *dpar* (*spar*) array parameters returned by ?_init_trig_transform. The routine initializes the entire array *ipar*. In the *dpar* or *spar* array, ?_init_trig_transform initializes elements that do not depend upon the type of transform. For a detailed description of arrays *ipar*, *dpar* and *spar*, refer to the Common Parameters section. You can skip calling the initialization routine in your code. For more information, see Caveat on Parameter Modifications.

Return Values

stat= 0	The routine successfully completed the task. In general, to proceed with computations, the routine should complete with this *stat* value.
stat= -99999	The routine failed to complete the task.

?_commit_trig_transform

Checks consistency and correctness of user's data as well as initializes certain data structures required to perform the Trigonometric Transform.

Syntax

```
void d_commit_trig_transform (double f[], DFTI_DESCRIPTOR_HANDLE *handle, int ipar[], double dpar[], int *stat);
```

```
void s_commit_trig_transform (float f[], DFTI_DESCRIPTOR_HANDLE *handle, int ipar[], float spar[], int *stat);
```

Input Parameters

f	`double` for `d_commit_trig_transform`, `float` for `s_commit_trig_transform`, array of size *n* for staggered2 transforms and of size *n*+1 for all other transforms, where *n* is the size of the problem. Contains data vector to be transformed. Note that the following values should be 0.0 up to rounding errors: • *f*[0] and *f*[*n*] for sine transforms • *f*[*n*] for staggered cosine transforms • *f*[0] for staggered sine transforms. Otherwise, the routine will produce a warning, and the result of the computations for sine transforms may be wrong. These restrictions meet the requirements of the Poisson Library (described in the Poisson Library Routines section), which the TT interface is primarily designed for.
ipar	`int` array of size 128. Contains integer data needed for Trigonometric Transform computations.
dpar	`double` array of size 5*n*/2+2. Contains double-precision data needed for Trigonometric Transform computations. The routine initializes most elements of this array.
spar	`float` array of size 5*n*/2+2. Contains single-precision data needed for Trigonometric Transform computations. The routine initializes most elements of this array.

Output Parameters

handle	`DFTI_DESCRIPTOR_HANDLE*`. The data structure used by Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms").
ipar	Contains integer data needed for Trigonometric Transform computations. On output, *ipar[6]* is updated with the *stat* value.
dpar	Contains double-precision data needed for Trigonometric Transform computations. On output, the entire array is initialized.
spar	Contains single-precision data needed for Trigonometric Transform computations. On output, the entire array is initialized.
stat	`int*`. Contains the routine completion status, which is also written to *ipar[6]*.

Description

The routine is declared in the `mkl_trig_transforms.h` header file for the C interface and `mkl_trig_transforms.f90` header file for the Fortran interface. The routine `?_commit_trig_transform` checks consistency and correctness of the parameters to be passed to the transform routines `?_forward_trig_transform` and/or `?_backward_trig_transform`. The routine also initializes the following data structures: *handle*, *dpar* in case of `d_commit_trig_transform`, and *spar* in case of `s_commit_trig_trans-`

form. The ?_commit_trig_transform routine initializes only those elements of *dpar* or *spar* that depend upon the type of transform, defined in the ?_init_trig_transform routine and passed to ?_commit_trig_transform with the *ipar* array. The size of the problem *n*, which determines sizes of the array parameters, is also passed to the routine with the *ipar* array and defined in the previously called ?_init_trig_transform routine. For a detailed description of arrays *ipar*, *dpar* and *spar*, refer to the Common Parameters section. The routine performs only a basic check for correctness and consistency of the parameters. If you are going to modify parameters of TT routines, see the Caveat on Parameter Modifications section. Unlike ?_init_trig_transform, the ?_commit_trig_transform routine is mandatory, and you cannot skip calling it in your code.

Return Values

stat= 11	The routine produced some warnings and made some changes in the parameters to achieve their correctness and/or consistency. You may proceed with computations by assigning *ipar[6]*=0 if you are sure that the parameters are correct.
stat= 10	The routine made some changes in the parameters to achieve their correctness and/or consistency. You may proceed with computations by assigning *ipar[6]*=0 if you are sure that the parameters are correct.
stat= 1	The routine produced some warnings. You may proceed with computations by assigning *ipar[6]*=0 if you are sure that the parameters are correct.
stat= 0	The routine completed the task normally.
stat= -100	The routine stopped for any of the following reasons: • An error in the user's data was encountered. • Data in *ipar*, *dpar* or *spar* parameters became incorrect and/or inconsistent as a result of modifications.
stat= -1000	The routine stopped because of an FFT interface error.
stat= -10000	The routine stopped because the initialization failed to complete or the parameter *ipar[0]* was altered by mistake.

NOTE. Although positive values of *stat* usually indicate minor problems with the input data and Trigonometric Transform computations can be continued, you are highly recommended to investigate the problem first and achieve *stat*=0.

?_forward_trig_transform

Computes the forward Trigonometric Transform of type specified by the parameter.

Syntax

```
void d_forward_trig_transform (double f[], DFTI_DESCRIPTOR_HANDLE *handle, int ipar[],
double dpar[], int *stat);
```

```
void s_forward_trig_transform (float f[], DFTI_DESCRIPTOR_HANDLE *handle, int ipar[],
float spar[], int *stat);
```

Input Parameters

f	`double` for `d_forward_trig_transform`, `float` for `s_forward_trig_transform`, array of size *n* for staggered2 transforms and of size *n*+1 for all other transforms, where *n* is the size of the problem. On input, contains data vector to be transformed. Note that the following values should be 0.0 up to rounding errors: • *f*[0] and *f*[*n*] for sine transforms • *f*[*n*] for staggered cosine transforms • *f*[0] for staggered sine transforms. Otherwise, the routine will produce a warning, and the result of the computations for sine transforms may be wrong. The above restrictions meet the requirements of the Poisson Library (described in the Poisson Library Routines section), which the TT interface is primarily designed for.
handle	`DFTI_DESCRIPTOR_HANDLE*`. The data structure used by Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms").
ipar	`int` array of size 128. Contains integer data needed for Trigonometric Transform computations.
dpar	`double` array of size 5*n*/2+2. Contains double-precision data needed for Trigonometric Transform computations.
spar	`float` array of size 5*n*/2+2. Contains single-precision data needed for Trigonometric Transform computations.

Output Parameters

f	Contains the transformed vector on output.
ipar	Contains integer data needed for Trigonometric Transform computations. On output, *ipar[6]* is updated with the *stat* value.
stat	`int*`. Contains the routine completion status, which is also written to *ipar[6]*.

Description

The routine is declared in the `mkl_trig_transforms.h` header file for the C interface and `mkl_trig_transforms.f90` header file for the Fortran interface. The routine computes the forward Trigonometric Transform of type defined in the `?_init_trig_transform` routine and passed to `?_forward_trig_transform` with the *ipar* array. The size of the problem *n*, which determines sizes of the array parameters, is also passed to the routine with the *ipar* array and defined in the previously called `?_init_trig_transform` routine. The other data that facilitates the computation is created by `?_commit_trig_transform` and supplied in *dpar* or *spar*. For a detailed description of arrays *ipar*, *dpar* and *spar*, refer to the Common Parameters section. The

routine has a commit step, which calls the ?_commit_trig_transform routine. The transform is computed according to formulas given in the Transforms Implemented section. The routine replaces the input vector *f* with the transformed vector.

NOTE. If you need a copy of the data vector *f* to be transformed, make the copy before calling the ?_forward_trig_transform routine.

Return Values

stat = 0	The routine completed the task normally.
stat = -100	The routine stopped for any of the following reasons: • An error in the user's data was encountered. • Data in *ipar*, *dpar* or *spar* parameters became incorrect and/or inconsistent as a result of modifications.
stat = -1000	The routine stopped because of an FFT interface error.
stat = -10000	The routine stopped because its commit step failed to complete or the parameter *ipar[0]* was altered by mistake.

?_backward_trig_transform

Computes the backward Trigonometric Transform of type specified by the parameter.

Syntax

```
void d_backward_trig_transform (double f[], DFTI_DESCRIPTOR_HANDLE *handle, int ipar[], double dpar[], int *stat);
```

```
void s_backward_trig_transform (float f[], DFTI_DESCRIPTOR_HANDLE *handle, int ipar[], float spar[], int *stat);
```

Input Parameters

f	double for d_backward_trig_transform, float for s_backward_trig_transform, array of size *n* for staggered2 transforms and of size *n*+1 for all other transforms, where *n* is the size of the problem. On input, contains data vector to be transformed. Note that the following values should be 0.0 up to rounding errors: • *f*[0] and *f*[*n*] for sine transforms • *f*[*n*] for staggered cosine transforms • *f*[0] for staggered sine transforms.

	Otherwise, the routine will produce a warning, and the result of the computations for sine transforms may be wrong. The above restrictions meet the requirements of the Poisson Library (described in the Poisson Library Routines section), which the TT interface is primarily designed for.
handle	DFTI_DESCRIPTOR_HANDLE*. The data structure used by Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms").
ipar	int array of size 128. Contains integer data needed for Trigonometric Transform computations.
dpar	double array of size 5*n*/2+2. Contains double-precision data needed for Trigonometric Transform computations.
spar	float array of size 5*n*/2+2. Contains single-precision data needed for Trigonometric Transform computations.

Output Parameters

f	Contains the transformed vector on output.
ipar	Contains integer data needed for Trigonometric Transform computations. On output, *ipar[6]* is updated with the *stat* value.
stat	int*. Contains the routine completion status, which is also written to *ipar[6]*.

Description

The routine is declared in the mkl_trig_transforms.h header file for the C interface and mkl_trig_transforms.f90 header file for the Fortran interface. The routine computes the backward Trigonometric Transform of type defined in the ?_init_trig_transform routine and passed to ?_backward_trig_transform with the *ipar* array. The size of the problem *n*, which determines sizes of the array parameters, is also passed to the routine with the *ipar* array and defined in the previously called ?_init_trig_transform routine. The other data that facilitates the computation is created by ?_commit_trig_transform and supplied in *dpar* or *spar*. For a detailed description of arrays *ipar*, *dpar* and *spar*, refer to the Common Parameters section. The routine has a commit step, which calls the ?_commit_trig_transform routine. The transform is computed according to formulas given in the Transforms Implemented section. The routine replaces the input vector *f* with the transformed vector.

NOTE. If you need a copy of the data vector *f* to be transformed, make the copy before calling the ?_backward_trig_transform routine.

Return Values

stat= 0	The routine completed the task normally.
stat= -100	The routine stopped for any of the following reasons: • An error in the user's data was encountered.

- Data in *ipar*, *dpar* or *spar* parameters became incorrect and/or inconsistent as a result of modifications.

stat = -1000	The routine stopped because of an FFT interface error.
stat = -10000	The routine stopped because its commit step failed to complete or the parameter *ipar[0]* was altered by mistake.

free_trig_transform

Cleans the memory allocated for the data structure used by the FFT interface.

Syntax

```
void free_trig_transform (DFTI_DESCRIPTOR_HANDLE *handle, int ipar[], int *stat);
```

Input Parameters

ipar	int array of size 128. Contains integer data needed for Trigonometric Transform computations.
handle	DFTI_DESCRIPTOR_HANDLE*. The data structure used by Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms").

Output Parameters

handle	The data structure used by Intel MKL FFT interface. Memory allocated for the structure is released on output.
ipar	Contains integer data needed for Trigonometric Transform computations. On output, *ipar[6]* is updated with the *stat* value.
stat	int*. Contains the routine completion status, which is also written to *ipar[6]*.

Description

The routine is declared in the mkl_trig_transforms.h header file for the C interface and mkl_trig_transforms.f90 header file for the Fortran interface. The routine cleans the memory used by the *handle* structure, needed for Intel MKL FFT functions. To release the memory allocated for other parameters, include cleaning of the memory in your code.

Return Values

stat = 0	The routine completed the task normally.
stat = -1000	The routine stopped because of an FFT interface error.
stat = -99999	The routine failed to complete the task.

Common Parameters

This section provides description of array parameters that hold TT routine options: *ipar*, *dpar* and *spar*.

NOTE. Initial values are assigned to the array parameters by the appropriate `?_init_trig_transform` and `?_commit_trig_transform` routines.

ipar `int` array of size 128, holds integer data needed for Trigonometric Transform computations. Its elements are described in Table 13-2:

Table 13-2 Elements of the ipar Array

Index	Description
0	Contains the size of the problem to solve. The `?_init_trig_transform` routine sets *ipar[0]*=*n*, and all subsequently called TT routines use *ipar[0]* as the size of the transform.
1	Contains error messaging options: • *ipar[1]*=-1 indicates that all error messages will be printed to the file `MKL_Trig_Transforms_log.txt` in the folder from which the routine is called. If the file does not exist, the routine tries to create it. If the attempt fails, the routine prints information that the file cannot be created to the standard output device. • *ipar[1]*=0 indicates that no error messages will be printed. • *ipar[1]*=1 (default) indicates that all error messages will be printed to the preconnected default output device (usually, screen). In case of errors, each TT routine assigns a non-zero value to *stat* regardless of the *ipar[1]* setting.
2	Contains warning messaging options: • *ipar[2]*=-1 indicates that all warning messages will be printed to the file `MKL_Trig_Transforms_log.txt` in the directory from which the routine is called. If the file does not exist, the routine tries to create it. If the attempt fails, the routine prints information that the file cannot be created to the standard output device. • *ipar[2]*=0 indicates that no warning messages will be printed. • *ipar[2]*=1 (default) indicates that all warning messages will be printed to the preconnected default output device (usually, screen). In case of warnings, the *stat* parameter will acquire a non-zero value regardless of the *ipar[2]* setting.
3 through 4	Reserved for future use.
5	Contains the type of the transform. The `?_init_trig_transform` routine sets *ipar[5]*=*tt_type*, and all subsequently called TT routines use *ipar[5]* as the type of the transform.
6	Contains the *stat* value returned by the last completed TT routine. Used to check that the previous call to a TT routine completed with *stat*=0.
7	Informs the `?_commit_trig_transform` routines whether to initialize data structures *dpar* (*spar*) and *handle*. *ipar[7]*=0 indicates that the routine should skip the initialization and only check correctness and consistency of the parameters. Otherwise, the routine initializes the data structures. The default value is 1.

Index	Description
	The possibility to check correctness and consistency of input data without initializing data structures *dpar*, *spar* and *handle* enables avoiding performance losses in a repeated use of the same transform for different data vectors. Note that you can benefit from the opportunity that *ipar[7]* gives only if you are sure to have supplied proper tolerance value in the *dpar* or *spar* array. Otherwise, avoid tuning this parameter.
8	Contains message style options for TT routines. If *ipar[8]*=0 then TT routines print all error and warning messages in Fortran-style notations. Otherwise, TT routines print the messages in C-style notations. The default value is 1. When selecting between these notations, mind that by default, numbering of elements in C arrays starts from 0 and in Fortran, it starts from 1. For example, for a C-style message "*parameter ipar[0]=3 should be an even integer*", the corresponding Fortran-style message will be "*parameter ipar(1)=3 should be an even integer*". The use of *ipar[8]* enables you to view messages in a more convenient style.
9	Specifies the number of OpenMP threads to run TT routines in the OpenMP environment of the Poisson Library. The default value is 1. You are highly recommended not to alter this value. See also Caveat on Parameter Modifications.
10	Specifies the mode of compatibility with FFTW. The default value is 0. Set the value to 1 to invoke compatibility with FFTW. In the latter case, results will not be normalized, because FFTW does not do this. It is highly recommended not to alter this value, but rather use real-to-real FFTW to MKL wrappers, described in the "FFTW to Intel® MKL Wrappers for FFTW 3.x" section in Appendix F. See also Caveat on Parameter Modifications.
11 through 127	Reserved for future use.

NOTE. You may declare the *ipar* array in your code as `int ipar[11]`. However, for compatibility with later versions of Intel MKL TT interface, which may require more *ipar* values, it is highly recommended to declare *ipar* as `int ipar[128]`.

Arrays *dpar* and *spar* are the same except in the data precision:

dpar	`double` array of size 5*n*/2+2, holds data needed for double-precision routines to perform TT computations. This array is initialized in the `d_init_trig_transform` and `d_commit_trig_transform` routines.
spar	`float` array of size 5*n*/2+2, holds data needed for single-precision routines to perform TT computations. This array is initialized in the `s_init_trig_transform` and `s_commit_trig_transform` routines.

As *dpar* and *spar* have similar elements in respective positions, the elements are described together in Table 13-3:

Table 13-3 Elements of the dpar and spar Arrays

Index	Description
0	Contains the first absolute tolerance used by the appropriate ?_commit_trig_transform routine. For a staggered cosine or a sine transform, *f[n]* should be equal to 0.0 and for a staggered sine or a sine transform, *f[0]* should be equal to 0.0. The ?_commit_trig_transform routine checks whether absolute values of these parameters are below *dpar[0]*n* or *spar[0]*n*, depending on the routine precision. To suppress warnings resulting from tolerance checks, set *dpar[0]* or *spar[0]* to a sufficiently large number.
1	Reserved for future use.
2 through 5*n*/2+1	Contain tabulated values of trigonometric functions. Contents of the elements depend upon the type of transform *tt_type*, set up in the ?_commit_trig_transform routine: • If *tt_type*=MKL_SINE_TRANSFORM, the transform uses only the first *n*/2 array elements, which contain tabulated sine values. • If *tt_type*=MKL_STAGGERED_SINE_TRANSFORM, the transform uses only the first 3*n*/2 array elements, which contain tabulated sine and cosine values. • If *tt_type*=MKL_STAGGERED2_SINE_TRANSFORM, the transform uses all the 5*n*/2 array elements, which contain tabulated sine and cosine values. • If *tt_type*=MKL_COSINE_TRANSFORM, the transform uses only the first *n* array elements, which contain tabulated cosine values. • If *tt_type*=MKL_STAGGERED_COSINE_TRANSFORM, the transform uses only the first 3*n*/2 elements, which contain tabulated sine and cosine values. • If *tt_type*=MKL_STAGGERED2_COSINE_TRANSFORM, the transform uses all the 5*n*/2 elements, which contain tabulated sine and cosine values.

NOTE. To save memory, you can define the array size depending upon the type of transform.

Caveat on Parameter Modifications

Flexibility of the TT interface enables you to skip calling the ?_init_trig_transform routine and to initialize the basic data structures explicitly in your code. You may also need to modify the contents of *ipar*, *dpar* and *spar* arrays after initialization. When doing so, provide correct and consistent data in the arrays. Mistakenly altered arrays cause errors or wrong computation. You can perform a basic check for correctness and consistency of parameters by calling the ?_commit_trig_transform routine; however, this does not ensure the correct result of a transform but only reduces the chance of errors or wrong results.

NOTE. To supply correct and consistent parameters to TT routines, you should have considerable experience in using the TT interface and good understanding of elements that the *ipar*, *spar* and *dpar* arrays contain and dependencies between values of these elements.

However, in rare occurrences, even advanced users might fail to compute a transform using TT routines after the parameter modifications. In cases like these, refer for technical support at http://www.intel.com/software/products/support/ .

WARNING. The only way that ensures proper computation of the Trigonometric Transforms is to follow a typical sequence of invoking the routines and not change the default set of parameters. So, avoid modifications of *ipar*, *dpar* and *spar* arrays unless a strong need arises.

Implementation Details

Several aspects of the Intel MKL TT interface are platform-specific and language-specific. To promote portability across platforms and ease of use across different languages, users are provided with the TT language-specific header files to include in their code. Currently, the following of them are available:

- `mkl_trig_transforms.h`, to be used together with `mkl_dfti.h`, for C programs.
- `mkl_trig_transforms.f90`, to be used together with `mkl_dfti.f90`, for Fortran 90 programs.

NOTE. Use of the Intel MKL TT software without including one of the above header files is not supported.

C-specific Header File

The C-specific header file defines the following function prototypes:

```
void d_init_trig_transform(int *, int *, int *, double *, int *);
void d_commit_trig_transform(double *, DFTI_DESCRIPTOR_HANDLE *, int *, double *, int *);

void d_forward_trig_transform(double *, DFTI_DESCRIPTOR_HANDLE *, int *, double *, int *);
void d_backward_trig_transform(double *, DFTI_DESCRIPTOR_HANDLE *, int *, double *, int *);

void s_init_trig_transform(int *, int *, int *, float *, int *);
void s_commit_trig_transform(float *, DFTI_DESCRIPTOR_HANDLE *, int *, float *, int *);

void s_forward_trig_transform(float *, DFTI_DESCRIPTOR_HANDLE *, int *, float *, int *);
void s_backward_trig_transform(float *, DFTI_DESCRIPTOR_HANDLE *, int *, float *, int *);

void free_trig_transform(DFTI_DESCRIPTOR_HANDLE *, int *, int *);
```

Fortran-Specific Header File

The Fortran90-specific header file defines the following function prototypes:

```
SUBROUTINE D_INIT_TRIG_TRANSFORM(n, tt_type, ipar, dpar, stat)
    INTEGER, INTENT(IN) :: n, tt_type
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(8), INTENT(INOUT) :: dpar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE D_INIT_TRIG_TRANSFORM

SUBROUTINE D_COMMIT_TRIG_TRANSFORM(f, handle, ipar, dpar, stat)
    REAL(8), INTENT(INOUT) :: f(*)
    TYPE(DFTI_DESCRIPTOR), POINTER :: handle
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(8), INTENT(INOUT) :: dpar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE D_COMMIT_TRIG_TRANSFORM

SUBROUTINE D_FORWARD_TRIG_TRANSFORM(f, handle, ipar, dpar, stat)
    REAL(8), INTENT(INOUT) :: f(*)
    TYPE(DFTI_DESCRIPTOR), POINTER :: handle
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(8), INTENT(INOUT) :: dpar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE D_FORWARD_TRIG_TRANSFORM

SUBROUTINE D_BACKWARD_TRIG_TRANSFORM(f, handle, ipar, dpar, stat)
    REAL(8), INTENT(INOUT) :: f(*)
    TYPE(DFTI_DESCRIPTOR), POINTER :: handle
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(8), INTENT(INOUT) :: dpar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE D_BACKWARD_TRIG_TRANSFORM

SUBROUTINE S_INIT_TRIG_TRANSFORM(n, tt_type, ipar, spar, stat)
    INTEGER, INTENT(IN) :: n, tt_type
```

```
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(4), INTENT(INOUT) :: spar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE S_INIT_TRIG_TRANSFORM

SUBROUTINE S_COMMIT_TRIG_TRANSFORM(f, handle, ipar, spar, stat)
    REAL(4), INTENT(INOUT) :: f(*)
    TYPE(DFTI_DESCRIPTOR), POINTER :: handle
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(4), INTENT(INOUT) :: spar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE S_COMMIT_TRIG_TRANSFORM

SUBROUTINE S_FORWARD_TRIG_TRANSFORM(f, handle, ipar, spar, stat)
    REAL(4), INTENT(INOUT) :: f(*)
    TYPE(DFTI_DESCRIPTOR), POINTER :: handle
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(4), INTENT(INOUT) :: spar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE S_FORWARD_TRIG_TRANSFORM

SUBROUTINE S_BACKWARD_TRIG_TRANSFORM(f, handle, ipar, spar, stat)
    REAL(4), INTENT(INOUT) :: f(*)
    TYPE(DFTI_DESCRIPTOR), POINTER :: handle
    INTEGER, INTENT(INOUT) :: ipar(*)
    REAL(4), INTENT(INOUT) :: spar(*)
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE S_BACKWARD_TRIG_TRANSFORM

SUBROUTINE FREE_TRIG_TRANSFORM(handle, ipar, stat)
    INTEGER, INTENT(INOUT) :: ipar(*)
    TYPE(DFTI_DESCRIPTOR), POINTER :: handle
    INTEGER, INTENT(OUT) :: stat
END SUBROUTINE FREE_TRIG_TRANSFORM
```

Fortran 90 specifics of the TT routines usage are similar for all Intel MKL PDE support tools and described in the Calling PDE Support Routines from Fortran 90 section.

Poisson Library Routines

In addition to Real Discrete Trigonometric Transforms (TT) interface (refer to Trigonometric Transform Routines), Intel® MKL supports the Poisson Library interface, referred to as PL interface. The interface implements a group of routines (PL routines) used to compute a solution of Laplace, Poisson, and Helmholtz problems of special kind using discrete Fourier transforms. Laplace and Poisson problems are special cases of a more general Helmholtz problem. The problems being solved are defined more exactly in the Poisson Library Implemented subsection. The PL interface provides much flexibility of use: you can adjust routines to your particular needs at the cost of manual tuning routine parameters or just call routines with default parameter values. The interface can adjust style of error and warning messages to C or Fortran notations by setting up a dedicated parameter. This adds convenience to debugging, because users can read information in the way that is natural for their code. The Intel MKL PL interface currently contains only routines that implement the following solvers:

- Fast Laplace, Poisson and Helmholtz solvers in a Cartesian coordinate system
- Fast Poisson and Helmholtz solvers in a spherical coordinate system.

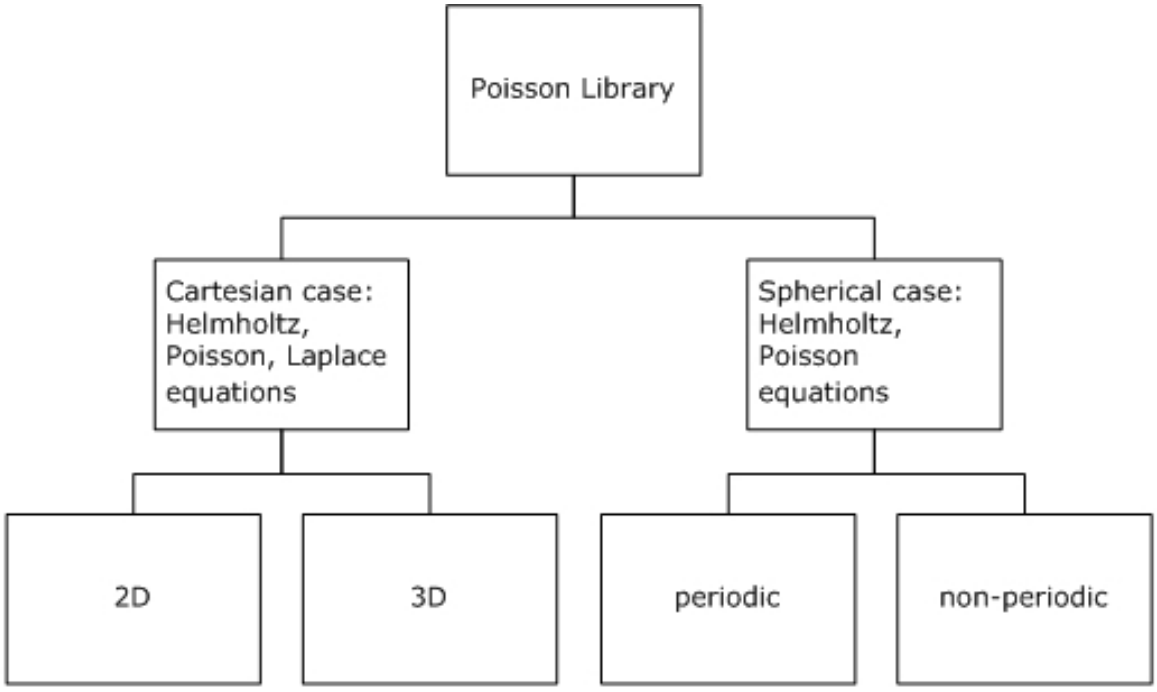
To describe the Intel MKL PL interface, the C convention is used. Fortran usage specifics can be found in the Calling PDE Support Routines from Fortran 90 section.

NOTE. Fortran users should mind that respective array indices in Fortran increase by 1.

Poisson Library Implemented

PL routines enable approximate solving of certain two-dimensional and three-dimensional problems. Figure 13-2 shows the general structure of the Poisson Library.

Figure 13-2 Structure of the Poisson Library



Sections below provide details of the problems that can be solved using Intel MKL PL.

Two-Dimensional Problems

Notational Conventions

The PL interface description uses the following notation for boundaries of a rectangular domain $a_x < x < b_x$, $a_y < y < b_y$ on a Cartesian plane:

$bd_a_x = \{x = a_x, a_y \le y \le b_y\}$, $bd_b_x = \{x = b_x, a_y \le y \le b_y\}$

$bd_a_y = \{a_x \le x \le b_x, y = a_y\}$, $bd_b_y = \{a_x \le x \le b_x, y = b_y\}$.

The wildcard "+" may stand for any of the symbols a_x, b_x, a_y, b_y, so that *bd_+* denotes any of the above boundaries.

The PL interface description uses the following notation for boundaries of a rectangular domain $a_\phi < \phi < b_\phi$, $a_\theta < \theta < b_\theta$ on a sphere $0 \le \phi \le 2\pi$, $0 \le \theta \le \pi$:

$bd_a_\phi = \{\phi = a_\phi, a_\theta \le \theta \le b_\theta\}$, $bd_b_\phi = \{\phi = b_\phi, a_\theta \le \theta \le b_\theta\}$

$bd_a_\theta = \{a_\phi \le \phi \le b_\phi, \theta = a_\theta\}$, $bd_b_\theta = \{a_\phi \le \phi \le b_\phi, \theta = b_\theta\}$.

The wildcard "~" may stand for any of the symbols a_ϕ, b_ϕ, a_θ, b_θ, so that *bd_~* denotes any of the above boundaries.

Two-dimensional (2D) Helmholtz problem on a Cartesian plane

The 2D Helmholtz problem is to find an approximate solution of the Helmholtz equation

$$-\frac{\partial^2 u}{\partial x^2}-\frac{\partial^2 u}{\partial y^2}+qu=f(x,y), q=const \ge 0$$

in a rectangle, that is, a rectangular domain $a_x < x < b_x$, $a_y < y < b_y$, with one of the following boundary conditions on each boundary *bd_+*:

- The Dirichlet boundary condition

$$u(x,y)=G(x,y)$$

- The Neumann boundary condition

$$\frac{\partial u}{\partial n}(x,y)=g(x,y)$$

where

$n = -x$ on bd_a_x, $n = x$ on bd_b_x,

$n = -y$ on bd_a_y, $n = y$ on bd_b_y.

Two-dimensional (2D) Poisson problem on a Cartesian plane

The Poisson problem is a special case of the Helmholtz problem, when q=0. The 2D Poisson problem is to find an approximate solution of the Poisson equation

$$-\frac{\partial^2 u}{\partial x^2}-\frac{\partial^2 u}{\partial y^2}=f(x,y)$$

in a rectangle $a_x < x < b_x$, $a_y < y < b_y$ with the Dirichlet or Neumann boundary condition on each boundary bd_+. In case of a problem with the Neumann boundary condition on the entire boundary, you can find the solution of the problem only up to a constant. In this case, the Poisson Library will compute the solution that provides the minimal Euclidean norm of a residual.

Two-dimensional (2D) Laplace problem on a Cartesian plane

The Laplace problem is a special case of the Helmholtz problem, when q=0 and $f(x, y)$=0. The 2D Laplace problem is to find an approximate solution of the Laplace equation

$$\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}=0$$

in a rectangle $a_x < x < b_x$, $a_y < y < b_y$ with the Dirichlet or Neumann boundary condition on each boundary bd_+.

Helmholtz problem on a sphere

The Helmholtz problem on a sphere is to find an approximate solution of the Helmholtz equation

$$-\Delta_s u+qu=f,\ q=const\geq 0,$$

$$\Delta_s=\frac{1}{\sin^2\theta}\frac{\partial^2}{\partial\varphi^2}+\frac{1}{\sin\theta}\frac{\partial}{\partial\theta}\left(\sin\theta\frac{\partial}{\partial\theta}\right)$$

in a spherical rectangle that is, a domain bounded by angles $a_\phi \leq \phi \leq b_\phi$, $a_\theta \leq \theta \leq b_\theta$, with boundary conditions for particular domains listed in Table 13-4.

Table 13-4 Details of Helmholtz Problem on a Sphere

Domain on a sphere	Boundary condition	Periodic/non-periodic case
Rectangular, that is, $b_\phi - a_\phi < 2\pi$ and $b_\theta - a_\theta < \pi$	Homogeneous Dirichlet boundary conditions on each boundary *bd_~*	*non-periodic*
Where $a_\phi = 0$, $b_\phi = 2\pi$, and $b_\theta - a_\theta < \pi$	Homogeneous Dirichlet boundary conditions on the boundaries bd_a_θ and bd_b_θ	*periodic*
Entire sphere, that is, $a_\phi = 0$, $b_\phi = 2\pi$, $a_\theta = 0$, and $b_\theta = \pi$	Boundary condition $\left(\sin\theta\frac{\partial u}{\partial\theta}\right)_{\substack{\theta\to 0\\ \theta\to\pi}} = 0$ at the poles.	*periodic*

Poisson problem on a sphere

The Poisson problem is a special case of the Helmholtz problem, when q=0. The Poisson problem on a sphere is to find an approximate solution of the Poisson equation

$$-\Delta_s u = f,\ \Delta_s = \frac{1}{\sin^2\theta}\frac{\partial^2}{\partial\varphi^2} + \frac{1}{\sin\theta}\frac{\partial}{\partial\theta}\left(\sin\theta\frac{\partial}{\partial\theta}\right)$$

in a spherical rectangle $a_\phi \le \phi \le b_\phi$, $a_\theta \le \theta \le b_\theta$ in cases listed in Table 13-4. The solution to the Poisson problem on the entire sphere can be found up to a constant only. In this case, Poisson Library will compute the solution that provides the minimal Euclidean norm of a residual.

Approximation of 2D problems

To find an approximate solution for any of the 2D problems, a uniform mesh is built in the rectangular domain:

$$\left\{x_i = a_x + ih_x, y_j = a_y + jh_y\right\},$$

$$i = 0,\ldots,n_x, j = 0,\ldots,n_y, h_x = \frac{b_x - a_x}{n_x}, h_y = \frac{b_y - a_y}{n_y}$$

in the Cartesian case and

$$\left\{\varphi_i = a_\varphi + ih_\varphi, \theta_j = a_\theta + jh_\theta\right\},$$

$$i = 0,\ldots,n_\varphi, j = 0,\ldots,n_\theta, h_\varphi = \frac{b_\varphi - a_\varphi}{n_\varphi}, h_\theta = \frac{b_\theta - a_\theta}{n_\theta}$$

in the spherical case.

Poisson Library uses the standard five-point finite difference approximation on this mesh to compute the approximation to the solution:

- In the Cartesian case, the values of the approximate solution will be computed in the mesh points (x_i , y_j) provided that the user knows the values of the right-hand side *f(x, y)* in these points and the values of the appropriate boundary functions *G(x, y)* and/or *g(x,y)* in the mesh points laying on the boundary of the rectangular domain.
- In the spherical case, the values of the approximate solution will be computed in the mesh points (ϕ_i , θ_j) provided that the user knows the values of the right-hand side $f(\phi, \theta)$ in these points.

NOTE. The number of mesh intervals n_ϕ in the ϕ direction of a spherical mesh must be even in the periodic case. The current implementation of the Poisson Library does not support meshes with the number of intervals that does not meet this condition.

Three-Dimensional Problems

Notational Conventions

The PL interface description uses the following notation for boundaries of a parallelepiped domain $a_x < x < b_x$, $a_y < y < b_y$, $a_z < z < b_z$:

$bd_a_x = \{x = a_x, a_y \le y \le b_y, a_z \le z \le b_z\}$, $bd_b_x = \{x = b_x, a_y \le y \le b_y, a_z \le z \le b_z\}$

$bd_a_y = \{a_x \le x \le b_x, y = a_y, a_z \le z \le b_z\}$, $bd_b_y = \{a_x \le x \le b_x, y = b_y, a_z \le z \le b_z\}$

$bd_a_z = \{a_x \le x \le b_x, a_y \le y \le b_y, z = a_z\}$, $bd_b_x = \{a_x \le x \le b_x, a_y \le y \le b_y, z = b_z\}$.

The wildcard "+" may stand for any of the symbols a_x, b_x, a_y, b_y, a_z, b_z, so that *bd_+* denotes any of the above boundaries.

Three-dimensional (3D) Helmholtz problem

The 3D Helmholtz problem is to find an approximate solution of the Helmholtz equation

$$-\frac{\partial^2 u}{\partial x^2}-\frac{\partial^2 u}{\partial y^2}-\frac{\partial^2 u}{\partial z^2}+qu=f(x,y,z), q=const \geq 0$$

in a parallelepiped, that is, a parallelepiped domain $a_x < x < b_x$, $a_y < y < b_y$, $a_z < z < b_z$, with one of the following boundary conditions on each boundary *bd_+*:

- The Dirichlet boundary condition

$$u(x,y,z)=G(x,y,z)$$

- The Neumann boundary condition

$$\frac{\partial u}{\partial n}(x,y,z)=g(x,y,z)$$

where

$n = -x$ on bd_a_x, $n = x$ on bd_b_x,

$n = -y$ on bd_a_y, $n = y$ on bd_b_y,

$n = -z$ on bd_a_z, $n = z$ on bd_b_z.

Three-dimensional (3D) Poisson problem

The Poisson problem is a special case of the Helmholtz problem, when q=0. The 3D Poisson problem is to find an approximate solution of the Poisson equation

$$-\frac{\partial^2 u}{\partial x^2}-\frac{\partial^2 u}{\partial y^2}-\frac{\partial^2 u}{\partial z^2}=f(x,y,z)$$

in a parallelepiped $a_x < x < b_x$, $a_y < y < b_y$, $a_z < z < b_z$ with Dirichlet or Neumann boundary condition on each boundary *bd_+*.

Three-dimensional (3D) Laplace problem

The Laplace problem is a special case of the Helmholtz problem, when q=0 and $f(x, y, z)$=0. The 3D Laplace problem is to find an approximate solution of the Laplace equation

$$\frac{\partial^2 u}{\partial x^2}+\frac{\partial^2 u}{\partial y^2}+\frac{\partial^2 u}{\partial z^2}=0$$

in a parallelepiped $a_x < x < b_x$, $a_y < y < b_y$, $a_z < z < b_z$ with the Dirichlet or Neumann boundary condition on each boundary *bd_+*.

Approximation of 3D problems

To find an approximate solution for each of the 3D problems, a uniform mesh is built in the parallelepiped domain

$$\left\{x_i = a_x + ih_x, y_j = a_y + jh_y, z_k = a_z + kh_z\right\}$$

where

$$i = 0,\ldots,n_x, j = 0,\ldots,n_y, k = 0,\ldots,n_z$$

$$h_x = \frac{b_x - a_x}{n_x}, h_y = \frac{b_y - a_y}{n_y}, h_z = \frac{b_z - a_z}{n_z}$$

The Poisson Library uses the standard seven-point finite difference approximation on this mesh to compute the approximation to the solution. The values of the approximate solution will be computed in the mesh points (x_i , y_j , z_k), provided that the user knows the values of the right-hand side `f(x, y, z)` in these points and the values of the appropriate boundary functions `G(x, y, z)` and/or `g(x, y, z)` in the mesh points laying on the boundary of the parallelepiped domain.

Sequence of Invoking PL Routines

NOTE. This description always considers the solution process for the Helmholtz problem, because Fast Poisson Solver and Fast Laplace Solver are special cases of Fast Helmholtz Solver (see Poisson Library Implemented).

Computation of a solution of the Helmholtz problem using the PL interface is conceptually divided into four steps, each of which is performed via a dedicated routine. Table 13-5 lists the routines and briefly describes their purpose.

Most PL routines have versions operating with single-precision and double-precision data. Names of such routines begin respectively with "s" and "d". The wildcard "?" stands for either of these symbols in routine names. The routines for Cartesian coordinate system have 2D and 3D versions. Their names end respectively in "2D" and "3D". The routines for spherical coordinate system have periodic and non-periodic versions. Their names end respectively in "p" and "np"

Table 13-5 PL Interface Routines

Routine	Description
?_init_Helmholtz_2D/?_init_Helmholtz_3D/ ?_init_sph_p/?_init_sph_np	Initializes basic data structures of Poisson Library for Fast Helmholtz Solver in the 2D/3D/periodic/non-periodic case, respectively.
?_commit_Helmholtz_2D/?_commit_Helmholtz_3D/ ?_commit_sph_p/?_commit_sph_np	Checks consistency and correctness of user's data, creates and initializes data structures to be used by the Intel MKL FFT interface[1], as well as other data structures needed for the solver.
?_Helmholtz_2D/?_Helmholtz_3D/ ?_sph_p/?_sph_np	Computes an approximate solution of 2D/3D/periodic/non-periodic Helmholtz problem (see Poisson Library Implemented) specified by the parameters.
free_Helmholtz_2D/free_Helmholtz_3D/ free_sph_p/free_sph_np	Cleans the memory used by the data structures needed for calling the Intel MKL FFT interface[1].

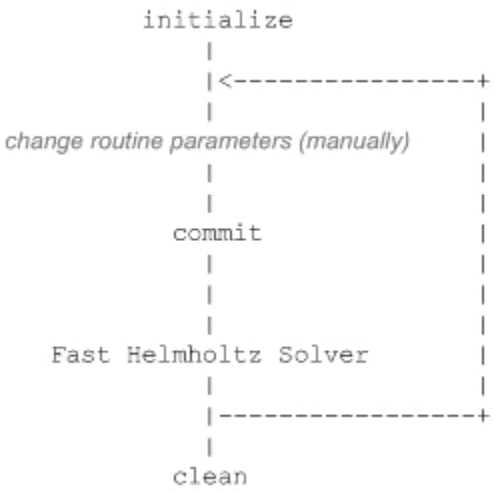
[1] PL routines call the Intel MKL FFT interface for better performance.

To find an approximate solution of Helmholtz problem only once, the Intel MKL PL interface routines are normally invoked in the order in which they are listed in Table 13-5.

NOTE. Though the order of invoking PL routines may be changed, it is highly recommended to follow the above order of routine calls.

The diagram in Figure 13-3 indicates the typical order in which PL routines can be invoked in a general case.

Figure 13-3 Typical Order of Invoking PL Routines



A general scheme of using PL routines for double-precision computations in a 3D Cartesian case is shown below. A similar scheme holds for single-precision computations with the only difference in the initial letter of routine names. The general scheme in a 2D Cartesian case differs form the one below in the set of routine parameters and the ending of routine names: “2D” instead of “3D”.

```
...
d_init_Helmholtz_3D(&ax, &bx, &ay, &by, &az, &bz, &nx, &ny, &nz, BCtype, ipar, dpar, &stat);
/* change parameters in ipar and/or dpar if necessary. */
/* note that the result of the Fast Helmholtz Solver will be in f! If you want to keep the data stored in
f,
save it before the function call below */
d_commit_Helmholtz_3D(f, bd_ax, bd_bx, bd_ay, bd_by, bd_az, bd_bz, &xhandle, &yhandle, ipar, dpar, &stat);
d_Helmholtz_3D(f, bd_ax, bd_bx, bd_ay, bd_by, bd_az, bd_bz, &xhandle, &yhandle, ipar, dpar, &stat);
free_Helmholtz_3D (&xhandle, &yhandle, ipar, &stat);
/* here you may clean the memory used by f, dpar, ipar */
...
```

A general scheme of using PL routines for double-precision computations in a spherical periodic case is shown below. Similar scheme holds for single-precision computations with the only difference in the initial letter of routine names. The general scheme in a spherical non-periodic case differs from the one below in the set of routine parameters and the ending of routine names: "np" instead of "p".

```
...
d_init_sph_p(&ap,&bp,&at,&bt,&np,&nt,&q,ipar,dpar,&stat);
/* change parameters in ipar and/or dpar if necessary. */
/* note that the result of the Fast Helmholtz Solver will be in f! If you want to
keep the data stored in f, save it before the function call below */
d_commit_sph_p(f,&handle_s,&handle_c,ipar,dpar,&stat);
d_sph_p(f,&handle_s,&handle_c,ipar,dpar,&stat);
free_sph_p(&handle_s,&handle_c,ipar,&stat);
/* here you may clean the memory used by f, dpar, ipar */
...
```

You can find examples of Fortran 90 and C code that use PL routines to solve Helmholtz problem (in both Cartesian and spherical cases) in the `examples\pdepoissonf\source` and `examples\pdepoissonc\source` folders of your Intel MKL directory.

Interface Description

All types in this documentation are standard C types: `int`, `float`, and `double`. Fortran 90 users can call the routines with `INTEGER`, `REAL`, and `DOUBLE PRECISION` Fortran types, respectively (see examples in the `examples\pdepoissonf\source` and `examples\pdepoissonc\source` folders of your Intel MKL directory.

The interface description uses the built-in type `int` for integer values. If you employ the ILP64 interface, read this type as `long long int` (or `INTEGER*8` for Fortran). For more information, refer to the *Intel(R) MKL User's Guide*.

Routine Options

All PL routines use parameters for passing various options to the routines. These parameters are arrays *ipar*, *dpar* and *spar*. Values for these parameters should be specified very carefully (see Common Parameters). You can change these values during computations to meet your needs.

WARNING. To avoid failure or wrong results, you must provide correct and consistent parameters to the routines.

User Data Arrays

PL routines take arrays of user data as input. For example, user arrays are passed to the routine `d_Helmholtz_3D` to compute an approximate solution to 3D Helmholtz problem. To minimize storage requirements and improve the overall run-time efficiency, Intel MKL PL routines do not make copies of user input arrays.

NOTE. If you need a copy of your input data arrays, save them yourself.

PL Routines for the Cartesian Solver

The section gives detailed description of Cartesian PL routines, their syntax, parameters and values they return. All flavors of the same routine, namely, double-precision and single-precision, 2D and 3D, are described together.

NOTE. Some of the routine parameters are used only in the 3D Fast Helmholtz Solver.

PL routines call the Intel MKL FFT interface (described in section "FFT Functions" in chapter "Fast Fourier Transforms"), which enhances performance of the routines.

?_init_Helmholtz_2D/?_init_Helmholtz_3D

Initializes basic data structures of the Fast 2D/3D Helmholtz Solver.

Syntax

```
void d_init_Helmholtz_2D(double* ax, double* bx, double* ay, double* by, int* nx, int* ny, char* BCtype, double* q, int* ipar, double* dpar, int* stat);
```

```
void s_init_Helmholtz_2D(float* ax, float* bx, float* ay, float* by, int* nx, int* ny, char* BCtype, float* q, int* ipar, float* spar, int* stat);
```

```
void d_init_Helmholtz_3D(double* ax, double* bx, double* ay, double* by, double* az, double* bz, int* nx, int* ny, int* nz, char* BCtype, double* q, int* ipar, double* dpar, int* stat);
```

```
void s_init_Helmholtz_3D(float* ax, float* bx, float* ay, float* by, float* az, float* bz, int* nx, int* ny, int* nz, char* BCtype, float* q, int* ipar, float* spar, int* stat);
```

Input Parameters

ax	`double*` for `d_init_Helmholtz_2D/d_init_Helmholtz_3D`, `float*` for `s_init_Helmholtz_2D/s_init_Helmholtz_3D`. The coordinate of the leftmost boundary of the domain along x-axis.
bx	`double*` for `d_init_Helmholtz_2D/d_init_Helmholtz_3D`, `float*` for `s_init_Helmholtz_2D/s_init_Helmholtz_3D`. The coordinate of the rightmost boundary of the domain along x-axis.
ay	`double*` for `d_init_Helmholtz_2D/d_init_Helmholtz_3D`, `float*` for `s_init_Helmholtz_2D/s_init_Helmholtz_3D`. The coordinate of the leftmost boundary of the domain along y-axis.
by	`double*` for `d_init_Helmholtz_2D/d_init_Helmholtz_3D`, `float*` for `s_init_Helmholtz_2D/s_init_Helmholtz_3D`. The coordinate of the rightmost boundary of the domain along y-axis.
az	`double*` for `d_init_Helmholtz_2D/d_init_Helmholtz_3D`,

	`float*` for `s_init_Helmholtz_2D/s_init_Helmholtz_3D`. The coordinate of the leftmost boundary of the domain along z-axis. This parameter is needed only for the `?_init_Helmholtz_3D` routine.
bz	`double*` for `d_init_Helmholtz_2D/d_init_Helmholtz_3D`, `float*` for `s_init_Helmholtz_2D/s_init_Helmholtz_3D`. The coordinate of the rightmost boundary of the domain along z-axis. This parameter is needed only for the `?_init_Helmholtz_3D` routine.
nx	`int*`. The number of mesh intervals along x-axis.
ny	`int*`. The number of mesh intervals along y-axis.
nz	`int*`. The number of mesh intervals along z-axis. This parameter is needed only for the `?_init_Helmholtz_3D` routine.
BCtype	`char*`. Contains the type of boundary conditions on each boundary. Must contain four characters for `?_init_Helmholtz_2D` and six characters for `?_init_Helmholtz_3D`. Each of the characters can be 'N' (Neumann boundary condition) or 'D' (Dirichlet boundary condition). Types of boundary conditions for the boundaries should be specified in the following order: *bd_a*$_x$, *bd_b*$_x$, *bd_a*$_y$, *bd_b*$_y$, *bd_a*$_z$, *bd_b*$_z$. Boundary condition types for the last two boundaries should be specified only in the 3D case.
q	`double*` for `d_init_Helmholtz_2D/d_init_Helmholtz_3D`, `float*` for `s_init_Helmholtz_2D/s_init_Helmholtz_3D` . The constant Helmholtz coefficient. Note that to solve Poisson or Laplace problem, you should set the value of *q* to 0.

Output Parameters

ipar	`int` array of size 128. Contains integer data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).
dpar	`double` array of size 5*nx/2+7 in the 2D case or 5*(nx+ny)/2+9 in the 3D case. Contains double-precision data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).
spar	`float` array of size 5*nx/2+7 in the 2D case or 5*(nx+ny)/2+9 in the 3D case. Contains single-precision data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).
stat	`int*`. Routine completion status, which is also written to *ipar[0]*. The status should be 0 to proceed to other PL routines.

Description

The routines routines `?_init_Helmholtz_2D/?_init_Helmholtz_3D` are declared in the `mkl_poisson.h` header file for the C interface and `mkl_poisson.f90` header file for the Fortran interface. The routines initialize basic data structures for Poisson Library computations of the appropriate precision. All routines invoked after a call to a `?_init_Helmholtz_2D/?_init_Helmholtz_3D` routine use values of the *ipar*, *dpar* and *spar* array parameters returned by the routine. Detailed description of the array parameters can be found in Common Parameters.

WARNING. Data structures initialized and created by 2D/3D flavors of the routine cannot be used by 3D/2D flavors of any PL routines, respectively.

You can skip calling this routine in your code. However, see Caveat on Parameter Modifications before doing so.

Return Values

stat = 0	The routine successfully completed the task. In general, to proceed with computations, the routine should complete with this *stat* value.
stat = -99999	The routine failed to complete the task because of a fatal error.

?_commit_Helmholtz_2D/?_commit_Helmholtz_3D

Checks consistency and correctness of user's data as well as initializes certain data structures required to solve 2D/3D Helmholtz problem.

Syntax

```
void d_commit_Helmholtz_2D(double* f, double* bd_ax, double* bd_bx, double* bd_ay, double* bd_by, DFTI_DESCRIPTOR* xhandle, int* ipar, double* dpar, int* stat);
```

```
void s_commit_Helmholtz_2D (float* f, float* bd_ax, float* bd_bx, float* bd_ay, float* bd_by, DFTI_DESCRIPTOR* xhandle, int* ipar, float* spar, int* stat);
```

```
void d_commit_Helmholtz_3D(double* f, double* bd_ax, double* bd_bx, double* bd_ay, double* bd_by, double* bd_az, double* bd_bz, DFTI_DESCRIPTOR* xhandle, DFTI_DESCRIPTOR* yhandle, int* ipar, double* dpar, int* stat);
```

```
void s_commit_Helmholtz_3D(float* f, float* bd_ax, float* bd_bx, float* bd_ay, float* bd_by, float* bd_az, float* bd_bz, DFTI_DESCRIPTOR* xhandle, DFTI_DESCRIPTOR* yhandle, int* ipar, float* spar, int* stat);
```

Input Parameters

f	`double*` for `d_commit_Helmholtz_2D/d_commit_Helmholtz_3D`, `float*` for `s_commit_Helmholtz_2D/s_commit_Helmholtz_3D`. Contains the right-hand side of the problem packed in a single vector. The size of the vector for the 2D problem is (*nx*+1)*(*ny*+1). In this case, the value of the right-hand side in the mesh point (*i, j*) is stored in *f*[*i*+*j**(*nx*+1)] . The size of the vector for the 3D problem is (*nx*+1)*(*ny*+1)*(*nz*+1). In this case, value of the right-hand side in the mesh point (*i, j, k*) is stored in *f*[*i*+*j**(*nx*+1)+*k**(*nx*+1)*(*ny*+1)]. Note that to solve the Laplace problem, you should set all the elements of the array *f* to 0. Note also that the array *f* may be altered by the routine. To preserve the vector, save it in another memory location.

ipar — `int` array of size 128. Contains integer data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).

dpar — `double` array of size 5*nx/2+7 in the 2D case or 5*(nx+ny)/2+9 in the 3D case. Contains double-precision data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).

spar — `float` array of size 5*nx/2+7 in the 2D case or 5*(nx+ny)/2+9 in the 3D case. Contains single-precision data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).

bd_ax — `double*` for `d_commit_Helmholtz_2D/d_commit_Helmholtz_3D`, `float*` for `s_commit_Helmholtz_2D/s_commit_Helmholtz_3D`. Contains values of the boundary condition on the leftmost boundary of the domain along x-axis.
For `?_commit_Helmholtz_2D`, the size of the array is ny+1. In case of the Dirichlet boundary condition (value of *BCtype*[0] is 'D'), it contains values of the function $G(ax, y_j)$, j=0, ..., ny. In case of the Neumann boundary condition (value of *BCtype*[0] is 'N'), it contains values of the function $g(ax, y_j)$, j=0, ..., ny. The value corresponding to the index j is placed in *bd_ax*[j].
For `?_commit_Helmholtz_3D`, the size of the array is (ny+1)*(nz+1). In case of the Dirichlet boundary condition (value of *BCtype*[0] is 'D'), it contains values of the function $G(ax, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. In case of the Neumann boundary condition (value of *BCtype*[0] is 'N'), it contains the values of the function $g(ax, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. The values are packed in the array so that the value corresponding to indices *(j, k)* is placed in *bd_ax*[j+k*(ny+1)].

bd_bx — `double*` for `d_commit_Helmholtz_2D/d_commit_Helmholtz_3D`, `float*` for `s_commit_Helmholtz_2D/s_commit_Helmholtz_3D`. Contains values of the boundary condition on the rightmost boundary of the domain along x-axis.
For `?_commit_Helmholtz_2D`, the size of the array is ny+1. In case of the Dirichlet boundary condition (value of *BCtype*[1] is 'D'), it contains values of the function $G(bx, y_j)$, j=0, ..., ny. In case of the Neumann boundary condition (value of *BCtype*[1] is 'N'), it contains values of the function $g(bx, y_j)$, j=0, ..., ny. The value corresponding to the index j is placed in *bd_bx*[j].
For `?_commit_Helmholtz_3D`, the size of the array is (ny+1)*(nz+1). In case of the Dirichlet boundary condition (value of *BCtype*[1] is 'D'), it contains values of the function $G(bx, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. In case of the Neumann boundary condition (value of *BCtype*[1] is 'N'), it contains the values of the function $g(bx, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. The values are packed in the array so that the value corresponding to indices *(j, k)* is placed in *bd_bx*[j+k*(ny+1)].

bd_ay — `double*` for `d_commit_Helmholtz_2D/d_commit_Helmholtz_3D`, `float*` for `s_commit_Helmholtz_2D/s_commit_Helmholtz_3D`. Contains values of the boundary condition on the leftmost boundary of the domain along y-axis.

For ?_commit_Helmholtz_2D, the size of the array is *nx*+1. In case of the Dirichlet boundary condition (value of *BCtype*[2] is 'D'), it contains values of the function *G*(x_i, *ay*), *i*=0, ..., *nx*. In case of the Neumann boundary condition (value of *BCtype*[2] is 'N'), it contains values of the function *g*(x_i, *ay*), *i*=0, ..., *nx*. The value corresponding to the index *i* is placed in *bd_ay*[*i*].
For ?_commit_Helmholtz_3D, the size of the array is (*nx*+1)*(*nz*+1). In case of the Dirichlet boundary condition (value of *BCtype*[2] is 'D'), it contains values of the function *G*(x_i,*ay*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. In case of the Neumann boundary condition (value of *BCtype*[2] is 'N'), it contains the values of the function *g*(x_i,*ay*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. The values are packed in the array so that the value corresponding to indices *(i, k)* is placed in *bd_ay*[*i*+*k**(*nx*+1)].

bd_by

double* for d_commit_Helmholtz_2D/d_commit_Helmholtz_3D, float* for s_commit_Helmholtz_2D/s_commit_Helmholtz_3D. Contains values of the boundary condition on the rightmost boundary of the domain along *y*-axis.
For ?_commit_Helmholtz_2D, the size of the array is *nx*+1. In case of the Dirichlet boundary condition (value of *BCtype*[3] is 'D'), it contains values of the function *G*(x_i, *by*), *i*=0, ..., *nx*. In case of the Neumann boundary condition (value of *BCtype*[3] is 'N'), it contains values of the function *g*(x_i, *by*), *i*=0, ..., *nx*. The value corresponding to the index *i* is placed in *bd_by*[*i*].
For ?_commit_Helmholtz_3D, the size of the array is (*nx*+1)*(*nz*+1). In case of the Dirichlet boundary condition (value of *BCtype*[3] is 'D'), it contains values of the function *G*(x_i,*by*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. In case of the Neumann boundary condition (value of *BCtype*[3] is 'N'), it contains the values of the function *g*(x_i,*by*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. The values are packed in the array so that the value corresponding to indices *(i, k)* is placed in *bd_by*[*i*+*k**(*nx*+1)].

bd_az

double* for d_commit_Helmholtz_2D/d_commit_Helmholtz_3D, float* for s_commit_Helmholtz_2D/s_commit_Helmholtz_3D. This parameter is needed only for ?_commit_Helmholtz_3D. Contains values of the boundary condition on the leftmost boundary of the domain along *z*-axis.
The size of the array is (*nx*+1)*(*ny*+1). In case of the Dirichlet boundary condition (value of *BCtype*[4] is 'D'), it contains values of the function *G*(x_i, y_j,*az*), *i*=0, ..., *nx*, *j*=0, ..., *ny*. In case of the Neumann boundary condition (value of *BCtype*[4] is 'N'), it contains the values of the function *g*(x_i, y_j,*az*), *i*=0, ..., *nx*, *j*=0, ..., *ny*. The values are packed in the array so that the value corresponding to indices *(i, j)* is placed in *bd_az*[*i*+*j**(*nx*+1)].

bd_bz

double* for d_commit_Helmholtz_2D/d_commit_Helmholtz_3D, float* for s_commit_Helmholtz_2D/s_commit_Helmholtz_3D.

	This parameter is needed only for ?_commit_Helmholtz_3D. Contains values of the boundary condition on the rightmost boundary of the domain along *z*-axis. The size of the array is (*nx*+1)*(*ny*+1). In case of the Dirichlet boundary condition (value of *BCtype*[5] is 'D'), it contains values of the function *G*(x_i, y_j,*bz*), *i*=0, ..., *nx*, *j*=0, ..., *ny*. In case of the Neumann boundary condition (value of *BCtype*[5] is 'N'), it contains the values of the function *g*(x_i, y_j,*bz*), *i*=0, ..., *nx*, *j*=0, ..., *ny*. The values are packed in the array so that the value corresponding to indices *(i, j)* is placed in *bd_bz*[*i*+*j**(*nx*+1)].

Output Parameters

f	Vector of the right-hand side of the problem. Possibly, altered on output.
ipar	Contains integer data to be used by Fast Helmholtz Solver. Modified on output as explained in Common Parameters.
dpar	Contains double-precision data to be used by Fast Helmholtz Solver. Modified on output as explained in Common Parameters.
spar	Contains single-precision data to be used by Fast Helmholtz Solver. Modified on output as explained in Common Parameters.
xhandle, yhandle	DESCRIPTOR_HANDLE*. Data structures used by the Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms"). *yhandle* is used only by ?_commit_Helmholtz_3D.
stat	int*. Routine completion status, which is also written to *ipar[0]*. The status should be 0 to proceed to other PL routines.

Description

The routines ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D are declared in the mkl_poisson.h header file for the C interface and mkl_poisson.f90 header file for the Fortran interface. The routines check consistency and correctness of the parameters to be passed to the solver routines ?_Helmholtz_2D/?_Helmholtz_3D. They also initialize data structures *xhandle*, *yhandle* as well as arrays *ipar* and *dpar/spar*, depending upon the routine precision. Refer to Common Parameters to find out which particular array elements the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routines initialize and what values are written there.

The routines perform only a basic check for correctness and consistency. If you are going to modify parameters of PL routines, see the Caveat on Parameter Modifications section. Unlike ?_init_Helmholtz_2D/?_init_Helmholtz_3D, the routines ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D are mandatory, and you cannot skip calling them in your code. Values of *ax*, *bx*, *ay*, *by*, *az*, *bz*, *nx*, *ny*, *nz*, and *BCtype* are passed to each of the routines with the *ipar* array and defined in a previous call to the appropriate ?_init_Helmholtz_2D/?_init_Helmholtz_3D routine.

Return Values

stat= 1	The routine completed without errors and produced some warnings.
stat= 0	The routine successfully completed the task.

stat = -100	The routine stopped because an error in the user's data was found or the data in the *dpar*, *spar* or *ipar* array was altered by mistake.
stat = -1000	The routine stopped because of an Intel MKL FFT or TT interface error.
stat = -10000	The routine stopped because the initialization failed to complete or the parameter *ipar*[0] was altered by mistake.
stat = -99999	The routine failed to complete the task because of a fatal error.

?_Helmholtz_2D/?_Helmholtz_3D

Computes the solution of 2D/3D Helmholtz problem specified by the parameters.

Syntax

```
void d_Helmholtz_2D(double* f, double* bd_ax, double* bd_bx, double* bd_ay, double* bd_by, DFTI_DESCRIPTOR* xhandle, int* ipar, double* dpar, int* stat);
```

```
void s_Helmholtz_2D (float* f, float* bd_ax, float* bd_bx, float* bd_ay, float* bd_by, DFTI_DESCRIPTOR* xhandle, int* ipar, float* spar, int* stat);
```

```
void d_Helmholtz_3D(double* f, double* bd_ax, double* bd_bx, double* bd_ay, double* bd_by, double* bd_az, double* bd_bz, DFTI_DESCRIPTOR* xhandle, DFTI_DESCRIPTOR* yhandle, int* ipar, double* dpar, int* stat);
```

```
void s_Helmholtz_3D(float* f, float* bd_ax, float* bd_bx, float* bd_ay, float* bd_by, float* bd_az, float* bd_bz, DFTI_DESCRIPTOR* xhandle, DFTI_DESCRIPTOR* yhandle, int* ipar, float* spar, int* stat);
```

Input Parameters

f	`double*` for `d_Helmholtz_2D/d_Helmholtz_3D`, `float*` for `s_Helmholtz_2D/s_Helmholtz_3D`. Contains the right-hand side of the problem packed in a single vector and modified by the appropriate `?_commit_Helmholtz_2D/?_commit_Helmholtz_3D` routine. Note that an attempt to substitute the original right-hand side vector at this point will result in a wrong solution. The size of the vector for the 2D problem is (*nx*+1)*(*ny*+1). In this case, value of the right-hand side in the mesh point (*i, j*) is stored in *f*[*i*+*j**(*nx*+1)] . The size of the vector for the 3D problem is (*nx*+1)*(*ny*+1)*(*nz*+1). In this case, value of the right-hand side in the mesh point (*i, j, k*) is stored in *f*[*i*+*j**(*nx*+1)+*k**(*nx*+1)*(*ny*+1)].
xhandle, yhandle	`DESCRIPTOR_HANDLE*`. Data structures used by the Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms"). *yhandle* is used only by `?_Helmholtz_3D`.

ipar — `int` array of size 128. Contains integer data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).

dpar — `double` array of size 5*nx/2+7 in the 2D case or 5*(nx+ny)/2+9 in the 3D case. Contains double-precision data to be used by Fast Helmholtz Solver (for details, refer toCommon Parameters

spar — float array of size 5*nx/2+7 in the 2D case or 5*(nx+ny)/2+9 in the 3D case. Contains single-precision data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).

bd_ax — `double*` for `d_Helmholtz_2D/d_Helmholtz_3D`, `float*` for `s_Helmholtz_2D/s_Helmholtz_3D`.
Contains values of the boundary condition on the leftmost boundary of the domain along x-axis.
For `?_Helmholtz_2D`, the size of the array is ny+1. In case of the the Dirichlet boundary condition (value of *BCtype*[0] is 'D'), it contains values of the function $G(ax, y_j)$, j=0, ..., ny. In case of the the Neumann boundary condition (value of *BCtype*[0] is 'N'), it contains values of the function $g(ax, y_j)$, j=0, ..., ny. The value corresponding to the index j is placed in *bd_ax*[j].
For `?_Helmholtz_3D`, the size of the array is (ny+1)*(nz+1). In case of the the Dirichlet boundary condition (value of *BCtype*[0] is 'D'), it contains values of the function $G(ax, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. In case of the Neumann boundary condition (value of *BCtype*[0] is 'N'), it contains the values of the function $g(ax, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. The values are packed in the array so that the value corresponding to indices *(j, k)* is placed in *bd_ax*[j+k*(ny+1)].

bd_bx — `double*` for `d_Helmholtz_2D/d_Helmholtz_3D`, `float*` for `s_Helmholtz_2D/s_Helmholtz_3D`.
Contains values of the boundary condition on the rightmost boundary of the domain along x-axis.
For `?_Helmholtz_2D`, the size of the array is ny+1. In case of the Dirichlet boundary condition (value of *BCtype*[1] is 'D'), it contains values of the function $G(bx, y_j)$, j=0, ..., ny. In case of the Neumann boundary condition (value of *BCtype*[1] is 'N'), it contains values of the function $g(bx, y_j)$, j=0, ..., ny. The value corresponding to the index j is placed in *bd_bx*[j].
For `?_Helmholtz_3D`, the size of the array is (ny+1)*(nz+1). In case of the Dirichlet boundary condition (value of *BCtype*[1] is 'D'), it contains values of the function $G(bx, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. In case of the Neumann boundary condition (value of *BCtype*[1] is 'N'), it contains the values of the function $g(bx, y_j, z_k)$, j=0, ..., ny, k=0, ..., nz. The values are packed in the array so that the value corresponding to indices *(j, k)* is placed in *bd_bx*[j+k*(ny+1)].

bd_ay — `double*` for `d_Helmholtz_2D/d_Helmholtz_3D`, `float*` for `s_Helmholtz_2D/s_Helmholtz_3D`.
Contains values of the boundary condition on the leftmost boundary of the domain along y-axis.

For ?_Helmholtz_2D, the size of the array is *nx*+1. In case of the Dirichlet boundary condition (value of *BCtype*[2] is 'D'), it contains values of the function *G*(x_i, *ay*), *i*=0, ..., *nx*. In case of the Neumann boundary condition (value of *BCtype*[2] is 'N'), it contains values of the function *g*(x_i, *ay*), *i*=0, ..., *nx*. The value corresponding to the index *i* is placed in *bd_ay*[*i*].
For ?_Helmholtz_3D, the size of the array is (*nx*+1)*(*nz*+1). In case of the Dirichlet boundary condition (value of *BCtype*[2] is 'D'), it contains values of the function *G*(x_i,*ay*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. In case of the Neumann boundary condition (value of *BCtype*[2] is 'N'), it contains the values of the function *g*(x_i,*ay*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. The values are packed in the array so that the value corresponding to indices *(i, k)* is placed in *bd_ay*[*i*+*k**(*nx*+1)].

bd_by

double* for d_Helmholtz_2D/d_Helmholtz_3D,
float* for s_Helmholtz_2D/s_Helmholtz_3D.
Contains values of the boundary condition on the rightmost boundary of the domain along *y*-axis.
For ?_Helmholtz_2D, the size of the array is *nx*+1. In case of the Dirichlet boundary condition (value of *BCtype*[3] is 'D'), it contains values of the function *G*(x_i, *by*), *i*=0, ..., *nx*. In case of the Neumann boundary condition (value of *BCtype*[3] is 'N'), it contains values of the function *g*(x_i, *by*), *i*=0, ..., *nx*. The value corresponding to the index *i* is placed in *bd_by*[*i*].
For ?_Helmholtz_3D, the size of the array is (*nx*+1)*(*nz*+1). In case of the Dirichlet boundary condition (value of *BCtype*[3] is 'D'), it contains values of the function *G*(x_i,*by*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. In case of the Neumann boundary condition (value of *BCtype*[3] is 'N'), it contains the values of the function *g*(x_i,*by*, z_k), *i*=0, ..., *nx*, *k*=0, ..., *nz*. The values are packed in the array so that the value corresponding to indices *(i, k)* is placed in *bd_by*[*i*+*k**(*nx*+1)].

bd_az

double* for d_Helmholtz_2D/d_Helmholtz_3D,
float* for s_Helmholtz_2D/s_Helmholtz_3D.
This parameter is needed only for ?_Helmholtz_3D. Contains values of the boundary condition on the leftmost boundary of the domain along *z*-axis.
The size of the array is (*nx*+1)*(*ny*+1). In case of the Dirichlet boundary condition (value of *BCtype*[4] is 'D'), it contains values of the function *G*(x_i, y_j,*az*), *i*=0, ..., *nx*, *j*=0, ..., *ny*. In case of the Neumann boundary condition (value of *BCtype*[4] is 'N'), it contains the values of the function *g*(x_i, y_j,*az*), *i*=0, ..., *nx*, *j*=0, ..., *ny*. The values are packed in the array so that the value corresponding to indices *(i, j)* is placed in *bd_az*[*i*+*j**(*nx*+1)].

bd_bz

double* for d_Helmholtz_2D/d_Helmholtz_3D,
float* for s_Helmholtz_2D/s_Helmholtz_3D.

	This parameter is needed only for ?_Helmholtz_3D. Contains values of the boundary condition on the rightmost boundary of the domain along *z*-axis. The size of the array is (*nx*+1)*(*ny*+1). In case of the Dirichlet boundary condition (value of *BCtype*[5] is 'D'), it contains values of the function $G(x_i, y_j, bz)$, *i*=0, ..., *nx*, *j*=0, ..., *ny*. In case of the Neumann boundary condition (value of *BCtype*[5] is 'N'), it contains the values of the function $g(x_i, y_j, bz)$, *i*=0, ..., *nx*, *j*=0, ..., *ny*. The values are packed in the array so that the value corresponding to indices *(i, j)* is placed in *bd_bz*[*i*+*j**(*nx*+1)].

NOTE. To avoid wrong computation results, do not change arrays *bd_ax*, *bd_bx*, *bd_ay*, *bd_by*, *bd_az*, *bd_bz* between a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine and a subsequent call to the appropriate ?_Helmholtz_2D/?_Helmholtz_3D routine.

Output Parameters

f	On output, contains the approximate solution to the problem packed the same way as the right-hand side of the problem was packed on input.
xhandle, yhandle	Data structures used by the Intel MKL FFT interface.
ipar	Contains integer data to be used by Fast Helmholtz Solver. Modified on output as explained in Common Parameters.
dpar	Contains double-precision data to be used by Fast Helmholtz Solver. Modified on output as explained in Common Parameters
spar	Contains single-precision data to be used by Fast Helmholtz Solver. Modified on output as explained in Common Parameters.
stat	int*. Routine completion status, which is also written to *ipar[0]*. The status should be 0 to proceed to other PL routines.

Description

The routines are declared in the mkl_poisson.h header file for the C interface and mkl_poisson.f90 header file for the Fortran interface. The routines compute the approximate solution of Helmholtz problem defined in the previous calls to the corresponding initialization and commit routines. The solution is computed according to formulas given in the Poisson Library Implemented section. The *f* parameter, which initially holds the packed vector of the right-hand side of the problem, is replaced by the computed solution packed in the same way. Values of *ax*, *bx*, *ay*, *by*, *az*, *bz*, *nx*, *ny*, *nz*, and *BCtype* are passed to each of the routines with the *ipar* array and defined in the previous call to the appropriate ?_init_Helmholtz_2D/?_init_Helmholtz_3D routine.

Return Values

stat= 1	The routine completed without errors and produced some warnings.
stat= 0	The routine successfully completed the task.

stat = -2	The routine stopped because division by zero occurred. It usually happens if the data in the *dpar* or *spar* array was altered by mistake.
stat = -3	The routine stopped because the memory was insufficient to complete the computations.
stat = -100	The routine stopped because an error in the user's data was found or the data in the *dpar*, *spar* or *ipar* array was altered by mistake.
stat = -1000	The routine stopped because of the Intel MKL FFT or TT interface error.
stat = -10000	The routine stopped because the initialization failed to complete or the parameter *ipar*[0] was altered by mistake.
stat = -99999	The routine failed to complete the task because of a fatal error.

free_Helmholtz_2D/free_Helmholtz_3D

Cleans the memory allocated for the data structures used by the FFT interface.

Syntax

```
void free_Helmholtz_2D(DFTI_DESCRIPTOR* xhandle, int* ipar, int* stat);
void free_Helmholtz_3D (DFTI_DESCRIPTOR* xhandle, DFTI_DESCRIPTOR* yhandle, int* ipar, int* stat);
```

Input Parameters

xhandle, yhandle	DESCRIPTOR_HANDLE*. Data structures used by the Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms"). The structure *yhandle* is used only by free_Helmholtz_3D.
ipar	int array of size 128. Contains integer data to be used by Fast Helmholtz Solver (for details, refer to Common Parameters).

Output Parameters

xhandle, yhandle	Data structures used by the Intel MKL FFT interface. Memory allocated for the structures is released on output.
ipar	Contains integer data to be used by Fast Helmholtz Solver. Status of the routine call is written to *ipar[0]*.
stat	int*. Routine completion status, which is also written to *ipar[0]*.

Description

The routine is declared in the mkl_poisson.h header file for the C interface and mkl_poisson.f90 header file for the Fortran interface. The routine cleans the memory used by the *xhandle* and *yhandle* structures, needed for calling the Intel MKL FFT functions. To release memory allocated for other parameters, include cleaning of the memory in your code.

Return Values

stat = 0	The routine successfully completed the task.
stat = -1000	The routine stopped because of an Intel MKL FFT or TT interface error.
stat = -99999	The routine failed to complete the task because of a fatal error.

PL Routines for the Spherical Solver

The section gives detailed description of spherical PL routines, their syntax, parameters and values they return. All flavors of the same routine, namely, double-precision and single-precision, periodic (having names ending in "p") and non-periodic (having names ending in "np"), are described together.

These PL routines also call the Intel MKL FFT interface (described in section "FFT Functions" in chapter "Fast Fourier Transforms"), which enhances performance of the routines.

?_init_sph_p/?_init_sph_np

Initializes basic data structures of the Fast periodic and non-periodic Helmholtz Solver on a sphere.

Syntax

```
void d_init_sph_p(double* ap, double* at, double* bp, double* bt, int* np, int* nt, double* q, int* ipar, double* dpar, int* stat);
```

```
void s_init_sph_p(float* ap, float* at, float* bp, float* bt, int* np, int* nt, float* q, int* ipar, float* spar, int* stat);
```

```
void d_init_sph_np(double* ap, double* at, double* bp, double* bt, int* np, int* nt, double* q, int* ipar, double* dpar, int* stat);
```

```
void s_init_sph_np(float* ap, float* at, float* bp, float* bt, int* np, int* nt, float* q, int* ipar, float* spar, int* stat);
```

Input Parameters

ap	`double*` for `d_init_sph_p/d_init_sph_np`, `float*` for `s_init_sph_p/s_init_sph_np`. The coordinate (angle) of the leftmost boundary of the domain along ϕ-axis.
bp	`double*` for `d_init_sph_p/d_init_sph_np`, `float*` for `s_init_sph_p/s_init_sph_np`. The coordinate (angle) of the rightmost boundary of the domain along ϕ-axis.
at	`double*` for `d_init_sph_p/d_init_sph_np`, `float*` for `s_init_sph_p/s_init_sph_np`. The coordinate (angle) of the leftmost boundary of the domain along θ-axis.
bt	`double*` for `d_init_sph_p/d_init_sph_np`,

`float*` for `s_init_sph_p/s_init_sph_np`.
The coordinate (angle) of the rightmost boundary of the domain along θ-axis.

np `int*`. The number of mesh intervals along ϕ-axis. Must be even in the periodic case.

nt `int*`. The number of mesh intervals along θ-axis.

q `double*` for `d_init_sph_p/d_init_sph_np`,
`float*` for `s_init_sph_p/s_init_sph_np`.
The constant Helmholtz coefficient. Note that to solve Poisson problem, you should set the value of *q* to 0.

Output Parameters

ipar `int` array of size 128. Contains integer data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).

dpar `double` array of size 5*_np_/2+_nt_+10. Contains double-precision data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).

spar `float` array of size 5*_np_/2+_nt_+10. Contains single-precision data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).

stat `int*`. Routine completion status, which is also written to *ipar[0]*.
The status should be 0 to proceed to other PL routines.

Description

The routines `?_init_sph_p/?_init_sph_np` are declared in the `mkl_poisson.h` header file for the C interface and `mkl_poisson.f90` header file for the Fortran interface. The routines initialize basic data structures for Poisson Library computations of the appropriate precision. All routines invoked after a call to a `?_init_Helmholtz_2D/?_init_Helmholtz_3D` routine use values of the *ipar*, *dpar* and *spar* array parameters returned by the routine. Detailed description of the array parameters can be found in Common Parameters.

WARNING. Data structures initialized and created by periodic/non-periodic flavors of the routine cannot be used by non-periodic/periodic flavors of any PL routines for Helmholtz Solver on a sphere, respectively.

You can skip calling this routine in your code. However, see Caveat on Parameter Modifications before doing so.

Return Values

stat = 0 The routine successfully completed the task. In general, to proceed with computations, the routine should complete with this *stat* value.

stat = -99999 The routine failed to complete the task because of fatal error.

?_commit_sph_p/?_commit_sph_np

Checks consistency and correctness of user's data as well as initializes certain data structures required to solve periodic/non-periodic Helmholtz problem on a sphere.

Syntax

```
void d_commit_sph_p(double* f, DFTI_DESCRIPTOR* handle_s, DFTI_DESCRIPTOR* handle_c, int* ipar, double* dpar, int* stat);
```

```
void s_commit_sph_p(float* f, DFTI_DESCRIPTOR* handle_s, DFTI_DESCRIPTOR* handle_c, int* ipar, float* spar, int* stat);
```

```
void d_commit_sph_np(double* f, DFTI_DESCRIPTOR* handle, int* ipar, double* dpar, int* stat);
```

```
void s_commit_sph_np(float* f, DFTI_DESCRIPTOR* handle, int* ipar, float* spar, int* stat);
```

Input Parameters

f	`double*` for `d_commit_sph_p/d_commit_sph_np`, `float*` for `s_commit_sph_p/s_commit_sph_np`. Contains the right-hand side of the problem packed in a single vector. The size of the vector is (*np*+1)*(*nt*+1) and value of the right-hand side in the mesh point (*i, j*) is stored in *f*[*i*+*j**(*np*+1)] . Note that the array *f* may be altered by the routine. Please save this vector in another memory location if you want to preserve it.
ipar	`int` array of size 128. Contains integer data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).
dpar	`double` array of size 5**np*/2+*nt*+10. Contains double-precision data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).
spar	`float` array of size 5**np*/2+*nt*+10. Contains single-precision data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).

Output Parameters

f	Vector of the right-hand side of the problem. Possibly, altered on output.
ipar	Contains integer data to be used by Fast Helmholtz Solver on a sphere. Modified on output as explained in Common Parameters.
dpar	Contains double-precision data to be used by Fast Helmholtz Solver on a sphere. Modified on output as explained in Common Parameters.
spar	Contains single-precision data to be used by Fast Helmholtz Solver on a sphere. Modified on output as explained in Common Parameters.

handle_s, handle_c, handle	DESCRIPTOR_HANDLE*. Data structures used by the Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms"). *handle_s* and *handle_c* are used only in ?_commit_sph_p and *handle* is used only in ?_commit_sph_np.
stat	int*. Routine completion status, which is also written to *ipar[0]*. The status should be 0 to proceed to other PL routines.

Description

The routines ?_commit_sph_p/?_commit_sph_np are declared in the mkl_poisson.h header file for the C interface and mkl_poisson.f90 header file for the Fortran interface. The routines check consistency and correctness of the parameters to be passed to the solver routines ?_sph_p/?_sph_np, respectively. They also initialize certain data structures. The routine ?_commit_sph_p initializes structures *handle_s* and *handle_c*, and ?_commit_sph_np initializes *handle*. The routines also initialize arrays *ipar* and *dpar/spar*, depending upon the routine precision. Refer to Common Parameters to find out which particular array elements the ?_commit_sph_p/?_commit_sph_np routines initialize and what values are written there.

The routines perform only a basic check for correctness and consistency. If you are going to modify parameters of PL routines, see the Caveat on Parameter Modifications section. Unlike ?_init_sph_p/?_init_sph_np, the routines ?_commit_sph_p/?_commit_sph_np are mandatory, and you cannot skip calling them in your code. Values of *np* and *nt* are passed to each of the routines with the *ipar* array and defined in a previous call to the appropriate ?_init_sph_p/?_init_sph_np routine.

Return Values

stat = 1	The routine completed without errors and produced some warnings.
stat = 0	The routine successfully completed the task.
stat = -100	The routine stopped because an error in the user's data was found or the data in the *dpar*, *spar* or *ipar* array was altered by mistake.
stat = -1000	The routine stopped because of an Intel MKL FFT or TT interface error.
stat = -10000	The routine stopped because the initialization failed to complete or the parameter *ipar*[0] was altered by mistake.
stat = -99999	The routine failed to complete the task because of a fatal error.

?_sph_p/?_sph_np

Computes the solution of a spherical Helmholtz problem specified by the parameters.

Syntax

```
void d_sph_p(double* f, DFTI_DESCRIPTOR* handle_s, DFTI_DESCRIPTOR* handle_c, int* ipar, double* dpar, int* stat);
```

```
void s_sph_p(float* f, DFTI_DESCRIPTOR* handle_s, DFTI_DESCRIPTOR* handle_c, int* ipar, float* spar, int* stat);
```

```
void d_sph_np(double* f, DFTI_DESCRIPTOR* handle, int* ipar, double* dpar, int* stat);
void s_sph_np(float* f, DFTI_DESCRIPTOR* handle, int* ipar, float* spar, int* stat);
```

Input Parameters

f	`double*` for `d_sph_p/d_sph_np`, `float*` for `s_sph_p/s_sph_np`. Contains the right-hand side of the problem packed in a single vector and modified by the appropriate `?_commit_sph_p/?_commit_sph_np` routine. Note that an attempt to substitute the original right-hand side vector at this point will result in a wrong solution. The size of the vector is (*np*+1)*(*nt*+1) and value of the right-hand side in the mesh point (*i, j*) is stored in *f*[*i*+*j**(*np*+1)] .
handle_s, handle_c, handle	`DESCRIPTOR_HANDLE*`. Data structures used by Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms"). *handle_s* and *handle_c* are used only in `?_sph_p` and *handle* is used only in `?_sph_np`.
ipar	`int` array of size 128. Contains integer data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).
dpar	`double` array of size 5*np/2+nt+10. Contains double-precision data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).
spar	float array of size 5*np/2+nt+10. Contains single-precision data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).

Output Parameters

f	On output, contains the approximate solution to the problem packed the same way as the right-hand side of the problem was packed on input.
handle_s, handle_c, handle	Data structures used by the Intel MKL FFT interface.
ipar	Contains integer data to be used by Fast Helmholtz Solver on a sphere. Modified on output as explained in Common Parameters.
dpar	Contains double-precision data to be used by Fast Helmholtz Solver on a sphere. Modified on output as explained in Common Parameters.
spar	Contains single-precision data to be used by Fast Helmholtz Solver on a sphere. Modified on output as explained in Common Parameters.
stat	`int*`. Routine completion status, which is also written to *ipar[0]*. The status should be 0 to proceed to other PL routines.

Description

The routines are declared in the `mkl_poisson.h` header file for the C interface and `mkl_poisson.f90` header file for the Fortran interface. The routines compute the approximate solution on a sphere of the Helmholtz problem defined in the previous calls to the corresponding initialization and commit routines. The solution is computed according to formulas given in the Poisson Library Implemented section. The *f* parameter, which initially holds the packed vector of the right-hand side of the problem, is replaced by the computed solution packed in the same way. Values of *np* and *nt* are passed to each of the routines with the *ipar* array and defined in the previous call to the appropriate `?_init_sph_p/?_init_sph_np` routine.

Return Values

stat = 1	The routine completed without errors and produced some warnings.
stat = 0	The routine successfully completed the task.
stat = -2	The routine stopped because division by zero occurred. It usually happens if the data in the *dpar* or *spar* array was altered by mistake.
stat = -3	The routine stopped because the memory was insufficient to complete the computations.
stat = -100	The routine stopped because an error in the user's data was found or the data in the *dpar*, *spar* or *ipar* array was altered by mistake.
stat = -1000	The routine stopped because of an Intel MKL FFT or TT interface error.
stat = -10000	The routine stopped because the initialization failed to complete or the parameter *ipar*[0] was altered by mistake.
stat = -99999	The routine failed to complete the task because of a fatal error.

free_sph_p/free_sph_np

Cleans the memory allocated for the data structures used by the FFT interface.

Syntax

```
void free_sph_p(DFTI_DESCRIPTOR* handle_s, DFTI_DESCRIPTOR* handle_c, int* ipar, int* stat);
```

```
void free_sph_np(DFTI_DESCRIPTOR* handle, int* ipar, int* stat);
```

Input Parameters

handle_s, *handle_c*, *handle*	DESCRIPTOR_HANDLE*. Data structures used by the Intel MKL FFT interface (for details, refer to section "FFT Functions" in chapter "Fast Fourier Transforms"). The structures *handle_s* and *handle_c* are used only in `free_sph_p`, and *handle* is used only in `free_sph_np`.

ipar	int array of size 128. Contains integer data to be used by Fast Helmholtz Solver on a sphere (for details, refer to Common Parameters).

Output Parameters

handle_s, handle_c, handle	Data structures used by the Intel MKL FFT interface. Memory allocated for the structures is released on output.
ipar	Contains integer data to be used by Fast Helmholtz Solver on a sphere. Status of the routine call is written to *ipar[0]*.
stat	int*. Routine completion status, which is also written to *ipar[0]*.

Description

The routine is declared in the mkl_poisson.h header file for the C interface and mkl_poisson.f90 header file for the Fortran interface. The routine cleans the memory used by the *handle_s*, *handle_c* or *handle* structures, needed for calling the Intel MKL FFT functions. To release memory allocated for other parameters, include cleaning of the memory in your code.

Return Values

stat = 0	The routine successfully completed the task.
stat = -1000	The routine stopped because of the Intel MKL FFT or TT interface error.
stat = -99999	The routine failed to complete the task because of a fatal error.

Common Parameters

This section provides description of array parameters *ipar*, *dpar* and *spar*, which hold PL routine options in both Cartesian and spherical cases.

NOTE. Initial values are assigned to the array parameters by the appropriate ?_init_Helmholtz_2D/?_init_Helmholtz_3D/?_init_sph_p/?_init_sph_np and ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D/?_commit_sph_p/?_commit_sph_np routines.

ipar	int array of size 128, holds integer data needed for Fast Helmholtz Solver (both for Cartesian and spherical coordinate systems). Its elements are described in Table 13-6:

Table 13-6 Elements of the ipar Array

Index	Description
0	Contains status value of the last called PL routine. In general, it should be 0 to proceed with Fast Helmholtz Solver. The element has no predefined values. This element can also be used to inform the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D/?_commit_sph_p/?_commit_sph_np routines of how the Commit step of the computation should be carried out (see Figure 13-3). A non-zero value of *ipar[0]* with decimal representation

Index	Description
	$\overline{abc} = 100a + 10b + c$ where each of *a*, *b*, and *c* is equal to 0 or 9, indicates that some parts of the Commit step should be omitted. • If *c*=9, the routine omits checking of parameters and initialization of the data structures. • If *b*=9, then in the Cartesian case, the routine omits the adjustment of the right-hand side vector *f* to the Neumann boundary condition (multiplication of boundary values by 0.5 as well as incorporation of the boundary function *g*) and/or the Dirichlet boundary condition (setting boundary values to 0 as well as incorporation of the boundary function *G*). In this case, the routine also omits the adjustment of the right-hand side vector *f* to the particular boundary functions. For the Helmholtz solver on a sphere, the routine omits computation of the spherical weights for the *dpar*/*spar* array. • If *a*=9, then the routine omits the normalization of the right-hand side vector *f*. In the 2D Cartesian case, it is the multiplication by hy^2, where *hy* is the mesh size in the *y* direction (for details, see Poisson Library Implemented). In the 3D (Cartesian) case, it is the multiplication by hz^2, where *hz* is the mesh size in the *z* direction. For the Helmholtz solver on a sphere, it is the multiplication by h_θ^2, where h_θ is the mesh size in the θ direction (for details, see Poisson Library Implemented). Using *ipar[0]* you can adjust the routine to your needs and gain efficiency in solving multiple Helmholtz problems that differ only in the right-hand side. You must be cautious using this opportunity, because misunderstanding of the commit process may cause wrong results or program failure (see also Caveat on Parameter Modifications).
1	Contains error messaging options: • *ipar[1]*=-1 indicates that all error messages will be printed to the file MKL_Poisson_Library_log.txt in the folder from which the routine is called. If the file does not exist, the routine tries to create it. If the attempt fails, the routine prints information that the file cannot be created to the standard output device. • *ipar[1]*=0 indicates that no error messages will be printed. • *ipar[1]*=1 is the default value. It indicates that all error messages will be printed to the preconnected default output device (usually, screen). In case of errors, the *stat* parameter will acquire a non-zero value regardless of the *ipar[1]* setting.
2	Contains warning messaging options: • *ipar[2]*=-1 indicates that all warning messages will be printed to the file MKL_Poisson_Library_log.txt in the directory from which the routine is called. If the file does not exist, the routine tries to create it. If the attempt fails, the routine prints information that the file cannot be created to the standard output device. • *ipar[2]*=0 indicates that no warning messages will be printed. • *ipar[2]*=1 is the default value. It indicates that all warning messages will be printed to the preconnected default output device (usually, screen).

Index	Description
	In case of warnings, the *stat* parameter will acquire a non-zero value regardless of the *ipar[2]* setting.
3	Contains the number of the combination of boundary conditions. In the Cartesian case, it corresponds to the value that the *BCtype* parameter holds: • In the 2D case, 0 corresponds to 'DDDD' 1 corresponds to 'DDDN' … 15 corresponds to 'NNNN' • In the 3D case, 0 corresponds to 'DDDDDD' 1 corresponds to 'DDDDDN' ... 63 corresponds to 'NNNNNN'. The Helmholtz solver on a sphere uses this parameter only in a periodic case. The *bp* and *bt* parameters of the ?_init_sph_p/?_init_sph_np routine, which initializes *ipar[3]*, determine its value: • 0 corresponds to the problem without poles. • 1 corresponds to the problem on the entire sphere.
Parameters 4 through 9 are used only in Cartesian case.	
4	Takes the value of 1 if *BCtype[0]*='N', 0 if *BCtype[0]*='D', and -1 otherwise.
5	Takes the value of 1 if *BCtype[1]*='N', 0 if *BCtype[1]*='D', and -1 otherwise.
6	Takes the value of 1 if *BCtype[2]*='N', 0 if *BCtype[2]*='D', and -1 otherwise.
7	Takes the value of 1 if *BCtype[3]*='N', 0 if *BCtype[3]*='D', and -1 otherwise.
8	Takes the value of 1 if *BCtype[4]*='N', 0 if *BCtype[4]*='D', and -1 otherwise. This parameter is used only in the 3D case.
9	Takes the value of 1 if *BCtype[5]*='N', 0 if *BCtype[5]*='D', and -1 otherwise. This parameter is used only in the 3D case.
10	Takes the value of • *nx*, that is, the number of intervals along *x*-axis, in the Cartesian case. • *np*, that is, the number of intervals along ϕ-axis, in the spherical case.
11	Takes the value of

Index	Description
	• *ny*, that is, the number of intervals along *y*-axis, in the Cartesian case • *nt*, that is, the number of intervals along θ-axis, in the spherical case.
12	Takes the value of *nz*, the number of intervals along *z*-axis. This parameter is used only in the 3D case (Cartesian).
13	Takes the value of 6, which specifies the internal partitioning of the *dpar/spar* array.
14	Takes the value of *ipar[13]*+*ipar[10]*+1, which specifies the internal partitioning of the *dpar/spar* array.

Subsequent values of *ipar* depend upon the dimension of the problem or upon whether the solver on a sphere is periodic.

	2D case	3D case	Periodic case	Non-periodic case
15	Unused	Takes the value of *ipar[14]*+1, which specifies the internal partitioning of the *dpar/spar* array.		
16	Unused	Takes the value of *ipar[14]*+ *ipar[11]*+1, which specifies the internal partitioning of the *dpar/spar* array.		
17	Takes the value of *ipar[14]*+1, which specifies the internal partitioning of the *dpar/spar* array.	Takes the value of *ipar[16]*+1, which specifies the internal partitioning of the *dpar/spar* array.		
18	Takes the value of *ipar[14]*+3**ipar[10]* /2+1, which specifies the internal partitioning of the *dpar/spar* array.	Takes the value of *ipar[16]*+3* *ipar[10]*/2+1, which specifies the internal partitioning of the *dpar/spar* array.	Takes the value of *ipar[16]*+3 **ipar[10]*/4+1, which specifies the internal partitioning of the *dpar/spar* array.	Takes the value of *ipar[16]* +3**ipar[10]* /2+1, which specifies the internal partitioning of the *dpar/spar* array.
19	Unused	Takes the value of *ipar[18]*+1, which specifies the internal partitioning of the *dpar/spar* array.		Unused
20	Unused	Takes the value of *ipar[18]*+ 3**ipar[11]*/2+1, which specifies the internal partitioning of the dpar/spar array.	Takes the value of *ipar[18]*+3**ipar[10]* /4+1, which specifies the internal partitioning of the dpar/spar array.	Unused

Subsequent values of *ipar* are assigned regardless.

21	Contains message style options:

Index	Description
	• *ipar[21]*=0 indicates that PL routines print all error and warning messages in Fortran-style notations. • *ipar[21]*=1 (default) indicates that PL routines print the messages in C-style notations.
22	Contains the number of threads to be used for computations in a multithreaded environment. The default value is 1.
23 through 39	Unused in the current implementation of the Poisson Library.
40 through 59	Contain the first twenty elements of the *ipar* array of the first Trigonometric Transform that the Solver uses. (For details, see Common Parameters in the "Trigonometric Transform Routines" chapter.)
60 through 79	Contain the first twenty elements of the *ipar* array of the second Trigonometric Transform that the 3D and periodic solvers use. (For details, see Common Parameters in the "Trigonometric Transform Routines" chapter.)

NOTE. You may declare the *ipar* array in your code as `int ipar[80]`. However, for compatibility with later versions of Intel MKL Poisson Library, which may require more *ipar* values, it is highly recommended to declare *ipar* as `int ipar[128]`.

Arrays *dpar* and *spar* are the same except in the data precision:

dpar Holds data needed for double-precision Fast Helmholtz Solver computations.

- For the Cartesian solver, `double` array of size 5**nx*/2+7 in the 2D case or 5*(*nx*+*ny*)/2+9 in the 3D case; initialized in the `d_init_Helmholtz_2D/d_init_Helmholtz_3D` and `d_commit_Helmholtz_2D/d_commit_Helmholtz_3D` routines.
- For the spherical solver, `double` array of size 5**np*/2+*nt*+10; initialized in the `d_init_sph_p/d_init_sph_np` and `d_commit_sph_p/d_commit_sph_np` routines.

spar Holds data needed for single-precision Fast Helmholtz Solver computations.

- For the Cartesian solver, `float` array of size 5**nx*/2+7 in the 2D case or 5*(*nx*+*ny*)/2+9 in the 3D case; initialized in the `s_init_Helmholtz_2D/s_init_Helmholtz_3D` and `s_commit_Helmholtz_2D/s_commit_Helmholtz_3D` routines.
- For the spherical solver, `float` array of size 5**np*/2+*nt*+10; initialized in the `s_init_sph_p/s_init_sph_np` and `s_commit_sph_p/s_commit_sph_np` routines.

As *dpar* and *spar* have similar elements in respective positions, the elements are described together in Table 13-7:

Table 13-7 Elements of the dpar and spar Arrays

Index	Description
0	In the Cartesian case, contains the length of the interval along *x*-axis right after a call to the ?_init_Helmholtz_2D/?_init_Helmholtz_3D routine or the mesh size h_x in the *x* direction (for details, see Poisson Library Implemented) after a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine. In the spherical case, contains the length of the interval along ϕ-axis right after a call to the ?_init_sph_p/?_init_sph_np routine or the mesh size h_ϕ in the ϕ direction (for details, see Poisson Library Implemented) after a call to the ?_commit_sph_p/?_commit_sph_np routine.
1	In the Cartesian case, contains the length of the interval along *y*-axis right after a call to the ?_init_Helmholtz_2D/?_init_Helmholtz_3D routine or the mesh size h_y in the *y* direction (for details, see Poisson Library Implemented) after a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine. In the spherical case, contains the length of the interval along θ-axis right after a call to the ?_init_sph_p/?_init_sph_np routine or the mesh size h_θ in the θ direction (for details, see Poisson Library Implemented) after a call to the ?_commit_sph_p/?_commit_sph_np routine.
2	In the Cartesian case, contains the length of the interval along *z*-axis right after a call to the ?_init_Helmholtz_2D/?_init_Helmholtz_3D routine or the mesh size h_z in the *z* direction (for details, see Poisson Library Implemented) after a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine. In the Cartesian solver, this parameter is used only in the 3D case. In the spherical solver, contains the coordinate of the leftmost boundary along θ-axis after a call to the ?_init_sph_p/?_init_sph_np routine.
3	Contains the value of the coefficient *q* after a call to the ?_init_Helmholtz_2D/?_init_Helmholtz_3D/?_init_sph_p/?_init_sph_np routine.
4	Contains the tolerance parameter after a call to the ?_init_Helmholtz_2D/?_init_Helmholtz_3D/?_init_sph_p/?_init_sph_np routine. • In the Cartesian case, this value is used only for the pure Neumann boundary conditions (*BCtype*="NNNN" in the 2D case; *BCtype*="NNNNNN" in the 3D case). This is a special case, because the right-hand side of the problem cannot be arbitrary if the coefficient *q* is zero. Poisson Library verifies that the classical solution exists (up to rounding errors) using this tolerance. In any case, Poisson Library computes the normal solution, that is, the solution that has the minimal Euclidean norm of residual. Nevertheless, the ?_Helmholtz_2D/?_Helmholtz_3D routine informs the user that the solution may not exist in a classical sense (up to rounding errors). • In the spherical case, the value is used for the special case of a periodic problem on the entire sphere. This special case is similar to the above described Cartesian case with pure Neumann boundary conditions. So, here Poisson Library computes the normal solution as well. The parameter is also used to detect whether the problem is periodic up to rounding errors.

Index	Description
	The default value for this parameter is 1.0E-10 in case of double-precision computations or 1.0E-4 in case of single-precision computations. You can increase the value of the tolerance, for instance, to avoid the warnings that may appear.
ipar[13]-1 through *ipar[14]*-1	In the Cartesian case, contain the spectrum of the 1D problem along *x*-axis after a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine. In the spherical case, contains the spectrum of the 1D problem along ϕ-axis after a call to the ?_commit_sph_p/?_commit_sph_np routine.
ipar[15]-1 through *ipar[16]*-1	In the Cartesian case, contain the spectrum of the 1D problem along *y*-axis after a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine. These elements are used only in the 3D case. In the spherical case, contains the spherical weights after a call to the ?_commit_sph_p/?_commit_sph_np routine.
ipar[17]-1 through *ipar[18]*-1	Take the values of the (staggered) sine/cosine in the mesh points: • along *x*-axis after a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine for a Cartesian solver • along ϕ-axis after a call to the ?_commit_sph_p/?_commit_sph_np routine for a spherical solver.
ipar[19]-1 through *ipar[20]*-1	Take the values of the (staggered) sine/cosine in the mesh points: • along *y*-axis after a call to the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine for a Cartesian 3D solver • along ϕ-axis after a call to the ?_commit_sph_p routine for a spherical periodic solver. These elements are not used in the 2D Cartesian case and in the non-periodic spherical case.

NOTE. You may define the array size depending upon the type of the problem to solve.

Caveat on Parameter Modifications

Flexibility of the PL interface enables you to skip calling the ?_init_Helmholtz_2D/?_init_Helmholtz_3D/?_init_sph_p/?_init_sph_np routine and to initialize the basic data structures explicitly in your code. You may also need to modify contents of *ipar*, *dpar* and *spar* arrays after initialization. When doing so, provide correct and consistent data in the arrays. Mistakenly altered arrays cause errors or wrong computation. You can perform a basic check for correctness and consistency of parameters by calling the ?_commit_Helmholtz_2D/?_commit_Helmholtz_3D routine; however, this does not ensure the correct solution but only reduces the chance of errors or wrong results.

NOTE. To supply correct and consistent parameters to PL routines, you should have considerable experience in using the PL interface and good understanding of the solution process as well as elements that the *ipar*, *spar* and *dpar* arrays contain and dependencies between values of these elements.

However, in rare occurrences, even advanced users might fail in tuning parameters for the Fast Helmholtz Solver. In cases like these, refer for technical support at http://www.intel.com/software/products/support/ .

WARNING. The only way that ensures a proper solution of a Helmholtz problem is to follow a typical sequence of invoking the routines and not change the default set of parameters. So, avoid modifications of *ipar*, *dpar* and *spar* arrays unless a strong need arises.

Implementation Details

Several aspects of the Intel MKL PL interface are platform-specific and language-specific. To promote portability across platforms and ease of use across different languages, users are provided with the PL language-specific header files to include in their code. Currently, the following header files are available:

- `mkl_poisson.h`, to be used together with `mkl_dfti.h`, for C programs.
- `mkl_poisson.f90`, to be used together with `mkl_dfti.f90`, for Fortran 90 programs.

NOTE. Use of the Intel MKL PL software without including one of the above header files is not supported.

The include files define function prototypes for appropriate languages.

C-specific Header File

The C-specific header file defines the following function prototypes for the Cartesian solver:

```
void d_init_Helmholtz_2D(double*, double*, double*, double*, int*, int*, char*, double*, int*, double*,
int*);

void d_commit_Helmholtz_2D(double*, double*, double*, double*, double*, DFTI_DESCRIPTOR_HANDLE*, int*,
double*, int*);

void d_Helmholtz_2D(double*, double*, double*, double*, double*, DFTI_DESCRIPTOR_HANDLE*, int*, double*,
int*);

void s_init_Helmholtz_2D(float*, float*, float*, float*, int*, int*, char*, float*, int*, float*, int*);

void s_commit_Helmholtz_2D(float*, float*, float*, float*, float*, DFTI_DESCRIPTOR_HANDLE*, int*, float*,
int*);
```

```
void s_Helmholtz_2D(float*, float*, float*, float*, float*, DFTI_DESCRIPTOR_HANDLE*, int*, float*, int*);

void free_Helmholtz_2D(DFTI_DESCRIPTOR_HANDLE*, int*, int*);

void d_init_Helmholtz_3D(double*, double*, double*, double*, double*, double*, int*, int*, int*, char*,
double*, int*, double*, int*);

void d_commit_Helmholtz_3D(double*, double*, double*, double*, double*, double*, double*,
DFTI_DESCRIPTOR_HANDLE*, DFTI_DESCRIPTOR_HANDLE*, int*, double*, int*);

void d_Helmholtz_3D(double*, double*, double*, double*, double*, double*, double*, DFTI_DESCRIPTOR_HANDLE*,
 DFTI_DESCRIPTOR_HANDLE*, int*, double*, int*);

void s_init_Helmholtz_3D(float*, float*, float*, float*, float*, float*, int*, int*, int*, char*, float*,
int*, float*, int*);

void s_commit_Helmholtz_3D(float*, float*, float*, float*, float*, float*, float*, DFTI_DESCRIPTOR_HANDLE*,
 DFTI_DESCRIPTOR_HANDLE*, int*, float*, int*);

void s_Helmholtz_3D(float*, float*, float*, float*, float*, float*, float*, DFTI_DESCRIPTOR_HANDLE*,
DFTI_DESCRIPTOR_HANDLE*, int*, float*, int*);

void free_Helmholtz_3D(DFTI_DESCRIPTOR_HANDLE*, DFTI_DESCRIPTOR_HANDLE*, int*, int*);
```

The C-specific header file defines the following function prototypes for the spherical solver:

```
void d_init_sph_p(double*, double*, double*, double*, int*, int*, double*, int*, double*, int*);

void d_commit_sph_p(double*, DFTI_DESCRIPTOR_HANDLE*, DFTI_DESCRIPTOR_HANDLE*, int*, double*, int*);

void d_sph_p(double*, DFTI_DESCRIPTOR_HANDLE*, DFTI_DESCRIPTOR_HANDLE*, int*, double*, int*);

void s_init_sph_p(float*, float*, float*, float*, int*, int*, float*, int*, float*, int*);

void s_commit_sph_p(float*, DFTI_DESCRIPTOR_HANDLE*, DFTI_DESCRIPTOR_HANDLE*, int*, float*, int*);

void s_sph_p(float*, DFTI_DESCRIPTOR_HANDLE*, DFTI_DESCRIPTOR_HANDLE*, int*, float*, int*);

void free_sph_p(DFTI_DESCRIPTOR_HANDLE*, DFTI_DESCRIPTOR_HANDLE*, int*, int*);

void d_init_sph_np(double*, double*, double*, double*, int*, int*, double*, int*, double*, int*);

void d_commit_sph_np(double*, DFTI_DESCRIPTOR_HANDLE*, int*, double*, int*);

void d_sph_np(double*, DFTI_DESCRIPTOR_HANDLE*, int*, double*, int*);

void s_init_sph_np(float*, float*, float*, float*, int*, int*, float*, int*, float*, int*);

void s_commit_sph_np(float*, DFTI_DESCRIPTOR_HANDLE*, int*, float*, int*);

void s_sph_np(float*, DFTI_DESCRIPTOR_HANDLE*, int*, float*, int*);

void free_sph_np(DFTI_DESCRIPTOR_HANDLE*, int*, int*);
```

Fortran-Specific Header File

The Fortran90-specific header file defines the following function prototypes for the Cartesian solver:

```
SUBROUTINE D_INIT_HELMHOLTZ_2D (AX, BX, AY, BY, NX, NY, BCTYPE, Q, IPAR, DPAR, STAT)

Fortran 90 specifics of the PL routines usage are similar for all Intel MKL PDE support tools and described in the Calling PDE Support Routines from Fortran 90 section.

Calling PDE Support Routines from Fortran 90

The calling interface for all the Intel MKL TT and PL routines is designed to be easily used in C. However, you can invoke each TT or PL routine directly from Fortran 90 if you are familiar with the inter-language calling conventions of your platform.

The TT or PL interface cannot be invoked from Fortran 77 due to restrictions imposed by the use of the Intel MKL FFT interface.

The inter-language calling conventions include, but are not limited to, the argument passing mechanisms for the language, the data type mappings from C to Fortran 90 and how C external names are decorated on the platform.

To promote portability and relieve a user of dealing with the calling conventions specifics, Fortran 90 header file `mkl_trig_transforms.f90` for TT routines and `mkl_poisson.f90` for PL routines, used together with `mkl_dfti.f90`, declare a set of macros and introduce type definitions intended to hide the inter-language calling conventions and provide an interface to the routines that looks natural in Fortran 90.

For example, consider a hypothetical library routine, `foo`, which takes a double-precision vector of length *n*. C users access such a function as follows:

```
int n;
double *x;
…
foo(x, &n);
```

As noted above, to invoke `foo`, Fortran 90 users would need to know what Fortran 90 data types correspond to C types `int` and `double` (or `float` in case of single-precision), what argument-passing mechanism the C compiler uses and what, if any, name decoration is performed by the C compiler when generating the external symbol `foo`. However, with the Fortran 90 header files `mkl_trig_transforms.f90` / `mkl_poisson.f90` and `mkl_dfti.f90` included, the invocation of `foo` within a Fortran 90 program will look as follows:

- For TT interface,
  ```
  use mkl_dfti
  use mkl_trig_transforms
  INTEGER n
  DOUBLE PRECISION, ALLOCATABLE :: x
  …
  CALL FOO(x,n)
  ```
- For PL interface,
  ```
  use mkl_dfti
  use mkl_poisson
  INTEGER n
  DOUBLE PRECISION, ALLOCATABLE :: x
  …
  CALL FOO(x,n)
  ```

Note that in the above example, the header files `mkl_trig_transforms.f90 / mkl_poisson.f90` and `mkl_dfti.f90` provide a definition for the subroutine `FOO`. To ease the use of PL or TT routines in Fortran 90, the general approach of providing Fortran 90 definitions of names is used throughout the libraries. Specifically, if a name from a PL or TT interface is documented as having the C-specific name `foo`, then the Fortran 90 header files provide an appropriate Fortran 90 language type definition `FOO`.

One of the key differences between Fortran 90 and C is the language argument-passing mechanism: C programs use pass-by-value semantics and Fortran 90 programs use pass-by-reference semantics. The Fortran 90 headers ensure proper treatment of this difference. In particular, in the above example, the header files `mkl_trig_transforms.f90 / mkl_poisson.f90` and `mkl_dfti.f90` hide the difference by defining a macro `FOO` that takes the address of the appropriate arguments.

Nonlinear Optimization Problem Solvers

14

Intel® Math Kernel Library provides tools for solving nonlinear least squares problems using the Trust-Region (TR) algorithms. Subroutines are available to solve nonlinear least squares problems with and without boundary constraints and also to compute the Jacobi matrix based on a central difference scheme.

For more information on the key concepts required to understand the use of the Intel MKL nonlinear least squares problem solver routines, see [Conn00]

Nonlinear optimization problem solver routines of Intel MKL are subdivided according to their purpose as follows:

Nonlinear Least Squares Problem without Constraints

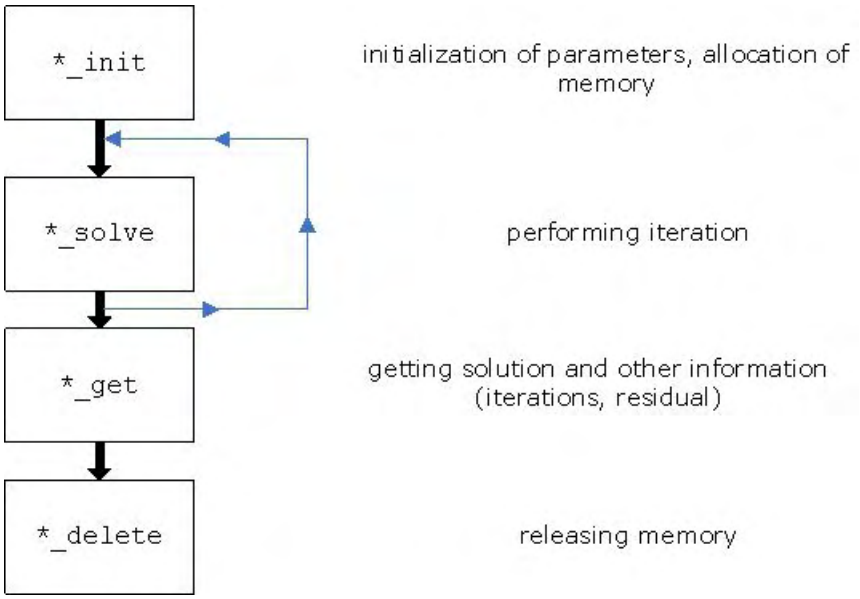
Nonlinear Least Squares Problem with Linear (Boundary) Constraints

Jacobi Matrix Calculation Routines.

Organization and Implementation

The TR solvers provided have reverse communication interfaces (RCI). RCI means that you need to provide certain information (or perform operations) to the solver, for example, the values of the objective function or a corresponding Jacobi matrix. This makes the solver independent of specific implementation of the operations. However, this approach requires some additional work from you.

Figure 14-1 Typical order for invoking RCI solver routines



The Trust-Region solvers are implemented with OpenMP* support. To use the multiprocessing mode, set the number of threads in the environment variable `MKL_NUM_THREADS`.

Memory Allocation and Handles

To make the routines easy to use, you are not required to allocate temporary working storage. The solver allocates any required memory. To allow multiple users to access the solver simultaneously, the solver keeps track of the storage allocated for a particular application by using a data object called a *handle*. Each RCI TR solver routine creates, uses, or deletes a handle.

C and C++ programmers should declare a handle as:

```
#include "mkl_rci.h"

_TRNSP_HANDLE_t handle;
```

or

```
_TRNSPBC_HANDLE_t handle;
```

Fortran programmers using compilers that support eight byte integers should declare a handle as:

```
INCLUDE "mkl_rci.fi"

INTEGER*8 handle
```

In addition to the necessary definition, for the correct declaration of a handle, the include file also defines the following:

- function prototypes for languages that support prototypes
- symbolic constants that are used for the error returns
- user options for the solver routines
- message severity.

Routine Naming Conventions

The Trust-Region routine names have the following structure:

`<character><name>_<action>( )`

where

- <*character*> indicates the data type:

s	real, single precision
d	real, double precision

- <*name*> indicates the task type:

`trnlsp`	nonlinear least squares problem without constraints
`trnlspbc`	nonlinear least squares problem with boundary constraints
`jacobi`	computation of the Jacobi matrix using central differences

- <*action*> indicates an action on the task:

`init`	initializes the solver
`solve`	solves the problem
`get`	retrieves the number of iterations, the stop criterion, the initial residual, and the final residual
`delete`	releases the allocated data

Nonlinear Least Squares Problem without Constraints

The nonlinear least squares problem without constraints can be described as follows:

$$\min_{x\in R^n} \left\|F(x)\right\|_2^2 = \min_{x\in R^n} \left\|y - f(x)\right\|_2^2,\ y \in R^m,\ x \in R^n,\ f : R^n \to R^m,\ m \ge n,$$

where $F(x) : R^n \to R^m$ is a twice differentiable function in R^n. Solving a nonlinear least squares problem means searching for the best approximation to the vector y with the model function $f_i(x)$ and nonlinear variables . The best approximation means that the sum of squares of residuals $y_i - f_i(x)$ is the minimum.

See usage examples in FORTRAN and C in the `examples\solver\source` folder of your Intel MKL directory (`ex_nlsqp_f.f` and `ex_nlsqp_c.c`, respectively).

Table 14-1 RCI TR Routines

Routine Name	Operation
?trnlsp_init	Initializes the solver.
?trnlsp_solve	Solves a nonlinear least squares problem using RCI and Trust-Region algorithms.
?trnlsp_get	Retrieves the number of iterations, stop criterion, initial residual, and final residual.
?trnlsp_delete	Releases allocated data.

?trnlsp_init

Initializes the solver of nonlinear least squares problem.

Syntax

Fortran:

```
res = strnlsp_init(handle, n, m, x, eps, iter1, iter2, rs)
res = dtrnlsp_init(handle, n, m, x, eps, iter1, iter2, rs)
```

C:

```
res = strnlsp_init(&handle, &n, &m, x, eps, &iter1, &iter2, &rs);
res = dtrnlsp_init(&handle, &n, &m, x, eps, &iter1, &iter2, &rs);
```

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine initializes the solver. After initialization, all subsequent invocations of the `?trnlsp_solve` routine should use the values of the handle returned by `?trnlsp_init`.

The *eps* array contains the stopping criteria:

eps(1): $\Delta < eps(1)$

eps(2): $||F(x)||_2 < eps(2)$

eps(3): the Jacobi matrix is singular. $||J(x)_{(1:m,j)}||_2 < eps(3)$, $j = 1, \ldots, n$

eps(4): $||s||_2 < eps(4)$

eps(5): $||F(x)||_2 - ||F(x) - J(x)s||_2 < eps(5)$

eps(6): the trial step precision. If *eps*(6) = 0, then *eps*(6) = 1.d-10,

where $J(x)$ is the Jacobi matrix, Δ is the trust-region area, $F(x)$ is the value of the functional, s is the trial step.

Input Parameters

n INTEGER. Length of *X*.

m	INTEGER. Length of $F(x)$.
x	REAL for strnlsp_init DOUBLE PRECISION for dtrnlsp_init Array of size *n*. Initial guess.
eps	REAL for strnlsp_init DOUBLE PRECISION for dtrnlsp_init Array of size 6; contains stopping criteria. See the values in Description.
iter1	INTEGER. Specifies the maximum number of iterations.
iter2	INTEGER. Specifies the maximum number of iterations of trial step calculation.
rs	REAL for strnlsp_init DOUBLE PRECISION for dtrnlsp_init Positive input variable used in determining the initial step bound. In most cases the factor should lie within the interval (0.1, 100.0). The generally recommended value is 100.

Output Parameters

handle	Type _TRNSP_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally. *res* = TR_INVALID_OPTION means an error in the input parameters. *res* = TR_OUT_OF_MEMORY means a memory error.

?trnlsp_solve

Solves a nonlinear least squares problem using the Trust-Region algorithm.

Syntax

Fortran:

```
res = strnlsp_solve(handle, fvec, fjac, RCI_Request)
res = dtrnlsp_solve(handle, fvec, fjac, RCI_Request)
```

C:

```
res = strnlsp_solve(&handle, fvec, fjac, &RCI_Request);
res = dtrnlsp_solve(&handle, fvec, fjac, &RCI_Request);
```

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The strnlsp_solve routine uses the Trust-Region algorithm to solve nonlinear least squares problems.

The problem is stated as follows:

$$\min_{x \in R^n} \left\| F(x) \right\|_2^2 = \min_{x \in R^n} \left\| y - f(x) \right\|_2^2, \; y \in R^m, \; x \in R^n, \; f : R^n \to R^m, \; m \geq n,$$

where $F(x) : R^n \to R^m$ and $m \geq n$. From a current point $x_{current}$, the algorithm uses the trust-region approach:

$$\min_{x \in R^n} \left\| F(x_{current}) + J(x_{current})(x_{new} - x_{current}) \right\|_2^2 \quad \text{subject to} \quad \left\| x_{new} - x_{current} \right\| \leq \Delta_{current}$$

to get $x_{new} = x_{current} + s$ that satisfies

$$\min_{x \in R^n} \left\| J^T(x) J(x) s + J^T F(x) \right\|_2^2,$$

where $J(x)$ is the Jacobi matrix, s is the trial step, and $||s||_2 \leq \Delta_{current}$.

The *RCI_Request* parameter provides additional information:

RCI_Request= 2 indicates the requirement to calculate the Jacobian matrix and put the result into *fjac*.

RCI_Request= 1 indicates the requirement to recalculate the function at vector X and put the result into *fvec*.

RCI_Request= 0 indicates a successful iteration on a current trust-region radius but does not mean that the value of *x* has changed.

RCI_Request= -1 indicates that the algorithm has exceeded the maximum number of iterations.

RCI_Request= -2 indicates that $\Delta < eps(1)$

RCI_Request= -3 indicates that $||F(x)||_2 < eps(2)$

RCI_Request= -4 indicates that the Jacobi matrix is singular. $||J(x)_{(1:m,j)}||_2 < eps(3), \; j = 1, \; ..., \; n$

RCI_Request= -5 indicates that $||s||_2 < eps(4)$

RCI_Request= -6 indicates that $||F(x)||_2 - ||F(x) - J(x)s||_2 < eps(5)$,

where $J(x)$ is the Jacobi matrix, Δ is the trust-region area, $F(x)$ is the value of the functional, and s is the trial step.

Input Parameters

handle	Type _TRNSP_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.
fvec	REAL for strnlsp_solve DOUBLE PRECISION for dtrnlsp_solve Array of size *m*. Contains the function values at X, where *fvec*(*i*) = (y_i – f_i(*x*)).
fjac	REAL for strnlsp_solve DOUBLE PRECISION for dtrnlsp_solve Array of size (*m*,*n*). Contains the Jacobi matrix of the function.

Output Parameters

fvec	REAL for strnlsp_solve DOUBLE PRECISION for dtrnlsp_solve Array of size *m*. Contains the updated function values at X.
RCI_Request	INTEGER. Informs about the task stage. See Description for the other values of the parameter and their meaning.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally.

?trnlsp_get

Retrieves the number of iterations, stop criterion, initial residual, and final residual.

Syntax

Fortran:

res = strnlsp_get(*handle*, *iter*, *st_cr*, *r1*, *r2*)

res = dtrnlsp_get(*handle*, *iter*, *st_cr*, *r1*, *r2*)

C:

res = strnlsp_get(*&handle*, *&iter*, *&st_cr*, *&r1*, *&r2*);

res = dtrnlsp_get(*&handle*, *&iter*, *&st_cr*, *&r1*, *&r2*);

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The ?trnlsp_get routine retrieves the current number of iterations, the stop criterion, the initial residual, and final residual.

The *st_cr* parameter contains the stop criterion:

st_cr = 1 indicates that the algorithm has exceeded the maximum number of iterations.

st_cr = 2 indicates that $\Delta < eps(1)$

st_cr = 3 indicates that $||F(x)||_2 < eps(2)$

st_cr = 4 indicates that the Jacobi matrix is singular. $||J(x)_{(1:m,j)}||_2 < eps(3)$, $j = 1, \ldots, n$

st_cr = 5 indicates that $||s||_2 < eps(4)$

st_cr = 6 indicates that $||F(x)||_2 - ||F(x) - J(x)s||_2 < eps(5)$,

where $J(x)$ is the Jacobi matrix, Δ is the trust region area, $F(x)$ is the value of the functional, and s is the trial step.

Input Parameters

handle	Type _TRNSP_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.

Output Parameters

iter	INTEGER. Contains the current number of iterations.
st_cr	INTEGER. Contains the stop criterion. See Description for the parameter values and their meanings.
r1	REAL for strnlsp_get DOUBLE PRECISION for dtrnlsp_get Contains the residual, (||*y* - *f*(*x*)||) given the initial .
r2	REAL for strnlsp_get DOUBLE PRECISION for dtrnlsp_get Contains the final residual, that is, the value of the functional (||*y* - *f*(*x*)||) of the final resulting from the algorithm operation.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally.

?trnlsp_delete

Releases allocated data.

Syntax

Fortran:

res = strnlsp_delete(*handle*)

res = dtrnlsp_delete(*handle*)

C:

res = strnlsp_delete(*&handle*);

res = dtrnlsp_delete(*&handle*);

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The ?trnlsp_delete routine releases allocated data.

Input Parameters

handle	Type _TRNSP_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.

Output Parameters

res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally.

Nonlinear Least Squares Problem with Linear (Bound) Constraints

The nonlinear least squares problem with linear bound constraints can be described and solved in the same way as the nonlinear least squares problem without constraints but it has the following constraints:

$$l_i \le x_i \le u_i, i = 1,\ldots,n, \quad l,u \in R^n.$$

See usage examples in FORTRAN and C in the `examples\solver\source` folder of your Intel MKL directory (`ex_nlsqp_bc_f.f` and `ex_nlsqp_bc_c.c`, respectively).

Table 14-2 RCI TR Routines for Problem with Bound Constraints

Routine Name	Operation
`?trnlspbc_init`	Initializes the solver.
`?trnlspbc_solve`	Solves a nonlinear least squares problem using RCI and the Trust-Region algorithm.
`?trnlspbc_get`	Retrieves the number of iterations, stop criterion, initial residual, and final residual.
`?trnlspbc_delete`	Releases allocated data.

?trnlspbc_init

Initializes the solver of nonlinear least squares problem with linear (boundary) constraints.

Syntax

Fortran:

```
res = strnlspbc_init(handle, n, m, x, LW, UP, eps, iter1, iter2, rs)
res = dtrnlspbc_init(handle, n, m, x, LW, UP, eps, iter1, iter2, rs)
```

C:

```
res = strnlspbc_init(&handle, &n, &m, x, LW, UP, eps, &iter1, &iter2, &rs);
res = dtrnlspbc_init(&handle, &n, &m, x, LW, UP, eps, &iter1, &iter2, &rs);
```

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The `?trnlspbc_init` routine initializes the solver. After initialization all subsequent invocations of the `?trnlspbc_solve` routine should use the values of the handle returned by `?trnlspbc_init`.

The *eps* array contains the stopping criteria:

eps(1): Δ < *eps*(1)

eps(2): $||F(x)||_2$ < *eps*(2)

eps(3): the Jacobi matrix is singular. $||J(x)_{(1:m,j)}||_2$ < *eps*(3), *j* = 1, ..., *n*

eps(4): ||s|| < *eps*(4)

eps(5): $||F(x)||_2$ - $||F(x) - J(x)s||_2$ < *eps*(5)

eps(6): the trial step precision. If *eps*(6) = 0, then *eps*(6) = 1.d-10,

where $J(x)$ is the Jacobi matrix, Δ is the trust-region area, $F(x)$ is the value of the functional, and s is the trial step.

Input Parameters

n	INTEGER. Length of *X*.
m	INTEGER. Length of $F(x)$.
x	REAL for strnlspbc_init DOUBLE PRECISION for dtrnlspbc_init Array of size *n*. Initial guess.
LW	REAL for strnlspbc_init DOUBLE PRECISION for dtrnlspbc_init Array of size *n*. Contains low bounds for *x* ($lw_i < x_i$).
UP	REAL for strnlspbc_init DOUBLE PRECISION for dtrnlspbc_init Array of size *n*. Contains upper bounds for *x* ($up_i > x_i$).
eps	REAL for strnlspbc_init DOUBLE PRECISION for dtrnlspbc_init Array of size 6; contains stopping criteria. See the values in Description.
iter1	INTEGER. Specifies the maximum number of iterations.
iter2	INTEGER. Specifies the maximum number of iterations of trial step calculation.
rs	REAL for strnlspbc_init DOUBLE PRECISION for dtrnlspbc_init Positive input variable used in determining the initial step bound. In most cases the factor should lie within the interval (0.1, 100.0). The generally recommended value is 100.

Output Parameters

handle	Type _TRNSPBC_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally. *res* = TR_INVALID_OPTION means an error in the input parameters. *res* = TR_OUT_OF_MEMORY means a memory error.

?trnlspbc_solve

Solves a nonlinear least squares problem with linear (bound) constraints using the Trust-Region algorithm.

Syntax

Fortran:

```
res = strnlspbc_solve(handle, fvec, fjac, RCI_Request)
res = dtrnlspbc_solve(handle, fvec, fjac, RCI_Request)
```

C:

```
res = strnlspbc_solve(&handle, fvec, fjac, &RCI_Request);
res = dtrnlspbc_solve(&handle, fvec, fjac, &RCI_Request);
```

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The `?trnlspbc_solve` routine, based on RCI, uses the Trust-Region algorithm to solve nonlinear least squares problems with linear (bound) constraints. The problem is stated as follows:

$$\min_{x\in R^n} \left\|F(x)\right\|_2^2 = \min_{x\in R^n} \left\|y - f(x)\right\|_2^2, y \in R^m, x \in R^n, f : R^n \to R^m, m \geq n, \text{ where } l_i \leq x_i \leq u_i, i = 1, \ldots, n.$$

The *RCI_Request* parameter provides additional information:

RCI_Request= 2 indicates the requirement to calculate the Jacobian matrix and put the result into *fjac*.

RCI_Request= 1 indicates the requirement to recalculate the function at vector X and put the result into *fvec*.

RCI_Request= 0 indicates a successful iteration on a current trust-region radius but does not mean that the value of *x* has changed.

RCI_Request= -1 indicates that the algorithm has exceeded the maximum number of iterations.

RCI_Request= -2 indicates that Δ < *eps*(1)

RCI_Request= -3 indicates that $||F(x)||_2$ < *eps*(2)

RCI_Request= -4 indicates that the Jacobi matrix is singular. $||J(x)_{(1:m,j)}||_2$ < *eps*(3), *j* = 1, ..., *N*

RCI_Request= -5 indicates that $||s||_2$ < *eps*(4)

RCI_Request= -6 indicates that $||F(x)||_2$ - $||F(x) - J(x)s||_2$ < *eps*(5),

where $J(x)$ is the Jacobi matrix, Δ is the trust-region area, $F(x)$ is the value of the functional, and s is the trial step.

Input Parameters

handle	Type _TRNSPBC_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.

fvec	REAL for strnlspbc_solve DOUBLE PRECISION for dtrnlspbc_solve Array of size *m*. Contains the function values at X, where *fvec*(*i*) = (y_i – $f_i(x)$).
fjac	REAL for strnlspbc_solve DOUBLE PRECISION for dtrnlspbc_solve Array of size *m* by *n*. Contains the Jacobi matrix of the function.

Output Parameters

fvec	REAL for strnlspbc_solve DOUBLE PRECISION for dtrnlspbc_solve Array of size *m*. Contains the updated function values at X.
RCI_Request	INTEGER. Informs about the task stage. See Description for the other values of the parameter and their meaning.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally.

?trnlspbc_get

Retrieves the number of iterations, stop criterion, initial residual, and final residual.

Syntax

Fortran:

res = strnlspbc_get(*handle*, *iter*, *st_cr*, *r1*, *r2*)

res = dtrnlspbc_get(*handle*, *iter*, *st_cr*, *r1*, *r2*)

C:

res = strnlspbc_get(*&handle*, *&iter*, *&st_cr*, *&r1*, *&r2*);

res = dtrnlspbc_get(*&handle*, *&iter*, *&st_cr*, *&r1*, *&r2*);

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The ?trnlspbc_get routine retrieves the current number of iterations, the stop criterion, the initial residual, and final residual.

The *st_cr* parameter contains the stop criterion:

st_cr = 1 indicates that the algorithm has exceeded the maximum number of iterations.

st_cr = 2 indicates that Δ < *eps*(1)

st_cr = 3 indicates that $||F(x)||_2$ < *eps*(2)

st_cr = 4 indicates that the Jacobi matrix is singular. $||J(x)_{(1:m,j)}||_2$ < *eps*(3), *j* = 1, ..., *n*

st_cr = 5 indicates that $||s||_2$ < *eps*(4)

st_cr = 6 indicates that $||F(x)||_2 - ||F(x) - J(x)s||_2 < eps(5)$,

where $J(x)$ is the Jacobi matrix, Δ is the trust region area, $F(x)$ is the value of the functional, and s is the trial step.

Input Parameters

handle	Type _TRNSPBC_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.

Output Parameters

iter	INTEGER. Contains the current number of iterations.
st_cr	INTEGER. Contains the stop criterion. See Description for the parameter values and their meanings.
r1	REAL for strnlspbc_get DOUBLE PRECISION for dtrnlspbc_get Contains the residual, $(||y - f(x)||)$ given the initial .
r2	REAL for strnlspbc_get DOUBLE PRECISION for dtrnlspbc_get Contains the final residual, that is, the value of the function $(||y - f(x)||)$ of the final resulting from the algorithm operation.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally.

?trnlspbc_delete

Releases allocated data.

Syntax

Fortran:

```
res = strnlspbc_delete(handle)
res = dtrnlspbc_delete(handle)
```

C:

```
res = strnlspbc_delete(&handle);
res = dtrnlspbc_delete(&handle);
```

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The ?trnlspbc_delete routine releases allocated data.

Input Parameters

handle	Type _TRNSPBC_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.

Output Parameters

res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS means the routine completed the task normally.

Jacobi Matrix Calculation Routines

This section describes routines that compute the Jacobi matrix using central differences. Jacobi matrix calculation is required to solve nonlinear least squares problem and systems of nonlinear equations (with or without linear bound constraints). Routines for calculation of the Jacobi matrix have "Black-Box" interfaces, where users pass the objective function via parameters. Note that in this case the user's objective function must have fixed interface.

Table 14-3 Jacobi Matrix Calculation Routines

Routine Name	Operation
?jacobi_init	Initializes the solver.
?jacobi_solve	Computes the Jacobi matrix of the function on the basis of RCI using the central difference.
?jacobi_delete	Removes data.
?jacobi	Computes the Jacobi matrix of the fcn function using the central difference.
?jacobix	Presents an alternative interface for the ?jacobi function enabling the user to pass additional data into the user's function.

?jacobi_init

Initializes the solver for Jacobian calculations.

Syntax

Fortran:

```
res = sjacobi_init(handle, n, m, x, fjac, esp)
res = djacobi_init(handle, n, m, x, fjac, esp)
```

C:

```
res = sjacobi_init(&handle, &n, &m, x, fjac, &eps);
res = djacobi_init(&handle, &n, &m, x, fjac, &eps);
```

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine initializes the solver.

Input Parameters

n	INTEGER. Length of *X*.
m	INTEGER. Length of *F*.
x	REAL for sjacobi_init DOUBLE PRECISION for djacobi_init Array of size *n*. Vector, at which the function is evaluated.
eps	REAL for sjacobi_init DOUBLE PRECISION for djacobi_init Precision of the Jacobi matrix calculation.
fjac	REAL for sjacobi_init DOUBLE PRECISION for djacobi_init Array of size (*m*,*n*). Contains the Jacobi matrix of the function.

Output Parameters

handle	Data object of the _JACOBIMATRIX_HANDLE_t type in C/C++ and INTEGER*8 in FORTRAN.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS indicates that the routine completed the task normally. *res* = TR_INVALID_OPTION indicates an error in the input parameters. *res* = TR_OUT_OF_MEMORY indicates a memory error.

?jacobi_solve

Computes the Jacobi matrix of the function using RCI and the central difference.

Syntax

Fortran:

```
res = sjacobi_solve(handle, f1, f2, RCI_Request)
res = djacobi_solve(handle, f1, f2, RCI_Request)
```

C:

```
res = sjacobi_solve(&handle, f1, f2, &RCI_Request);
res = djacobi_solve(&handle, f1, f2, &RCI_Request);
```

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The ?jacobi_solve routine computes the Jacobi matrix of the function using RCI and the central difference.

See usage examples in FORTRAN and C in the examples\solver\source folder of your Intel MKL directory (sjacobi_rci_f.f, djacobi_rci_f.f and sjacobi_rci_c.c, djacobi_rci_c.c, respectively).

Input Parameters

handle	Type _JACOBIMATRIX_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.

Output Parameters

f1	REAL for sjacobi_solve DOUBLE PRECISION for djacobi_solve Array of size *m*. Contains the updated function values at X + *eps*.
f2	REAL for sjacobi_solve DOUBLE PRECISION for djacobi_solve Array of size *m*. Contains the updated function values at X - *eps*.
RCI_Request	INTEGER. Informs about the task completion. When equal to 0, the task is completed successfully. *RCI_Request*= 1 indicates the user should calculate the Jacobian matrix and put the result into *f1*. *RCI_Request*= 2 indicates the user should calculate the Jacobian matrix and put the result into *f2*.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS indicates that the routine has completed the task normally. *res* = TR_INVALID_OPTION indicates an error in the input parameters.

?jacobi_delete

Releases allocated data.

Syntax

Fortran:

```
res = sjacobi_delete(handle)
res = djacobi_delete(handle)
```

C:

```
res = sjacobi_delete(&handle);
res = djacobi_delete(&handle);
```

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

The routine releases allocated data.

Input Parameters

handle	Type _JACOBIMATRIX_HANDLE_t in C/C++ and INTEGER*8 in FORTRAN.

Output Parameters

res	INTEGER. Informs about the task completion.

res = TR_SUCCESS means the routine completed the task normally.

?jacobi

Computes the Jacobi matrix of the user's objective function using the central difference.

Syntax

Fortran:

```
res = sjacobi(fcn, n, m, fjac, x, jac_eps)
res = djacobi(fcn, n, m, fjac, x, jac_eps)
```

C:

```
res = sjacobi(fcn, &n, &m, fjac, x, &jac_eps);
res = djacobi(fcn, &n, &m, fjac, x, &jac_eps);
```

Description

This routine is declared in `mkl_rci.fi` for Fortran interface and in `mkl_rci.h` for C interface.

The routine computes the Jacobi matrix for function *fcn* using the central difference. This routine has a "Black-Box" interface, where the user inputs the objective function via parameters. Note that in this case the user's objective function must have a fixed interface.

See calling and usage examples in FORTRAN and C in the `examples\solver\source` folder of your Intel MKL directory (`ex_nlsqp_f.f`, `ex_nlsqp_bc_f.f` and `ex_nlsqp_c.c`, `ex_nlsqp_bc_c.c`, respectively).

Input Parameters

fcn	User-supplied subroutine to evaluate the function that defines the least squares problem. Call `fcn` (*m*, *n*, *x*, *f*) with the following parameters:
	m - `INTEGER`. Input parameter. Length of *f*
	n - `INTEGER`. Input parameter. Length of *x*.
	x -
	`REAL` for `sjacobi`
	`DOUBLE PRECISION` for `djacobi`
	Input parameter. Array of size *n*. Vector, at which the function is evaluated. The `fcn` function should not change this parameter.
	f -
	`REAL` for `sjacobi`
	`DOUBLE PRECISION` for `djacobi`
	Output parameter. Array of size *m*; contains the function values at *x*.
	Declare `fcn` as `EXTERNAL` in the calling program.

n	`INTEGER`. Length of *X*.
m	`INTEGER`. Length of *F*.
x	`REAL` for `sjacobi` `DOUBLE PRECISION` for `djacobi`

	Array of size *n*. Vector at which the function is evaluated.
eps	REAL for sjacobi DOUBLE PRECISION for djacobi Precision of the Jacobi matrix calculation.

Output Parameters

fjac	REAL for sjacobi DOUBLE PRECISION for djacobi Array of size (*m*,*n*). Contains the Jacobi matrix of the function.
res	INTEGER. Informs about the task completion. *res* = TR_SUCCESS indicates that the routine has completed the task normally. *res* = TR_INVALID_OPTION indicates an error in the input parameters. *res* = TR_OUT_OF_MEMORY indicates a memory error.

?jacobix

Alternative interface for ?jacobi function enabling user to pass additional data into user's objective function.

Syntax

Fortran:

```
res = sjacobix(fcn, n, m, fjac, x, jac_eps, user_data)
res = djacobix(fcn, n, m, fjac, x, jac_eps, user_data)
```

C:

```
res = sjacobix(fcn, &n, &m, fjac, x, &jac_eps, user_data);
res = djacobix(fcn, &n, &m, fjac, x, &jac_eps, user_data);
```

Description

This routine is declared in mkl_rci.fi for Fortran interface and in mkl_rci.h for C interface.

This routine presents an alternative interface for the ?jacobi function that enables the user to pass additional data into the user's objective function *fcn*.

See calling and usage examples in FORTRAN and C in the examples\solver\source folder of your Intel MKL directory (ex_nlsqp_f_x.f, ex_nlsqp_bc_f_x.f and ex_nlsqp_c_x.c, ex_nlsqp_bc_c_x.c, respectively).

Input Parameters

fcn	User-supplied subroutine to evaluate the function that defines the least squares problem. Call fcn (*m*, *n*, *x*, *f*, *user_data*) with the following parameters: *m* - INTEGER. Input parameter. Length of *f* *n* - INTEGER. Input parameter. Length of *x*. *x* - REAL for sjacobix DOUBLE PRECISION for djacobix

Input parameter. Array of size *n*. Vector, at which the function is evaluated. The `fcn` function should not change this parameter.
f -
`REAL` for `sjacobix`
`DOUBLE PRECISION` for `djacobix`
Output parameter. Array of size *m*; contains the function values at *x*.
user_data - Pointer to `void` (for FORTRAN, `integer user_data(*)`). Input parameter. Contains additional user's data, if any. Otherwise, a dummy argument. Declare `fcn` as `EXTERNAL` in the calling program.

n — `INTEGER`. Length of *X*.

m — `INTEGER`. Length of *F*.

x — `REAL` for `sjacobix`
`DOUBLE PRECISION` for `djacobix`
Array of size *n*. Vector at which the function is evaluated.

eps — `REAL` for `sjacobix`
`DOUBLE PRECISION` for `djacobix`
Precision of the Jacobi matrix calculation.

user_data — Pointer to `void` (for FORTRAN, `integer user_data(*)`). Input parameter. Contains additional user's data, if any. Otherwise, a dummy argument.

Output Parameters

fjac — `REAL` for `sjacobix`
`DOUBLE PRECISION` for `djacobix`
Array of size (*m*,*n*). Contains the Jacobi matrix of the function.

res — `INTEGER`. Informs about the task completion.
res = `TR_SUCCESS` indicates that the routine has completed the task normally.
res = `TR_INVALID_OPTION` indicates an error in the input parameters.
res = `TR_OUT_OF_MEMORY` indicates a memory error.

15 Support Functions

Intel® MKL support functions are used to:

- retrieve information about the current Intel MKL version
- additionally control the number of threads
- handle errors
- test characters and character strings for equality
- measure user time for a process and elapsed CPU time
- set and measure CPU frequency
- free memory allocated by Intel MKL memory management software

Functions described below are subdivided according to their purpose into the following groups:

Version Information Functions

Threading Control Functions

Error Handling Functions

Equality Test Functions

Timing Functions

Memory Functions

Miscellaneous Utility Functions

Table 15-1 contains the list of support functions common for Intel MKL.

Table 15-1 Intel MKL Support Functions

Function Name	Operation
Version Information Functions	
`mkl_get_version`	Returns information about the active library version.
`mkl_get_version_string`	Returns information about the library version string.
Threading Control Functions	
`mkl_set_num_threads`	Suggests the number of threads to use.
`mkl_domain_set_num_threads`	Suggests the number of threads for a particular function domain.

Function Name	Operation
mkl_set_dynamic	Enables Intel MKL to dynamically change the number of threads.
mkl_get_max_threads	Inquires about the number of threads targeted for parallelism.
mkl_domain_get_max_threads	Inquires about the number of threads targeted for parallelism in different domains.
mkl_get_dynamic	Returns the current value of the MKL_DYNAMIC variable.
Error Handling Functions	
xerbla	Handles error conditions for the BLAS, LAPACK, VSL, VML routines.
pxerbla	Handles error conditions for the ScaLAPACK routines.
Equality Test Functions	
lsame	Tests two characters for equality regardless of the case.
lsamen	Tests two character strings for equality regardless of the case.
Timing Functions	
second/dsecnd	Returns user time for a process.
mkl_get_cpu_clocks	Returns full precision elapsed CPU clocks.
mkl_get_cpu_frequency	Returns CPU frequency value in GHz.
mkl_set_cpu_frequency	Sets CPU frequency value in GHz.
Memory Functions	
mkl_free_buffers	Frees memory buffers.
mkl_thread_free_buffers	Frees memory buffers allocated only in the current thread.
mkl_mem_stat	Reports an amount of memory utilized by MKL Memory Manager.
mkl_malloc	Allocates the aligned memory buffer.
mkl_free	Frees the aligned memory buffer allocated by MKL_malloc.
Miscellaneous Utility Functions	
mkl_progress	Tracks computational progress of selective MKL routines.

Function Name	Operation
mkl_enable_instructions	Allows Intel MKL to dispatch Intel® Advanced Vector Extensions (Intel® AVX) if run on the respective hardware (or simulation).

Version Information Functions

Intel® MKL provides two methods for extracting information about the library version number:

- extracting a version string using the `mkl_get_version_string` function
- using the `mkl_get_version` function to obtain an `MKLVersion` structure that contains the version information

A makefile is also provided to automatically build the examples and output summary files containing the version information for the current library.

mkl_get_version

Returns information about the active library C version.

Syntax

```
void mkl_get_version( MKLVersion* pVersion );
```

Output Parameters

pVersion	Pointer to the `MKLVersion` structure.

Description

The C interface for this function is declared in `mkl_service.h` header file.

The `mkl_get_version` function collects information about the active C version of the Intel MKL software and returns this information in a structure of `MKLVersion` type by the *pVersion* address. The `MKLVersion` structure type is defined in the `mkl_types.h` file. The following fields of the `MKLVersion` structure are available:

`MajorVersion`	is the major number of the current library version.
`MinorVersion`	is the minor number of the current library version.
`UpdateVersion`	is the update number of the current library version.
`ProductStatus`	is the status of the current library version. Possible variants could be “Beta”, “Product”.
`Build`	is the string that contains the build date and the internal build number.
`Processor`	is the processor optimization that is targeted for the specific processor. It is not the definition of the processor installed in the system, rather the MKL library detection that is optimal for the processor installed in the system.

NOTE. `MKLGetVersion` is an obsolete name for the `mkl_get_version` function that is referenced in the library for back compatibility purposes but is deprecated and subject to removal in subsequent releases.

mkl_get_version Usage

```
-----------------------------------------------------------------------------------------
#include <stdio.h>
#include <stdlib.h>
#include "mkl_service.h"

int main(void)
  {
    MKLVersion Version;

    mkl_get_version(&Version);

  //  MKL_Get_Version(&Version);

    printf("Major version:           %d\n",Version.MajorVersion);
    printf("Minor version:           %d\n",Version.MinorVersion);
    printf("Update version:          %d\n",Version.UpdateVersion);
    printf("Product status:          %s\n",Version.ProductStatus);
    printf("Build:                   %s\n",Version.Build);
    printf("Processor optimization:  %s\n",Version.Processor);
    printf("================================================================\n");
    printf("\n");

    return 0;
  }
```

Output:

Major Version	9
Minor Version	0
Update Version	0
Product status	Product
Build	061909.09

Processor optimization	Intel® Xeon® Processor with Intel® 64 architecture

mkl_get_version_string

Gets the library version string.

Syntax

Fortran:

```
call mkl_get_version_string( buf )
```

C:

```
mkl_get_version_string( buf, len );
```

Output Parameters

Name	Type	Description
buf	**FORTRAN:** `CHARACTER*198` **C:** `char*`	Source string
len	**FORTRAN:** `INTEGER` **C:** `int`	Length of the source string

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

The function returns a string that contains the library version information.

NOTE. `MKLGetVersionString` is an obsolete name for the `mkl_get_version_string` function that is referenced in the library for back compatibility purposes but is deprecated and subject to removal in subsequent releases.

See example below:

Examples

Fortran:

```
program mkl_get_version_string
character*198  buf
call mkl_get_version_string(buf)
write(*,'(a)') buf
end
```

C:

```
#include <stdio.h>
#include "mkl_blas.h"
int main(void)
{
  int len=198;
  char buf[198];
  mkl_get_version_string(buf, len);
  printf("%s\n",buf);
  printf("\n");
  return 0;
}
```

Threading Control Functions

Intel® MKL provides optional threading control functions that take precedence over OpenMP* environment variable settings with the same purpose (see *Intel® MKL User's Guide* for details).

These functions enable you to specify the number of threads for Intel MKL independently of the OpenMP* settings and takes precedence over them. Although Intel MKL may actually use a different number of threads from the number suggested, the controls also enable you to instruct the library to try using the suggested number when the number used in the calling application is unavailable.

See the following examples of Fortran and C usage:

Fortran Usage

```
call mkl_set_num_threads( foo )
ierr = mkl_domain_set_num_threads( num, MKL_BLAS )
call mkl_set_dynamic ( 1 )
num = mkl_get_max_threads()
num = mkl_domain_get_max_threads( MKL_BLAS );
ret = mkl_get_dynamic()
```

C Usage

```
#include “mkl.h”  // Mandatory to make these definitions work!
mkl_set_num_threads(num);
return_code = mkl_domain_set_num_threads( num, MKL_FFT );
mkl_set_dynamic( 1 );
num = mkl_get_max_threads();
num = mkl_domain_get_max_threads( MKL_FFT );
return_code = mkl_get_dynamic();
```

NOTE. Always remember to add `#include “mkl.h”` to use the C usage syntax.

mkl_set_num_threads

Suggests the number of threads to use.

Syntax

Fortran:

```
call mkl_set_num_threads( number )
```

C:

```
void mkl_set_num_threads( number );
```

Input Parameters

Name	Type	Description
number	**FORTRAN:** `INTEGER` **C:** `int`	Number of threads suggested by user

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

This function allows you to request independently of OpenMP* how many threads MKL should use. This is just a hint, and it is not guaranteed that this number of threads will be used. Enter a positive integer. This routine takes precedence over the `MKL_NUM_THREADS` environment variable.

NOTE. Always remember to add `#include “mkl.h”` to use the C usage syntax.

See *Intel MKL User’s Guide* for implementation details.

mkl_domain_set_num_threads

Suggests the number of threads for a particular function domain.

Syntax

Fortran:

```
ierr = mkl_domain_set_num_threads( num, mask )
```

C:

```
ierr = mkl_domain_set_num_threads( num, mask );
```

Input Parameters

Name	Type	Description
num	**FORTRAN:** INTEGER **C:** int	Number of threads suggested by user
mask	**FORTRAN:** INTEGER **C:** int	Name of the targeted domain

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

This function allows you to request different domains of Intel MKL to use different numbers of threads. The currently supported domains are:

- `MKL_BLAS` - BLAS domain
- `MKL_FFT` - FFT domain (excluding cluster FFT)
- `MKL_VML` - vector math library
- `MKL_ALL` - another way to do what `mkl_set_num_threads` does

This is only a hint, and use of this number of threads is not guaranteed. Enter a valid domain and a positive integer for the number of threads. This routine has precedence over the `MKL_DOMAIN_NUM_THREADS` environment variable.

See *Intel MKL User's Guide* for implementation details.

Return Values

`1(true)`	Indicates no error, execution is successful.
`0(false)`	Indicates failure, possibly because the inputs were invalid.

mkl_set_dynamic

Enables Intel MKL to dynamically change the number of threads.

Syntax

Fortran:

```
call mkl_set_dynamic( boolean_var )
```

C:

```
void mkl_set_dynamic( boolean_var );
```

Input Parameters

Name	Type	Description
boolean_var	**FORTRAN:** `INTEGER` **C:** `int`	The parameter that determines whether dynamic adjustment of the number of threads is enabled or disabled.

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

This function indicates whether or not Intel MKL can dynamically change the number of threads. The default for this is `true`, regardless of how the `OMP_DYNAMIC` variable is set. This will also hold precedent over the `OMP_DYNAMIC` variable.

A value of `false` does not guarantee that the user's requested number of threads will be used. But it means that MKL will attempt to use that value. This routine takes precedence over the environment variable `MKL_DYNAMIC`.

Note that if MKL is called from within a parallel region, MKL may not thread unless `MKL_DYNAMIC` is set to `false`, either with the environment variable or by this routine call.

See *Intel MKL User's Guide* for implementation details.

mkl_get_max_threads

Inquires about the number of threads targeted for parallelism.

Syntax

Fortran:

```
num = mkl_get_max_threads()
```

C:

```
num = mkl_get_max_threads();
```

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

This function allows you to inquire independently of OpenMP* how many threads Intel MKL is targeting for parallelism. This is just a hint, and it is not guaranteed that this number of threads will be used.

See *Intel MKL User's Guide* for implementation details.

Return Values

The output is `INTEGER` equal to the number of threads.

mkl_domain_get_max_threads

Inquires about the number of threads targeted for parallelism in different domains.

Syntax

Fortran:

```
ierr = mkl_domain_get_max_threads( mask )
```

C:

```
ierr = mkl_domain_get_max_threads( mask );
```

Input Parameters

Name	Type	Description
mask	**FORTRAN:** `INTEGER` **C:** `int`	The name of the targeted domain

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

This function allows the user of different domains of Intel MKL to inquire what number of threads is being used as a hint. The inquiry does not imply that this is the actual number of threads used. The number may vary depending on the value of the `MKL_DYNAMIC` variable and/or problem size, system resources, etc. But the function returns the value that MKL is targeting for a given domain.

The currently supported domains are:

- `MKL_BLAS` - BLAS domain
- `MKL_FFT` - FFT domain (excluding cluster FFT)
- `MKL_VML` - vector math library
- `MKL_ALL` - another way to do what `mkl_get_max_threads` does.

You are supposed to enter a valid domain.

See *Intel MKL User's Guide* for implementation details.

Return Values

Returns the hint about the number of threads for a given domain.

mkl_get_dynamic

Returns current value of `MKL_DYNAMIC` *variable.*

Syntax

Fortran:

```
ret = mkl_get_dynamic()
```

C:

```
ret = mkl_get_dynamic();
```

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

This function returns the current value of the `MKL_DYNAMIC` variable. This variable can be changed by manipulating the `MKL_DYNAMIC` environment variable before the MKL run is launched or by calling `mkl_set_dynamic()`. Doing the latter has precedence over the former.

The function returns a value of 0 or 1: 1 indicates that `MKL_DYNAMIC` is true, 0 indicates that `MKL_DYNAMIC` is false. This variable indicates whether or not Intel MKL can dynamically change the number of threads. A value of `false` does not guarantee that the user's requested number of threads will be used. But it means that Intel MKL will attempt to use that value.

Note that if MKL is called from within a parallel region, MKL may not thread unless `MKL_DYNAMIC` is set to `false`, either with the environment variable or by this routine call.

See *Intel MKL User's Guide* for implementation details.

Return Values

`1`	Indicates `MKL_DYNAMIC` is true.
`0`	Indicates `MKL_DYNAMIC` is false.

Error Handling Functions

xerbla

Error handling routine called by BLAS, LAPACK, VML, VSL routines.

Syntax

Fortran:

```
call xerbla( srname, info )
```

C:

```
xerbla( srname, info, len );
```

Input Parameters

Name	Type	Description
srname	**FORTRAN:** CHARACTER*(*) **C:** char*	The name of the routine that called xerbla
info	**FORTRAN:** INTEGER **C:** int*	The position of the invalid parameter in the parameter list of the calling routine
len	**C:** int	Length of the source string

Description

The FORTRAN 77 interface for this routine is declared in mkl_blas.fi and the C interface in mkl_blas.h.

The routine xerbla is an error handler for the BLAS, LAPACK, VSL, and VML routines. It is called by a BLAS, LAPACK, VSL or VML routine if an input parameter has an invalid value. If an issue is found with an input parameter, xerbla prints a message similar to the following:

```
MKL ERROR: Parameter 6 was incorrect on entry to DGEMM
```

and then returns to your application. Comments in the LAPACK reference code (http://www.netlib.org/lapack/explore-html/xerbla.f.html) suggest this behavior though the LAPACK User's Guide recommends that the execution should stop when an error is found.

Note that xerbla is an internal function. You can change or disable printing of an error message by providing your own xerbla function. FORTRAN and C examples are provided below.

Examples

Fortran:

```
subroutine xerbla (srname, info)
character*(*) srname  !Name of subprogram that called xerbla
integer*4     info    !Position of the invalid parameter in the parameter list
return                !Return to the calling subprogram
end
```

C:

```
void xerbla(char* srname, int* info, int len){
// srname - name of the function that called xerbla
// info - position of the invalid parameter in the parameter list
// len - length of the name in bytes
printf("\nXERBLA is called :%s: %d\n",srname,*info);
}
```

pxerbla

Error handling routine called by ScaLAPACK routines.

Syntax

`call pxerbla(`*`ictxt`*`, `*`srname`*`, `*`info`*`)`

Input Parameters

ictxt	(global) INTEGER The BLACS context handle, indicating the global context of the operation. The context itself is global.
srname	(global) CHARACTER*6 The name of the routine which called pxerbla.
info	(global) INTEGER. The position of the invalid parameter in the parameter list of the calling routine.

Description

The C interface for this routine is declared in `mkl_scalapack.h` file.

This routine is an error handler for the *ScaLAPACK* routines. It is called if an input parameter has an invalid value. A message is printed and program execution continues. For ScaLAPACK driver and computational routines, a RETURN statement is issued following the call to `pxerbla`.

Control returns to the higher-level calling routine, and you can determine how the program should proceed. However, in the specialized low-level ScaLAPACK routines (auxiliary routines that are Level 2 equivalents of computational routines), the call to `pxerbla()` is immediately followed by a call to BLACS_ABORT() to terminate program execution since recovery from an error at this level in the computation is not possible.

It is always good practice to check for a nonzero value of *info* on return from a ScaLAPACK routine. Installers may consider modifying this routine in order to call system-specific exception-handling facilities.

Equality Test Functions

lsame

Tests two characters for equality regardless of the case.

Syntax

Fortran:

```
val = lsame( ca, cb )
```

C:

```
val = lsame( ca, cb );
```

Input Parameters

Name	Type	Description
ca, *cb*	**FORTRAN:** `CHARACTER*1`	**FORTRAN:** The single characters to be compared
	C: `const char*`	**C:** Pointers to the single characters to be compared

Output Parameters

Name	Type	Description
val	**FORTRAN:** `LOGICAL`	Result of the comparison
	C: `int`	

Description

The FORTRAN 77 interface for this function is declared in `mkl_blas.fi` and the C interface in `mkl_blas.h`.

This logical function returns `.TRUE.` if *ca* is the same letter as *cb* regardless of the case, and `.FALSE.` otherwise.

lsamen

Tests two character strings for equality regardless of the case.

Syntax

Fortran:

```
val = lsamen( n, ca, cb )
```

C:

```
val = lsamen( n, ca, cb );
```

Input Parameters

Name	Type	Description
n	**FORTRAN:** INTEGER **C:** const int*	**FORTRAN:** The number of characters in *ca* and *cb* to be compared. **C:** Pointer to the number of characters in *ca* and *cb* to be compared.
ca, *cb*	**FORTRAN:** CHARACTER*(*) **C:** const char*	Specify two character strings of length at least *n* to be compared. Only the first *n* characters of each string will be accessed.

Output Parameters

Name	Type	Description
val	**FORTRAN:** LOGICAL **C:** int	**FORTRAN:** Result of the comparison. .TRUE. if *ca* and *cb* are equivalent except for the case, and .FALSE. otherwise. The function also returns .FALSE. if len(*ca*) or len(*cb*) is less than *n*. **C:** Result of the comparison. Non-zero if *ca* and *cb* are equivalent except for the case, and zero otherwise.

Description

The FORTRAN 77 interface for this function is declared in mkl_lapack.fi and the C interface in mkl_lapack.h.

This logical function tests if the first *n* letters of one string are the same as the first *n* letters of another string, regardless of the case.

Timing Functions

second/dsecnd

Returns elapsed CPU time in seconds.

Syntax

Fortran:

```
val = second()
val = dsecnd()
```

C:

```
val = second();
val = dsecnd();
```

Output Parameters

Name	Type	Description
val	**FORTRAN:** REAL for second DOUBLE PRECISION for dsecnd **C:** float for second double for dsecnd	Elapsed CPU time in seconds

Description

The FORTRAN 77 interface for this function is declared in mkl_lapack.fi and the C interface in mkl_lapack.h.

The second/dsecnd functions return the elapsed CPU time in seconds. These versions get the time from the elapsed CPU clocks divided by CPU frequency. The difference is that dsecnd returns the result with double precision.

The functions should be applied in pairs: the first time, before a routine to be measured, and the second time - after the measurement. The difference between the returned values is the time spent in the routine. The usage of second is discouraged for measuring short time intervals because the single precision format is not capable of holding sufficient timer precision.

mkl_get_cpu_clocks

Returns full precision elapsed CPU clocks.

Syntax

Fortran:

```
call mkl_get_cpu_clocks( clocks )
```

C:

```
mkl_get_cpu_clocks( &clocks );
```

Output Parameters

Name	Type	Description
clocks	**FORTRAN:** INTEGER*8 **C:** unsigned MKL_INT64	Elapsed CPU clocks

Description

The FORTRAN 77 interface for this function is declared in mkl_service.fi and the C interface in mkl_service.h.

The mkl_get_cpu_clocks function returns the elapsed CPU clocks.

This may be useful when timing short intervals with high resolution. The `mkl_get_cpu_clocks` function is also applied in pairs like `second/dsecnd`. Note that out-of-order code execution on IA-32 or Intel® 64 architecture processors may disturb the exact elapsed CPU clocks value a little bit, which may be important while measuring extremely short time intervals.

NOTE. `getcpuclocks` is an obsolete name for the `mkl_get_cpu_clocks` function that is referenced in the library for back compatibility purposes but is deprecated and subject to removal in subsequent releases.

mkl_get_cpu_frequency

Returns CPU frequency value in GHz.

Syntax

Fortran:

```
freq = mkl_get_cpu_frequency()
```

C:

```
freq = mkl_get_cpu_frequency();
```

Output Parameters

Name	Type	Description
freq	**FORTRAN:** `DOUBLE PRECISION` **C:** `double`	CPU frequency value in GHz

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

The function `mkl_get_cpu_frequency` returns the CPU frequency in GHz. This value is used by `second /dsecnd` functions while converting CPU clocks into seconds.

Obtaining a frequency may take some time when `second /dsecnd`/`mkl_get_cpu_frequency` is called for the first time. To avoid it, call `mkl_set_cpu_frequency` before setting the exact CPU frequency if it is known in advance.

NOTE. `getcpufrequency` is an obsolete name for the `mkl_get_cpu_frequency` function that is referenced in the library for back compatibility purposes but is deprecated and subject to removal in subsequent releases.

mkl_set_cpu_frequency

Sets CPU frequency value in GHz.

Syntax

Fortran:

```
call mkl_set_cpu_frequency( freq )
```

C:

```
mkl_set_cpu_frequency( &freq );
```

Input Parameters

Name	Type	Description
freq	**FORTRAN:** DOUBLE PRECISION **C:** double	CPU frequency value in GHz

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

The `mkl_set_cpu_frequency` function sets the CPU frequency in GHz, used then by second /dsecnd functions while converting CPU clocks into seconds. Setting the exact CPU frequency is useful to bypass obtaining a frequency by `mkl_get_cpu_frequency`.

Initially, CPU frequency value is unset. The CPU frequency value can be set only by `mkl_set_cpu_frequency` call, or during the first call of `mkl_get_cpu_frequency`, if `mkl_set_cpu_frequency` has not been called before. Calling `mkl_set_cpu_frequency` with a special parameter *freq* = -1.0 forces the CPU frequency value be unset.

Note that the CPU frequency of your machine is not actually changed when the `mkl_set_cpu_frequency` subroutine is called.

NOTE. `setcpufrequency` is an obsolete name for the `mkl_set_cpu_frequency` function that is referenced in the library for back compatibility purposes but is deprecated and subject to removal in subsequent releases.

Memory Functions

This section describes the Intel MKL memory support functions. See the *Intel® MKL User's Guide* for details of the Intel MKL memory management.

mkl_free_buffers

Frees memory buffers.

Syntax

Fortran:

```
call mkl_free_buffers
```

C:

```
mkl_free_buffers();
```

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

The `mkl_free_buffers` function frees the memory allocated by the Intel MKL Memory Manager. The Memory Manager allocates new buffers if no free buffers are currently available. Call `mkl_free_buffers()` to free all memory buffers and to avoid memory leaking on completion of work with the Intel MKL functions, that is, after the last call of an Intel MKL function from your application.

See *Intel® MKL User's Guide* for details.

NOTE. `MKL_FreeBuffers` is an obsolete name for the `mkl_free_buffers` function that is referenced in the library for back compatibility purposes but is deprecated and subject to removal in subsequent releases.

mkl_free_buffers Usage with FFT Functions

```
-----------------------------------------------------------------------------------------
DFTI_DESCRIPTOR_HANDLE hand1;
DFTI_DESCRIPTOR_HANDLE hand2;
void mkl_free_buffers(void);
. . . . . .
/* Using MKL FFT */
Status = DftiCreateDescriptor(&hand1, DFTI_SINGLE, DFTI_COMPLEX, dim, m1);
Status = DftiCommitDescriptor(hand1);
Status = DftiComputeForward(hand1, s_array1);
. . . . . .
Status = DftiCreateDescriptor(&hand2, DFTI_SINGLE, DFTI_COMPLEX, dim, m2);
Status = DftiCommitDescriptor(hand2);
. . . . . .
Status = DftiFreeDescriptor(&hand1);
/* Do not call mkl_free_buffers() here as the hand2 descriptor will be corrupted!  */
. . . . . .
Status = DftiComputeBackward(hand2, s_array2));
Status = DftiFreeDescriptor(&hand2);
/* Here user finishes the MKL FFT usage */
/* Memory leak will be triggered by any memory control tool */
/* Use mkl_free_buffers() to avoid memory leaking */
mkl_free_buffers();
-----------------------------------------------------------------------------------------
```

If the memory space is sufficient, use `mkl_free_buffers` after the last call of the MKL functions. Otherwise, a drop in performance can occur due to reallocation of buffers for the subsequent MKL functions.

WARNING. For FFT calls, do not use `mkl_free_buffers` between `DftiCreateDescriptor(hand)` and `DftiFreeDescriptor(&hand)`.

mkl_thread_free_buffers

Frees memory buffers allocated in the current thread.

Syntax

Fortran:

```
call mkl_thread_free_buffers
```

C:

```
mkl_thread_free_buffers();
```

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

The `mkl_thread_free_buffers` function frees the memory allocated by the Intel MKL Memory Manager in the current thread only. Memory buffers allocated in oither threads are not affected. Call `mkl_thread_free_buffers()` to avoid memory leaking if you are unable to call the `mkl_free_buffers` function in the multi-threaded application when you are not sure if all the other running Intel MKL functions completed operation.

mkl_mem_stat

Reports amount of memory utilized by MKL Memory Manager.

Syntax

Fortran:

```
AllocatedBytes = mkl_mem_stat( AllocatedBuffers )
```

C:

```
AllocatedBytes = mkl_mem_stat( &AllocatedBuffers );
```

Output Parameters

Name	Type	Description
AllocatedBytes	**FORTRAN:** INTEGER*8 **C:** MKL_INT64	Amount of allocated bytes
AllocatedBuffers	**FORTRAN:** INTEGER*4, **C:** int	Number of allocated buffers

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

The function returns the amount of the allocated memory in the *AllocatedBuffers* buffers. If there are no allocated buffers at the moment, the function returns 0. Call the `mkl_mem_stat()` function to check the Intel MKL memory status.

Note that after calling `mkl_free_buffers` there should not be any allocated buffers.

See Example "mkl_malloc(), mkl_free(), mkl_mem_stat() Usage".

NOTE. `MKL_MemStat` is an obsolete name for the `MKL_Mem_Stat` function that is referenced in the library for back compatibility purposes but is deprecated and subject to removal in subsequent releases.

mkl_malloc

Allocates the aligned memory buffer.

Syntax

Fortran:

```
a_ptr = mkl_malloc( alloc_size, alignment )
```

C:

```
a_ptr = mkl_malloc( alloc_size, alignment );
```

Input Parameters

Name	Type	Description
alloc_size	**FORTRAN:** `INTEGER*4` **C:** `size_t`	Size of the buffer to be allocated Note that Fortran type `INTEGER*4` is given for the 32-bit systems. Otherwise, it is `INTEGER*8`.
alignment	**FORTRAN:** `INTEGER*4` **C:** `int`	Alignment of the allocated buffer

Output Parameters

Name	Type	Description
a_ptr	**FORTRAN:** `POINTER` **C:** `void*`	Pointer to the allocated buffer

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi` and the C interface in `mkl_service.h`.

The function allocates a *size*-bytes buffer, aligned on the *alignment* boundary, and returns a pointer to this buffer.

The function returns NULL if *size* < 1. If alignment is not power of 2, the alignment 32 is used.

See Example "mkl_malloc(), mkl_free(), mkl_mem_stat() Usage".

mkl_free

Frees the aligned memory buffer allocated by mkl_malloc.

Syntax

Fortran:

```
call mkl_free( a_ptr )
```

C:

```
mkl_free( a_ptr );
```

Input Parameters

Name	Type	Description
a_ptr	**FORTRAN:** POINTER **C:** void*	Pointer to the buffer to be freed

Description

The FORTRAN 77 interface for this function is declared in mkl_service.fi and the C interface in mkl_service.h.

The function frees the buffer pointed by *ptr* and allocated by mkl_malloc().

See Example "mkl_malloc(), mkl_free(), mkl_mem_stat() Usage".

Examples of mkl_malloc(), mkl_free(), mkl_mem_stat() Usage

Usage Example in Fortran

```
  PROGRAM FOO

  REAL*8     A,B,C
  POINTER    (A_PTR,A(1)), (B_PTR,B(1)), (C_PTR,C(1)
  INTEGER    N, I
  REAL*8     ALPHA, BETA
  INTEGER*8  ALLOCATED_BYTES
  INTEGER*4  ALLOCATED_BUFFERS

  #ifdef _SYSTEM_BITS32
        INTEGER*4 MKL_MALLOC
        INTEGER*4 ALLOC_SIZE
  #else
        INTEGER*8 MKL_MALLOC
        INTEGER*8 ALLOC_SIZE
  #endif

  INTEGER    MKL_MEM_STAT
```

```
  EXTERNAL   MKL_MALLOC, MKL_FREE, MKL_MEM_STAT

  ALPHA = 1.1; BETA = -1.2
  N = 1000
  ALLOC_SIZE = 8*N*N
  A_PTR = MKL_MALLOC(ALLOC_SIZE,128)
  B_PTR = MKL_MALLOC(ALLOC_SIZE,128)
  C_PTR = MKL_MALLOC(ALLOC_SIZE,128)
  DO I=1,N*N
    A(1) = I
    B(1) = -I
    C(1) = 0.0
  END DO

  CALL DGEMM('N','N',N,N,N,ALPHA,A,N,B,N,BETA,C,N);

  ALLOCATED_BYTES = MKL_MEM_STAT(ALLOCATED_BUFFERS)
  PRINT *,'DGEMM uses ',ALLOCATED_BYTES,' bytes in ',
 $  ALLOCATED_BUFFERS,' buffers '

  CALL MKL_FREE_BUFFERS

  ALLOCATED_BYTES = MKL_MEM_STAT(ALLOCATED_BUFFERS)
  IF (ALLOCATED_BYTES > 0) THEN
    PRINT *,'MKL MEMORY LEAK!'
    PRINT *,'AFTER MKL_FREE_BUFFERS there are ',
 $    ALLOCATED_BYTES,' bytes in ',
 $    ALLOCATED_BUFFERS,' buffers'
  END IF

  CALL MKL_FREE(A_PTR)
  CALL MKL_FREE(B_PTR)
  CALL MKL_FREE(C_PTR)

  STOP
  END
```

Usage Example in C

```
#include <stdio.h>
#include <mkl.h>
int main(void) {
  double *a, *b, *c;
  int n, i;
  double alpha, beta;
  MKL_INT64 AllocatedBytes;
  int N_AllocatedBuffers;

  alpha = 1.1; beta = -1.2;
  n = 1000;
  a = (double*)mkl_malloc(n*n*sizeof(double),128);
  b = (double*)mkl_malloc(n*n*sizeof(double),128);
  c = (double*)mkl_malloc(n*n*sizeof(double),128);
  for (i=0;i<(n*n);i++) {
     a[i] = (double)(i+1);
     b[i] = (double)(-i-1);
     c[i] = 0.0;
  }

  dgemm("N","N",&n,&n,&n,&alpha,a,&n,b,&n,&beta,c,&n);

  AllocatedBytes = mkl_mem_stat(&N_AllocatedBuffers);
```

```
  printf("\nDGEMM uses %ld bytes in %d buffers',(long)AllocatedBytes,N_AllocatedBuffers);

  mkl_free_buffers();

  AllocatedBytes = mkl_mem_stat(&N_AllocatedBuffers);
  if (AllocatedBytes > 0) {
      printf("\nMKL memory leak!");
      printf("\nAfter mkl_free_buffers there are %ld bytes in %d buffers",
         (long)AllocatedBytes,N_AllocatedBuffers);
  }

  mkl_free(a);
  mkl_free(b);
  mkl_free(c);

  return 0;
}
```

Miscellaneous Utility Functions

mkl_progress

Provides progress information.

Syntax

Fortran:

```
stopflag = mkl_progress( thread, step, stage )
```

C:

```
stopflag = mkl_progress( thread, step, stage, lstage );
```

Input Parameters

Name	Type	Description
thread	**FORTRAN:** INTEGER*4 **C:** const int*	**FORTRAN:** The number of the thread the progress routine is called from. 0 is passed for sequential code. **C:** Pointer to the number of the thread the progress routine is called from. 0 is passed for sequential code.
step	**FORTRAN:** INTEGER*4 **C:** const int*	**FORTRAN:** The linear progress indicator that shows the amount of work done. Increases from 0 to the linear size of the problem during the computation. **C:** Pointer to the linear progress indicator that shows the amount of work done. Increases from 0 to the linear size of the problem during the computation.
stage	**FORTRAN:** CHARACTER*(*) **C:** const char*	Message indicating the name of the routine or the name of the computation stage the progress routine is called from.

Name	Type	Description
lstage	**C:** `int`	The length of a stage string excluding the trailing `NULL` character.

Output Parameters

Name	Type	Description
stopflag	**FORTRAN:** `INTEGER` **C:** `int`	The stopping flag. A non-zero flag forces the routine to be interrupted. The zero flag is the default return value.

Description

The FORTRAN 77 interface for this function is declared in `mkl_service.fi`, and the C interface in `mkl_lapack.h` and `mkl_service.h`.

This function is intended to track progress of a lengthy computation and/or interrupt the computation. By default this routine does nothing but the user application can redefine it to obtain the computation progress information. You can set it to perform certain operations during the routine computation, for instance, to print a progress indicator. A non-zero return value may be supplied by the redefined function to break the computation.

The progress function `mkl_progress` is regularly called from some LAPACK and DSS/PARDISO functions during the computation. Refer to a specific LAPACK or DSS/PARDISO function description to see whether the function supports this feature or not.

Application Notes

Note that `mkl_progress` is a Fortran routine, that is, to redefine the progress routine from C, the name should be spelt differently, parameters should be passed by reference, and an extra parameter meaning the length of the stage string should be considered. The stage string is not terminated with the `NULL` character. The C interface of the progress routine is as follows:

```
int mkl_progress_( int* thread, int* step, char* stage, int lstage ); // Linux, Mac
int MKL_PROGRESS( int* thread, int* step, char* stage, int lstage ); // Windows
```

See further the examples of printing a progress information on the standard output in Fortran and C languages:

Examples

Fortran:

```
integer function mkl_progress( thread, step, stage )
integer*4 thread, step
character*(*) stage
print*,'Thread:',thread,',stage:',stage,',step:',step
mkl_progress = 0
return
end
```

C:

```
#include <string.h>
#define BUFLEN 16
int mkl_progress_( int* ithr, int* step, char* stage, int lstage ){
  char buf[BUFLEN];
  if( lstage >= BUFLEN ) lstage = BUFLEN-1;
  strncpy( buf, stage, lstage );
  buf[lstage] = '\0';
  printf( 'In thread %i, at stage %s, steps passed %i\n', *ithr, buf, *step
);
  return 0;
}
```

mkl_enable_instructions

Allows dispatching Intel® Advanced Vector Extensions.

Syntax

Fortran:

```
irc = mkl_enable_instructions(MKL_AVX_ENABLE)
```

C:

```
irc = mkl_enable_instructions(MKL_AVX_ENABLE);
```

Input Parameters

MKL_AVX_ENABLE	Parameter indicating which new instructions the user needs to enable.

Output Parameters

Name	Type	Description	
irc	**FORTRAN:** INTEGER*4 **C:** int	Value reflecting AVX usage status:	
		=1	MKL uses the AVX code, if the hardware supports Intel® AVX.
		=0	The request is rejected. Most likely, mkl_enable_instructions has been called after another Intel MKL function.

Description

The FORTRAN 77 interface for this function is declared in mkl_service.fi and the C interface in mkl_service.h.

This function allows Intel MKL to dispatch Intel® Advanced Vector Extensions (Intel® AVX) if run on Intel® AVX-enabled hardware (or simulation). Note that `mkl_enable_instructions` must be executed before any other Intel MKL call.

NOTE. Always remember to add `#include “mkl.h”` to use the C usage syntax.

See *Intel MKL User’s Guide* for implementation details.

BLACS Routines 16

This chapter describes the Intel® Math Kernel Library implementation of FORTRAN 77 routines from the BLACS (Basic Linear Algebra Communication Subprograms) package. These routines are used to support a linear algebra oriented message passing interface that may be implemented efficiently and uniformly across a large range of distributed memory platforms.

The BLACS routines make linear algebra applications both easier to program and more portable. For this purpose, they are used in Intel MKL intended for the Linux* and Windows* OSs as the communication layer of ScaLAPACK and Cluster FFT.

On computers, a linear algebra matrix is represented by a two dimensional array (2D array), and therefore the BLACS operate on 2D arrays. See description of the basic matrix shapes in a special section.

The BLACS routines implemented in Intel MKL are of four categories:

- Combines
- Point to Point Communication
- Broadcast
- Support.

The Combines take data distributed over processes and combine the data to produce a result. The Point to Point routines are intended for point-to-point communication and Broadcast routines send data possessed by one process to all processes within a scope.

The Support routines perform distinct tasks that can be used for initialization, destruction, information, and miscellaneous tasks.

Matrix Shapes

The BLACS routines recognize the two most common classes of matrices for dense linear algebra. The first of these classes consists of general rectangular matrices, which in machine storage are 2D arrays consisting of *m* rows and *n* columns, with a leading dimension, *lda*, that determines the distance between successive columns in memory.

The *general rectangular* matrices take the following parameters as input when determining what array to operate on:

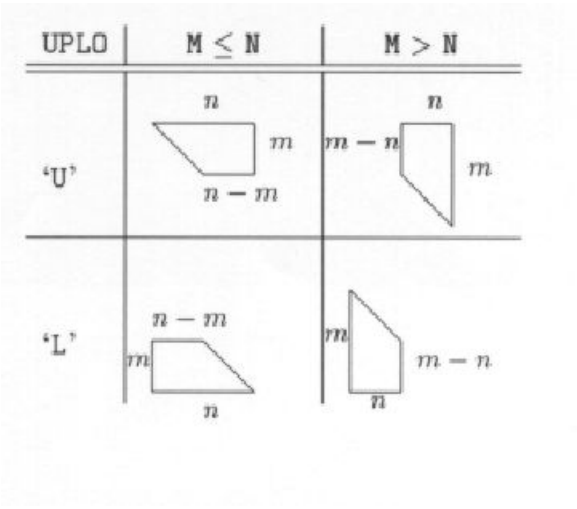
m	(input) INTEGER. The number of matrix rows to be operated on.
n	(input) INTEGER. The number of matrix columns to be operated on.
a	(input/output) TYPE (depends on routine), array of dimension (*lda*,*n*). A pointer to the beginning of the (sub)array to be sent.
lda	(input) INTEGER. The distance between two elements in matrix row.

The second class of matrices recognized by the BLACS are *trapezoidal* matrices (triangular matrices are a sub-class of trapezoidal). Trapezoidal arrays are defined by *m*, *n*, and *lda*, as above, but they have two additional parameters as well. These parameters are:

uplo	(input) CHARACTER*1 . Indicates whether the matrix is upper or lower trapezoidal, as discussed below.
diag	(input) CHARACTER*1 . Indicates whether the diagonal of the matrix is unit diagonal (will not be operated on) or otherwise (will be operated on).

The shape of the trapezoidal arrays is determined by these parameters as follows:

Figure 16-1 Trapezoidal Arrays Shapes



The packing of arrays, if required, so that they may be sent efficiently is hidden, allowing the user to concentrate on the logical matrix, rather than on how the data is organized in the system memory.

BLACS Combine Operations

This section describes BLACS routines that combine the data to produce a result.

In a combine operation, each participating process contributes data that is combined with other processes' data to produce a result. This result can be given to a particular process (called the *destination* process), or to all participating processes. If the result is given to only one process, the operation is referred to as a *leave-on-one* combine, and if the result is given to all participating processes the operation is referenced as a *leave-on-all* combine.

At present, three kinds of combines are supported. They are:

- element-wise summation
- element-wise absolute value maximization
- element-wise absolute value minimization

of general rectangular arrays.

Note that a combine operation combines data between processes. By definition, a combine performed across a scope of only one process does not change the input data. This is why the operations (max/min/sum) are specified as *element-wise*. Element-wise indicates that each element of the input array will be combined with the corresponding element from all other processes' arrays to produce the result. Thus, a 4 x 2 array of inputs produces a 4 x 2 answer array.

When the max/min comparison is being performed, absolute value is used. For example, -5 and 5 are equivalent. However, the returned value is unchanged; that is, it is not the absolute value, but is a signed value instead. Therefore, if you performed a BLACS absolute value maximum combine on the numbers -5, 3, 1, 8 the result would be -8.

The initial symbol ? in the routine names below masks the data type:

i	integer
s	single precision real
d	double precision real
c	single precision complex
z	double precision complex.

Table 16-1 BLACS Combines

Routine name	Results of operation
?gamx2d	Entries of result matrix will have the value of the greatest absolute value found in that position.
?gamn2d	Entries of result matrix will have the value of the smallest absolute value found in that position.
?gsum2d	Entries of result matrix will have the summation of that position.

?gamx2d

Performs element-wise absolute value maximization.

Syntax

```
call igamx2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call sgamx2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call dgamx2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call cgamx2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call zgamx2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
scope	CHARACTER*1. Indicates what scope the combine should proceed on. Limited to ROW, COLUMN, or ALL.
top	CHARACTER*1. Communication pattern to use during the combine operation.

m	INTEGER. The number of matrix rows to be combined.
n	INTEGER. The number of matrix columns to be combined.
a	TYPE array (*lda*, *n*). Matrix to be compared with to produce the maximum.
lda	INTEGER. The leading dimension of the matrix *A*, that is, the distance between two successive elements in a matrix row.
rcflag	INTEGER. If *rcflag* = -1, the arrays *ra* and *ca* are not referenced and need not exist. Otherwise, *rcflag* indicates the leading dimension of these arrays, and so must be ≥ *m*.
rdest	INTEGER. The process row coordinate of the process that should receive the result. If *rdest* or *cdest* = -1, all processes within the indicated scope receive the answer.
cdest	INTEGER. The process column coordinate of the process that should receive the result. If *rdest* or *cdest* = -1, all processes within the indicated scope receive the answer.

Output Parameters

a	TYPE array (*lda*, *n*). Contains the result if this process is selected to receive the answer, or intermediate results if the process is not selected to receive the result.
ra	INTEGER array (*rcflag*, *n*). If *rcflag* = -1, this array will not be referenced, and need not exist. Otherwise, it is an integer array (of size at least *rcflag* x *n*) indicating the row index of the process that provided the maximum. If the calling process is not selected to receive the result, this array will contain intermediate (useless) results.
ca	INTEGER array (*rcflag*, *n*). If *rcflag* = -1, this array will not be referenced, and need not exist. Otherwise, it is an integer array (of size at least *rcflag* x *n*) indicating the row index of the process that provided the maximum. If the calling process is not selected to receive the result, this array will contain intermediate (useless) results.

Description

This routine performs element-wise absolute value maximization, that is, each element of matrix *A* is compared with the corresponding element of the other process's matrices. Note that the value of *A* is returned, but the absolute value is used to determine the maximum (the 1-norm is used for complex numbers). Combines may be globally-blocking, so they must be programmed as if no process returns until all have called the routine.

?gamn2d

Performs element-wise absolute value minimization.

Syntax

```
call igamn2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call sgamn2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call dgamn2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call cgamn2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
call zgamn2d( icontxt, scope, top, m, n, a, lda, ra, ca, rcflag, rdest, cdest )
```

Input Parameters

icontxt — INTEGER. Integer handle that indicates the context.

scope — CHARACTER*1. Indicates what scope the combine should proceed on. Limited to ROW, COLUMN, or ALL.

top — CHARACTER*1. Communication pattern to use during the combine operation.

m — INTEGER. The number of matrix rows to be combined.

n — INTEGER. The number of matrix columns to be combined.

a — TYPE array (*lda*, *n*). Matrix to be compared with to produce the minimum.

lda — INTEGER. The leading dimension of the matrix *A*, that is, the distance between two successive elements in a matrix row.

rcflag — INTEGER.
If *rcflag* = -1, the arrays *ra* and *ca* are not referenced and need not exist. Otherwise, *rcflag* indicates the leading dimension of these arrays, and so must be ≥ *m*.

rdest — INTEGER.
The process row coordinate of the process that should receive the result. If *rdest* or *cdest* = -1, all processes within the indicated scope receive the answer.

cdest — INTEGER.
The process column coordinate of the process that should receive the result. If *rdest* or *cdest* = -1, all processes within the indicated scope receive the answer.

Output Parameters

a — TYPE array (*lda*, *n*). Contains the result if this process is selected to receive the answer, or intermediate results if the process is not selected to receive the result.

ra — INTEGER array (*rcflag*, *n*).

	If *rcflag* = -1, this array will not be referenced, and need not exist. Otherwise, it is an integer array (of size at least *rcflag* x *n*) indicating the row index of the process that provided the minimum. If the calling process is not selected to receive the result, this array will contain intermediate (useless) results.
ca	INTEGER array (*rcflag*, *n*). If *rcflag* = -1, this array will not be referenced, and need not exist. Otherwise, it is an integer array (of size at least *rcflag* x *n*) indicating the row index of the process that provided the minimum. If the calling process is not selected to receive the result, this array will contain intermediate (useless) results.

Description

This routine performs element-wise absolute value minimization, that is, each element of matrix *A* is compared with the corresponding element of the other process's matrices. Note that the value of *A* is returned, but the absolute value is used to determine the minimum (the 1-norm is used for complex numbers). Combines may be globally-blocking, so they must be programmed as if no process returns until all have called the routine.

?gsum2d

Performs element-wise summation.

Syntax

```
call igsum2d( icontxt, scope, top, m, n, a, lda, rdest, cdest )
call sgsum2d( icontxt, scope, top, m, n, a, lda, rdest, cdest )
call dgsum2d( icontxt, scope, top, m, n, a, lda, rdest, cdest )
call cgsum2d( icontxt, scope, top, m, n, a, lda, rdest, cdest )
call zgsum2d( icontxt, scope, top, m, n, a, lda, rdest, cdest )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
scope	CHARACTER*1. Indicates what scope the combine should proceed on. Limited to ROW, COLUMN, or ALL.
top	CHARACTER*1. Communication pattern to use during the combine operation.
m	INTEGER. The number of matrix rows to be combined.
n	INTEGER. The number of matrix columns to be combined.
a	TYPE array (*lda*, *n*). Matrix to be added to produce the sum.
lda	INTEGER. The leading dimension of the matrix *A*, that is, the distance between two successive elements in a matrix row.

rdest	INTEGER. The process row coordinate of the process that should receive the result. If *rdest* or *cdest* = -1, all processes within the indicated scope receive the answer.
cdest	INTEGER. The process column coordinate of the process that should receive the result. If *rdest* or *cdest* = -1, all processes within the indicated scope receive the answer.

Output Parameters

a	TYPE array (*lda*, *n*). Contains the result if this process is selected to receive the answer, or intermediate results if the process is not selected to receive the result.

Description

This routine performs element-wise summation, that is, each element of matrix *A* is summed with the corresponding element of the other process's matrices. Combines may be globally-blocking, so they must be programmed as if no process returns until all have called the routine.

BLACS Point To Point Communication

This section describes BLACS routines for point to point communication.

Point to point communication requires two complementary operations. The *send* operation produces a message that is then consumed by the *receive* operation. These operations have various resources associated with them. The main such resource is the buffer that holds the data to be sent or serves as the area where the incoming data is to be received. The level of *blocking* indicates what correlation the return from a send/receive operation has with the availability of these resources and with the status of message.

Non-blocking

The return from the *send* or *receive* operations does not imply that the resources may be reused, that the message has been sent/received or that the complementary operation has been called. Return means only that the send/receive has been started, and will be completed at some later date. Polling is required to determine when the operation has finished.

In non-blocking message passing, the concept of *communication/computation overlap* (abbreviated C/C overlap) is important. If a system possesses C/C overlap, independent computation can occur at the same time as communication. That means a nonblocking operation can be posted, and unrelated work can be done while the message is sent/received in parallel. If C/C overlap is not present, after returning from the routine call, computation will be interrupted at some later date when the message is actually sent or received.

Locally-blocking

Return from the *send* or *receive* operations indicates that the resources may be reused. However, since this only depends on local information, it is unknown whether the complementary operation has been called. There are no locally-blocking receives: the send must be completed before the receive buffer is available for re-use.

If a receive has not been posted at the time a locally-blocking send is issued, buffering will be required to avoid losing the message. Buffering can be done on the sending process, the receiving process, or not done at all, losing the message.

Globally-blocking

Return from a globally-blocking procedure indicates that the operation resources may be reused, and that complement of the operation has at least been posted. Since the receive has been posted, there is no buffering required for globally-blocking sends: the message is always sent directly into the user's receive buffer.

Almost all processors support non-blocking communication, as well as some other level of blocking sends. What level of blocking the send possesses varies between platforms. For instance, the Intel® processors support locally-blocking sends, with buffering done on the receiving process. This is a very important distinction, because codes written assuming locally-blocking sends will hang on platforms with globally-blocking sends. Below is a simple example of how this can occur:

```
IAM = MY_PROCESS_ID()
IF (IAM .EQ. 0) THEN
   SEND TO PROCESS 1
   RECV FROM PROCESS 1
ELSE IF (IAM .EQ. 1) THEN
   SEND TO PROCESS 0
   RECV FROM PROCESS 0
END IF
```

If the send is globally-blocking, process 0 enters the send, and waits for process 1 to start its receive before continuing. In the meantime, process 1 starts to send to 0, and waits for 0 to receive before continuing. Both processes are now waiting on each other, and the program will never continue.

The solution for this case is obvious. One of the processes simply reverses the order of its communication calls and the hang is avoided. However, when the communication is not just between two processes, but rather involves a hierarchy of processes, determining how to avoid this kind of difficulty can become problematic.

For this reason, it was decided the BLACS would support locally-blocking sends. On systems natively supporting globally-blocking sends, non-blocking sends coupled with buffering is used to simulate locally-blocking sends. The BLACS support globally-blocking receives.

In addition, the BLACS specify that point to point messages between two given processes will be strictly ordered. If process 0 sends three messages (label them *A*, *B*, and *C*) to process 1, process 1 must receive *A* before it can receive *B*, and message *C* can be received only after both *A* and *B*. The main reason for this restriction is that it allows for the computation of message identifiers.

Note, however, that messages from different processes are not ordered. If processes 0, . . ., 3 send messages *A*, . . ., *D* to process 4, process 4 may receive these messages in any order that is convenient.

Convention

The convention used in the communication routine names follows the template ?xxyy2d, where the letter in the ? position indicates the data type being sent, xx is replaced to indicate the shape of the matrix, and the yy positions are used to indicate the type of communication to perform:

i	integer
s	single precision real
d	double precision real
c	single precision complex
z	double precision complex
ge	The data to be communicated is stored in a general rectangular matrix.
tr	The data to be communicated is stored in a trapezoidal matrix.
sd	Send. One process sends to another.
rv	Receive. One process receives from another.

Table 16-2 BLACS Point To Point Communication

Routine name	Operation performed
?gesd2d ?trsd2d	Take the indicated matrix and send it to the destination process.
?gerv2d ?trrv2d	Receive a message from the process into the matrix.

As a simple example, the pseudo code given above is rewritten below in terms of the BLACS. It is further specifed that the data being exchanged is the double precision vector *X*, which is 5 elements long.

```
CALL GRIDINFO(NPROW, NPCOL, MYPROW, MYPCOL)

IF (MYPROW.EQ.0 .AND. MYPCOL.EQ.0) THEN
   CALL DGESD2D(5, 1, X, 5, 1, 0)
   CALL DGERV2D(5, 1, X, 5, 1, 0)
ELSE IF (MYPROW.EQ.1 .AND. MYPCOL.EQ.0) THEN
   CALL DGESD2D(5, 1, X, 5, 0, 0)
   CALL DGERV2D(5, 1, X, 5, 0, 0)
END IF
```

?gesd2d

Takes a general rectangular matrix and sends it to the destination process.

Syntax

```
call igesd2d( icontxt, m, n, a, lda, rdest, cdest )
call sgesd2d( icontxt, m, n, a, lda, rdest, cdest )
call dgesd2d( icontxt, m, n, a, lda, rdest, cdest )
call cgesd2d( icontxt, m, n, a, lda, rdest, cdest )
call zgesd2d( icontxt, m, n, a, lda, rdest, cdest )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
m, *n*, *a*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.
rdest	INTEGER. The process row coordinate of the process to send the message to.
cdest	INTEGER. The process column coordinate of the process to send the message to.

Description

This routine takes the indicated general rectangular matrix and sends it to the destination process located at {RDEST, CDEST} in the process grid. Return from the routine indicates that the buffer (the matrix *A*) may be reused. The routine is locally-blocking, that is, it will return even if the corresponding receive is not posted.

See Also

- BLACS Routines Usage Example

?trsd2d

Takes a trapezoidal matrix and sends it to the destination process.

Syntax

```
call itrsd2d( icontxt, uplo, diag, m, n, a, lda, rdest, cdest )
call strsd2d( icontxt, uplo, diag, m, n, a, lda, rdest, cdest )
call dtrsd2d( icontxt, uplo, diag, m, n, a, lda, rdest, cdest )
call ctrsd2d( icontxt, uplo, diag, m, n, a, lda, rdest, cdest )
call ztrsd2d( icontxt, uplo, diag, m, n, a, lda, rdest, cdest )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
uplo, *diag*, *m*, *n*, *a*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.
rdest	INTEGER. The process row coordinate of the process to send the message to.
cdest	INTEGER. The process column coordinate of the process to send the message to.

Description

This routine takes the indicated trapezoidal matrix and sends it to the destination process located at {RDEST, CDEST} in the process grid. Return from the routine indicates that the buffer (the matrix *A*) may be reused. The routine is locally-blocking, that is, it will return even if the corresponding receive is not posted.

?gerv2d

Receives a message from the process into the general rectangular matrix.

Syntax

```
call igerv2d( icontxt, m, n, a, lda, rsrc, csrc )
call sgerv2d( icontxt, m, n, a, lda, rsrc, csrc )
call dgerv2d( icontxt, m, n, a, lda, rsrc, csrc )
call cgerv2d( icontxt, m, n, a, lda, rsrc, csrc )
call zgerv2d( icontxt, m, n, a, lda, rsrc, csrc )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
m, *n*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.
rsrc	INTEGER. The process row coordinate of the source of the message.
csrc	INTEGER. The process column coordinate of the source of the message.

Output Parameters

a	An array of dimension (*lda*,*n*) to receive the incoming message into.

Description

This routine receives a message from process {RSRC, CSRC} into the general rectangular matrix *A*. This routine is globally-blocking, that is, return from the routine indicates that the message has been received into *A*.

See Also

- BLACS Routines Usage Example

?trrv2d

Receives a message from the process into the trapezoidal matrix.

Syntax

```
call itrrv2d( icontxt, uplo, diag, m, n, a, lda, rsrc, csrc )
call strrv2d( icontxt, uplo, diag, m, n, a, lda, rsrc, csrc )
call dtrrv2d( icontxt, uplo, diag, m, n, a, lda, rsrc, csrc )
call ctrrv2d( icontxt, uplo, diag, m, n, a, lda, rsrc, csrc )
call ztrrv2d( icontxt, uplo, diag, m, n, a, lda, rsrc, csrc )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
uplo, *diag*, *m*, *n*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.
rsrc	INTEGER. The process row coordinate of the source of the message.
csrc	INTEGER. The process column coordinate of the source of the message.

Output Parameters

a	An array of dimension (*lda*, *n*) to receive the incoming message into.

Description

This routine receives a message from process {RSRC, CSRC} into the trapezoidal matrix *A*. This routine is globally-blocking, that is, return from the routine indicates that the message has been received into *A*.

BLACS Broadcast Routines

This section describes BLACS broadcast routines.

A broadcast sends data possessed by one process to all processes within a scope. Broadcast, much like point to point communication, has two complementary operations. The process that owns the data to be broadcast issues a *broadcast*/*send*. All processes within the same scope must then issue the complementary *broadcast*/*receive*.

The BLACS define that both broadcast/send and broadcast/receive are *globally-blocking*. Broadcasts/receives cannot be locally-blocking since they must post a receive. Note that receives cannot be locally-blocking. When a given process can leave, a broadcast/receive operation is topology dependent, so, to avoid a hang as topology is varied, the broadcast/receive must be treated as if no process can leave until all processes have called the operation.

Broadcast/sends could be defined to be *locally-blocking*. Since no information is being received, as long as locally-blocking point to point sends are used, the broadcast/send will be locally blocking. However, defining one process within a scope to be locally-blocking while all other processes are globally-blocking adds little to the programmability of the code. On the other hand, leaving the option open to have globally-blocking broadcast/sends may allow for optimization on some platforms.

The fact that broadcasts are defined as globally-blocking has several important implications. The first is that scoped operations (broadcasts or combines) must be strictly ordered, that is, all processes within a scope must agree on the order of calls to separate scoped operations. This constraint falls in line with that already in place for the computation of message IDs, and is present in point to point communication as well.

A less obvious result is that scoped operations with `SCOPE = 'ALL'` must be ordered with respect to any other scoped operation. This means that if there are two broadcasts to be done, one along a column, and one involving the entire process grid, all processes within the process column issuing the column broadcast must agree on which broadcast will be performed first.

The convention used in the communication routine names follows the template `?xxyy2d`, where the letter in the `?` position indicates the data type being sent, `xx` is replaced to indicate the shape of the matrix, and the `yy` positions are used to indicate the type of communication to perform:

`i`	integer
`s`	single precision real
`d`	double precision real
`c`	single precision complex
`z`	double precision complex
`ge`	The data to be communicated is stored in a general rectangular matrix.
`tr`	The data to be communicated is stored in a trapezoidal matrix.
`bs`	Broadcast/send. A process begins the broadcast of data within a scope.
`br`	Broadcast/receive A process receives and participates in the broadcast of data within a scope.

Table 16-3 BLACS Broadcast Routines

Routine name	Operation performed
`?gebs2d`	Start a broadcast along a scope.
`?trbs2d`	
`?gebr2d`	Receive and participate in a broadcast along a scope.
`?trbr2d`	

?gebs2d

Starts a broadcast along a scope for a general rectangular matrix.

Syntax

```
call igebs2d( icontxt, scope, top, m, n, a, lda )
call sgebs2d( icontxt, scope, top, m, n, a, lda )
call dgebs2d( icontxt, scope, top, m, n, a, lda )
```

```
call cgebs2d( icontxt, scope, top, m, n, a, lda )
call zgebs2d( icontxt, scope, top, m, n, a, lda )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
scope	CHARACTER*1. Indicates what scope the broadcast should proceed on. Limited to 'Row', 'Column', or 'All'.
top	CHARACTER*1. Indicates the communication pattern to use for the broadcast.
m, *n*, *a*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.

Description

This routine starts a broadcast along a scope. All other processes within the scope must call broadcast/receive for the broadcast to proceed. At the end of a broadcast, all processes within the scope will possess the data in the general rectangular matrix *A*.

Broadcasts may be globally-blocking. This means no process is guaranteed to return from a broadcast until all processes in the scope have called the appropriate routine (broadcast/send or broadcast/receive).

See Also

- BLACS Routines Usage Example

?trbs2d

Starts a broadcast along a scope for a trapezoidal matrix.

Syntax

```
call itrbs2d( icontxt, scope, top, uplo, diag, m, n, a, lda )
call strbs2d( icontxt, scope, top, uplo, diag, m, n, a, lda )
call dtrbs2d( icontxt, scope, top, uplo, diag, m, n, a, lda )
call ctrbs2d( icontxt, scope, top, uplo, diag, m, n, a, lda )
call ztrbs2d( icontxt, scope, top, uplo, diag, m, n, a, lda )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
scope	CHARACTER*1. Indicates what scope the broadcast should proceed on. Limited to 'Row', 'Column', or 'All'.
top	CHARACTER*1. Indicates the communication pattern to use for the broadcast.
uplo, *diag*, *m*, *n*, *a*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.

Description

This routine starts a broadcast along a scope. All other processes within the scope must call broadcast/receive for the broadcast to proceed. At the end of a broadcast, all processes within the scope will possess the data in the trapezoidal matrix *A*.

Broadcasts may be globally-blocking. This means no process is guaranteed to return from a broadcast until all processes in the scope have called the appropriate routine (broadcast/send or broadcast/receive).

?gebr2d

Receives and participates in a broadcast along a scope for a general rectangular matrix.

Syntax

```
call igebr2d( icontxt, scope, top, m, n, a, lda, rsrc, csrc )
call sgebr2d( icontxt, scope, top, m, n, a, lda, rsrc, csrc )
call dgebr2d( icontxt, scope, top, m, n, a, lda, rsrc, csrc )
call cgebr2d( icontxt, scope, top, m, n, a, lda, rsrc, csrc )
call zgebr2d( icontxt, scope, top, m, n, a, lda, rsrc, csrc )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
scope	CHARACTER*1. Indicates what scope the broadcast should proceed on. Limited to 'Row', 'Column', or 'All'.
top	CHARACTER*1. Indicates the communication pattern to use for the broadcast.
m, *n*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.
rsrc	INTEGER. The process row coordinate of the process that called broadcast/send.
csrc	INTEGER. The process column coordinate of the process that called broadcast/send.

Output Parameters

a	An array of dimension (*lda*, *n*) to receive the incoming message into.

Description

This routine receives and participates in a broadcast along a scope. At the end of a broadcast, all processes within the scope will possess the data in the general rectangular matrix *A*. Broadcasts may be globally-blocking. This means no process is guaranteed to return from a broadcast until all processes in the scope have called the appropriate routine (broadcast/send or broadcast/receive).

See Also

- BLACS Routines Usage Example

?trbr2d

Receives and participates in a broadcast along a scope for a trapezoidal matrix.

Syntax

```
call itrbr2d( icontxt, scope, top, uplo, diag, m, n, a, lda, rsrc, csrc )
call strbr2d( icontxt, scope, top, uplo, diag, m, n, a, lda, rsrc, csrc )
call dtrbr2d( icontxt, scope, top, uplo, diag, m, n, a, lda, rsrc, csrc )
call ctrbr2d( icontxt, scope, top, uplo, diag, m, n, a, lda, rsrc, csrc )
call ztrbr2d( icontxt, scope, top, uplo, diag, m, n, a, lda, rsrc, csrc )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
scope	CHARACTER*1. Indicates what scope the broadcast should proceed on. Limited to 'Row', 'Column', or 'All'.
top	CHARACTER*1. Indicates the communication pattern to use for the broadcast.
uplo, *diag*, *m*, *n*, *lda*	Describe the matrix to be sent. See Matrix Shapes for details.
rsrc	INTEGER. The process row coordinate of the process that called broadcast/send.
csrc	INTEGER. The process column coordinate of the process that called broadcast/send.

Output Parameters

a	An array of dimension (*lda*, *n*) to receive the incoming message into.

Description

This routine receives and participates in a broadcast along a scope. At the end of a broadcast, all processes within the scope will possess the data in the trapezoidal matrix *A*. Broadcasts may be globally-blocking. This means no process is guaranteed to return from a broadcast until all processes in the scope have called the appropriate routine (broadcast/send or broadcast/receive).

BLACS Support Routines

The support routines perform distinct tasks that can be used for:

Initialization

Destruction

Information Purposes

Miscellaneous Tasks.

Initialization Routines

This section describes BLACS routines that deal with grid/context creation, and processing before the grid/context has been defined.

Table 16-4 BLACS Initialization Routines

Routine name	Operation performed
blacs_pinfo	Returns the number of processes available for use.
blacs_setup	Allocates virtual machine and spawns processes.
blacs_get	Gets values that BLACS use for internal defaults.
blacs_set	Sets values that BLACS use for internal defaults.
blacs_gridinit	Assigns available processes into BLACS process grid.
blacs_gridmap	Maps available processes into BLACS process grid.

blacs_pinfo

Returns the number of processes available for use.

Syntax

```
call blacs_pinfo( mypnum, nprocs )
```

Output Parameters

mypnum	INTEGER. An integer between 0 and (*nprocs* - 1) that uniquely identifies each process.
nprocs	INTEGER.The number of processes available for BLACS use.

Description

This routine is used when some initial system information is required before the BLACS are set up. On all platforms except PVM, *nprocs* is the actual number of processes available for use, that is, *nprows* * *npcols* <= *nprocs*. In PVM, the virtual machine may not have been set up before this call, and therefore no parallel machine exists. In this case, *nprocs* is returned as less than one. If a process has been spawned via the keyboard, it receives *mypnum* of 0, and all other processes get *mypnum* of -1. As a result, the user can distinguish between processes. Only after the virtual machine has been set up via a call to BLACS_SETUP, this routine returns the correct values for *mypnum* and *nprocs*.

See Also

- BLACS Routines Usage Example

blacs_setup

Allocates virtual machine and spawns processes.

Syntax

```
call blacs_setup( mypnum, nprocs )
```

Input Parameters

nprocs	INTEGER. On the process spawned from the keyboard rather than from pvmspawn, this parameter indicates the number of processes to create when building the virtual machine.

Output Parameters

mypnum	INTEGER. An integer between 0 and (*nprocs* - 1) that uniquely identifies each process.
nprocs	INTEGER. For all processes other than spawned from the keyboard, this parameter means the number of processes available for BLACS use.

Description

This routine only accomplishes meaningful work in the PVM BLACS. On all other platforms, it is functionally equivalent to blacs_pinfo. The BLACS assume a static system, that is, the given number of processes does not change. PVM supplies a dynamic system, allowing processes to be added to the system on the fly.

blacs_setup is used to allocate the virtual machine and spawn off processes. It reads in a file called blacs_setup.dat, in which the first line must be the name of your executable. The second line is optional, but if it exists, it should be a PVM spawn flag. Legal values at this time are 0 (PvmTaskDefault), 4 (PvmTaskDebug), 8 (PvmTaskTrace), and 12 (PvmTaskDebug + PvmTaskTrace). The primary reason for this line is to allow the user to easily turn on and off PVM debugging. Additional lines, if any, specify what machines should be added to the current configuration before spawning *nprocs*-1 processes to the machines in a round robin fashion.

nprocs is input on the process which has no PVM parent (that is, *mypnum*=0), and both parameters are output for all processes. So, on PVM systems, the call to blacs_pinfo informs you that the virtual machine has not been set up, and a call to blacs_setup then sets up the machine and returns the real values for *mypnum* and *nprocs*.

Note that if the file blacs_setup.dat does not exist, the BLACS prompt the user for the executable name, and processes are spawned to the current PVM configuration.

See Also

- BLACS Routines Usage Example

blacs_get

Gets values that BLACS use for internal defaults.

Syntax

```
call blacs_get( icontxt, what, val )
```

Input Parameters

icontxt	INTEGER. On values of *what* that are tied to a particular context, this parameter is the integer handle indicating the context. Otherwise, ignored.
what	INTEGER. Indicates what BLACS internal(s) should be returned in *val*. Present options are: • *what* = 0 : Handle indicating default system context • *what* = 1 : The BLACS message ID range • *what* = 2 : The BLACS debug level the library was compiled with • *what* = 10 : Handle indicating the system context used to define the BLACS context whose handle is *icontxt* • *what* = 11 : Number of rings multiring topology is presently using • *what* = 12 : Number of branches general tree topology is presently using.

Output Parameters

val	INTEGER. The value of the BLACS internal.

Description

This routine gets the values that the BLACS are using for internal defaults. Some values are tied to a BLACS context, and some are more general. The most common use is in retrieving a default system context for input into `blacs_gridinit` or `blacs_gridmap`.

Some systems, such as MPI*, supply their own version of context. For those users who mix system code with BLACS code, a BLACS context should be formed in reference to a system context. Thus, the grid creation routines take a system context as input. If you wish to have strictly portable code, you may use `blacs_get` to retrieve a default system context that will include all available processes. This value is not tied to a BLACS context, so the parameter *icontxt* is unused.

`blacs_get` returns information on three quantities that are tied to an individual BLACS context, which is passed in as *icontxt*. The information that may be retrieved is:

- The handle of the system context upon which this BLACS context was defined
- The number of rings for `TOP = 'M'` (multiring broadcast)
- The number of branches for `TOP = 'T'` (general tree broadcast/general tree gather).

See Also

- BLACS Routines Usage Example

blacs_set

Sets values that BLACS use for internal defaults.

Syntax

```
call blacs_set( icontxt, what, val )
```

Input Parameters

icontxt	INTEGER. For values of *what* that are tied to a particular context, this parameter is the integer handle indicating the context. Otherwise, ignored.
what	INTEGER. Indicates what BLACS internal(s) should be set. Present values are: • 1 = The BLACS message ID range • 11 = Number of rings for multiring topology to use • 12 = Number of branches for general tree topology to use.
val	INTEGER. Array of dimension (*). Indicates the value(s) the internals should be set to. The specific meanings depend on *what* values, as discussed in Description below.

Description

This routine sets the BLACS internal defaults depending on *what* values:

what = 1	Setting the BLACS message ID range. If you wish to mix the BLACS with other message-passing packages, restrict the BLACS to a certain message ID range not to be used by the non-BLACS routines. The message ID range must be set before the first call to blacs_gridinit or blacs_gridmap. Subsequent calls will have no effect. Because the message ID range is not tied to a particular context, the parameter *icontxt* is ignored, and *val* is defined as: VAL (input) INTEGER array of dimension (2) VAL(1) : The smallest message ID (also called message type or message tag) the BLACS should use. VAL(2) : The largest message ID (also called message type or message tag) the BLACS should use.
what = 11	Set number of rings for TOP = 'M' (multiring broadcast).This quantity is tied to a context, so *icontxt* is used, and *val* is defined as: VAL (input) INTEGER array of dimension (1) VAL(1) : The number of rings for multiring topology to use.
what = 12	Set number of rings for TOP = 'T' (general tree broadcast/general tree gather). This quantity is tied to a context, so *icontxt* is used, and *val* is defined as: VAL (input) INTEGER array of dimension (1) VAL(1) : The number of branches for general tree topology to use.

blacs_gridinit

Assigns available processes into BLACS process grid.

Syntax

```
call blacs_gridinit( icontxt, order, nprow, npcol )
```

Input Parameters

icontxt	INTEGER. Integer handle indicating the system context to be used in creating the BLACS context. Call blacs_get to obtain a default system context.
order	CHARACTER*1. Indicates how to map processes to BLACS grid. Options are: • 'R' : Use row-major natural ordering • 'C' : Use column-major natural ordering • ELSE : Use row-major natural ordering
nprow	INTEGER. Indicates how many process rows the process grid should contain.
npcol	INTEGER. Indicates how many process columns the process grid should contain.

Output Parameters

icontxt	INTEGER. Integer handle to the created BLACS context.

Description

All BLACS codes must call this routine, or its sister routine blacs_gridmap. These routines take the available processes, and assign, or map, them into a BLACS process grid. In other words, they establish how the BLACS coordinate system maps into the native machine process numbering system. Each BLACS grid is contained in a context, so that it does not interfere with distributed operations that occur within other grids/contexts. These grid creation routines may be called repeatedly to define additional contexts/grids.

The creation of a grid requires input from all processes that are defined to be in this grid. Processes belonging to more than one grid have to agree on which grid formation will be serviced first, much like the globally blocking sum or broadcast.

These grid creation routines set up various internals for the BLACS, and one of them must be called before any calls are made to the non-initialization BLACS.

Note that these routines map already existing processes to a grid: the processes are not created dynamically. On most parallel machines, the processes are actual processors (hardware), and they are "created" when you run your executable. When using the PVM BLACS, if the virtual machine has not been set up yet, the routine blacs_setup should be used to create the virtual machine.

This routine creates a simple nprow x npcol process grid. This process grid uses the first nprow * npcol processes, and assigns them to the grid in a row- or column-major natural ordering. If these process-to-grid mappings are unacceptable, call blacs_gridmap.

- blacs_setup

blacs_gridmap

Maps available processes into BLACS process grid.

Syntax

```
call blacs_gridmap( icontxt, usermap, ldumap, nprow, npcol )
```

Input Parameters

icontxt	INTEGER. Integer handle indicating the system context to be used in creating the BLACS context. Call blacs_get to obtain a default system context.
usermap	INTEGER. Array, dimension (*ldumap*, *npcol*), indicating the process-to-grid mapping.
ldumap	INTEGER. Leading dimension of the 2D array *usermap*. *ldumap* ≥ *nprow*.
nprow	INTEGER. Indicates how many process rows the process grid should contain.
npcol	INTEGER. Indicates how many process columns the process grid should contain.

Output Parameters

icontxt	INTEGER. Integer handle to the created BLACS context.

Description

All BLACS codes must call this routine, or its sister routine blacs_gridinit. These routines take the available processes, and assign, or map, them into a BLACS process grid. In other words, they establish how the BLACS coordinate system maps into the native machine process numbering system. Each BLACS grid is contained in a context, so that it does not interfere with distributed operations that occur within other grids/contexts. These grid creation routines may be called repeatedly to define additional contexts/grids.

The creation of a grid requires input from all processes that are defined to be in this grid. Processes belonging to more than one grid have to agree on which grid formation will be serviced first, much like the globally blocking sum or broadcast.

These grid creation routines set up various internals for the BLACS, and one of them must be called before any calls are made to the non-initialization BLACS.

Note that these routines map already existing processes to a grid: the processes are not created dynamically. On most parallel machines, the processes are actual processors (hardware), and they are "created" when you run your executable. When using the PVM BLACS, if the virtual machine has not been set up yet, the routine blacs_setup should be used to create the virtual machine.

This routine allows the user to map processes to the process grid in an arbitrary manner. `usermap(i,j)` holds the process number of the process to be placed in `{i, j}` of the process grid. On most distributed systems, this process number is a machine defined number between 0 ... *nprow*-1. For PVM, these node numbers are the PVM TIDS (Task IDs). The `blacs_gridmap` routine is intended for an experienced user. The `blacs_gridinit` routine is much simpler. `blacs_gridinit` simply performs a `gridmap` where the first `nprow * npcol` processes are mapped into the current grid in a row-major natural ordering. If you are an experienced user, `blacs_gridmap` allows you to take advantage of your system's actual layout. That is, you can map nodes that are physically connected to be neighbors in the BLACS grid, etc. The `blacs_gridmap` routine also opens the way for *multigridding*: you can separate your nodes into arbitrary grids, join them together at some later date, and then re-split them into new grids. `blacs_gridmap` also provides the ability to make arbitrary grids or subgrids (for example, a "nearest neighbor" grid), which can greatly facilitate operations among processes that do not fall on a row or column of the main process grid.

Destruction Routines

This section describes BLACS routines that destroy grids, abort processes, and free resources.

Table 16-5 BLACS Destruction Routines

Routine name	Operation performed
`blacs_freebuff`	Frees BLACS buffer.
`blacs_gridexit`	Frees a BLACS context.
`blacs_abort`	Aborts all processes.
`blacs_exit`	Frees all BLACS contexts and releases all allocated memory.

blacs_freebuff

Frees BLACS buffer.

Syntax

```
call blacs_freebuff( icontxt, wait )
```

Input Parameters

icontxt	`INTEGER`. Integer handle that indicates the BLACS context.
wait	`INTEGER`. Parameter indicating whether to wait for non-blocking operations or not. If equals 0, the operations should not be waited for; free only unused buffers. Otherwise, wait in order to free all buffers.

Description

This routine releases the BLACS buffer.

The BLACS have at least one internal buffer that is used for packing messages. The number of internal buffers depends on what platform you are running the BLACS on. On systems where memory is tight, keeping this buffer or buffers may become expensive. Call `freebuff` to release the buffer. However, the next call of a communication routine that requires packing reallocates the buffer.

The *wait* parameter determines whether the BLACS should wait for any non-blocking operations to be completed or not. If *wait* = 0, the BLACS free any buffers that can be freed without waiting. If *wait* is not 0, the BLACS free all internal buffers, even if non-blocking operations must be completed first.

blacs_gridexit

Frees a BLACS context.

Syntax

```
call blacs_gridexit( icontxt )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the BLACS context to be freed.

Description

This routine frees a BLACS context.

Release the resources when contexts are no longer needed. After freeing a context, the context no longer exists, and its handle may be re-used if new contexts are defined.

blacs_abort

Aborts all processes.

Syntax

```
call blacs_abort( icontxt, errornum )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the BLACS context to be aborted.
errornum	INTEGER. User-defined integer error number.

Description

This routine aborts all the BLACS processes, not only those confined to a particular context.

Use `blacs_abort` to abort all the processes in case of a serious error. Note that both parameters are input, but the routine uses them only in printing out the error message. The context handle passed in is not required to be a valid context handle.

blacs_exit

Frees all BLACS contexts and releases all allocated memory.

Syntax

```
call blacs_exit( continue )
```

Input Parameters

continue	INTEGER. Flag indicating whether message passing continues after the BLACS are done. If *continue* is non-zero, the user is assumed to continue using the machine after completing the BLACS. Otherwise, no message passing is assumed after calling this routine.

Description

This routine frees all BLACS contexts and releases all allocated memory.

This routine should be called when a process has finished all use of the BLACS. The *continue* parameter indicates whether the user will be using the underlying communication platform after the BLACS are finished. This information is most important for the PVM BLACS. If *continue* is set to 0, then pvm_exit is called; otherwise, it is not called. Setting *continue* not equal to 0 indicates that explicit PVM send/recvs will be called after the BLACS routines are used. Make sure your code calls pvm_exit. PVM users should either call blacs_exit or explicitly call pvm_exit to avoid PVM problems.

Informational Routines

This section describes BLACS routines that return information involving the process grid.

Table 16-6 BLACS Informational Routines

Routine name	Operation performed
blacs_gridinfo	Returns information on the current grid.
blacs_pnum	Returns the system process number of the process in the process grid.
blacs_pcoord	Returns the row and column coordinates in the process grid.

blacs_gridinfo

Returns information on the current grid.

Syntax

```
call blacs_gridinfo( icontxt, nprow, npcol, myprow, mypcol )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.

Output Parameters

nprow	INTEGER. Number of process rows in the current process grid.
npcol	INTEGER. Number of process columns in the current process grid.
myprow	INTEGER. Row coordinate of the calling process in the process grid.
mypcol	INTEGER. Column coordinate of the calling process in the process grid.

Description

This routine returns information on the current grid. If the context handle does not point at a valid context, all quantities are returned as -1.

See Also

- BLACS Routines Usage Example

blacs_pnum

Returns the system process number of the process in the process grid.

Syntax

```
call blacs_pnum( icontxt, prow, pcol )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
prow	INTEGER. Row coordinate of the process the system process number of which is to be determined.
pcol	INTEGER. Column coordinate of the process the system process number of which is to be determined.

Description

This function returns the system process number of the process at {PROW, PCOL} in the process grid.

See Also

- BLACS Routines Usage Example

blacs_pcoord

Returns the row and column coordinates in the process grid.

Syntax

```
call blacs_pcoord( icontxt, pnum, prow, pcol )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
pnum	INTEGER. Process number the coordinates of which are to be determined. This parameter stand for the process number of the underlying machine, that is, it is a `tid` for PVM.

Output Parameters

prow	INTEGER. Row coordinates of the *pnum* process in the BLACS grid.
pcol	INTEGER. Column coordinates of the *pnum* process in the BLACS grid.

Description

Given the system process number, this function returns the row and column coordinates in the BLACS process grid.

Miscellaneous Routines

This section describes `blacs_barrier` routine.

Table 16-7 BLACS Informational Routines

Routine name	Operation performed
`blacs_barrier`	Holds up execution of all processes within the indicated scope until they have all called the routine.

blacs_barrier

Holds up execution of all processes within the indicated scope.

Syntax

```
call blacs_barrier( icontxt, scope )
```

Input Parameters

icontxt	INTEGER. Integer handle that indicates the context.
scope	CHARACTER*1. Parameter that indicates whether a process row (*scope*='R'), column ('C'), or entire grid ('A') will participate in the barrier.

Description

This routine holds up execution of all processes within the indicated scope until they have all called the routine.

Examples of BLACS Routines Usage

Example 16-1. BLACS Usage. Hello World

The following routine takes the available processes, forms them into a process grid, and then has each process check in with the process at {0,0} in the process grid.

```
      PROGRAM HELLO
*     -- BLACS example code --
*     Written by Clint Whaley 7/26/94
*     Performs a simple check-in type hello world
*     ..
*     .. External Functions ..
      INTEGER BLACS_PNUM
      EXTERNAL BLACS_PNUM
*     ..
*     .. Variable Declaration ..
      INTEGER CONTXT, IAM, NPROCS, NPROW, NPCOL, MYPROW, MYPCOL
      INTEGER ICALLER, I, J, HISROW, HISCOL
*
*     Determine my process number and the number of processes in
*     machine
*
      CALL BLACS_PINFO(IAM, NPROCS)
*
*     If in PVM, create virtual machine if it doesn't exist
*
      IF (NPROCS .LT. 1) THEN
         IF (IAM .EQ. 0) THEN
            WRITE(*, 1000)
            READ(*, 2000) NPROCS
         END IF
         CALL BLACS_SETUP(IAM, NPROCS)
      END IF
*
*     Set up process grid that is as close to square as possible
*
```

```
      NPROW = INT( SQRT( REAL(NPROCS) ) )
      NPCOL = NPROCS / NPROW
*
*     Get default system context, and define grid
*
      CALL BLACS_GET(0, 0, CONTXT)
      CALL BLACS_GRIDINIT(CONTXT, 'Row', NPROW, NPCOL)
      CALL BLACS_GRIDINFO(CONTXT, NPROW, NPCOL, MYPROW, MYPCOL)
*
*     If I'm not in grid, go to end of program
*
      IF ( (MYPROW.GE.NPROW) .OR. (MYPCOL.GE.NPCOL) ) GOTO 30
*
*     Get my process ID from my grid coordinates
*
      ICALLER = BLACS_PNUM(CONTXT, MYPROW, MYPCOL)
*
*     If I am process {0,0}, receive check-in messages from
*     all nodes
*
      IF ( (MYPROW.EQ.0) .AND. (MYPCOL.EQ.0) ) THEN

         WRITE(*,*) ' '
         DO 20 I = 0, NPROW-1
            DO 10 J = 0, NPCOL-1

               IF ( (I.NE.0) .OR. (J.NE.0) ) THEN
                  CALL IGERV2D(CONTXT, 1, 1, ICALLER, 1, I, J)
               END IF
*
*              Make sure ICALLER is where we think in process grid
*
              CALL BLACS_PCOORD(CONTXT, ICALLER, HISROW, HISCOL)
              IF ( (HISROW.NE.I) .OR. (HISCOL.NE.J) ) THEN
                 WRITE(*,*) 'Grid error!  Halting . . .'
```

```
               STOP
            END IF
            WRITE(*, 3000) I, J, ICALLER

10         CONTINUE
20      CONTINUE
        WRITE(*,*) ' '
        WRITE(*,*) 'All processes checked in.  Run finished.'
*
*     All processes but {0,0} send process ID as a check-in
*
      ELSE
         CALL IGESD2D(CONTXT, 1, 1, ICALLER, 1, 0, 0)
      END IF

30    CONTINUE

      CALL BLACS_EXIT(0)
1000  FORMAT('How many processes in machine?')
2000  FORMAT(I)
3000  FORMAT('Process {',i2,',',i2,'} (node number =',I,
     $       ') has checked in.')

      STOP
      END
```

Example 16-2. BLACS Usage. PROCMAP

This routine maps processes to a grid using `blacs_gridmap`.

```
      SUBROUTINE PROCMAP(CONTEXT, MAPPING, BEGPROC, NPROW, NPCOL, IMAP)
*
*     -- BLACS example code --
*     Written by Clint Whaley 7/26/94
*     ..
*     .. Scalar Arguments ..
      INTEGER CONTEXT, MAPPING, BEGPROC, NPROW, NPCOL
*     ..
*     .. Array Arguments ..
      INTEGER IMAP(NPROW, *)
*     ..
*
*  Purpose
*  =======
*  PROCMAP maps NPROW*NPCOL processes starting from process BEGPROC to
*  the grid in a variety of ways depending on the parameter MAPPING.
*
*  Arguments
*  =========
*
*  CONTEXT      (output) INTEGER
*               This integer is used by the BLACS to indicate a context.
*               A context is a universe where messages exist and do not
*               interact with other context's messages.  The context
*               includes the definition of a grid, and each process's
*               coordinates in it.
```

```
*
*  MAPPING      (input) INTEGER
*               Way to map processes to grid.  Choices are:
*               1 : row-major natural ordering
*               2 : column-major natural ordering
*
*  BEGPROC      (input) INTEGER
*               The process number (between 0 and NPROCS-1) to use as
*               {0,0}. From this process, processes will be assigned
*               to the grid as indicated by MAPPING.
*
*  NPROW        (input) INTEGER
*               The number of process rows the created grid
*               should have.
*
*  NPCOL        (input) INTEGER
*               The number of process columns the created grid
*               should have.
*
*  IMAP         (workspace) INTEGER array of dimension (NPROW, NPCOL)
*               Workspace, where the array which maps the
*               processes to the grid will be stored for the
*               call to GRIDMAP.

```

Example 16-3. BLACS Usage. PARALLEL DOT PRODUCT

This routine does a bone-headed parallel double precision dot product of two vectors. Arguments are input on process {0,0}, and output everywhere else.

```
      DOUBLE PRECISION FUNCTION PDDOT( CONTEXT, N, X, Y )
*
*     -- BLACS example code --
*     Written by Clint Whaley 7/26/94
*     ..
*     .. Scalar Arguments ..
      INTEGER CONTEXT, N
*     ..
*     .. Array Arguments ..
      DOUBLE PRECISION X(*), Y(*)
*     ..
*
*  Purpose
*  =======
*  PDDOT is a restricted parallel version of the BLAS routine
*  DDOT.  It assumes that the increment on both vectors is one,
*  and that process {0,0} starts out owning the vectors and

*  has N.  It returns the dot product of the two N-length vectors
*  X and Y, that is, PDDOT = X' Y.
*
*  Arguments
*  =========
*
*  CONTEXT      (input) INTEGER
*               This integer is used by the BLACS to indicate a context.
*               A context is a universe where messages exist and do not
*               interact with other context's messages.  The context

*               includes the definition of a grid, and each process's

*               coordinates in it.
```

```
*
*  N            (input/output) INTEGER
*               The length of the vectors X and Y. Input
*               for {0,0}, output for everyone else.
*
*  X            (input/output) DOUBLE PRECISION array of dimension (N)
*               The vector X of PDDOT = X' Y. Input for {0,0},
*               output for everyone else.
*
*  Y            (input/output) DOUBLE PRECISION array of dimension (N)
*               The vector Y of PDDOT = X' Y. Input for {0,0},
*               output for everyone else.
*

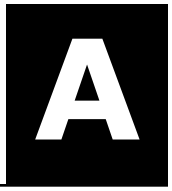
Linear Solvers Basics



Many applications in science and engineering require the solution of a system of linear equations. This problem is usually expressed mathematically by the matrix-vector equation, $Ax = b$, where A is an m-by-n matrix, x is the n element column vector and b is the m element column vector. The matrix A is usually referred to as the coefficient matrix, and the vectors x and b are referred to as the solution vector and the right-hand side, respectively.

Basic concepts related to solving linear systems with sparse matrices are described in section Sparse Linear Systems that follows.

Sparse Linear Systems

In many real-life applications, most of the elements in A are zero. Such a matrix is referred to as sparse. Conversely, matrices with very few zero elements are called dense. For sparse matrices, computing the solution to the equation $Ax = b$ can be made much more efficient with respect to both storage and computation time, if the sparsity of the matrix can be exploited. The more an algorithm can exploit the sparsity without sacrificing the correctness, the better the algorithm.

Generally speaking, computer software that finds solutions to systems of linear equations is called a solver. A solver designed to work specifically on sparse systems of equations is called a sparse solver. Solvers are usually classified into two groups - direct and iterative.

Iterative Solvers start with an initial approximation to a solution and attempt to estimate the difference between the approximation and the true result. Based on the difference, an iterative solver calculates a new approximation that is closer to the true result than the initial approximation. This process is repeated until the difference between the approximation and the true result is sufficiently small. The main drawback to iterative solvers is that the rate of convergence depends greatly on the values in the matrix A. Consequently, it is not possible to predict how long it will take for an iterative solver to produce a solution. In fact, for ill-conditioned matrices, the iterative process will not converge to a solution at all. However, for well-conditioned matrices it is possible for iterative solvers to converge to a solution very quickly. Consequently for the right applications, iterative solvers can be very efficient.

Direct Solvers, on the other hand, often factor the matrix A into the product of two triangular matrices and then perform a forward and backward triangular solve.

This approach makes the time required to solve a systems of linear equations relatively predictable, based on the size of the matrix. In fact, for sparse matrices, the solution time can be predicted based on the number of non-zero elements in the array A.

Matrix Fundamentals

A matrix is a rectangular array of either real or complex numbers. A matrix is denoted by a capital letter; its elements are denoted by the same lower case letter with row/column subscripts. Thus, the value of the element in row *i* and column *j* in matrix *A* is denoted by *a*(*i*,*j*). For example, a 3 by 4 matrix *A*, is written as follows:

$$A = \begin{bmatrix} a(1,1) & a(1,2) & a(1,3) & a(1,4) \\ a(2,1) & a(2,2) & a(2,3) & a(2,4) \\ a(3,1) & a(3,2) & a(3,3) & a(3,4) \end{bmatrix}$$

Note that with the above notation, we assume the standard Fortran programming language convention of starting array indices at 1 rather than the C programming language convention of starting them at 0.

A matrix in which all of the elements are real numbers is called a real matrix. A matrix that contains at least one complex number is called a complex matrix. A real or complex matrix *A* with the property that *a*(*i*,*j*) = *a*(*j*,*i*), is called a symmetric matrix. A complex matrix *A* with the property that *a*(*i*,*j*) = *conj*(*a*(*j*,*i*)), is called a Hermitian matrix. Note that programs that manipulate symmetric and Hermitian matrices need only store half of the matrix values, since the values of the non-stored elements can be quickly reconstructed from the stored values.

A matrix that has the same number of rows as it has columns is referred to as a square matrix. The elements in a square matrix that have same row index and column index are called the diagonal elements of the matrix, or simply the diagonal of the matrix.

The transpose of a matrix *A* is the matrix obtained by "flipping" the elements of the array about its diagonal. That is, we exchange the elements *a*(*i*,*j*) and *a*(*j*,*i*). For a complex matrix, if we both flip the elements about the diagonal and then take the complex conjugate of the element, the resulting matrix is called the Hermitian transpose or conjugate transpose of the original matrix. The transpose and Hermitian transpose of a matrix *A* are denoted by A^T and A^H respectively.

A column vector, or simply a vector, is a $n \times 1$ matrix, and a row vector is a $1 \times n$ matrix. A real or complex matrix *A* is said to be positive definite if the vector-matrix product x^TAx is greater than zero for all non-zero vectors *x*. A matrix that is not positive definite is referred to as indefinite.

An upper (or lower) triangular matrix, is a square matrix in which all elements below (or above) the diagonal are zero. A unit triangular matrix is an upper or lower triangular matrix with all 1's along the diagonal.

A matrix *P* is called a permutation matrix if, for any matrix *A*, the result of the matrix product *PA* is identical to *A* except for interchanging the rows of *A*. For a square matrix, it can be shown that if *PA* is a permutation of the rows of *A*, then AP^T is the same permutation of the columns of *A*. Additionally, it can be shown that the inverse of *P* is P^T.

In order to save space, a permutation matrix is usually stored as a linear array, called a permutation vector, rather than as an array. Specifically, if the permutation matrix maps the *i*-th row of a matrix to the *j*-th row, then the *i*-th element of the permutation vector is *j*.

A matrix with non-zero elements only on the diagonal is called a diagonal matrix. As is the case with a permutation matrix, it is usually stored as a vector of values, rather than as a matrix.

Direct Method

For solvers that use the direct method, the basic technique employed in finding the solution of the system $Ax = b$ is to first factor A into triangular matrices. That is, find a lower triangular matrix L and an upper triangular matrix U, such that $A = LU$. Having obtained such a factorization (usually referred to as an LU decomposition or LU factorization), the solution to the original problem can be rewritten as follows.

$$Ax = b$$
$$\Rightarrow \quad LUx = b$$
$$\Rightarrow \quad (Ux) = b$$

This leads to the following two-step process for finding the solution to the original system of equations:

1. Solve the systems of equations $Ly = b$.
2. Solve the system $Ux = y$.

Solving the systems $Ly = b$ and $Ux = y$ is referred to as a forward solve and a backward solve, respectively.

If a symmetric matrix A is also positive definite, it can be shown that A can be factored as LL^T where L is a lower triangular matrix. Similarly, a Hermitian matrix, A, that is positive definite can be factored as $A = LL^H$. For both symmetric and Hermitian matrices, a factorization of this form is called a Cholesky factorization.

In a Cholesky factorization, the matrix U in an LU decomposition is either L^T or L^H. Consequently, a solver can increase its efficiency by only storing L, and one-half of A, and not computing U. Therefore, users who can express their application as the solution of a system of positive definite equations will gain a significant performance improvement over using a general representation.

For matrices that are symmetric (or Hermitian) but not positive definite, there are still some significant efficiencies to be had. It can be shown that if A is symmetric but not positive definite, then A can be factored as $A = LDL^T$, where D is a diagonal matrix and L is a lower unit triangular matrix. Similarly, if A is Hermitian, it can be factored as $A = LDL^H$. In either case, we again only need to store L, D, and half of A and we need not compute U. However, the backward solve phases must be amended to solving $L^Tx = D^{-1}y$ rather than $L^Tx = y$.

Fill-In and Reordering of Sparse Matrices

Two important concepts associated with the solution of sparse systems of equations are fill-in and reordering. The following example illustrates these concepts.

Consider the system of linear equation $Ax = b$, where A is the symmetric positive definite sparse matrix defined by the following:

$$A = \begin{bmatrix} 9 & \frac{3}{2} & 6 & \frac{3}{4} & 3 \\ \frac{3}{2} & \frac{1}{2} & * & * & * \\ 6 & * & 12 & * & * \\ \frac{3}{4} & * & \frac{5}{8} & * & * \\ 3 & * & * & * & 16 \end{bmatrix} b \begin{bmatrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{bmatrix}$$

A star (*) is used to represent zeros and to emphasize the sparsity of A. The Cholesky factorization of A is: $A = LL^T$, where L is the following:

$$L = \begin{bmatrix} 3 & * & * & * & * \\ \frac{1}{2} & \frac{1}{2} & * & * & * \\ 2 & -2 & 2 & * & * \\ \frac{1}{4} & \frac{1}{-4} & \frac{1}{-2} & \frac{1}{2} & * \\ 1 & -1 & -2 & -3 & 1 \end{bmatrix}$$

Notice that even though the matrix A is relatively sparse, the lower triangular matrix L has no zeros below the diagonal. If we computed L and then used it for the forward and backward solve phase, we would do as much computation as if A had been dense.

The situation of L having non-zeros in places where A has zeros is referred to as fill-in. Computationally, it would be more efficient if a solver could exploit the non-zero structure of A in such a way as to reduce the fill-in when computing L. By doing this, the solver would only need to compute the non-zero entries in L. Toward this end, consider permuting the rows and columns of A. As described in Matrix Fundamentals section , the permutations of the rows of A can be represented as a permutation matrix, P. The result of permuting the rows is the product of P and A. Suppose, in the above example, we swap the first and fifth row of A, then swap the first and fifth columns of A, and call the resulting matrix B. Mathematically, we can express the process of permuting the rows and columns of A to get B as $B = PAP^T$. After permuting the rows and columns of A, we see that B is given by the following:

$$B = \begin{bmatrix} 16 & * & * & * & 3 \\ * & \frac{1}{2} & * & * & \frac{3}{2} \\ * & * & 12 & * & 6 \\ * & * & * & \frac{5}{8} & \frac{3}{4} \\ 3 & \frac{3}{2} & 6 & \frac{3}{4} & 9 \end{bmatrix}$$

Since B is obtained from A by simply switching rows and columns, the numbers of non-zero entries in A and B are the same. However, when we find the Cholesky factorization, $B = LL^T$, we see the following:

$$L = \begin{bmatrix} 4 & * & * & * & * \\ * & \frac{1}{\sqrt{2}} & * & * & * \\ * & * & 2(\sqrt{3}) & * & * \\ * & * & * & \frac{\sqrt{10}}{4} & * \\ \frac{3}{4} & \frac{3}{\sqrt{2}} & \sqrt{3} & \frac{3}{\sqrt{10}} & \frac{\sqrt{\frac{3}{5}}}{4} \end{bmatrix}$$

The fill-in associated with B is much smaller than the fill-in associated with A. Consequently, the storage and computation time needed to factor B is much smaller than to factor A. Based on this, we see that an efficient sparse solver needs to find permutation P of the matrix A, which minimizes the fill-in for factoring $B = PAP^T$, and then use the factorization of B to solve the original system of equations.

Although the above example is based on a symmetric positive definite matrix and a Cholesky decomposition, the same approach works for a general LU decomposition. Specifically, let P be a permutation matrix, $B = PAP^T$ and suppose that B can be factored as $B = LU$. Then

$Ax = b$

$\Rightarrow \quad PA(P^{-1}P)x = Pb$

$\Rightarrow \quad PA(P^TP)x = Pb$

$\Rightarrow \quad (PAP^T)(Px) = Pb$

$\Rightarrow \quad B(Px) = Pb$

$\Rightarrow \quad LU(Px) = Pb$

It follows that if we obtain an LU factorization for B, we can solve the original system of equations by a three step process:

1. Solve $Ly = Pb$.

2. Solve $Uz = y$.

3. Set $x = P^Tz$.

If we apply this three-step process to the current example, we first need to perform the forward solve of the systems of equation $Ly = Pb$:

$$L = \begin{bmatrix} 4 & * & * & * & * \\ * & \frac{1}{\sqrt{2}} & * & * & * \\ * & * & 2(\sqrt{3}) & * & * \\ * & * & * & \frac{\sqrt{10}}{4} & * \\ \frac{3}{4} & \frac{3}{\sqrt{2}} & \sqrt{3} & \frac{3}{\sqrt{10}} & \frac{\sqrt{\frac{3}{5}}}{4} \end{bmatrix} * \begin{bmatrix} y1 \\ y2 \\ y3 \\ y4 \\ y5 \end{bmatrix} = \begin{bmatrix} 5 \\ 2 \\ 3 \\ 4 \\ 1 \end{bmatrix}$$

This gives: $y^T = \frac{5}{4}, 2\sqrt{2}, \frac{\sqrt{3}}{2}, \frac{16}{\sqrt{10}}, \frac{-979\sqrt{\frac{3}{5}}}{12}$.

The second step is to perform the backward solve, $Uz = y$. Or, in this case, since we are using a Cholesky factorization, $L^T z = y$.

$$\begin{bmatrix} 4 & * & * & * & \frac{3}{4} \\ * & \frac{1}{\sqrt{2}} & * & * & \frac{3}{\sqrt{2}} \\ * & * & 2(\sqrt{3}) & * & \sqrt{3} \\ * & * & * & \frac{\sqrt{10}}{4} & \frac{3}{\sqrt{10}} \\ \frac{3}{4} & \frac{3}{\sqrt{2}} & \sqrt{3} & \frac{3}{\sqrt{10}} & \frac{\sqrt{\frac{3}{5}}}{4} \end{bmatrix} * \begin{bmatrix} z1 \\ z2 \\ z3 \\ z4 \\ z5 \end{bmatrix} = \begin{bmatrix} \frac{5}{4} \\ 2(\sqrt{2}) \\ \frac{\sqrt{3}}{2} \\ \frac{16}{\sqrt{10}} \\ \frac{-979\sqrt{\frac{3}{5}}}{12} \end{bmatrix}$$

This gives $z = \frac{123}{2}, 983, \frac{1961}{12}, 398, \frac{-979}{3}$.

The third and final step is to set $x = P^T z$. This gives $X^T = \frac{-979}{3}, 983, \frac{1961}{12}, 398, \frac{123}{2}$.

Sparse Matrix Storage Formats

As discussed above, it is more efficient to store only the non-zero elements of a sparse matrix. There are a number of common storage formats used for sparse matrices, but most of them employ the same basic technique. That is, store all non-zero elements of the matrix into a linear array and provide auxiliary arrays to describe the locations of the non-zero elements in the original matrix.

Storage Formats for the Direct Sparse Solvers

The storing the non-zero elements of a sparse matrix into a linear array is done by walking down each column (column-major format) or across each row (row-major format) in order, and writing the non-zero elements to a linear array in the order they appear in the walk.

For symmetric matrices, it is necessary to store only the upper triangular half of the matrix (upper triangular format) or the lower triangular half of the matrix (lower triangular format).

The Intel MKL direct sparse solvers use a row-major upper triangular storage format: the matrix is compressed row-by-row and for symmetric matrices only non-zero elements in the upper triangular half of the matrix are stored.

The Intel MKL sparse matrix storage format for direct sparse solvers is specified by three arrays: *values*, *columns*, and *rowIndex*. The following table describes the arrays in terms of the values, row, and column positions of the non-zero elements in a sparse matrix.

values	A real or complex array that contains the non-zero elements of a sparse matrix. The non-zero elements are mapped into the *values* array using the row-major upper triangular storage mapping described above.
columns	Element *I* of the integer array *columns* is the number of the column that contains the *I*-th element in the *values* array.
rowIndex	Element *j* of the integer array *rowIndex* gives the index of the element in the *values* array that is first non-zero element in a row *j*.

The length of the *values* and *columns* arrays is equal to the number of non-zero elements in the matrix.

As the *rowIndex* array gives the location of the first non-zero element within a row, and the non-zero elements are stored consecutively, the number of non-zero elements in the *I*-th row is equal to the difference of *rowIndex*(*I*) and *rowIndex*(*I*+1).

To have this relationship hold for the last row of the matrix, an additional entry (dummy entry) is added to the end of *rowIndex*. Its value is equal to the number of non-zero elements plus one. This makes the total length of the *rowIndex* array one larger than the number of rows in the matrix.

NOTE. The Intel MKL sparse storage scheme for the direct sparse solvers uses the Fortran programming language convention of starting array indices at 1.

Consider the symmetric matrix *A*:

$$A = \begin{bmatrix} 1 & -1 & * & -3 & * \\ -1 & 5 & * & * & * \\ * & * & 4 & 6 & 4 \\ -3 & * & 6 & 7 & * \\ * & * & 4 & * & -5 \end{bmatrix}$$

Only elements from the upper triangle are stored. The actual arrays for the matrix *A* are as follows:

Table A-1 Storage Arrays for a Symmetric Matrix

values	=	(1	-1	-3	5	4	6	4	7	-5)
columns	=	(1	2	4	2	3	4	5	4	5)
rowIndex	=	(1	4	5	8	9	10)			

For a non-symmetric or non-Hermitian matrix, all non-zero elements need to be stored. Consider the non-symmetric matrix *B*:

$$B = \begin{bmatrix} 1 & -1 & * & -3 & * \\ -2 & 5 & * & * & * \\ * & * & 4 & 6 & 4 \\ -4 & * & 2 & 7 & * \\ * & 8 & * & * & -5 \end{bmatrix}$$

The matrix *B* has 13 non-zero elements, and all of them are stored as follows:

Table A-2 Storage Arrays for a Non-Symmetric Matrix

values	=	(1	-1	-3	-2	5	4	6	4	-4	2	7	8	-5)
columns	=	(1	2	4	1	2	3	4	5	1	3	4	2	5)
rowIndex	=	(1	4	6	9	12	14)							

Direct sparse solvers can also solve symmetrically structured systems of equations. A symmetrically structured system of equations is one where the pattern of non-zero elements is symmetric. That is, a matrix has a symmetric structure if $a(j,I)$ is not zero if and only if $a(j, I)$ is not zero. From the point of view of the solver software, a "non-zero" element of a matrix is any element stored in the *values* array, even if its value is equal to 0. In that sense, any non-symmetric matrix can be turned into a symmetrically structured matrix by carefully adding zeros to the *values* array. For example, the above matrix *B* can be turned into a symmetrically structured matrix by adding two non-zero entries:

$$B = \begin{bmatrix} 1 & -1 & * & -3 & * \\ -2 & 5 & * & * & 0 \\ * & * & 4 & 6 & 4 \\ -4 & * & 2 & 7 & * \\ * & 8 & 0 & * & -5 \end{bmatrix}$$

The matrix *B* can be considered to be symmetrically structured with 15 non-zero elements and represented as:

Table A-3 Storage Arrays for a Symmetrically Structured Matrix

values	=	(1	-1	-3	-2	5	0	4	6	4	-4	2	7	8	0	-5)
columns	=	(1	2	4	1	2	5	3	4	5	1	3	4	2	3	5)
rowIndex	=	(1	4	7	10	13	16)									

Storage Format Restrictions

The storage format for the sparse solver must conform to two important restrictions:

- the non-zero values in a given row must be placed into the *values* array in the order in which they occur in the row (from left to right);

- no diagonal element can be omitted from the *values* array for any symmetric or structurally symmetric matrix.

The second restriction implies that if symmetric or structurally symmetric matrices have zero diagonal elements, then they must be explicitly represented in the *values* array.

Sparse Matrix Storage Formats for Sparse BLAS Levels 2 and Level 3

This section describes in detail the sparse matrix storage formats supported in the current version of the Intel MKL Sparse BLAS Level 2 and Level 3.

CSR Format

The Intel MKL compressed sparse row (CSR) format is specified by four arrays: the *values*, *columns*, *pointerB*, and *pointerE*. The following table describes the arrays in terms of the values, row, and column positions of the non-zero elements in a sparse matrix *A*.

values	A real or complex array that contains the non-zero elements of *A*. Values of the non-zero elements of *A* are mapped into the *values* array using the row-major storage mapping described above.
columns	Element *I* of the integer array *columns* is the number of the column in *A* that contains the *I*-th value in the *values* array.
pointerB	Element *j* of this integer array gives the index of the element in the *values* array that is first non-zero element in a row *j* of *A*. Note that this index is equal to *pointerB*(*j*) - *pointerB*(1)+1 .
pointerE	An integer array that contains row indices, such that *pointerE*(*j*)-*pointerB*(1) is the index of the element in the *values* array that is last non-zero element in a row *j* of *A*.

The length of the *values* and *columns* arrays is equal to the number of non-zero elements in *A*.The length of the *pointerB* and *pointerE* arrays is equal to the number of rows in *A*.

NOTE. Note that the Intel MKL Sparse BLAS routines support the CSR format both with one-based indexing and zero-based indexing.

The matrix *B*

$$B = \begin{bmatrix} 1 & -1 & * & -3 & * \\ -2 & 5 & * & * & * \\ * & * & 4 & 6 & 4 \\ -4 & * & 2 & 7 & * \\ * & 8 & * & * & -5 \end{bmatrix}$$

can be represented in the CSR format as:

Table A-4 Storage Arrays for a Matrix in CSR Format

one-based indexing													
values	=	(1	-1	-3	-2	5	4	6	4	-4	2	7	8	-5)
columns	=	(1	2	4	1	2	3	4	5	1	3	4	2	5)
pointerB	=	(1	4	6	9	12)								
pointerE	=	(4	6	9	12	14)								
zero-based indexing													
values	=	(1	-1	-3	-2	5	4	6	4	-4	2	7	8	-5)
columns	=	(0	1	3	0	1	2	3	4	0	2	3	1	4)
pointerB	=	(0	3	5	8	11)								
pointerE	=	(3	5	8	11	13)								

This storage format is used in the NIST Sparse BLAS library [Rem05].

Note that the storage format accepted for the direct sparse solvers and described above (see Storage Formats for the Direct Sparse Solvers) is a variation of the CSR format. It also is used in the Intel MKL Sparse BLAS Level 2 both with one-based indexing and zero-based indexing. The above matrix *B* can be represented in this format (referred to as the 3-array variation of the CSR format) as:

Table A-5 Storage Arrays for a Matrix in CSR Format (3-Array Variation)

one-based indexing													
values	=	(1	-1	-3	-2	5	4	6	4	-4	2	7	8	-5)
columns	=	(1	2	4	1	2	3	4	5	1	3	4	2	5)
rowIndex	=	(1	4	6	9	12	14)							
zero-based indexing													
values	=	(1	-1	-3	-2	5	4	6	4	-4	2	7	8	-5)
columns	=	(0	1	3	0	1	2	3	4	0	2	3	1	4)
rowIndex	=	(0	3	5	8	11	13)							

The 3-array variation of the CSR format has a restriction: all non-zero elements are stored continuously, that is the set of non-zero elements in the row *J* goes just after the set of non-zero elements in the row *J-1*.

There are no such restrictions in the general (NIST) CSR format. This may be useful, for example, if there is a need to operate with different submatrices of the matrix at the same time. In this case, it is enough to define the arrays *pointerB* and *pointerE* for each needed submatrix so that all these arrays are pointers to the same array *values*.

Comparing the array *rowIndex* from the Table A-2 with the arrays *pointerB* and *pointerE* from the Table A-4 it is easy to see that

pointerB(*I*) = *rowIndex*(*I*) for *I*=1, ..5;

pointerE(*I*) = *rowIndex*(*I*+1) for *I*=1, ..5.

This enables calling a routine that has *values*, *columns*, *pointerB* and *pointerE* as input parameters for a sparse matrix stored in the format accepted for the direct sparse solvers. For example, a routine with the interface:

```
Subroutine name_routine(.... ,  values, columns, pointerB, pointerE, ...)
```

can be called with parameters *values*, *columns*, *rowIndex* as follows:

```
call name_routine(.... ,  values, columns, rowIndex, rowindex(2), ...).
```

CSC Format

The compressed sparse column format (CSC) is similar to the CSR format, but the columns are used instead the rows. In other words, the CSC format is identical to the CSR format for the transposed matrix. The CSR format is specified by four arrays: *values*, *columns*, *pointerB*, and *pointerE*. The following table describes the arrays in terms of the values, row, and column positions of the non-zero elements in a sparse matrix *A*.

values	A real or complex array that contains the non-zero elements of *A*. Values of the non-zero elements of *A* are mapped into the *values* array using the column-major storage mapping.
rows	Element *I* of the integer array *rows* is the number of the row in *A* that contains the *I*-th value in the *values* array.
pointerB	Element *j* of this integer array gives the index of the element in the *values* array that is first non-zero element in a column *j* of *A*. Note that this index is equal to *pointerB*(*j*) - *pointerB*(1)+1 .
pointerE	An integer array that contains column indices, such that *pointerE*(*j*)-*pointerB*(1) is the index of the element in the *values* array that is last non-zero element in a column *j* of *A*.

The length of the *values* and *columns* arrays is equal to the number of non-zero elements in *A*.The length of the *pointerB* and *pointerE* arrays is equal to the number of columns in *A*.

NOTE. Note that the Intel MKL Sparse BLAS routines support the CSC format both with one-based indexing and zero-based indexing.

The above matrix *B* can be represented in the CSC format as:

Table A-6 Storage Arrays for a Matrix in CSC Format

one-based indexing													
values	=	(1	-2	-4	-1	5	8	4	2	-3	6	7	4	-5)
rows	=	(1	2	4	1	2	5	3	4	1	3	4	2	5)
pointerB	=	(1	4	7	9	12)								
pointerE	=	(4	7	9	12	14)								
zero-based indexing													
values	=	(1	-2	-4	-1	5	8	4	2	-3	6	7	4	-5)

rows	=	(0	1	3	0	1	4	2	3	0	2	3	1	4)
pointerB	=	(0	3	6	8	11)								
pointerE	=	(3	6	8	11	13)								

Coordinate Format

The coordinate format is the most flexible and simplest format for the sparse matrix representation. Only non-zero elements are stored, and the coordinates of each non-zero element are given explicitly. Many commercial libraries support the matrix-vector multiplication for the sparse matrices in the coordinate format.

The Intel MKL coordinate format is specified by three arrays: *values*, *rows*, and *column*, and a parameter *nnz* which is number of non-zero elements in *A*. All three arrays have dimension *nnz*. The following table describes the arrays in terms of the values, row, and column positions of the non-zero elements in a sparse matrix *A*.

values	A real or complex array that contains the non-zero elements of *A* in any order.
rows	Element *I* of the integer array *rows* is the number of the row in *A* that contains the *I*-th value in the *values* array.
columns	Element *I* of the integer array *columns* is the number of the column in *A* that contains the *I*-th value in the *values* array .

NOTE. Note that the Intel MKL Sparse BLAS routines support the coordinate format both with one-based indexing and zero-based indexing.

For example, the sparse matrix *C*

$$C = \begin{bmatrix} 1 & -1 & -3 & 0 & 0 \\ -2 & 5 & 0 & 0 & 0 \\ 0 & 0 & 4 & 6 & 4 \\ -4 & 0 & 2 & 7 & 0 \\ 0 & 8 & 0 & 0 & -5 \end{bmatrix}$$

can be represented in the coordinate format as follows:

Table A-7 Storage Arrays for an Example Matrix in case of the coordinate format

one-based indexing													
values	=	(1	-1	-3	-2	5	4	6	4	-4	2	7	8	-5)
rows	=	(1	1	1	2	2	3	3	3	4	4	4	5	5)
columns	=	(1	2	3	1	2	3	4	5	1	3	4	2	5)
zero-based indexing													
values	=	(1	-1	-3	-2	5	4	6	4	-4	2	7	8	-5)
rows	=	(0	0	0	1	1	2	2	2	3	3	3	4	4)
columns	=	(0	1	2	0	1	2	3	4	0	2	3	1	4)

Diagonal Storage Format

If the sparse matrix has diagonals containing only zero elements, then the diagonal storage format can be used to reduce the amount of information needed to locate the non-zero elements. This storage format is particularly useful in many applications where the matrix arises from a finite element or finite difference discretization. The Intel MKL diagonal storage format is specified by two arrays: *values* and *distance*, and two parameters: *ndiag*, which is the number of non-empty diagonals, and *lval*, which is the declared leading dimension in the calling (sub)programs. The following table describes the arrays *values* and *distance*:

values	A real or complex two-dimensional array is dimensioned as *lval* by *ndiag*. Each column of it contains the non-zero elements of certain diagonal of *A*. The key point of the storage is that each element in *values* retains the row number of the original matrix. To achieve this diagonals in the lower triangular part of the matrix are padded from the top, and those in the upper triangular part are padded from the bottom. Note that the value of *distance*(*I*) is the number of elements to be padded for diagonal *I*.
distance	An integer array with dimension *ndiag*. Element *I* of the array *distance* is the distance between *I*-diagonal and the main diagonal. The distance is positive if the diagonal is above the main diagonal, and negative if the diagonal is below the main diagonal. The main diagonal has a distance equal to zero.

The above matrix *C* can be represented in the diagonal storage format as follows:

$$distance = (-3 \quad -1 \quad 0 \quad 1 \quad 2)$$

$$values = \begin{bmatrix} * & * & 1 & -1 & -3 \\ * & -2 & 5 & 0 & 0 \\ * & 0 & 4 & 6 & 4 \\ -4 & 2 & 7 & 0 & * \\ 8 & 0 & -5 & * & * \end{bmatrix}$$

where the asterisks denote padded elements.

When storing symmetric, Hermitian, or skew-symmetric matrices, it is necessary to store only the upper or the lower triangular part of the matrix.

For the Intel MKL triangular solver routines elements of the array *distance* must be sorted in increasing order. In all other cases the diagonals and distances can be stored in arbitrary order.

Skyline Storage Format

The skyline storage format is important for the direct sparse solvers, and it is well suited for Cholesky or LU decomposition when no pivoting is required.

The skyline storage format accepted in Intel MKL can store only triangular matrix or triangular part of a matrix. This format is specified by two arrays: *values* and *pointers*. The following table describes these arrays:

values	A scalar array. For a lower triangular matrix it contains the set of elements from each row of the matrix starting from the first non-zero element to and including the diagonal element. For an upper triangular matrix it contains the set of elements from each column of the matrix starting with the first non-zero element down to and including the diagonal element. Encountered zero elements are included in the sets.
pointers	An integer array with dimension (*m*+1), where *m* is the number of rows for lower triangle (columns for the upper triangle). *pointers*(*I*) - *pointers*(1)+1 gives the index of element in *values* that is first non-zero element in row (column) *I*. The value of *pointers*(*m*+1) is set to *nz*+*pointers*(1), where *nnz* is the number of elements in the array *values*.

For example, the low triangle of the matrix *C* given above can be stored as follows:

values = (1 -2 5 4 -4 0 2 7 8 0 0 -5)

pointers = (1 2 4 5 9 13)

and the upper triangle of this matrix *C* can be stored as follows:

values = (1 -1 5 -3 0 4 6 7 4 0 -5)

pointers = (1 2 4 7 9 12)

This storage format is supported by the NIST Sparse BLAS library [Rem05].

Note that the Intel MKL Sparse BLAS routines operating with the skyline storage format does not support general matrices.

BSR Format

The Intel MKL block compressed sparse row (BSR) format for sparse matrices is specified by four arrays: *values*, *columns*, *pointerB*, and *pointerE*. The following table describes these arrays.

values	A real array that contains the elements of the non-zero blocks of a sparse matrix. The elements are stored block-by-block in row-major order. A non-zero block is the block that contains at least one non-zero element. All elements of non-zero blocks are stored, even if some of them is equal to zero. Within each non-zero block elements are stored in column-major order in the case of one-based indexing, and in row-major order in the case of the zero-based indexing.
columns	Element *I* of the integer array *columns* is the number of the column in the block matrix that contains the *I*-th non-zero block.
pointerB	Element *j* of this integer array gives the index of the element in the *columns* array that is first non-zero block in a row *j* of the block matrix.
pointerE	Element *j* of this integer array gives the index of the element in the *columns* array that contains the last non-zero block in a row *j* of the block matrix plus 1.

The length of the *values* array is equal to the number of all elements in the non-zero blocks, the length of the *columns* array is equal to the number of non-zero blocks. The length of the *pointerB* and *pointerE* arrays is equal to the number of block rows in the block matrix.

NOTE. Note that the Intel MKL Sparse BLAS routines support BSR format both with one-based indexing and zero-based indexing.

For example, consider the sparse matrix *D*

$$D = \begin{bmatrix} 1 & 0 & 6 & 7 & * & * \\ 2 & 1 & 8 & 2 & * & * \\ * & * & 1 & 4 & * & * \\ * & * & 5 & 1 & * & * \\ * & * & 4 & 3 & 7 & 2 \\ * & * & 0 & 0 & 0 & 0 \end{bmatrix}$$

If the size of the block equals 2, then the sparse matrix *D* can be represented as a 3x3 block matrix *E* with the following structure:

$$E = \begin{bmatrix} L & M & * \\ * & N & * \\ * & P & Q \end{bmatrix}$$

where

$$L = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}, M = \begin{bmatrix} 6 & 7 \\ 8 & 2 \end{bmatrix}, N = \begin{bmatrix} 1 & 4 \\ 5 & 1 \end{bmatrix}, P = \begin{bmatrix} 4 & 3 \\ 0 & 0 \end{bmatrix}, Q = \begin{bmatrix} 7 & 2 \\ 0 & 0 \end{bmatrix}$$

The matrix *D* can be represented in the BSR format as follows:

one-based indexing

values = (1 2 0 1 6 8 7 2 1 5 4 1 4 0 3 0 7 0 2 0)

columns = (1 2 2 2 3)

pointerB = (1 3 4)

pointerE = (3 4 6)

zero-based indexing

values = (1 0 2 1 6 7 8 2 1 4 5 1 4 3 0 0 7 2 0 0)

columns = (0 1 1 1 2)

pointerB = (0 2 3)

pointerE = (2 3 5)

This storage format is supported by the NIST Sparse BLAS library [Rem05].

Intel MKL supports the variation of the BSR format that is specified by three arrays: *values*, *columns*, and *rowIndex*. The following table describes these arrays.

values	A real array that contains the elements of the non-zero blocks of a sparse matrix. The elements are stored block by block in row-major order. A non-zero block is the block that contains at least one non-zero element. All elements of non-zero blocks are stored, even if some of them is equal to zero. Within each non-zero block the elements are stored in column major order in the case of the one-based indexing, and in row major order in the case of the zero-based indexing.
columns	Element *I* of the integer array *columns* is the number of the column in the block matrix that contains the *I*-th non-zero block.
rowIndex	Element *j* of this integer array gives the index of the element in the *columns* array that is first non-zero block in a row *j* of the block matrix.

The length of the *values* array is equal to the number of all elements in the non-zero blocks, the length of the *columns* array is equal to the number of non-zero blocks.

As the *rowIndex* array gives the location of the first non-zero block within a row, and the non-zero blocks are stored consecutively, the number of non-zero blocks in the *I*-th row is equal to the difference of *rowIndex*(*I*) and *rowIndex*(*I*+1).

To retain this relationship for the last row of the block matrix, an additional entry (dummy entry) is added to the end of *rowIndex* with value equal to the number of non-zeros blocks plus one. This makes the total length of the *rowIndex* array one larger than the number of rows of the block matrix.

The above matrix *D* can be represented in this 3-array variation of the BSR format as follows:

one-based indexing

values = (1 2 0 1 6 8 7 2 1 5 4 2 4 0 3 0 7 0 2 0)

columns = (1 2 2 2 3)

rowIndex = (1 3 4 6)

zero-based indexing

values = (1 0 2 1 6 7 8 2 1 4 5 1 4 3 0 0 7 2 0 0)

columns = (0 1 1 1 2)

rowIndex = (0 2 3 5)

When storing symmetric matrices, it is necessary to store only the upper or the lower triangular part of the matrix.

For example, consider the symmetric sparse matrix *F*:

$$F = \begin{bmatrix} 1 & 0 & 6 & 7 & * & * \\ 2 & 1 & 8 & 2 & * & * \\ 6 & 8 & 1 & 4 & * & * \\ 7 & 2 & 5 & 2 & * & * \\ * & * & * & * & 7 & 2 \\ * & * & * & * & 0 & 0 \end{bmatrix}$$

If the size of the block equals 2, then the sparse matrix *F* can be represented as a 3x3 block matrix *G* with the following structure:

$$G = \begin{bmatrix} L & M & * \\ M' & N & * \\ * & * & Q \end{bmatrix}$$

where

$$L = \begin{bmatrix} 1 & 0 \\ 2 & 1 \end{bmatrix}, M = \begin{bmatrix} 6 & 7 \\ 8 & 2 \end{bmatrix}, M' = \begin{bmatrix} 6 & 8 \\ 7 & 2 \end{bmatrix}, N = \begin{bmatrix} 1 & 4 \\ 5 & 2 \end{bmatrix}, Q = \begin{bmatrix} 7 & 2 \\ 0 & 0 \end{bmatrix}$$

The symmetric matrix *F* can be represented in this 3-array variation of the BSR format (storing only upper triangular) as follows:

one-based indexing

values = (1 2 0 1 6 8 7 2 1 5 4 2 7 0 2 0)

columns = (1 2 2 3)

rowIndex = (1 3 4 5)

zero-based indexing

values = (1 0 2 1 6 7 8 2 1 4 5 2 7 2 0 0)

columns = (0 1 1 2)

rowIndex = (0 2 3 4)

Routine and Function Arguments

B

The major arguments in the BLAS routines are vector and matrix, whereas VML functions work on vector arguments only. The sections that follow discuss each of these arguments and provide examples.

Vector Arguments in BLAS

Vector arguments are passed in one-dimensional arrays. The array dimension (length) and vector increment are passed as integer variables. The length determines the number of elements in the vector. The increment (also called stride) determines the spacing between vector elements and the order of the elements in the array in which the vector is passed.

A vector of length *n* and increment *incx* is passed in a one-dimensional array *x* whose values are defined as

x(1), *x*(1+|*incx*|), ..., *x*(1+(*n*-1)* |*incx*|)

If *incx* is positive, then the elements in array *x* are stored in increasing order. If *incx* is negative, the elements in array *x* are stored in decreasing order with the first element defined as *x*(1+(*n*-1)* |*incx*|). If *incx* is zero, then all elements of the vector have the same value, *x*(1). The dimension of the one-dimensional array that stores the vector must always be at least

idimx = 1 + (*n*-1)* |*incx* |

Example B-1 One-dimensional Real Array

Let *x*(1:7) be the one-dimensional real array

x = (1.0, 3.0, 5.0, 7.0, 9.0, 11.0, 13.0).

If *incx* =2 and *n* = 3, then the vector argument with elements in order from first to last is (1.0, 5.0, 9.0).

If *incx* = -2 and *n* = 4, then the vector elements in order from first to last is (13.0, 9.0, 5.0, 1.0).

If *incx* = 0 and *n* = 4, then the vector elements in order from first to last is (1.0, 1.0, 1.0, 1.0).

One-dimensional substructures of a matrix, such as the rows, columns, and diagonals, can be passed as vector arguments with the starting address and increment specified. In Fortran, storing the *m*-by-*n* matrix is based on column-major ordering where the increment between elements in the same column is 1, the increment between elements in the same row is *m*, and the increment between elements on the same diagonal is *m* + 1.

Example B-2 Two-dimensional Real Matrix

Let *a* be the real 5 x 4 matrix declared as REAL A (5,4).

To scale the third column of *a* by 2.0, use the BLAS routine sscal with the following calling sequence:

callsscal (5, 2.0, a(1,3), 1)

To scale the second row, use the statement:

```
callsscal (4, 2.0, a(2,1), 5)
```

To scale the main diagonal of A by 2.0, use the statement:

```
callsscal (5, 2.0, a(1,1), 6)
```

NOTE. The default vector argument is assumed to be 1.

Vector Arguments in VML

Vector arguments of VML mathematical functions are passed in one-dimensional arrays with unit vector increment. It means that a vector of length *n* is passed contiguously in an array *a* whose values are defined as `a[0], a[1], ..., a[`*n*`-1]` (for the C interface).

To accommodate for arrays with other increments, or more complicated indexing, VML contains auxiliary pack/unpack functions that gather the array elements into a contiguous vector and then scatter them after the computation is complete.

Generally, if the vector elements are stored in a one-dimensional array *a* as

```
a[m0], a[m1], ..., a[mn-1]
```

and need to be regrouped into an array *y* as

```
y[k0], y[k1], ..., y[kn-1],
```

VML pack/unpack functions can use one of the following indexing methods:

Positive Increment Indexing

```
kj = incy * j, mj = inca * j, j = 0 ,..., n-1
```

Constraint: `incy > 0` and `inca > 0`.

For example, setting incy = 1 specifies gathering array elements into a contiguous vector.

This method is similar to that used in BLAS, with the exception that negative and zero increments are not permitted.

Index Vector Indexing

```
kj = iy[j], mj = ia[j], j = 0 ,..., n-1,
```

where ia and iy are arrays of length *n* that contain index vectors for the input and output arrays *a* and *y*, respectively.

Mask Vector Indexing

Indices `kj` , `mj` are such that:

```
my[kj] ≠ 0, ma[mj] ≠ 0 , j = 0,..., n-1,
```

where `ma` and `my` are arrays that contain mask vectors for the input and output arrays *a* and *y*, respectively.

Matrix Arguments

Matrix arguments of the Intel® Math Kernel Library routines can be stored in either one- or two-dimensional arrays, using the following storage schemes:

- conventional full storage (in a two-dimensional array)
- packed storage for Hermitian, symmetric, or triangular matrices (in a one-dimensional array)
- band storage for band matrices (in a two-dimensional array)
- rectangular full packed storage for symmetric, Hermitian, or triangular matrices as compact as the Packed storage while maintaining efficiency by using Level 3 BLAS/LAPACK kernels.

Full storage is the following obvious scheme: a matrix A is stored in a two-dimensional array *a*, with the matrix element a_{ij} stored in the array element *a*(*i*,*j*).

If a matrix is triangular (upper or lower, as specified by the argument *uplo*), only the elements of the relevant triangle are stored; the remaining elements of the array need not be set.

Routines that handle symmetric or Hermitian matrices allow for either the upper or lower triangle of the matrix to be stored in the corresponding elements of the array:

if *uplo* ='U',	a_{ij} is stored in *a*(*i*,*j*) for $i \le j$, other elements of *a* need not be set.
if *uplo* ='L',	a_{ij} is stored in *a*(*i*,*j*) for $j \le i$, other elements of *a* need not be set.

Packed storage allows you to store symmetric, Hermitian, or triangular matrices more compactly: the relevant triangle (again, as specified by the argument *uplo*) is packed by columns in a one-dimensional array *ap*:

if *uplo* ='U', a_{ij} is stored in *ap*(*i*+*j*(*j*-1)/2) for $i \le j$

if *uplo* ='L', a_{ij} is stored in *ap*(*i*+(2**n*-*j*)*(*j*-1)/2) for $j \le i$.

In descriptions of LAPACK routines, arrays with packed matrices have names ending in *p*.

Band storage is as follows: an *m*-by-*n* band matrix with *kl* non-zero sub-diagonals and *ku* non-zero super-diagonals is stored compactly in a two-dimensional array *ab* with *kl*+*ku*+1 rows and *n* columns. Columns of the matrix are stored in the corresponding columns of the array, and diagonals of the matrix are stored in rows of the array. Thus,

a_{ij} is stored in *ab*(*ku*+1+*i*-*j*,*j*) for $\max(1,j-ku) \le i \le \min(n,j+kl)$.

Use the band storage scheme only when *kl* and *ku* are much less than the matrix size *n*. Although the routines work correctly for all values of *kl* and *ku*, using the band storage is inefficient if your matrices are not really banded.

The band storage scheme is illustrated by the following example, when

m = *n* = 6, *kl* = 2, *ku* = 1

Array elements marked * are not used by the routines:

Banded matrix A

$$\begin{bmatrix} a_{11} & a_{12} & 0 & 0 & 0 & 0 \\ a_{21} & a_{22} & a_{23} & 0 & 0 & 0 \\ a_{31} & a_{42} & a_{43} & a_{34} & 0 & 0 \\ 0 & a_{42} & a_{43} & a_{44} & a_{45} & 0 \\ 0 & 0 & a_{53} & a_{54} & a_{55} & a_{56} \\ 0 & 0 & 0 & a_{64} & a_{65} & a_{66} \end{bmatrix}$$

Band storage of A

$$\begin{matrix} * & a_{12} & a_{23} & a_{34} & a_{45} & a_{56} \\ a_{11} & a_{22} & a_{33} & a_{44} & a_{55} & a_{66} \\ a_{21} & a_{32} & a_{43} & a_{54} & a_{65} & * \\ a_{31} & a_{42} & a_{53} & a_{64} & * & * \end{matrix}$$

When a general band matrix is supplied for *LU factorization*, space must be allowed to store kl additional super-diagonals generated by fill-in as a result of row interchanges. This means that the matrix is stored according to the above scheme, but with $kl + ku$ super-diagonals. Thus,

a_{ij} is stored in $ab(kl+ku+1+i-j,j)$ for $\max(1,j-ku) \le i \le \min(n,j+kl)$.

The band storage scheme for LU factorization is illustrated by the following example, when $m = n = 6$, $kl = 2$, $ku = 1$:

Banded matrix A

$$\begin{bmatrix} a_{11} & a_{12} & 0 & 0 & 0 & 0 \\ a_{21} & a_{22} & a_{23} & 0 & 0 & 0 \\ a_{31} & a_{42} & a_{43} & a_{34} & 0 & 0 \\ 0 & a_{42} & a_{43} & a_{44} & a_{45} & 0 \\ 0 & 0 & a_{53} & a_{54} & a_{55} & a_{56} \\ 0 & 0 & 0 & a_{64} & a_{65} & a_{66} \end{bmatrix}$$

Band storage of A

$$\begin{matrix} * & * & * & + & + & + \\ * & * & + & + & + & + \\ * & a_{12} & a_{23} & a_{34} & a_{45} & a_{56} \\ a_{11} & a_{22} & a_{33} & a_{44} & a_{55} & a_{66} \\ a_{21} & a_{32} & a_{43} & a_{54} & a_{65} & * \\ a_{31} & a_{42} & a_{53} & a_{64} & * & * \end{matrix}$$

Array elements marked * are not used by the routines; elements marked + need not be set on entry, but are required by the LU factorization routines to store the results. The input array will be overwritten on exit by the details of the LU factorization as follows:

$$\begin{matrix} * & * & * & u_{14} & u_{25} & u_{36} \\ * & * & u_{13} & u_{24} & u_{35} & u_{46} \\ * & u_{12} & u_{23} & u_{34} & u_{45} & u_{56} \\ u_{11} & u_{22} & u_{33} & u_{44} & u_{55} & u_{66} \\ m_{21} & m_{32} & m_{43} & m_{54} & m_{65} & * \\ m_{31} & m_{42} & m_{53} & m_{64} & * & * \end{matrix}$$

where u_{ij} are the elements of the upper triangular matrix U, and m_{ij} are the multipliers used during factorization.

Triangular band matrices are stored in the same format, with either *kl*= 0 if upper triangular, or *ku* = 0 if lower triangular. For symmetric or Hermitian band matrices with *k* sub-diagonals or super-diagonals, you need to store only the upper or lower triangle, as specified by the argument *uplo*:

if *uplo* ='U', a_{ij} is stored in *ab*(*k*+1+*i*-*j*,*j*) for max(1,*j*-*k*) ≤ *i* ≤ *j*

if *uplo* ='L', a_{ij} is stored in *ab*(1+*i*-*j*,*j*) for *j* ≤ *i* ≤ min(*n*,*j*+*k*).

In descriptions of LAPACK routines, arrays that hold matrices in band storage have names ending in *b*.

In Fortran, column-major ordering of storage is assumed. This means that elements of the same column occupy successive storage locations.

Three quantities are usually associated with a two-dimensional array argument: its leading dimension, which specifies the number of storage locations between elements in the same row, its number of rows, and its number of columns. For a matrix in full storage, the leading dimension of the array must be at least as large as the number of rows in the matrix.

A character transposition parameter is often passed to indicate whether the matrix argument is to be used in normal or transposed form or, for a complex matrix, if the conjugate transpose of the matrix is to be used.

The values of the transposition parameter for these three cases are the following:

'N' or *'n'*	normal (no conjugation, no transposition)
'T' or *'t'*	transpose
'C' or *'c'*	conjugate transpose.

Example B-3 Two-Dimensional Complex Array

Suppose *A* (1:5, 1:4) is the complex two-dimensional array presented by matrix

$$\begin{bmatrix} (1.1,0.11) & (1.2,0.12) & (1.3,0.13) & (1.4,0.14) \\ (2.1,0.21) & (2.2,0.22) & (2.3,0.23) & (1.4,0.24) \\ (3.1,0.31) & (3.2,0.32) & (3.3,0.33) & (1.4,0.34) \\ (4.1,0.41) & (4.2,0.42) & (4.3,0.43) & (1.4,0.44) \\ (5.1,0.51) & (5.2,0.52) & (5.3,0.53) & (1.4,0.54) \end{bmatrix}$$

Let *transa* be the transposition parameter, *m* be the number of rows, *n* be the number of columns, and *lda* be the leading dimension. Then if

transa = *'N'*, *m* = 4, *n* = 2, and *lda* = 5, the matrix argument would be

$$\begin{bmatrix} (1.1,0.11) & (1.2,0.12) \\ (2.1,0.21) & (2.2,0.22) \\ (3.1,0.31) & (3.2,0.32) \\ (4.1,0.41) & (4.2,0.42) \end{bmatrix}$$

If *transa* = *'T'*, *m* = 4, *n* = 2, and *lda* =5, the matrix argument would be

$$\begin{bmatrix} (1.1, 0.11) & (2.1, 0.21) & (3.1, 0.31) & (4.1, 0.41) \\ (1.2, 0.12) & (2.2, 0.22) & (3.2, 0.32) & (4.2, 0.42) \end{bmatrix}$$

If *transa* = 'C', *m* = 4, *n* = 2, and *lda* =5, the matrix argument would be

$$\begin{bmatrix} (1.1, -0.11) & (2.1, -0.21) & (3.1, -0.31) & (4.1, -0.41) \\ (1.2, -0.12) & (2.2, -0.22) & (3.2, -0.32) & (4.2, -0.42) \end{bmatrix}$$

Note that care should be taken when using a leading dimension value which is different from the number of rows specified in the declaration of the two-dimensional array. For example, suppose the array *A* above is declared as COMPLEX A (5,4).

Then if *transa* = 'N', *m* = 3, *n* = 4, and *lda* = 4, the matrix argument will be

$$\begin{bmatrix} (1.1, 0.11) & (5.1, 0.51) & (4.2, 0.42) & (3.3, 0.33) \\ (2.1, 0.21) & (1.2, 0.12) & (5.2, 0.52) & (4.3, 0.43) \\ (3.1, 0.31) & (2.2, 0.22) & (1.3, 0.13) & (5.3, 0.53) \end{bmatrix}$$

Rectangular Full Packed storage allows you to store symmetric, Hermitian, or triangular matrices as compact as the Packed storage while maintaining efficiency by using Level 3 BLAS/LAPACK kernels. To store an *n*-by-*n* triangle (and suppose for simplicity that *n* is even), you partition the triangle into three parts: two *n*/2-by-*n*/2 triangles and an *n*/2-by-*n*/2 square, then pack this as an *n*-by-*n*/2 rectangle (or *n*/2-by-*n* rectangle), by transposing (or transpose-conjugating) one of the triangles and packing it next to the other triangle. Since the two triangles are stored in full storage, you can use existing efficient routines on them.

There are eight cases of RFP storage representation: when *n* is even or odd, the packed matrix is transposed or not, the triangular matrix is lower or upper. See below for all the eight storage schemes illustrated:

n is odd, *A* is lower triangular

Full format

$$\begin{matrix} a_{11} & X & X & X & X & X & X \\ a_{21} & a_{22} & X & X & X & X & X \\ a_{31} & a_{32} & a_{33} & X & X & X & X \\ a_{41} & a_{42} & a_{43} & a_{44} & X & X & X \\ \mathbf{a_{51}} & \mathbf{a_{52}} & \mathbf{a_{53}} & \mathbf{a_{54}} & a_{55} & X & X \\ \mathbf{a_{61}} & \mathbf{a_{62}} & \mathbf{a_{63}} & \mathbf{a_{64}} & a_{65} & a_{66} & X \\ \mathbf{a_{71}} & \mathbf{a_{72}} & \mathbf{a_{73}} & \mathbf{a_{74}} & a_{75} & a_{76} & a_{77} \end{matrix}$$

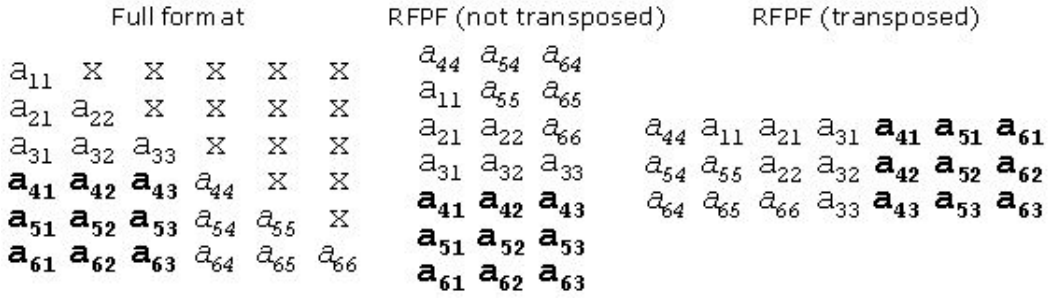
RFPF (not transposed)

$$\begin{matrix} a_{11} & a_{55} & a_{65} & a_{75} \\ a_{21} & a_{22} & a_{66} & a_{76} \\ a_{31} & a_{32} & a_{33} & a_{77} \\ a_{41} & a_{42} & a_{43} & a_{44} \\ \mathbf{a_{51}} & \mathbf{a_{52}} & \mathbf{a_{53}} & \mathbf{a_{54}} \\ \mathbf{a_{61}} & \mathbf{a_{62}} & \mathbf{a_{63}} & \mathbf{a_{64}} \\ \mathbf{a_{71}} & \mathbf{a_{72}} & \mathbf{a_{73}} & \mathbf{a_{74}} \end{matrix}$$

RFPF (transposed)

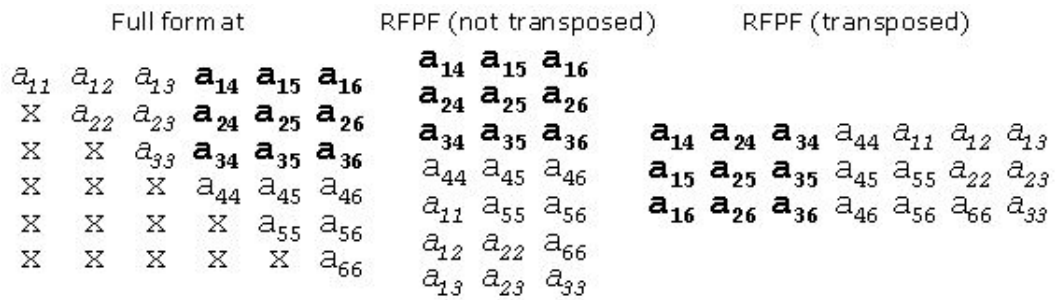
$$\begin{matrix} a_{11} & a_{21} & a_{31} & a_{41} & \mathbf{a_{51}} & \mathbf{a_{61}} & \mathbf{a_{71}} \\ a_{55} & a_{22} & a_{32} & a_{42} & \mathbf{a_{52}} & \mathbf{a_{62}} & \mathbf{a_{72}} \\ a_{65} & a_{66} & a_{33} & a_{43} & \mathbf{a_{53}} & \mathbf{a_{63}} & \mathbf{a_{73}} \\ a_{75} & a_{76} & a_{77} & a_{44} & \mathbf{a_{54}} & \mathbf{a_{64}} & \mathbf{a_{74}} \end{matrix}$$

n is even, *A* is lower triangular



n is odd, *A* is upper triangular

n is even, *A* is upper triangular



Intel MKL provides a number of routines such as `?hfrk`, `?sfrk` performing BLAS operations working directly on RFP matrices, as well as some conversion routines, for instance, `?tpttf` goes from the standard packed format to RFP and `?trttf` goes from the full format to RFP.

Please refer to the Netlib site for more information.

Note that in the descriptions of LAPACK routines, arrays with RFP matrices have names ending in `fp`.

Code Examples

C

This appendix presents code examples of using some Intel MKL routines and functions. You can find here example code written in both Fortran and C.

Please refer to respective chapters in the manual for detailed descriptions of function parameters and operation.

BLAS Code Examples

Example C-1. Using BLAS Level 1 Function

The following example illustrates a call to the BLAS Level 1 function `sdot`. This function performs a vector-vector operation of computing a scalar product of two single-precision real vectors *x* and *y*.

Parameters

n	Specifies the number of elements in vectors *x* and *y*.
incx	Specifies the increment for the elements of *x*.
incy	Specifies the increment for the elements of *y*.

```
program dot_main
real x(10), y(10), sdot, res
integer n, incx, incy, i
external sdot
n = 5
incx = 2
incy = 1
do i = 1, 10
  x(i) = 2.0e0
  y(i) = 1.0e0
end do
res = sdot (n, x, incx, y, incy)
print*, `SDOT = `, res
end
```

As a result of this program execution, the following line is printed:

SDOT = 10.000

Example C-2. Using BLAS Level 1 Routine

The following example illustrates a call to the BLAS Level 1 routine `scopy`. This routine performs a vector-vector operation of copying a single-precision real vector *x* to a vector *y*.

Parameters

n	Specifies the number of elements in vectors *x* and *y*.

Parameters

incx	Specifies the increment for the elements of *x*.
incy	Specifies the increment for the elements of *y*.

```
program copy_main
real x(10), y(10)
integer n, incx, incy, i
n = 3
incx = 3
incy = 1
do i = 1, 10
  x(i) = i
end do
call scopy (n, x, incx, y, incy)
print*, `Y = `, (y(i), i = 1, n)
end
```

As a result of this program execution, the following line is printed:

Y = 1.00000 4.00000 7.00000

Example C-3. Using BLAS Level 2 Routine

The following example illustrates a call to the BLAS Level 2 routine `sger`. This routine performs a matrix-vector operation

a := *alpha***x***y*' + *a*.

Parameters

alpha	Specifies a scalar *alpha*.
x	*m*-element vector.
y	*n*-element vector.
a	*m*-by-*n* matrix.

```
program ger_main
real a(5,3), x(10), y(10), alpha
integer m, n, incx, incy, i, j, lda
m = 2
 n = 3
lda = 5
incx = 2
incy = 1
alpha = 0.5
do i = 1, 10
  x(i) = 1.0
  y(i) = 1.0
end do
do i = 1, m
  do j = 1, n
    a(i,j) = j
  end do
end do
call sger (m, n, alpha, x, incx, y, incy, a, lda)
print*, `Matrix A: `
do i = 1, m
```

```
  print*, (a(i,j), j = 1, n)
end do
end
```

As a result of this program execution, matrix *a* is printed as follows:

Matrix A:

1.50000 2.50000 3.50000

1.50000 2.50000 3.50000

Example C-4. Using BLAS Level 3 Routine

The following example illustrates a call to the BLAS Level 3 routine ssymm. This routine performs a matrix-matrix operation

c := *alpha***a***b*' + *beta***c*.

Parameters

alpha	Specifies a scalar *alpha*.
beta	Specifies a scalar *beta*.
a	Symmetric matrix
b	*m*-by-*n* matrix
c	*m*-by-*n* matrix

```
program symm_main
real a(3,3), b(3,2), c(3,3), alpha, beta
integer m, n, lda, ldb, ldc, i, j
character uplo, side
uplo = 'u'
side = 'l'
m = 3
n = 2
lda = 3
ldb = 3
ldc = 3
alpha = 0.5
beta = 2.0
do i = 1, m
  do j = 1, m
    a(i,j) = 1.0
  end do
end do
do i = 1, m
  do j = 1, n
    c(i,j) = 1.0
    b(i,j) = 2.0
  end do
end do
call ssymm (side, uplo, m, n, alpha,
a, lda, b, ldb, beta, c, ldc)
print*, `Matrix C: `
do i = 1, m
  print*, (c(i,j), j = 1, n)
end do
end
```

As a result of this program execution, matrix *c* is printed as follows:

Matrix C:

5.00000 5.00000

5.00000 5.00000

5.00000 5.00000

The following example illustrates a call from a C program to the complex BLAS Level 1 function `zdotc()`. This function computes the dot product of two double-precision complex vectors.

Example C-5. Calling a Complex BLAS Level 1 Function from C

In this example, the complex dot product is returned in the structure *c*.

```
#define N 5
void main()
{

  int n, inca = 1, incb = 1, i;
  typedef struct{ double re; double im; } complex16;
  complex16 a[N], b[N], c;
  void zdotc();
  n = N;
  for( i = 0; i < n; i++ ){
    a[i].re = (double)i; a[i].im = (double)i * 2.0;
    b[i].re = (double)(n - i); b[i].im = (double)i * 2.0;
  }
  zdotc( &c, &n, a, &inca, b, &incb );
  printf( "The complex dot product is: ( %6.2f, %6.2f )\n", c.re, c.im );
}
```

NOTE. Instead of calling BLAS directly from C programs, you might wish to use the CBLAS interface; this is the supported way of calling BLAS from C. For more information about CBLAS, see Appendix D , which presents CBLAS, the C interface to the Basic Linear Algebra Subprograms (BLAS) implemented in Intel® MKL.

Fourier Transform Functions Code Examples

This section presents code examples of functions described in the "FFT Functions" and "Cluster FFT Functions" sections in the "Fourier Transform Functions" chapter. The examples are grouped in subsections

- Examples for FFT Functions, including Examples of Using Multi-Threading for FFT Computation
- Examples for Cluster FFT Functions
- Auxiliary data transformations.

FFT Code Examples

This section presents code examples of using the FFT interface functions described in "Fourier Transform Functions" chapter. Here are the examples of two one-dimensional computations. These examples use the default settings for all of the configuration parameters, which are specified in "Configuration Settings".

Example C-6 One-dimensional In-place FFT (Fortran Interface)

```
! Fortran example.
! 1D complex to complex, and real to conjugate-even
Use MKL_DFTI
Complex :: X(32)
Real :: Y(34)
type(DFTI_DESCRIPTOR), POINTER :: My_Desc1_Handle, My_Desc2_Handle
Integer :: Status
!...put input data into X(1),...,X(32); Y(1),...,Y(32)

! Perform a complex to complex transform
Status = DftiCreateDescriptor( My_Desc1_Handle, DFTI_SINGLE,&
   DFTI_COMPLEX, 1, 32 )
Status = DftiCommitDescriptor( My_Desc1_Handle )
Status = DftiComputeForward( My_Desc1_Handle, X )
Status = DftiFreeDescriptor(My_Desc1_Handle)
! result is given by {X(1),X(2),...,X(32)}

! Perform a real to complex conjugate-even transform
Status = DftiCreateDescriptor(My_Desc2_Handle, DFTI_SINGLE,&
   DFTI_REAL, 1, 32)
Status = DftiCommitDescriptor(My_Desc2_Handle)
Status = DftiComputeForward(My_Desc2_Handle, Y)
Status = DftiFreeDescriptor(My_Desc2_Handle)
! result is given in CCS format.
```

Example C-7 One-dimensional Out-of-place FFT (Fortran Interface)

```
! Fortran example.
! 1D complex to complex, and real to conjugate-even
Use MKL_DFTI
Complex :: X_in(32)
Complex :: X_out(32)
Real :: Y_in(32)
Real :: Y_out(34)
type(DFTI_DESCRIPTOR), POINTER :: My_Desc1_Handle, My_Desc2_Handle
Integer :: Status
...put input data into X_in(1),...,X_in(32); Y_in(1),...,Y_in(32)
! Perform a complex to complex transform
Status = DftiCreateDescriptor( My_Desc1_Handle, DFTI_SINGLE,
DFTI_COMPLEX, 1, 32 )
Status = DftiSetValue( My_Desc1_Handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE)
Status = DftiCommitDescriptor( My_Desc1_Handle )
Status = DftiComputeForward( My_Desc1_Handle, X_in, X_out )
Status = DftiFreeDescriptor(My_Desc1_Handle)
! result is given by {X_out(1),X_out(2),...,X_out(32)}
! Perform a real to complex conjugate-even transform
Status = DftiCreateDescriptor(My_Desc2_Handle, DFTI_SINGLE,
DFTI_REAL, 1, 32)
Status = DftiSetValue( My_Desc2_Handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE)
Status = DftiCommitDescriptor(My_Desc2_Handle)
Status = DftiComputeForward(My_Desc2_Handle, Y_in, Y_out)
Status = DftiFreeDescriptor(My_Desc2_Handle)
! result is given by Y_out in CCS format.
```

Example C-8 One-dimensional In-place FFT (C Interface)

```
/* C example, float _Complex is defined in C9X */
#include "mkl_dfti.h"
float _Complex x[32];
float y[34];
DFTI_DESCRIPTOR_HANDLE my_desc1_handle;
DFTI_DESCRIPTOR_HANDLE my_desc2_handle;
MKL_LONG status;
//...put input data into x[0],...,x[31]; y[0],...,y[31]
status = DftiCreateDescriptor( &my_desc1_handle, DFTI_SINGLE,
          DFTI_COMPLEX, 1, 32);
status = DftiCommitDescriptor( my_desc1_handle );
status = DftiComputeForward( my_desc1_handle, x);
status = DftiFreeDescriptor(&my_desc1_handle);
/* result is x[0], ..., x[31]*/
status = DftiCreateDescriptor( &my_desc2_handle, DFTI_SINGLE,
          DFTI_REAL, 1, 32);
status = DftiCommitDescriptor( my_desc2_handle);
status = DftiComputeForward( my_desc2_handle, y);
status = DftiFreeDescriptor(&my_desc2_handle);
/* result is given in CCS format*/
```

Example C-9 One-dimensional Out-of-place FFT (C Interface)

```
/* C example, float _Complex is defined in C9X */
#include "mkl_dfti.h"
float _Complex x_in[32];
float _Complex x_out[32];
float y_in[32];
float y_out[34];

DFTI_DESCRIPTOR_HANDLE my_desc1_handle;
DFTI_DESCRIPTOR_HANDLE my_desc2_handle;
MKL_LONG status;
//...put input data into x_in[0],...,x_in[31]; y_in[0],...,y_in[31]
status = DftiCreateDescriptor( &my_desc1_handle, DFTI_SINGLE,
          DFTI_COMPLEX, 1, 32);
status = DftiSetValue( my_desc1_handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE);
status = DftiCommitDescriptor( my_desc1_handle );
status = DftiComputeForward( my_desc1_handle, x_in, x_out);
status = DftiFreeDescriptor(&my_desc1_handle);
/* result is x_out[0], ..., x_out[31]*/
status = DftiCreateDescriptor( &my_desc2_handle, DFTI_SINGLE,
          DFTI_REAL, 1, 32);
Status = DftiSetValue( My_Desc2_Handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE);
status = DftiCommitDescriptor( my_desc2_handle);
status = DftiComputeForward( my_desc2_handle, y_in, y_out);
status = DftiFreeDescriptor(&my_desc2_handle);
/* result is given by y_out in CCS format*
```

Example C-10 Two-dimensional FFT (Fortran Interface)

The following is an example of two simple two-dimensional transforms. Notice that the data and result parameters in computation functions are all declared as assumed-size rank-1 array `DIMENSION(0:*)`. Therefore two-dimensional array must be transformed to one-dimensional array by `EQUIVALENCE` statement or other facilities of Fortran.

```
! Fortran example.
! 2D complex to complex, and real to conjugate-even
Use MKL_DFTI
Complex ::  X_2D(32,100)
Real :: Y_2D(34, 102)
Complex ::  X(3200)
Real :: Y(3468)
Equivalence (X_2D, X)
Equivalence (Y_2D, Y)
type(DFTI_DESCRIPTOR), POINTER :: My_Desc1_Handle, My_Desc2_Handle
Integer :: Status, L(2)
!...put input data into X_2D(j,k), Y_2D(j,k), 1<=j=32,1<=k<=100
!...set L(1) = 32, L(2) = 100
!...the transform is a 32-by-100

! Perform a complex to complex transform
Status = DftiCreateDescriptor( My_Desc1_Handle, DFTI_SINGLE,&
          DFTI_COMPLEX, 2, L)
Status = DftiCommitDescriptor( My_Desc1_Handle)
Status = DftiComputeForward( My_Desc1_Handle, X)
Status = DftiFreeDescriptor(My_Desc1_Handle)
! result is given by X_2D(j,k), 1<=j<=32, 1<=k<=100

! Perform a real to complex conjugate-even transform
Status = DftiCreateDescriptor( My_Desc2_Handle, DFTI_SINGLE,&
          DFTI_REAL, 2, L)
Status = DftiCommitDescriptor( My_Desc2_Handle)
Status = DftiComputeForward( My_Desc2_Handle, Y)
Status = DftiFreeDescriptor(My_Desc2_Handle)
! result is given by the complex value z(j,k) 1<=j<=32; 1<=k<=100
! and is stored in CCS format
```

Example C-11 Two-dimensional FFT (C Interface)

```
/* C99 example */
#include "mkl_dfti.h"
float _Complex x[32][100];
float y[34][102];
DFTI_DESCRIPTOR_HANDLE my_desc1_handle;
DFTI_DESCRIPTOR_HANDLE my_desc2_handle;
MKL_LONG status, l[2];
//...put input data into x[j][k] 0<=j<=31, 0<=k<=99
//...put input data into y[j][k] 0<=j<=31, 0<=k<=99
l[0] = 32; l[1] = 100;
status = DftiCreateDescriptor( &my_desc1_handle, DFTI_SINGLE,
          DFTI_COMPLEX, 2, l);
status = DftiCommitDescriptor( my_desc1_handle);
status = DftiComputeForward( my_desc1_handle, x);
status = DftiFreeDescriptor(&my_desc1_handle);
/* result is the complex value x[j][k], 0<=j<=31, 0<=k<=99 */
status = DftiCreateDescriptor( &my_desc2_handle, DFTI_SINGLE,
          DFTI_REAL, 2, l);
```

```
status = DftiCommitDescriptor( my_desc2_handle);
status = DftiComputeForward( my_desc2_handle, y);
status = DftiFreeDescriptor(&my_desc2_handle);
/* result is the complex value z(j,k) 0<=j<=31; 0<=k<=99
/* and is stored in CCS format*/
```

The following examples demonstrate how you can change the default configuration settings by using the `DftiSetValue` function.

For instance, to preserve the input data after the FFT computation, the configuration of the `DFTI_PLACEMENT` should be changed to "not in place" from the default choice of "in place."

Example C-12 Changing Default Settings (Fortran)

The code below illustrates how this can be done:

```
! Fortran example
! 1D complex to complex, not in place
Use MKL_DFTI
Complex :: X_in(32), X_out(32)
type(DFTI_DESCRIPTOR), POINTER :: My_Desc_Handle
Integer :: Status
!...put input data into X_in(j), 1<=j<=32
Status = DftiCreateDescriptor( My_Desc_Handle,& DFTI_SINGLE, DFTI_COMPLEX, 1, 32)
Status = DftiSetValue( My_Desc_Handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE)
Status = DftiCommitDescriptor( My_Desc_Handle)
Status = DftiComputeForward( My_Desc_Handle, X_in, X_out)
Status = DftiFreeDescriptor (My_Desc_Handle)
! result is X_out(1),X_out(2),...,X_out(32)
```

Example C-13 Changing Default Settings (C)

```
/* C99 example */
#include "mkl_dfti.h"
float  _Complex x_in[32], x_out[32];
DFTI_DESCRIPTOR_HANDLE my_desc_handle;
MKL_LONG status;
//...put input data into x_in[j], 0 <= j < 32
status = DftiCreateDescriptor( &my_desc_handle, DFTI_SINGLE,
   DFTI_COMPLEX, 1, 32);
status = DftiSetValue( my_desc_handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE);
status = DftiCommitDescriptor( my_desc_handle);
status = DftiComputeForward( my_desc_handle, x_in, x_out);
status = DftiFreeDescriptor(&my_desc_handle);
/* result is x_out[0], x_out[1], ..., x_out[31] */
```

Example C-14 Using Status Checking Functions

The example illustrates the use of status checking functions described in Chapter 11.

```
/* C */
DFTI_DESCRIPTOR_HANDLE desc;
MKL_LONG status;
// . . . descriptor creation and other code
```

```
status = DftiCommitDescriptor(desc);
if (status && !DftiErrorClass(status,DFTI_NO_ERROR))
{
   printf ('Error: %s\n', DftiErrorMessage(status));
}

! Fortran
type(DFTI_DESCRIPTOR), POINTER :: desc
integer status
! ...descriptor creation and other code
status =  DftiCommitDescriptor(desc)
if (status .ne. 0) then
  if (.not. DftiErrorClass(status,DFTI_NO_ERROR) then
     print *, 'Error: ‘, DftiErrorMessage(status)
  endif
endif
```

Example C-15. Computing 2D FFT by One-Dimensional Transforms

Below is an example where a 20-by-40 two-dimensional FFT is computed explicitly using one-dimensional transforms. Notice that the data and result parameters in computation functions are all declared as assumed-size rank-1 array `DIMENSION(0:*)`. Therefore two-dimensional array must be transformed to one-dimensional array by `EQUIVALENCE` statement or other facilities of Fortran.

```
! Fortran
use mkl_dfti
Complex ::  X_2D(20,40)
Complex ::  X(800)
Equivalence (X_2D, X)
INTEGER :: STRIDE(2)
type(DFTI_DESCRIPTOR), POINTER :: Desc_Handle_Dim1
type(DFTI_DESCRIPTOR), POINTER :: Desc_Handle_Dim2
! ...
Status = DftiCreateDescriptor(Desc_Handle_Dim1, DFTI_SINGLE,&
                                DFTI_COMPLEX, 1, 20 )
Status = DftiCreateDescriptor(Desc_Handle_Dim2, DFTI_SINGLE,&
                                DFTI_COMPLEX, 1, 40 )
! perform 40 one-dimensional transforms along 1st dimension
Status = DftiSetValue( Desc_Handle_Dim1, DFTI_NUMBER_OF_TRANSFORMS, 40 )
Status = DftiSetValue( Desc_Handle_Dim1, DFTI_INPUT_DISTANCE, 20 )
Status = DftiSetValue( Desc_Handle_Dim1, DFTI_OUTPUT_DISTANCE, 20 )
Status = DftiCommitDescriptor( Desc_Handle_Dim1 )
Status = DftiComputeForward( Desc_Handle_Dim1, X )
! perform 20 one-dimensional transforms along 2nd dimension
Stride(1) = 0; Stride(2) = 20
Status = DftiSetValue( Desc_Handle_Dim2, DFTI_NUMBER_OF_TRANSFORMS, 20 )
Status = DftiSetValue( Desc_Handle_Dim2, DFTI_INPUT_DISTANCE, 1 )
Status = DftiSetValue( Desc_Handle_Dim2, DFTI_OUTPUT_DISTANCE, 1 )
Status = DftiSetValue( Desc_Handle_Dim2, DFTI_INPUT_STRIDES, Stride )
Status = DftiSetValue( Desc_Handle_Dim2, DFTI_OUTPUT_STRIDES, Stride )
Status = DftiCommitDescriptor( Desc_Handle_Dim2 )
Status = DftiComputeForward( Desc_Handle_Dim2, X )
Status = DftiFreeDescriptor( Desc_Handle_Dim1 )
Status = DftiFreeDescriptor( Desc_Handle_Dim2 )

/* C */
#include "mkl_dfti.h"
float _Complex x[20][40];
MKL_LONG stride[2];
```

```
MKL_LONG status;
DFTI_DESCRIPTOR_HANDLE desc_handle_dim1;
DFTI_DESCRIPTOR_HANDLE desc_handle_dim2;
//...
status = DftiCreateDescriptor( &desc_handle_dim1, DFTI_SINGLE,
 DFTI_COMPLEX, 1, 20 );
status = DftiCreateDescriptor( &desc_handle_dim2, DFTI_SINGLE,
 DFTI_COMPLEX, 1, 40 );

/* perform 40 one-dimensional transforms along 1st dimension */
/* note that the 1st dimension data are not unit-stride */
stride[0] = 0; stride[1] = 40;
status = DftiSetValue( desc_handle_dim1, DFTI_NUMBER_OF_TRANSFORMS, 40 );
status = DftiSetValue( desc_handle_dim1, DFTI_INPUT_DISTANCE, 1 );
status = DftiSetValue( desc_handle_dim1, DFTI_OUTPUT_DISTANCE, 1 );
status = DftiSetValue( desc_handle_dim1, DFTI_INPUT_STRIDES, stride );
status = DftiSetValue( desc_handle_dim1, DFTI_OUTPUT_STRIDES, stride );
status = DftiCommitDescriptor( desc_handle_dim1 );
status = DftiComputeForward( desc_handle_dim1, x );
/* perform 20 one-dimensional transforms along 2nd dimension */
/* note that the 2nd dimension is unit stride */
status = DftiSetValue( desc_handle_dim2, DFTI_NUMBER_OF_TRANSFORMS, 20 );
status = DftiSetValue( desc_handle_dim2,
DFTI_INPUT_DISTANCE, 40 );
status = DftiSetValue( desc_handle_dim2,
DFTI_OUTPUT_DISTANCE, 40 );
status = DftiCommitDescriptor( desc_handle_dim2 );
status = DftiComputeForward( desc_handle_dim2, x );
status = DftiFreeDescriptor( &Desc_Handle_dim1 );
status = DftiFreeDescriptor( &Desc_Handle_dim2 );
```

The following are examples of real multi-dimensional transforms with CCE format storage of conjugate-even complex matrix. Example C-16 is two-dimensional in-place transform and Example C-17 is two-dimensional out-of-place transform in Fortran interface. Example C-18 is three-dimensional out-of-place transform in C interface. Note that the data and result parameters in computation functions are all declared as assumed-size rank-1 array `DIMENSION(0:*)`. Therefore two-dimensional array must be transformed to one-dimensional array by `EQUIVALENCE` statement or other facilities of Fortran.

Example C-16. Two-Dimensional REAL In-place FFT (Fortran Interface)

```
! Fortran example.
! 2D and real to conjugate-even
Use MKL_DFTI
Real :: X_2D(34,100) ! 34  = (32/2 + 1)*2
Real :: X(3400)
Equivalence (X_2D, X)
type(DFTI_DESCRIPTOR), POINTER :: My_Desc_Handle
Integer :: Status, L(2)
Integer :: strides_in(3)
Integer :: strides_out(3)
! ...put input data into X_2D(j,k), 1<=j=32,1<=k<=100
! ...set L(1) = 32, L(2) = 100
! ...set strides_in(1) = 0, strides_in(2) = 1, strides_in(3) = 34
! ...set strides_out(1) = 0, strides_out(2) = 1, strides_out(3) = 17
! ...the transform is a 32-by-100
! Perform a real to complex conjugate-even transform
Status = DftiCreateDescriptor( My_Desc_Handle, DFTI_SINGLE,&
DFTI_REAL, 2, L )
```

```
Status = DftiSetValue(My_Desc_Handle, DFTI_CONJUGATE_EVEN_STORAGE,&
DFTI_COMPLEX_COMPLEX)
Status = DftiSetValue(My_Desc_Handle, DFTI_INPUT_STRIDES, strides_in)
Status = DftiSetValue(My_Desc_Handle, DFTI_OUTPUT_STRIDES, strides_out)
Status = DftiCommitDescriptor( My_Desc_Handle)
Status = DftiComputeForward( My_Desc_Handle, X )
Status = DftiFreeDescriptor(My_Desc_Handle)
! result is given by the complex value z(j,k) 1<=j<=17; 1<=k<=100 and
! is stored in real matrix X_2D in CCE format.
```

Example C-17. Two-Dimensional REAL Out-of-place FFT (Fortran Interface)

```
! Fortran example.
! 2D and real to conjugate-even
Use MKL_DFTI
Real :: X_2D(32,100)
Complex :: Y_2D(17, 100) ! 17 = 32/2 + 1
Real :: X(3200)
Complex :: Y(1700)
Equivalence (X_2D, X)
Equivalence (Y_2D, Y)
type(DFTI_DESCRIPTOR), POINTER :: My_Desc_Handle
Integer :: Status, L(2)
Integer :: strides_out(3)

! ...put input data into X_2D(j,k), 1<=j=32,1<=k<=100
! ...set L(1) = 32, L(2) = 100
! ...set strides_out(1) = 0, strides_out(2) = 1, strides_out(3) = 17

! ...the transform is a 32-by-100
! Perform a real to complex conjugate-even transform
Status = DftiCreateDescriptor( My_Desc_Handle, DFTI_SINGLE,&
DFTI_REAL, 2, L )
Status = DftiSetValue(My_Desc_Handle,&
DFTI_CONJUGATE_EVEN_STORAGE, DFTI_COMPLEX_COMPLEX)
Status = DftiSetValue( My_Desc_Handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE )
Status = DftiSetValue(My_Desc_Handle,&
DFTI_OUTPUT_STRIDES, strides_out)

Status = DftiCommitDescriptor(My_Desc_Handle)
Status = DftiComputeForward(My_Desc_Handle, X, Y)
Status = DftiFreeDescriptor(My_Desc_Handle)
! result is given by the complex value z(j,k) 1<=j<=17; 1<=k<=100 and
! is stored in complex matrix Y_2D in CCE format.
```

Example C-18. Three-Dimensional REAL FFT (C Interface)

```
/* C99 example */
#include "mkl_dfti.h"
float x[32][100][19];
float _Complex y[32][100][10]; /* 10 = 19/2 + 1 */
DFTI_DESCRIPTOR_HANDLE my_desc_handle;
MKL_LONG status, l[3];
MKL_LONG strides_out[4];

//...put input data into x[j][k][s] 0<=j<=31, 0<=k<=99, 0<=s<=18
l[0] = 32; l[1] = 100; l[2] = 19;

strides_out[0] = 0; strides_out[1] = 1000;
```

```
strides_out[2] = 10; strides_out[3] = 1;

status = DftiCreateDescriptor( &my_desc_handle, DFTI_SINGLE,
DFTI_REAL, 3, l );
status = DftiSetValue(my_desc_handle,
DFTI_CONJUGATE_EVEN_STORAGE, DFTI_COMPLEX_COMPLEX);
status = DftiSetValue( my_desc_handle, DFTI_PLACEMENT, DFTI_NOT_INPLACE );
status = DftiSetValue(my_desc_handle,
DFTI_OUTPUT_STRIDES, strides_out);

status = DftiCommitDescriptor(my_desc_handle);
status = DftiComputeForward(my_desc_handle, x, y);
status = DftiFreeDescriptor(&my_desc_handle);
/* result is the complex value z(j,k,s) 0<=j<=31; 0<=k<=99, 0<=s<=9
and is stored in complex matrix y in CCE format. */
```

Examples of Using Multi-Threading for FFT Computation

The following sample program shows how to employ internal threading in Intel MKL for FFT computation (see case "a" in "Number of user threads").

To specify the number of threads inside Intel MKL, use the following settings:

set `MKL_NUM_THREADS = 1` for one-threaded mode;

set `MKL_NUM_THREADS = 4` for multi-threaded mode.

Note that the configuration parameter `DFTI_NUMBER_OF_USER_THREADS` must be equal to its default value 1.

Example C-19 Using Intel MKL Internal Threading Mode

```
#include "mkl_dfti.h"

void main () {

float x[200][100];
DFTI_DESCRIPTOR_HANDLE my_desc1_handle;
MKL_LONG status, len[2];
//...put input data into x[j][k] 0<=j<=199, 0<=k<=99

len[0] = 200; len[1] = 100;
status = DftiCreateDescriptor( &my_desc1_handle, DFTI_SINGLE,DFTI_REAL, 2,
 len);
status = DftiCommitDescriptor(
my_desc1_handle);
status = DftiComputeForward(
my_desc1_handle, x);
status = DftiFreeDescriptor(&my_desc1_handle);
}
```

The following Example C-20 and Example C-21 illustrate a parallel customer program with each descriptor instance used only in a single thread (see cases "b" and "c" in Number of user threads).

Specify the number of threads for Example C-20 like this:

set `MKL_SERIAL = yes` (or `YES`) for Intel MKL to work in the single-threaded mode (recommended);

set `OMP_NUM_THREADS = 4` for the customer program to work in the multi-threaded mode.

The configuration parameter `DFTI_NUMBER_OF_USER_THREADS` must have its default value of 1.

Example C-20. Using Parallel Mode with Multiple Descriptors Initialized in a Parallel Region

Note that in this example, the program can be transformed to become single-threaded at the customer level but using parallel mode within Intel MKL (case "a"). To achieve this, you need to set the parameter DFTI_NUMBER_OF_TRANSFORMS = 4 and to set the corresponding parameter DFTI_INPUT_DISTANCE = 5000.

```
#include "mkl_dfti.h"
#include "omp.h"
void main ()
{
   float _Complex x[200][100];
   MKL_LONG len[2];
   //...put input data into x[j][k] 0<=j<=199, 0<=k<=99
   len[0] = 50; len[1] = 100;

   // each thread calculates real FFT for matrix (50*100)
   #pragma omp parallel
   {
      DFTI_DESCRIPTOR_HANDLE my_desc_handle;
      MKL_LONG myStatus;
      int myID = omp_get_thread_num ();

myStatus    =   DftiCreateDescriptor (&my_desc_handle, DFTI_SINGLE,
DFTI_COMPLEX, 2, len);
      myStatus = DftiCommitDescriptor (my_desc_handle);
      myStatus = DftiComputeForward (my_desc_handle, &x[myID * len[0] * len[1]]);
      myStatus = DftiFreeDescriptor (&my_desc_handle);
   }   /* End OpenMP parallel region */
}
```

Specify the number of threads for Example C-21 like this:

set MKL_NUM_THREADS = 1 for Intel MKL to work in the single-threaded mode (obligatory);

set OMP_NUM_THREADS = 4 for the customer program to work in the multi-threaded mode.

The configuration parameter DFTI_NUMBER_OF_USER_THREADS must have the default value of 1.

Example C-21. Using Parallel Mode with Multiple Descriptors Initialized in One Thread

```
#include "mkl_dfti.h"
#include "omp.h"
void main ()
{
float _Complex x[200][100];
MKL_LONG len[2];
MKL_LONG i;
//...put input data into x[j][k] 0<=j<=199, 0<=k<=99
len[0] = 50; len[1] = 100;
DFTI_DESCRIPTOR_HANDLE my_desc_handle[4];
MKL_LONG myStatus;
for (i=0;i<3;i++) myStatus = DftiCreateDescriptor (&my_desc_handle[i], DFTI_SINGLE, DFTI_COMPLEX, 2, len);
// each thread calculates real FFT for matrix (50*100)
#pragma omp parallel
{
int myID = omp_get_thread_num ();
myStatus = DftiCommitDescriptor (my_desc_handle[myID]);
myStatus = DftiComputeForward (my_desc_handle[myID], &x[myID * len[0] *len[1]]);
```

```
} /* End OpenMP parallel region */
for (i=0;i<3;i++)  myStatus = DftiFreeDescriptor (&my_desc_handle[i]);
}
```

The following Example C-22 illustrates a parallel customer program with a common descriptor used in several threads (see case "d" in "Number of user threads".

In this case, the number of threads, as well as any other configuration parameter, must not be changed after FFT initialization by the `DftiCommitDescriptor()` function is done.

Example C-22. Using Parallel Mode with a Common Descriptor

```
// set number of threads inside Intel MKL:
//rem set MKL_SERIAL = YES   -   is not required
// since one-threaded mode for Intel MKL is forced automatically
// set OMP_NUM_THREADS = 4   -   multi-threaded mode for customer

#include "mkl_dfti.h"
#include "omp.h"
void main ()
{
   float _Complex x[200][100];
   MKL_LONG status;
   DFTI_DESCRIPTOR_HANDLE desc_handle;
   int nThread = omp_get_max_threads ();
   MKL_LONG len[2];
   //...put input data into x[j][k] 0<=j<=199, 0<=k<=99
   len[0] = 50; len[1] = 100;

   status =
DftiCreateDescriptor (&desc_handle, DFTI_SINGLE, DFTI_COMPLEX, 2, len);
   status = DftiSetValue (desc_handle,
DFTI_NUMBER_OF_USER_THREADS, nThread);
   status = DftiCommitDescriptor (desc_handle);

   // each thread calculates real FFT for matrix (50*100)
   #pragma omp parallel num_threads(nThread)
   {
      MKL_LONG myStatus;
      int myID = omp_get_thread_num ();

      myStatus = DftiComputeForward (desc_handle, &x[myID * len[0] * len[1]]);
   }   /* End OpenMP parallel region */

   status = DftiFreeDescriptor (&desc_handle);
}
```

Examples for Cluster FFT Functions

The following C example computes a 2-dimensional out-of-place FFT using the cluster FFT interface:

Example 23. 2D Out-of-place Cluster FFT Computation

```
DFTI_DESCRIPTOR_DM_HANDLE desc;
MKL_LONG len[2],v,i,j,n,s;
Complex *in,*out;
```

```
MPI_Init(...);

// Create descriptor for 2D FFT
len[0]=nx;
len[1]=ny;
DftiCreateDescriptorDM(MPI_COMM_WORLD,&desc,DFTI_DOUBLE,DFTI_COMPLEX,2,len);
// Ask necessary length of in and out arrays and allocate memory
DftiGetValueDM(desc,CDFT_LOCAL_SIZE,&v);
in=(Complex*)malloc(v*sizeof(Complex));
out=(Complex*)malloc(v*sizeof(Complex));
// Fill local array with initial data. Current process performs n rows,
// 0 row of in corresponds to s row of virtual global array
DftiGetValueDM(desc,CDFT_LOCAL_NX,&n);
DftiGetValueDM(desc,CDFT_LOCAL_X_START,&s);
// Virtual global array globalIN is defined by function f as
// globalIN[i*ny+j]=f(i,j)
for(i=0;i<n;i++)
   for(j=0;j<ny;j++) in[i*ny+j]=f(i+s,j);
// Set that we want out-of-place transform (default is DFTI_INPLACE)
DftiSetValueDM(desc,DFTI_PLACEMENT,DFTI_NOT_INPLACE);
// Commit descriptor, calculate FFT, free descriptor
DftiCommitDescriptorDM(desc);
DftiComputeForwardDM(desc,in,out);
// Virtual global array globalOUT is defined by function g as
// globalOUT[i*ny+j]=g(i,j)
// Now out contains result of FFT. out[i*ny+j]=g(i+s,j)
DftiFreeDescriptorDM(&desc);
free(in);
free(out);
MPI_Finalize();
```

Example 24. 1D In-place Cluster FFT Computations

The C example below illustrates one-dimensional in-place cluster FFT computations effected with a user-defined workspace:

```
DFTI_DESCRIPTOR_DM_HANDLE desc;
MKL_LONG len,v,i,n_out,s_out;
Complex *in,*work;

MPI_Init(...);
// Create descriptor for 1D FFT
DftiCreateDescriptorDM(MPI_COMM_WORLD,&desc,DFTI_DOUBLE,DFTI_COMPLEX,1,len);
// Ask necessary length of array and workspace and allocate memory
DftiGetValueDM(desc,CDFT_LOCAL_SIZE,&v);
in=(Complex*)malloc(v*sizeof(Complex));
work=(Complex*)malloc(v*sizeof(Complex));
// Fill local array with initial data. Local array has n elements,
// 0 element of in corresponds to s element of virtual global array
DftiGetValueDM(desc,CDFT_LOCAL_NX,&n);
DftiGetValueDM(desc,CDFT_LOCAL_X_START,&s);
// Set work array as a workspace
DftiSetValueDM(desc,CDFT_WORKSPACE,work);
// Virtual global array globalIN is defined by function f as globalIN[i]=f(i)
for(i=0;i<n;i++) in[i]=f(i+s);
// Commit descriptor, calculate FFT, free descriptor
DftiCommitDescriptorDM(desc);
DftiComputeForwardDM(desc,in);
DftiGetValueDM(desc,CDFT_LOCAL_OUT_NX,&n_out);
DftiGetValueDM(desc,CDFT_LOCAL_OUT_X_START,&s_out);
// Virtual global array globalOUT is defined by function g as globalOUT[i]=g(i)
```

```
// Now in contains result of FFT. Local array has n_out elements,
// 0 element of in corresponds to s_out element of virtual global array.
// in[i]==g(i+s_out)
DftiFreeDescriptorDM(&desc);
free(in);
free(work);
MPI_Finalize();
```

Auxiliary Data Transformations

This section presents code examples for conversion from the Cartesian to polar representation of complex data and vice versa.

Example C-25. Conversion from Cartesian to polar representation of complex data

```
// Cartesian->polar conversion of complex data
// Cartesian representation: z = re + I*im
// Polar representation: z = r * exp( I*phi )
#include <mkl_vml.h>

void
variant1_Cartesian2Polar(int n,const double *re,const double *im,
                         double *r,double *phi)
{
    vdHypot(n,re,im,r);         // compute radii r[]
    vdAtan2(n,re,im,phi);       // compute phases phi[]
}

void
variant2_Cartesian2Polar(int n,const MKL_Complex16 *z,double *r,double *phi,
                         double *temp_re,double *temp_im)
{
    vzAbs(n,z,r);               // compute radii r[]
    vdPackI(n, (double*)z + 0, 2, temp_re);
    vdPackI(n, (double*)z + 1, 2, temp_im);
    vdAtan2(n,temp_re,temp_im,phi); // compute phases phi[]
}
```

Example C-26. Conversion from polar to Cartesian representation of complex data

```
// Polar->Cartesian conversion of complex data.
// Polar representation: z = r * exp( I*phi )
// Cartesian representation: z = re + I*im
#include <mkl_vml.h>

void
variant1_Polar2Cartesian(int n,const double *r,const double *phi,
                         double *re,double *im)
{
    vdSinCos(n,phi,im,re);      // compute direction, i.e. z[]/abs(z[])
    vdMul(n,r,re,re);           // scale real part
    vdMul(n,r,im,im);           // scale imaginary part
}

void
variant2_Polar2Cartesian(int n,const double *r,const double *phi,
```

```
                        MKL_Complex16 *z,
                        double *temp_re,double *temp_im)
{
    vdSinCos(n,phi,temp_im,temp_re); // compute direction, i.e. z[]/abs(z[])
    vdMul(n,r,temp_im,temp_im); // scale imaginary part
    vdMul(n,r,temp_re,temp_re); // scale real part
    vdUnpackI(n,temp_re,(double*)z + 0, 2); // fill in result.re
    vdUnpackI(n,temp_im,(double*)z + 1, 2); // fill in result.im
}
```

CBLAS Interface to the BLAS

D

This appendix presents CBLAS, the C interface to the Basic Linear Algebra Subprograms (BLAS) implemented in Intel® MKL.

Similar to BLAS, the CBLAS interface includes the following levels of functions:

- "Level 1 CBLAS" (vector-vector operations)
- "Level 2 CBLAS" (matrix-vector operations)
- "Level 3 CBLAS" (matrix-matrix operations).
- "Sparse CBLAS" (operations on sparse vectors).

To obtain the C interface, the Fortran routine names are prefixed with `cblas_` (for example, `dasum` becomes `cblas_dasum`). Names of all CBLAS functions are in lowercase letters.

Complex functions `?dotc` and `?dotu` become CBLAS subroutines (void functions); they return the complex result via a void pointer, added as the last parameter. CBLAS names of these functions are suffixed with `_sub`. For example, the BLAS function `cdotc` corresponds to `cblas_cdotc_sub`.

WARNING. Users of the CBLAS interface should be aware that the CBLAS are just a C interface to the BLAS, which is based on the FORTRAN standard and subject to the FORTRAN standard restrictions. In particular, the output parameters should not be referenced through more than one argument.

In the descriptions of CBLAS interfaces, links provided for each function group lead to the descriptions of the respective Fortran-interface BLAS functions.

CBLAS Arguments

The arguments of CBLAS functions comply with the following rules:

- Input arguments are declared with the `const` modifier.
- Non-complex scalar input arguments are passed by value.
- Complex scalar input arguments are passed as void pointers.
- Array arguments are passed by address.
- BLAS character arguments are replaced by the appropriate enumerated type.
- Level 2 and Level 3 routines acquire an additional parameter of type `CBLAS_ORDER` as their first argument. This parameter specifies whether two-dimensional arrays are row-major (`CblasRowMajor`) or column-major (`CblasColMajor`).

Enumerated Types

The CBLAS interface uses the following enumerated types:

```
enum CBLAS_ORDER {
   CblasRowMajor=101,  /* row-major arrays */
   CblasColMajor=102};   /* column-major arrays */
enum CBLAS_TRANSPOSE {
   CblasNoTrans=111,     /* trans='N' */
   CblasTrans=112,       /* trans='T' */
   CblasConjTrans=113};  /* trans='C' */
enum CBLAS_UPLO {
   CblasUpper=121,        /* uplo ='U' */
   CblasLower=122};       /* uplo ='L' */
enum CBLAS_DIAG {
   CblasNonUnit=131,      /* diag ='N' */
   CblasUnit=132};        /* diag ='U' */
enum CBLAS_SIDE {
   CblasLeft=141,         /* side ='L' */
   CblasRight=142};       /* side ='R' */
```

Level 1 CBLAS

This is an interface to "BLAS Level 1 Routines and Functions", which perform basic vector-vector operations.

?asum

```
float cblas_sasum(const int N, const float *X, const int incX);
double cblas_dasum(const int N, const double *X, const int incX);
float cblas_scasum(const int N, const void *X, const int incX);
double cblas_dzasum(const int N, const void *X, const int incX);
```

?axpy

```
void cblas_saxpy(const int N, const float alpha, const float *X, const int incX, float *Y, const int incY);

```

Sparse CBLAS

This is an interface to "Sparse BLAS Level 1 Routines and Functions", which perform a number of common vector operations on sparse vectors stored in compressed form.

Note that all index parameters, *indx*, are in C-type notation and vary in the range [0..*N*-1].

?axpyi

```
void cblas_saxpyi(const int N, const float alpha, const float *X, const int *indx, float *Y);
void cblas_daxpyi(const int N, const double alpha, const double *X, const int *indx, double *Y);
void cblas_caxpyi(const int N, const void *alpha, const void *X, const int *indx, void *Y);
void cblas_zaxpyi(const int N, const void *alpha, const void *X, const int *indx, void *Y);
```

?doti

```
float cblas_sdoti(const int N, const float *X, const int *indx, const float *Y);
double cblas_ddoti(const int N, const double *X, const int *indx, const double *Y);
```

?dotci

```

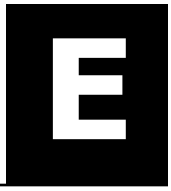
void cblas_zsctr(const int N, const void *X, const int *indx, void *Y);
```

Specific Features of Fortran 95 Interfaces for LAPACK Routines



Intel® MKL implements Fortran 95 interface for LAPACK package, further referred to as MKL LAPACK95, to provide full capacity of MKL FORTRAN 77 LAPACK routines. This is the principal difference of Intel MKL from the Netlib Fortran 95 implementation for LAPACK.

A new feature of MKL LAPACK95 by comparison with Intel MKL LAPACK77 implementation is presenting a package of source interfaces along with wrappers that make the implementation compiler-independent. As a result, the MKL LAPACK package can be used in all programming environments intended for Fortran 95.

Depending on the degree and type of difference from Netlib implementation, the MKL LAPACK95 interfaces fall into several groups that require different transformations (see "MKL Fortran 95 Interfaces for LAPACK Routines vs. Netlib Implementation"). The groups are given in full with the calling sequences of the routines and appropriate differences from Netlib analogs.

The following conventions are used:

```
<interface> ::=  <name of interface> '(' <arguments list>')'
<arguments list> ::=  <first argument> {<argument>}*
<first argument> ::=  < identifier >
<argument> ::=  <required argument>|<optional argument>
<required argument> ::=  ',' <identifier>
<optional argument> ::=  '[,' <identifier> ']'
<name of interface> ::=  <identifier>
```

where defined notions are separated from definitions by `::=`, notion names are marked by angle brackets, terminals are given in quotes, and {…}* denotes repetition zero, one, or more times.

<*first argument*> and each <*required argument*> should be present in all calls of denoted interface, <*optional argument*> may be omitted. Comments to interface definitions are provided where necessary. Comment lines begin with character `!`.

Two interfaces with one name are presented when two variants of subroutine calls (separated by types of arguments) exist.

Interfaces Identical to Netlib

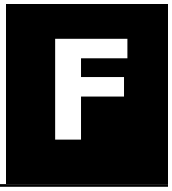
FFTW Interface to Intel® Math Kernel Library



Intel® Math Kernel Library (Intel® MKL) offers FFTW2 and FFTW3 interfaces to Intel MKL Fast Fourier Transform and Trigonometric Transform functionality. The purpose of these interfaces is to enable applications using FFTW (www.fftw.org) to gain performance with Intel MKL without changing the program source code.

Both FFTW2 and FFTW3 interfaces are provided in open source as FFTW wrappers to Intel MKL. For ease of use, FFTW3 interface is also integrated in Intel MKL.

Notational Conventions

This appendix typically employs path notations for Windows* OS.

FFTW2 Interface to Intel® Math Kernel Library

This section describes a collection of wrappers providing FFTW 2.x interface to Intel MKL. The wrappers translate calls to FFTW 2.x functions into the calls of the Intel MKL Fast Fourier Transform interface (FFT interface).

The wrappers correspond to the FFTW version 2.x and the Intel MKL versions 7.0 or higher.

Because of differences between FFTW and Intel MKL FFT functionalities, there are restrictions on using wrappers instead of the FFTW functions. Some FFTW functions have empty wrappers. However, many typical FFTs can be computed using these wrappers.

Refer to chapter 11 "Fourier Transform Functions", for better understanding the effects from the use of the wrappers.

More wrappers may be added in the future to extend FFTW functionality available with Intel MKL.

Wrappers Reference

The section provides a brief reference for the FFTW 2.x C interface. For details please refer to the original FFTW 2.x documentation available at www.fftw.org.

Each FFTW function has its own wrapper. Some of them, which are *not* expressly listed in this section, are empty and do nothing, but they are provided to avoid link errors and satisfy the function calls.

Intel MKL FFT interface operates on both float and double-precision data types.

One-dimensional Complex-to-complex FFTs

The following functions compute a one-dimensional complex-to-complex Fast Fourier transform.

```
fftw_plan fftw_create_plan(int n, fftw_direction dir, int flags);
```

```
fftw_plan fftw_create_plan_specific(int n, fftw_direction dir, int flags, fftw_complex
*in, int istride, fftw_complex *out, int ostride);

void fftw(fftw_plan plan, int howmany, fftw_complex *in, int istride, int idist,
fftw_complex *out, int ostride, int odist);

void fftw_one(fftw_plan plan, fftw_complex *in , fftw_complex *out);

void fftw_destroy_plan(fftw_plan plan);
```

Multi-dimensional Complex-to-complex FFTs

The following functions compute a multi-dimensional complex-to-complex Fast Fourier transform.

```
fftwnd_plan fftwnd_create_plan(int rank, const int *n, fftw_direction dir, int flags);

fftwnd_plan fftw2d_create_plan(int nx, int ny, fftw_direction dir, int flags);

fftwnd_plan fftw3d_create_plan(int nx, int ny, int nz, fftw_direction dir, int flags);

fftwnd_plan fftwnd_create_plan_specific(int rank, const int *n, fftw_direction dir, int
flags, fftw_complex *in, int istride, fftw_complex *out, int ostride);

fftwnd_plan fftw2d_create_plan_specific(int nx, int ny, fftw_direction dir, int flags,
fftw_complex *in, int istride, fftw_complex *out, int ostride);

fftwnd_plan fftw3d_create_plan_specific(int nx, int ny, int nz, fftw_direction dir, int
flags, fftw_complex *in, int istride, fftw_complex *out, int ostride);

void fftwnd(fftwnd_plan plan, int howmany, fftw_complex *in, int istride, int idist,
fftw_complex *out, int ostride, int odist);

void fftwnd_one(fftwnd_plan plan, fftw_complex *in, fftw_complex *out);

void fftwnd_destroy_plan(fftwnd_plan plan);
```

One-dimensional Real-to-half-complex/Half-complex-to-real FFTs

Half-complex representation of a conjugate-even symmetric vector of size *N* in a real array of the same size *N* consists of *N*/2+1 real parts of the elements of the vector followed by non-zero imaginary parts in the reverse order. Because the Intel MKL FFT interface does not currently support this representation, all wrappers of this kind are empty and do nothing.

Nevertheless, you can perform one-dimensional real-to-complex and complex-to-real transforms using `rfftwnd` functions with *rank*=1.

Multi-dimensional Real-to-complex/Complex-to-real FFTs

The following functions compute multi-dimensional real-to-complex and complex-to-real Fast Fourier transforms.

```
rfftwnd_plan rfftwnd_create_plan(int rank, const int *n, fftw_direction dir, int flags);

rfftwnd_plan rfftw2d_create_plan(int nx, int ny, fftw_direction dir, int flags);

rfftwnd_plan rfftw3d_create_plan(int nx, int ny, int nz, fftw_direction dir, int flags);

rfftwnd_plan rfftwnd_create_plan_specific(int rank, const int *n, fftw_direction dir, int
flags, fftw_real *in, int istride, fftw_real *out, int ostride);
```

```
rfftwnd_plan rfftw2d_create_plan_specific(int nx, int ny, fftw_direction dir, int flags,
fftw_real *in, int istride, fftw_real *out, int ostride);

rfftwnd_plan rfftw3d_create_plan_specific(int nx, int ny, int nz, fftw_direction dir, int
flags, fftw_real *in, int istride, fftw_real *out, int ostride);

void rfftwnd_real_to_complex(rfftwnd_plan plan, int howmany, fftw_real *in, int istride,
int idist, fftw_complex *out, int ostride, int odist);

void rfftwnd_complex_to_real(rfftwnd_plan plan, int howmany, fftw_complex *in, int istride,
int idist, fftw_real *out, int ostride, int odist);

void rfftwnd_one_real_to_complex(rfftwnd_plan plan, fftw_real *in, fftw_complex *out);

void rfftwnd_one_complex_to_real(rfftwnd_plan plan, fftw_complex *in, fftw_real *out);

void rfftwnd_destroy_plan(rfftwnd_plan plan);
```

Multi-threaded FFTW

This section discusses multi-threaded FFTW wrappers only. MPI FFTW wrappers, available only with Intel MKL for the Linux* and Windows* operating systems, are described in section "MPI FFTW Wrappers".

Unlike the original FFTW interface, every computational function in the FFTW2 interface to Intel MKL provides multithreaded computation by default, with the number of threads defined by the number of processors available on the system (see section "Managing Performance and Memory" in the Intel MKL User's Guide). To limit the number of threads that use the FFTW interface, call the threaded FFTW computational functions:

```
void fftw_threads(int nthreads, fftw_plan plan, int howmany, fftw_complex *in, int istride,
int idist, fftw_complex *out, int ostride, int odist);

void fftw_threads_one(int nthreads, rfftwnd_plan plan, fftw_complex *in, fftw_complex
*out);

...

void rfftwnd_threads_real_to_complex( int nthreads, rfftwnd_plan plan, int howmany,
fftw_real *in, int istride, int idist, fftw_complex *out, int ostride, int odist);
```

Compared to its non-threaded counterpart, every threaded computational function has `threads_` as the second part of its name and additional first parameter *nthreads*. Set the *nthreads* parameter to the thread limit to ensure that the computation requires at most that number of threads.

FFTW Support Functions

The FFTW wrappers provide memory allocation functions to be used with FFTW:

```
void* fftw_malloc(size_t n);

void fftw_free(void* x);
```

The `fftw_malloc` wrapper aligns the memory on a 16-byte boundary.

If `fftw_malloc` fails to allocate memory, it aborts the application. To override this behavior, set a global variable `fftw_malloc_hook` and optionally the complementary variable `fftw_free_hook`:

```
void *(*fftw_malloc_hook) (size_t n);

void (*fftw_free_hook) (void *p);
```

The wrappers use the function `fftw_die` to abort the application in cases when a caller cannot be informed of an error otherwise (for example, in computational functions that return `void`). To override this behavior, set a global variable `fftw_die_hook`:

```
void (*fftw_die_hook)(const char *error_string);
```

```
void fftw_die(const char *s);
```

Limitations of the FFTW2 Interface to Intel MKL

The FFTW2 wrappers implement the functionality of only those FFTW functions that Intel MKL can reasonably support. Other functions are provided as no-operation functions, whose only purpose is to satisfy link-time symbol resolution. Specifically, no-operation functions include:

- Real-to-half-complex and respective backward transforms
- Print plan functions
- Functions for importing/exporting/forgetting wisdom
- Most of the FFTW functions not covered by the original FFTW2 documentation

Because the Intel MKL implementation of FFTW2 wrappers does not use plan and plan node structures declared in `fftw.h`, the behavior of an application that relies on the internals of the plan structures defined in that header file is undefined.

FFTW2 wrappers define plan as a set of attributes, such as strides, used to commit the Intel MKL FFT descriptor structure. If an FFTW2 computational function is called with attributes different from those recorded in the plan, the function attempts to adjust the attributes of the plan and recommit the descriptor. Thus, repeated calls of a computational function with the same plan but different strides, distances, and other parameters may be performance inefficient.

Plan creation functions disregard most planner flags passed through the *flags* parameter. These functions take into account only the following values of *flags*:

- FFTW_IN_PLACE

  If this value of *flags* is supplied, the plan is marked so that computational functions using that plan ignore the parameters related to output (*out*, *ostride*, and *odist*). Unlike the original FFTW interface, the wrappers never use the *out* parameter as a scratch space for in-place transforms.

- FFTW_THREADSAFE

  If this value of *flags* is supplied, the plan is marked read-only. An attempt to change attributes of a read-only plan aborts the application.

FFTW wrappers are generally not thread safe. Therefore, do not use the same plan in parallel user threads simultaneously.

Calling Wrappers from Fortran

The FFTW2 wrappers to Intel MKL provide the following subroutines for calling from Fortran:

```
call fftw_f77_create_plan(plan, n, dir, flags)
```

```
call fftw_f77(plan, howmany, in, istride, idist, out, ostride, odist)
```

```
call fftw_f77_one(plan, in, out)
```

```
call fftw_f77_threads(nthreads, plan, howmany, in, istride, idist, out, ostride, odist)
```

```
call fftw_f77_threads_one(nthreads, plan, in, out)
call fftw_f77_destroy_plan(plan)
call fftwnd_f77_create_plan(plan, rank, n, dir, flags)
call fftw2d_f77_create_plan(plan, nx, ny, dir, flags)
call fftw3d_f77_create_plan(plan, nx, ny, nz, dir, flags)
call fftwnd_f77(plan, howmany, in, istride, idist, out, ostride, odist)
call fftwnd_f77_one(plan, in, out)
call fftwnd_f77_threads(nthreads, plan, howmany, in, istride, idist, out, ostride, odist)
call fftwnd_f77_threads_one(nthreads, plan, in, out)
call fftwnd_f77_destroy_plan(plan)
call rfftw_f77_create_plan(plan, n, dir, flags)
call rfftw_f77(plan, howmany, in, istride, idist, out, ostride, odist)
call rfftw_f77_one(plan, in, out)
call rfftw_f77_threads(nthreads, plan, howmany, in, istride, idist, out, ostride, odist)
call rfftw_f77_threads_one(nthreads, plan, in, out)
call rfftw_f77_destroy_plan(plan)
call rfftwnd_f77_create_plan(plan, rank, n, dir, flags)
call rfftw2d_f77_create_plan(plan, nx, ny, dir, flags)
call rfftw3d_f77_create_plan(plan, nx, ny, nz, dir, flags)
call rfftwnd_f77_complex_to_real(plan, howmany, in, istride, idist, out, ostride, odist)
call rfftwnd_f77_one_complex_to_real (plan, in, out)
call rfftwnd_f77_real_to_complex(plan, howmany, in, istride, idist, out, ostride, odist)
call rfftwnd_f77_one_real_to_complex (plan, in, out)
call rfftwnd_f77_threads_complex_to_real(nthreads, plan, howmany, in, istride, idist,
out, ostride, odist)
call rfftwnd_f77_threads_one_complex_to_real(nthreads, plan, in, out)
call rfftwnd_f77_threads_real_to_complex(nthreads, plan, howmany, in, istride, idist,
out, ostride, odist)
call rfftwnd_f77_threads_one_real_to_complex(nthreads, plan, in, out)
call rfftwnd_f77_destroy_plan(plan)
call fftw_f77_threads_init(info)
```

The FFTW Fortran functions are actually the wrappers to FFTW C functions. So, their functionality and limitations are the same as of the corresponding C wrappers.

See Also

- Wrappers Reference

- Limitations of the FFTW2 Interface to Intel MKL

Installation

Wrappers are delivered as source code, which you must compile to build the wrapper library. Then you can substitute the wrapper and Intel MKL libraries for the FFTW library. The source code for the wrappers and makefiles with the wrapper list files are located in the `.\interfaces\fftw2xc` and `.\interfaces\fftw2xf` subdirectory in the Intel MKL directory for C and Fortran wrappers, respectively.

Creating the Wrapper Library

Two header files are used to compile the C wrapper library: `fftw2_mkl.h` and `fftw.h`. The `fftw2_mkl.h` file is located in the `.\interfaces\fftw2xc\wrappers` subdirectory in the Intel MKL directory.

Three header files are used to compile the Fortran wrapper library: `fftw2_mkl.h`, `fftw2_f77_mkl.h`, and `fftw.h`. The `fftw2_mkl.h` and `fftw2_f77_mkl.h` files are located in the `.\interfaces\fftw2xf\wrappers` subdirectory in the Intel MKL directory.

The file `fftw.h`, used to compile libraries for both interfaces and located in the `.\include\fftw` subdirectory in the Intel MKL directory, slightly differs from the original FFTW (www.fftw.org) header file `fftw.h`.

The source code for the wrappers, makefiles, and function list files are located in subdirectories `.\interfaces\fftw2xc` and `.\interfaces\fftw2xf` in the Intel MKL directory for C and Fortran wrappers, respectively.

A wrapper library contains C or Fortran wrappers for complex and real transforms in a serial and multi-threaded mode for one of the two data types (`double` or `float`). A makefile parameter manages the data type.

The makefile parameters specify the platform (required), compiler, and data precision. Specifying the platform is required. The makefile comment heading provides the exact description of these parameters.

Because a C compiler builds the Fortran wrapper library, function names in the wrapper library and Fortran object module may be different. The file `fftw2_f77_mkl.h` in the `.\interfaces\fftw2xf\source` subdirectory in the Intel MKL directory defines function names according to the names in the Fortran module. If a required name is missing in the file, you can modify the file to add the name before building the library.

To build the library, run the `make` command on Linux* OS and Mac OS* X or the `nmake` command on Windows* OS with appropriate parameters.

For example, the command

```
make lib64
```

builds on Linux OS a double-precision wrapper library for IA-64 architecture based applications using the Intel® C++ Compiler or the Intel® Fortran Compiler version 9.1 or higher (compilers and data precision are chosen by default.).

Each makefile creates the library in the directory with the Intel MKL libraries corresponding to the used platform. For example, `./lib/64` (on Linux OS and Mac OS X) or `.\ia32\lib` (on Windows* OS).

In the wrapper library names, the suffix corresponds to the used compiler, the letter `"f"` precedes the underscore for Fortran, and the letter `"c"` precedes the underscore for C.

For example,

`fftw2xf_intel.lib` (on Windows OS); `libfftw2xf_intel.a` (on Linux OS and Mac OS X);

`fftw2xc_intel.lib` (on Windows OS); `libfftw2xc_intel.a` (on Linux OS and Mac OS X);

`fftw2xc_ms.lib` (on Windows OS); `libfftw2xc_gnu.a` (on Linux OS and Mac OS X).

Application Assembling

Use the necessary original FFTW (www.fftw.org) header files without any modifications. Use the created wrapper library and the Intel MKL library instead of the FFTW library.

Running Examples

Intel MKL provides examples to demonstrate how to use the wrapper library. The source code for the examples, makefiles used to run them, and the example list files are located in the `.\examples\fftw2xc` and `.\examples\fftw2xf` subdirectories in the Intel MKL directory for C and Fortran, respectively. To build examples, several additional files are needed: `fftw.h`, `fftw_threads.h`, `rfftw.h`, `rfftw_threads.h`, and `fftw_f77.I`. These files are distributed with permission from FFTW and are available in `.\include\fftw`. The original files can also be found in FFTW 2.1.5 at http://www.fftw.org/download.html.

An example makefile uses the `function` parameter in addition to the parameters that the respective wrapper library makefile uses (see Creating a Wrapper Library). The makefile comment heading provides the exact description of these parameters.

An example makefile normally invokes examples. However, if the appropriate wrapper library is not yet created, the makefile first builds the library the same way as the wrapper library makefile does and then proceeds to examples.

If the parameter `function=<example_name>` is defined, only the specified example runs. Otherwise, all examples from the appropriate subdirectory run. The subdirectory `.\_results` is created, and the results are stored there in the `<example_name>.res` files.

MPI FFTW

MPI FFTW wrappers are available only with Intel® MKL for the Linux* and Windows* operating systems.

MPI FFTW Wrappers Reference

The section provides a reference for MPI FFTW C interface.

Complex MPI FFTW

Complex One-dimensional MPI FFTW Transforms

```
fftw_mpi_plan fftw_mpi_create_plan(MPI_Comm comm, int n, fftw_direction dir, int flags);
```

```
void fftw_mpi(fftw_mpi_plan p, int n_fields, fftw_complex *local_data, fftw_complex *work);
```

```
void fftw_mpi_local_sizes(fftw_mpi_plan p, int *local_n, int *local_start, int
*local_n_after_transform, int *local_start_after_transform, int *total_local_size);
```

```
void fftw_mpi_destroy_plan(fftw_mpi_plan plan);
```

Argument restrictions:

- Supported values of *flags* are `FFTW_ESTIMATE`, `FFTW_MEASURE`, `FFTW_SCRAMBLED_INPUT` and `FFTW_SCRAMBLED_OUTPUT`. The same algorithm corresponds to all these values of the flags parameter. If any other *flags* value is supplied, the wrapper library reports an error '*CDFT error in wrapper: unknown flags*'.
- The only supported value of *n_fields* is 1.

Complex Multi-dimensional MPI FFTW Transforms

```
fftwnd_mpi_plan fftw2d_mpi_create_plan(MPI_Comm comm, int nx, int ny, fftw_direction dir,
int flags);
```

```
fftwnd_mpi_plan fftw3d_mpi_create_plan(MPI_Comm comm, int nx, int ny, int nz, fftw_direction
dir, int flags);
```

```
fftwnd_mpi_plan fftwnd_mpi_create_plan(MPI_Comm comm, int dim, int *n, fftw_direction dir,
int flags);
```

```
void fftwnd_mpi(fftwnd_mpi_plan p, int n_fields, fftw_complex *local_data, fftw_complex
*work, fftwnd_mpi_output_order output_order);
```

```
void fftwnd_mpi_local_sizes(fftwnd_mpi_plan p, int *local_nx, int *local_x_start, int
*local_ny_after_transpose, int *local_y_start_after_transpose, int *total_local_size);
```

```
void fftwnd_mpi_destroy_plan(fftwnd_mpi_plan plan);
```

Argument restrictions:

- Supported values of *flags* are FFTW_ESTIMATE and FFTW_MEASURE. If any other value of *flags* is supplied, the wrapper library reports an error '*CDFT error in wrapper: unknown flags*'.
- The only supported value of *n_fields* is 1.

Real MPI FFTW

Real-to-Complex MPI FFTW Transforms

```
rfftwnd_mpi_plan rfftw2d_mpi_create_plan(MPI_Comm comm, int nx, int ny, fftw_direction
dir, int flags);
```

```
rfftwnd_mpi_plan rfftw3d_mpi_create_plan(MPI_Comm comm, int nx, int ny, int nz,
fftw_direction dir, int flags);
```

```
rfftwnd_mpi_plan rfftwnd_mpi_create_plan(MPI_Comm comm, int dim, int *n, fftw_direction
dir, int flags);
```

```
void rfftwnd_mpi(rfftwnd_mpi_plan p, int n_fields, fftw_real *local_data, fftw_real *work,
fftwnd_mpi_output_order output_order);
```

```
void rfftwnd_mpi_local_sizes(rfftwnd_mpi_plan p, int *local_nx, int *local_x_start, int
*local_ny_after_transpose, int *local_y_start_after_transpose, int *total_local_size);
```

```
void rfftwnd_mpi_destroy_plan(rfftwnd_mpi_plan plan);
```

Argument restrictions:

- Supported values of *flags* are FFTW_ESTIMATE and FFTW_MEASURE. If any other value of *flags* is supplied, the wrapper library reports an error '*CDFT error in wrapper: unknown flags*'.
- The only supported value of *n_fields* is 1.

- Function *rfftwnd_mpi_create_plan* can be used for both one-dimensional and multi-dimensional transforms.

- Both values of the *output_order* parameter are supported: FFTW_NORMAL_ORDER and FFTW_TRANSPOSED_ORDER.

Creating MPI FFTW Wrapper Library

The source code for the wrappers, makefile, and wrapper list file are located in the .\interfaces\fftw2x_cdft subdirectory in the Intel MKL directory.

A wrapper library contains C wrappers for Complex One-dimensional MPI FFTW Transforms and Complex Multi-dimensional MPI FFTW Transforms. The library also contains empty C wrappers for Real Multi-dimensional MPI FFTW Transforms. For details, see MPI FFTW Wrappers Reference.

The makefile parameters specify the platform (required), compiler, and data precision. Specifying the platform is required. The makefile comment heading provides the exact description of these parameters.

To build the library, run the make command on Linux* OS and Mac OS* X or the nmake command on Windows* OS with appropriate parameters.

For example, the command

```
make lib64
```

builds on Linux OS a double-precision wrapper library for IA-64 architecture based applications using Intel MPI 2.0 and the Intel® C++ Compiler version 9.1 or higher (compilers and data precision are chosen by default.).

The makefile creates the wrapper library in the directory with the Intel MKL libraries corresponding to the used platform. For example, ./lib/64 (on Linux OS) or .\ia32\lib (on Windows* OS).

In the wrapper library names, the suffix corresponds to the used data precision. For example,

fftw2x_cdft_SINGLE.lib on Windows OS;

libfftw2x_cdft_DOUBLE.a on Linux OS.

Application Assembling with MPI FFTW Wrapper Library

Use the necessary original FFTW (www.fftw.org) header files without any modifications. Use the created MPI FFTW wrapper library and the Intel MKL library instead of the FFTW library.

Running Examples

There are some examples that demonstrate how to use the MPI FFTW wrapper library. The source C code for the examples, makefiles used to run them, and the example list files are located in the .\examples\fftw2x_cdft subdirectory in the Intel MKL directory. To build examples, one additional file fftw_mpi.h is needed. This file is distributed with permission from FFTW and is available in .\include\fftw. The original file can also be found in FFTW 2.1.5 at http://www.fftw.org/download.html.

Parameters for the example makefiles are described in the makefile comment headings and are similar to the wrapper library makefile parameters (see Creating MPI FFTW Wrapper Library).

The table below lists examples available in the .\examples\fftw2x_cdft\source subdirectory.

Table F-1 Examples of MPI FFTW Wrappers

Source file for the example	Description
wrappers_c1d.c	One-dimensional Complex MPI FFTW transform, using plan = fftw_mpi_create_plan(...)

Source file for the example	Description
`wrappers_c2d.c`	Two-dimensional Complex MPI FFTW transform, using `plan = fftw2d_mpi_create_plan(...)`
`wrappers_c3d.c`	Three-dimensional Complex MPI FFTW transform, using `plan = fftw3d_mpi_create_plan(...)`
`wrappers_c4d.c`	Four-dimensional Complex MPI FFTW transform, using `plan = fftwnd_mpi_create_plan(...)`
`wrappers_r1d.c`	One-dimensional Real MPI FFTW transform, using `plan = rfftw_mpi_create_plan(...)`
`wrappers_r2d.c`	Two-dimensional Real MPI FFTW transform, using `plan = rfftw2d_mpi_create_plan(...)`
`wrappers_r3d.c`	Three-dimensional Real MPI FFTW transform, using `plan = rfftw3d_mpi_create_plan(...)`
`wrappers_r4d.c`	Four-dimensional Real MPI FFTW transform, using `plan = rfftwnd_mpi_create_plan(...)`

FFTW3 Interface to Intel® Math Kernel Library

This section describes a collection of FFTW3 wrappers to Intel MKL. The wrappers translate calls of FFTW3 functions to the calls of the Intel MKL Fourier transform (FFT) or Trigonometric Transform (TT) functions. The purpose of FFTW3 wrappers is to enable developers whose programs currently use the FFTW3 library to gain performance with the Intel MKL Fourier transforms without changing the program source code.

The wrappers correspond to the FFTW release 3.2 and the Intel MKL releases starting with 10.2. For a detailed description of FFTW interface, refer to www.fftw.org. For a detailed description of Intel MKL FFT and TT functionality the wrappers use, see chapter 11 and section "Trigonometric Transform Routines" in chapter 13, respectively.

The FFTW3 wrappers provide a limited functionality compared to the original FFTW 3.2 library, because of differences between FFTW and Intel MKL FFT and TT functionality. This section describes limitations of the FFTW3 wrappers and hints for their usage. Nevertheless, many typical FFT tasks can be performed using the FFTW3 wrappers to Intel MKL. More functionality may be added to the wrappers and Intel MKL in the future to reduce the constraints of the FFTW3 interface to Intel MKL.

The FFTW3 wrappers are integrated in Intel MKL. The only change required to use Intel MKL through the FFTW3 wrappers is to link your application using FFTW3 against Intel MKL.

A reference implementation of the FFTW3 wrappers is also provided in open source. You can find it in the `interfaces` directory of the Intel MKL distribution. You can use the reference implementation to create your own wrapper library (see Building Your Own Wrapper Library)

Using FFTW3 Wrappers

The FFTW3 wrappers are a set of functions and data structures depending on one another. The wrappers are not designed to provide the interface on a function-per-function basis. Some FFTW3 wrapper functions are empty and do nothing, but they are present to avoid link errors and satisfy function calls.

This manual does not list the declarations of the functions that the FFTW3 wrappers provide (you can find the declarations in the `fftw3.h` header file). Instead, this section comments particular limitations of the wrappers and provides usage hints:

- Long double precision is not supported. The Intel MKL FFT functions operate only on single- and double-precision floating-point data types (`float` and `double`, respectively), therefore the FFTW3 wrappers do not support the `long double` data type. All the FFTW3 wrapper functions with prefix `fftwl_` have an empty body and are provided only for link compatibility.
- The wrappers provide equivalent implementation for double- and single-precision functions (those with prefixes `fftw_` and `fftwf_`, respectively). So, all these comments equally apply to the double- and single-precision functions and will refer to functions with prefix `fftw_`, that is, double-precision functions, for brevity.
- The FFTW3 interface that the wrappers provide is defined in header files `fftw3.h` and `fftw3.f`. These files are borrowed from the FFTW3.2 package and distributed within Intel MKL with permission. Additionally, files `fftw3_mkl.h`, `fftw3_mkl.f`, and `fftw3_mkl_f77.h` define supporting structures, supplementary constants and macros, and expose Fortran interface in C.
- Actual functionality of the plan creation wrappers is implemented in guru64 set of functions. Basic interface, advanced interface, and guru interface plan creation functions call the guru64 interface functions. Thus, all types of the FFTW3 plan creation interface in the wrappers are functional.
- Plan creation functions may return a `NULL` plan, indicating that the functionality is not supported. So, please carefully check the result returned by plan creation functions in your application. In particular, the following problems return a `NULL` plan:
  - All long double-precision problems.
  - c2r and r2c problems with a split storage of complex data.
  - r2r problems with *kind* values `FFTW_R2HC`, `FFTW_HC2R`, and `FFTW_DHT`. The only supported r2r kinds are even/odd DFTs (sine/cosine transforms).
  - Multidimensional r2r transforms.
  - Transforms of multidimensional vectors. That is, the only supported values for parameter *howmany_rank* in guru and guru64 plan creation functions are 0 and 1.
  - Multidimensional transforms with *rank* > MKL_MAXRANK.
- The `MKL_RODFT00` value of the *kind* parameter is introduced by the FFTW3 wrappers. For better performance, you are strongly encouraged to use this value rather than `FFTW_RODFT00`. To use this *kind* value, provide an extra first element equal to 0.0 for the input/output vectors. Consider the following example:

  ```
  plan1 = fftw_plan_r2r_1d(n, in1, out1, FFTW_RODFT00, FFTW_ESTIMATE);
  plan2 = fftw_plan_r2r_1d(n, in2, out2, MKL_RODFT00, FFTW_ESTIMATE);
  ```

  Both plans perform the same transform, except that the *in2/out2* arrays have one extra zero element at location 0. For example, if $n=3$, $in1=\{x,y,z\}$ and $out1=\{u,v,w\}$, then $in2=\{0,x,y,z\}$ and $out2=\{0,u,v,w\}$.
- The *flags* parameter in plan creation functions is always ignored. The same algorithm is used regardless of the value of this parameter. In particular, *flags* values `FFTW_ESTIMATE`, `FFTW_MEASURE`, etc. have no effect.
- For multithreaded plans, use normal sequence of calls to the `fftw_init_threads()` and `fftw_plan_with_nthreads()` functions (refer to FFTW documentation).

- FFTW3 wrappers are not fully thread safe. If the new-array execute functions, such as `fftw_execute_dft()`, share the same plan from parallel user threads, set the number of the sharing threads before creation of the plan. For this purpose, the FFTW3 wrappers provide a header file `fftw3_mkl.h`, which defines a global structure `fftw3_mkl` with a field to be set to the number of sharing threads. Below is an example of setting the number of sharing threads:

```
#include "fftw3.h"
#include "fftw3_mkl.h"
fftw3_mkl.number_of_user_threads = 4;
plan = fftw_plan_dft(...);
```

- Memory allocation function `fftw_malloc` returns memory aligned at a 16-byte boundary. You must free the memory with `fftw_free`.
- The FFTW3 wrappers to Intel MKL use the 32-bit `int` type in both LP64 and ILP64 interfaces of Intel MKL. Use guru64 FFTW3 interfaces for 64-bit sizes.
- Fortran wrappers (see Calling Wrappers from Fortran) use the `INTEGER` type, which is 32-bit in LP64 interfaces and 64-bit in ILP64 interfaces.
- The wrappers typically indicate a problem by returning a `NULL` plan. In a few cases, the wrappers may report a descriptive message of the problem detected. By default the reporting is turned off. To turn it on, set variable `fftw3_mkl.verbose` to a non-zero value, for example:

```
#include "fftw3.h"
#include "fftw3_mkl.h"
fftw3_mkl.verbose = 0;
plan = fftw_plan_r2r(...);
```

- The following functions are empty:
  - For saving, loading, and printing plans
  - For saving and loading wisdom
  - For estimating arithmetic cost of the transforms.
- Do not use macro `FFTW_DLL` with the FFTW3 wrappers to Intel MKL.
- Do not use negative stride values. Though FFTW3 wrappers support negative strides in the part of advanced and guru FFTW interface, the underlying implementation does not.

Calling Wrappers from Fortran

Intel MKL also provides Fortran 77 interfaces of the FFTW3 wrappers. The Fortran wrappers are available for all FFTW3 interface functions and are based on C interface of the FFTW3 wrappers, and so they have the same functionality and restrictions as the corresponding C interface wrappers.

The Fortran wrappers use the default `INTEGER` type for integer arguments. The default `INTEGER` is 32-bit in Intel MKL LP64 interfaces and 64-bit in ILP64 interfaces. Argument *plan* in a Fortran application must have type `INTEGER*8`.

Double-precision wrappers have prefix `dfftw_`, single-precision subroutines have prefix `sfftw_` and provide an equivalent functionality. Long double subroutines (with prefix `lfftw_`) are all empty.

The Fortran FFTW3 wrappers use the default Intel® Fortran compiler convention for name decoration. If your compiler uses a different convention, or if you are using compiler options affecting the name decoration (such as `/Qlowercase`), you may need to compile the wrappers from sources, as described in section Building Your Own Wrapper Library.

For interoperability with C, the declaration of the Fortran FFTW3 interface is provided in header file `include/fftw/fftw3_mkl_f77.h`.

You can call Fortran wrappers from a FORTRAN 77 or Fortran 90 application, although Intel MKL does not provide a Fortran 90 module for the wrappers. For a detailed description of the FFTW Fortran interface, refer to FFTW3 documentation (www.fftw.org).

The following example illustrates calling the FFTW3 wrappers from Fortran:

```
INTEGER*8 plan
INTEGER N
INCLUDE 'fftw3.f'
COMPLEX*16 IN(*), OUT(*)
!...initialize array IN
CALL DFFTW_PLAN_DFT_1D(PLAN, N, IN, OUT, -1, FFTW_ESTIMATE)
IF (PLAN .EQ. 0) STOP
CALL DFFTW_EXECUTE
!...result is in array OUT
```

Building Your Own Wrapper Library

The FFTW3 wrappers to Intel MKL are delivered both integrated in Intel MKL and as source code, which can be compiled to build a standalone wrapper library with exactly the same functionality. Normally you do not need to build the wrappers yourself. However, if your Fortran application is compiled with a compiler that uses a different name decoration than the Intel® Fortran compiler or if you are using compiler options altering the Fortran name decoration, you may need to build the wrappers that use the appropriate name changing convention.

The source code for the wrappers, makefiles, and function list files are located in subdirectories `.\interfaces\fftw3xc` and `.\interfaces\fftw3xf` in the Intel MKL directory for C and Fortran wrappers, respectively.

To build the wrappers,

1. Change the current directory to the wrapper directory
2. Run the `make` command on Linux* OS and Mac OS* X or the `nmake` command on Windows* OS with a required target and optionally several parameters.

The target, that is, one of `{lib32, lib64, libem64t}`, defines the platform architecture, and the other parameters facilitate selection of the compiler, size of the default `INTEGER` type, and placement of the resulting wrapper library. You can find a detailed and up-to-date description of the parameters in the makefile.

In the following example, the `make` command is used to build the FFTW3 Fortran wrappers to MKL for use from the GNU g77 Fortran compiler on Linux OS based on Intel® 64 architecture:

```
cd interfaces/fftw3xf
make libem64t compiler=gcc fname=a_name__ install_to=/my/path
```

This command builds the wrapper library using the GNU gcc compiler, decorates the name with the second underscore, and places the result, named `libfftw3xf_gcc.a`, into directory `/my/path`. The name of the resulting library is composed of the name of the compiler used and may be changed by an optional parameter.

Building an Application

Normally, the only change needed to build your application with FFTW3 wrappers replacing original FFTW library is to add Intel MKL at the link stage (see section *"Linking Your Application with Intel® Math Kernel Library" in the Intel MKL User's Guide*).

If you recompile your application, add subdirectory `include\fftw` to the search path for header files to avoid FFTW3 version conflicts.

Sometimes, you may have to modify your application according to the following recommendations:

- The application requires

  `#include "fftw3.h"` ,

  which it probably already includes.
- The application does not require

  `#include "mkl_dfti.h"` .
- The application does not require

  `#include "fftw3_mkl.h"` .

  It is required only in case you want to use the `MKL_RODFT00` constant.
- If the application does not check whether a `NULL` plan is returned by plan creation functions, this check must be added, because the FFTW3 to Intel MKL wrappers do not provide 100% of FFTW3 functionality.
- If the application is threaded, take care about shared plans, because the execute functions in the wrappers are not thread safe, unlike the original FFTW3 functions. See a note about setting `fftw3_mkl.number_of_user_threads` in section "Using FFTW3 wrappers".

Running Examples

There are some examples that demonstrate how to use the wrapper library. The source code for the examples, makefiles used to run them, and the example list files are located in the `.\examples\fftw3xc` and `.\examples\fftw3xf` subdirectories in the Intel MKL directory. To build Fortran examples, one additional file `fftw3.f` is needed. This file is distributed with permission from FFTW and is available in the `.\include\fftw` subdirectory of the Intel MKL directory. The original file can also be found in FFTW 3.2 at http://www.fftw.org/download.html.

Example makefile parameters are similar to the wrapper library makefile parameters. Example makefiles normally build and invoke the examples. If the parameter `function=<example_name>` is defined, then only the specified example will run. Otherwise, all examples will be executed. Results of running the examples are saved in subdirectory `.\_results` in files with extension `.res`.

For detailed information about options for the example makefile, refer to the makefile.

Glossary

A^H	Denotes the conjugate transpose of a general matrix *A*. *See also* conjugate matrix.
A^T	Denotes the transpose of a general matrix *A*. *See also* transpose.
band matrix	A general *m*-by-*n* matrix *A* such that $a_{ij} = 0$ for $\|i - j\| > l$, where $1 < l < \min(m, n)$. For example, any tridiagonal matrix is a band matrix.
band storage	A special storage scheme for band matrices. A matrix is stored in a two-dimensional array: columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.
BLAS	Abbreviation for Basic Linear Algebra Subprograms. These subprograms implement vector, matrix-vector, and matrix-matrix operations.
BRNG	Abbreviation for Basic Random Number Generator. Basic random number generators are pseudorandom number generators imitating i.i.d. random number sequences of uniform distribution. Distributions other than uniform are generated by applying different transformation techniques to the sequences of random numbers of uniform distribution.
BRNG registration	Standardized mechanism that allows a user to include a user-designed BRNG into the VSL and use it along with the predefined VSL basic generators.
Bunch-Kaufman factorization	Representation of a real symmetric or complex Hermitian matrix *A* in the form $A = PUDU^{H}P^{T}$ (or $A = PLDL^{H}P^{T}$) where *P* is a permutation matrix, *U* and *L* are upper and lower triangular matrices with unit diagonal, and *D* is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.
c	When found as the first letter of routine names, c indicates the usage of single-precision complex data type.
CBLAS	C interface to the BLAS. *See* BLAS.
CDF	Cumulative Distribution Function. The function that determines probability distribution for univariate or multivariate random variable *X*. For univariate distribution the cumulative distribution function is the function of real argument *x*, which for every *x* takes a value equal to probability of the event $A: X \le x$. For multivariate distribution the cumulative distribution function is the function of a real vector $x = (x_1, x_2, \ldots, x_n)$, which, for every *x*, takes a value equal to probability of the event $A = (X_1 \le x_1 \ \& \ X_2 \le x_2, \ \& \ \ldots, \ \& \ X_n \le x_n)$.

Cholesky factorization	Representation of a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix A in the form $A = U^H U$ or $A = LL^H$, where L is a lower triangular matrix and U is an upper triangular matrix.
condition number	The number $\kappa(A)$ defined for a given square matrix A as follows: $\kappa(A) = \|\|A\|\| \ \|\|A^{-1}\|\|$.
conjugate matrix	The matrix A^H defined for a given general matrix A as follows: $(A^H)_{ij} = (a_{ji})^*$.
conjugate number	The conjugate of a complex number $z = a + bi$ is $z^* = a - bi$.
d	When found as the first letter of routine names, d indicates the usage of double-precision real data type.
dot product	The number denoted $x \cdot y$ and defined for given vectors x and y as follows: $x \cdot y = \Sigma_i \ x_i y_i$. Here x_i and y_i stand for the i-th elements of x and y, respectively.
double precision	A floating-point data type. On Intel® processors, this data type allows you to store real numbers x such that $2.23*10^{-308} < \| x \| < 1.79*10^{308}$. For this data type, the machine precision ε is approximately 10^{-15}, which means that double-precision numbers usually contain no more than 15 significant decimal digits. For more information, refer to *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1: Basic Architecture*.
eigenvalue	*See* eigenvalue problem.
eigenvalue problem	A problem of finding non-zero vectors x and numbers λ (for a given square matrix A) such that $Ax = \lambda x$. Here the numbers λ are called the eigenvalues of the matrix A and the vectors x are called the eigenvectors of the matrix A.
eigenvector	*See* eigenvalue problem.
elementary reflector(Householder matrix)	Matrix of a general form $H = I - \tau v v^T$, where v is a column vector and τ is a scalar. In LAPACK elementary reflectors are used, for example, to represent the matrix Q in the QR factorization (the matrix Q is represented as a product of elementary reflectors).
factorization	Representation of a matrix as a product of matrices. *See also* Bunch-Kaufman factorization, Cholesky factorization, LU factorization, LQ factorization, QR factorization, Schur factorization.
FFTs	Abbreviation for Fast Fourier Transforms. *See* Chapter 11 of this book.
full storage	A storage scheme allowing you to store matrices of any kind. A matrix A is stored in a two-dimensional array a, with the matrix element a_{ij} stored in the array element $a(i,j)$.
Hermitian matrix	A square matrix A that is equal to its conjugate matrix A^H. The conjugate A^H is defined as follows: $(A^H)_{ij} = (a_{ji})^*$.
I	*See* identity matrix.
identity matrix	A square matrix I whose diagonal elements are 1, and off-diagonal elements are 0. For any matrix A, $AI = A$ and $IA = A$.
i.i.d.	Independent Identically Distributed.
in-place	Qualifier of an operation. A function that performs its operation in-place takes its input from an array and returns its output to the same array.

Intel MKL	Abbreviation for Intel® Math Kernel Library.
inverse matrix	The matrix denoted as A^{-1} and defined for a given square matrix A as follows: $AA^{-1} = A^{-1}A = I$. A^{-1} does not exist for singular matrices A.
LQ factorization	Representation of an m-by-n matrix A as $A = LQ$ or $A = (L\ 0)Q$. Here Q is an n-by-n orthogonal (unitary) matrix. For $m \le n$, L is an m-by-m lower triangular matrix with real diagonal elements; for $m > n$, $$L = \begin{bmatrix} L_1 \\ L_2 \end{bmatrix}$$ where L_1 is an n-by-n lower triangular matrix, and L_2 is a rectangular matrix.
LU factorization	Representation of a general m-by-n matrix A as $A = PLU$, where P is a permutation matrix, L is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$) and U is upper triangular (upper trapezoidal if $m < n$).
machine precision	The number ε determining the precision of the machine representation of real numbers. For Intel® architecture, the machine precision is approximately 10^{-7} for single-precision data, and approximately 10^{-15} for double-precision data. The precision also determines the number of significant decimal digits in the machine representation of real numbers. *See also* double precision and single precision.
MPI	Message Passing Interface. This standard defines the user interface and functionality for a wide range of message-passing capabilities in parallel computing.
MPICH	A freely available, portable implementation of MPI standard for message-passing libraries.
orthogonal matrix	A real square matrix A whose transpose and inverse are equal, that is, $A^T = A^{-1}$, and therefore $AA^T = A^TA = I$. All eigenvalues of an orthogonal matrix have the absolute value 1.
packed storage	A storage scheme allowing you to store symmetric, Hermitian, or triangular matrices more compactly. The upper or lower triangle of a matrix is packed by columns in a one-dimensional array.
PDF	Probability Density Function. The function that determines probability distribution for univariate or multivariate continuous random variable X. The probability density function $f(x)$ is closely related with the cumulative distribution function $F(x)$. For univariate distribution the relation is $$F(x) = \int_{-\infty}^{x} f(t)dt\ .$$ For multivariate distribution the relation is

$$F(x_1, x_2, \ldots, x_n) = \int_{-\infty}^{x_1} \int_{-\infty}^{x_2} \ldots \int_{-\infty}^{x_n} f(t_1, t_2, \ldots, t_n) dt_1 dt_2 \ldots dt_n .$$

positive-definitematrix	A square matrix *A* such that $Ax \cdot x > 0$ for any non-zero vector *x*. Here · denotes the dot product.
pseudorandom number generator	A completely deterministic algorithm that imitates truly random sequences.
QR factorization	Representation of an *m*-by-*n* matrix *A* as $A = QR$, where *Q* is an *m*-by-*m* orthogonal (unitary) matrix, and *R* is *n*-by-*n* upper triangular with real diagonal elements (if $m \geq n$) or trapezoidal (if $m < n$) matrix.
random stream	An abstract source of independent identically distributed random numbers of uniform distribution. In this manual a random stream points to a structure that uniquely defines a random number sequence generated by a basic generator associated with a given random stream.
RNG	Abbreviation for Random Number Generator. In this manual the term "random number generators" stands for pseudorandom number generators, that is, generators based on completely deterministic algorithms imitating truly random sequences.
Rectangular Full Packed (RFP) storage	A storage scheme combining the full and packed storage schemes for the upper or lower triangle of the matrix. This combination enables using half of the full storage as packed storage while maintaining efficiency by using Level 3 BLAS/LAPACK kernels as the full storage.
s	When found as the first letter of routine names, s indicates the usage of single-precision real data type.
ScaLAPACK	Stands for Scalable Linear Algebra PACKage.
Schur factorization	Representation of a square matrix *A* in the form $A = ZTZ^H$. Here T is an upper quasi-triangular matrix (for complex *A*, triangular matrix) called the Schur form of *A*; the matrix *Z* is orthogonal (for complex *A*, unitary). Columns of *Z* are called Schur vectors.
single precision	A floating-point data type. On Intel® processors, this data type allows you to store real numbers *x* such that $1.18*10^{-38} < |x| < 3.40*10^{38}$. For this data type, the machine precision (ε) is approximately 10^{-7}, which means that single-precision numbers usually contain no more than 7 significant decimal digits. For more information, refer to *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1: Basic Architecture*.
singular matrix	A matrix whose determinant is zero. If *A* is a singular matrix, the inverse A^{-1} does not exist, and the system of equations $Ax = b$ does not have a unique solution (that is, there exist no solutions or an infinite number of solutions).
singular value	The numbers defined for a given general matrix *A* as the eigenvalues of the matrix AA^H. *See also* SVD.
SMP	Abbreviation for Symmetric MultiProcessing. The MKL offers performance gains through parallelism provided by the SMP feature.
sparse BLAS	Routines performing basic vector operations on sparse vectors. Sparse BLAS routines take advantage of vectors' sparsity: they allow you to store only non-zero elements of vectors. *See* BLAS.

sparse vectors	Vectors in which most of the components are zeros.
storage scheme	The way of storing matrices. *See* full storage, packed storage, and band storage.
SVD	Abbreviation for Singular Value Decomposition. *See also* Singular value decomposition section in Chapter 5.
symmetric matrix	A square matrix A such that $a_{ij} = a_{ji}$.
transpose	The transpose of a given matrix A is a matrix A^T such that $(A^T)_{ij} = a_{ji}$ (rows of A become columns of A^T, and columns of A become rows of A^T).
trapezoidal matrix	A matrix A such that $A = (A_1A_2)$, where A_1 is an upper triangular matrix, A_2 is a rectangular matrix.
triangular matrix	A matrix A is called an upper (lower) triangular matrix if all its subdiagonal elements (superdiagonal elements) are zeros. Thus, for an upper triangular matrix $a_{ij} = 0$ when $i > j$; for a lower triangular matrix $a_{ij} = 0$ when $i < j$.
tridiagonal matrix	A matrix whose non-zero elements are in three diagonals only: the leading diagonal, the first subdiagonal, and the first super-diagonal.
unitary matrix	A complex square matrix A whose conjugate and inverse are equal, that is, that is, $A^H = A^{-1}$, and therefore $AA^H = A^HA = I$. All eigenvalues of a unitary matrix have the absolute value 1.
VML	Abbreviation for Vector Mathematical Library. *See* Chapter 9 of this book.
VSL	Abbreviation for Vector Statistical Library. *See* Chapter 10 of this book.
z	When found as the first letter of routine names, z indicates the usage of double-precision complex data type.
