Intel® MKL 10.2 Update 7

Legal Information

INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER, AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS OTHERWISE AGREED IN WRITING BY INTEL, THE INTEL PRODUCTS ARE NOT DESIGNED NOR INTENDED FOR ANY APPLICATION IN WHICH THE FAILURE OF THE INTEL PRODUCT COULD CREATE A SITUATION WHERE PERSONAL INJURY OR DEATH MAY OCCUR.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined." Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Contact your local Intel sales office or your distributor to obtain the latest specifications and before placing your product order.

Copies of documents which have an order number and are referenced in this document, or other Intel literature, may be obtained by calling 1-800-548-4725, or go to

http://www.intel.com/design/literature.htm

Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families. See http://www.intel.com/products/processor_number/ for details.

Chapter 1: Overview

Introducing the Intel® Math Kernel Library.....39
Getting Help and Support.....39
What's New.....40
Notational Conventions.....41
Function Domains.....42
BLAS Routines.....42
Sparse BLAS Routines.....43
LAPACK Routines.....43
ScaLAPACK Routines.....43
PBLAS Routines.....44
Sparse Solver Routines.....44
VML Functions.....44
Statistical Functions.....44
Fourier Transform Functions.....45
Partial Differential Equations Support.....45
Nonlinear Optimization Problem Solvers.....45
Support Functions.....45
BLACS Routines.....45
GMP Arithmetic Functions.....46
Performance Enhancements.....46
Parallelism.....46

Chapter 2: BLAS and Sparse BLAS Routines

BLAS Routines.....47
Routine Naming Conventions.....47
Fortran 95 Interface Conventions.....49
Matrix Storage Schemes.....50

Introducing the Intel® Math Kernel Library

The Intel® Math Kernel Library (Intel® MKL) enables improving performance of scientific, engineering, and financial software that solves large computational problems. Intel MKL provides a set of linear algebra routines, fast Fourier transforms, as well as vectorized math and random number generation functions, all optimized for the latest Intel® processors, including processors with multiple cores (see the *Intel MKL Release Notes* for the full list of supported processors). Intel MKL also performs well on non-Intel processors.

Intel MKL is thread-safe and extensively threaded using the OpenMP* technology.

Getting Help and Support

Getting Help

The online version of the Intel® Math Kernel Library (Intel® MKL) Reference Manual integrates into the Microsoft Visual Studio* development system help on Windows* OS or into the Eclipse* development system help on Linux* OS. For information on how to use the online help, see the online version of the Reference Manual.

Getting Technical Support

Intel MKL provides a product web site that offers timely and comprehensive product information, including product features, white papers, and technical articles. For the latest information, check: http://www.intel.com/software/products/support.

Intel also provides a support web site that contains a rich repository of self help information, including getting started tips, known product issues, product errata, license information, user forums, and more (visit http://www.intel.com/software/products/).

Registering your product entitles you to one year of technical support and product updates through Intel® Premier Support. Intel Premier Support is an interactive issue management and communication web site providing these services:

- Submit issues and review their status.
- Download product updates anytime of the day.

To register your product, contact Intel, or seek product support, please visit http://www.intel.com/software/products/support.

What's New

This Reference Manual documents Intel® Math Kernel Library (Intel® MKL) 10.2 Update 7.

The following function domains have been updated in Intel MKL 10.2 with new functions or enhancements to the existing functionality, reflected in the function descriptions and code examples provided in the manual:

- LAPACK (see LAPACK Routines: Linear Equations, LAPACK Routines: Least Squares and Eigenvalue Problems, LAPACK Auxiliary and Utility Routines), to reflect LAPACK 3.2 update
- Sparse BLAS (see BLAS and Sparse BLAS Routines), with new flavors for `?gemm` function
- Sparse Solvers (see Sparse Solver Routines)
- Fast Fourier Transforms (see Fourier Transform Functions)
- Optimization Solvers (see Optimization Solver Routines)
- Support Functions (see Support Functions)

FFTW3 wrappers have been integrated into Intel MKL (see FFTW3 Interface to Intel® Math Kernel Library).

VML description has been updated with information on special values (see Vector Mathematical Functions).

For Intel MKL 10.2 Update 2,

- the frontmatter of the manual was restructured for cross-product consistency and better reading
- Description of Optimization Solver Routines was modified and the Appendix on Optimization Solvers Basics was removed
- several minor bugs were fixed.

For Intel MKL 10.2 Update 3,

- code examples duplicated from the `examples` folder of the library were removed from Appendix C
- the PARDISO* Solver description was updated
- description of Vector Mathematical Functions was modified
- several minor bugs were fixed (BLAS, LAPACK, ScaLAPACK, and VML routines).

For Intel MKL 10.2 Update 4,

- the single precision version of the `?cabs1` function was added (see BLAS and Sparse BLAS Routines).
- the diagonally dominant tridiagonal routines were added to the LAPACK Routines: Linear Equations functions (see `?dttrfb`, `?dttrsb`, and `?dtsvb`).
- several minor bugs were fixed (BLAS, ScaLAPACK, FFT, VML, and Support routines).

For Intel MKL 10.2 Update 6,

- three LAPACK routines have been added to reflect LAPACK 3.2.2 update - `?geqrfp`, `?geqr2p`, and `?larfgp`.
- the list of FFTW2 to Intel MKL wrappers for multi-dimensional real-to-complex/complex-to-real FFTs has been extended. The wording in the description of FFTW2 Interface to Intel MKL has been improved.
- a new ILP64 (64-bit integer) version of the PARDISO solver has been added (see `pardiso_64`).
- several minor bugs have been fixed in the description of BLAS, ScaLAPACK (added description of three driver routines), FFT, VML, and Support routines.

For Intel MKL 10.2 Update 7,

- Sparse Solvers (see Sparse Solver Routines) to reflect addition of the C interface for the direct sparse solver routines
- Nonlinear Optimization Problem Solvers (see Nonlinear Optimization Problem Solvers), to reflect addition of single precision routines
- minor bugs were fixed in the description of the Support functions, and the LAPACK, Sparse Solver, and Nonlinear Optimization Problem Solvers domains.

Notational Conventions

This manual uses the following terms to refer to operating systems:

Windows* OS	This term refers to information that is valid on all supported Windows* operating systems.
Linux* OS	This term refers to information that is valid on all supported Linux* operating systems.
Mac OS* X	This term refers to information that is valid on Intel®-based systems running the Mac OS* X operating system.

This manual uses the following notational conventions:

- Routine name shorthand (for example, `?ungqr` instead of `cungqr/zungqr`).
- Font conventions used for distinction between the text and the code.

Routine Name Shorthand

For shorthand, names that contain a question mark "?" represent groups of routines with similar functionality. Each group typically consists of routines used with four basic data types: single-precision real, double-precision real, single-precision complex, and double-precision complex. The question mark is used to indicate any or all possible varieties of a function; for example:

`?swap`	Refers to all four data types of the vector-vector `?swap` routine: `sswap`, `dswap`, `cswap`, and `zswap`.

Font Conventions

The following font conventions are used:

`UPPERCASE COURIER`	Data type used in the description of input and output parameters for Fortran interface. For example, `CHARACTER*1`.
`lowercase courier`	Code examples: `a(k+i,j) = matrix(i,j)` and data types for C interface, for example, `const float*`
`lowercase courier mixed with UpperCase courier`	Function names for C interface, for example, `vmlSetMode`
`lowercase courier italic`	Variables in arguments and parameters description. For example, *`incx`*.
*	Used as a multiplication symbol in code examples and equations and where required by the Fortran syntax.

Function Domains

The Intel® Math Kernel Library includes Fortran routines and functions optimized for Intel® processor-based computers running operating systems that support multiprocessing. In addition to the Fortran interface, Intel MKL includes a C-language interface for the Discrete Fourier transform functions, as well as for the Vector Mathematical Library and Vector Statistical Library functions. For hardware and software requirements to use Intel MKL, see *Intel® MKL Release Notes*.

The Intel® Math Kernel Library includes the following groups of routines:

- Basic Linear Algebra Subprograms (BLAS):
  - vector operations
  - matrix-vector operations
  - matrix-matrix operations
- Sparse BLAS Level 1, 2, and 3 (basic operations on sparse vectors and matrices)
- LAPACK routines for solving systems of linear equations
- LAPACK routines for solving least squares problems, eigenvalue and singular value problems, and Sylvester's equations
- Auxiliary and utility LAPACK routines
- ScaLAPACK computational, driver and auxiliary routines (only in Intel MKL for Linux* and Windows* operating systems)
- PBLAS routines for distributed vector, matrix-vector, and matrix-matrix operation
- Direct and Iterative Sparse Solver routines
- Vector Mathematical Library (VML) functions for computing core mathematical functions on vector arguments (with Fortran and C interfaces)
- Vector Statistical Library (VSL) functions for generating vectors of pseudorandom numbers with different types of statistical distributions and for performing convolution and correlation computations
- General Fast Fourier Transform (FFT) Functions, providing fast computation of Discrete Fourier Transform via the FFT algorithms and having Fortran and C interfaces
- Cluster FFT functions (only in Intel MKL for Linux* and Windows* operating systems)
- Tools for solving partial differential equations - trigonometric transform routines and Poisson solver
- Nonlinear Optimization Problem Solver routines for solving nonlinear least squares problems through the Trust-Region (TR) algorithms and computing Jacobi matrix by central differences
- Basic Linear Algebra Communication Subprograms (BLACS) that are used to support a linear algebra oriented message passing interface
- GMP arithmetic functions

For specific issues on using the library, also see the *Intel® MKL Release Notes*.

BLAS Routines

The BLAS routines and functions are divided into the following groups according to the operations they perform:

- BLAS Level 1 Routines perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.

- BLAS Level 2 Routines perform matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.
- BLAS Level 3 Routines perform matrix-matrix operations, such as matrix-matrix multiplication, rank-k update, and solution of triangular systems.

Starting from release 8.0, Intel® MKL also supports Fortran 95 interface to the BLAS routines.

Starting from release 10.1, a number of BLAS-like Extensions are added to enable the user to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations.

Sparse BLAS Routines

The Sparse BLAS Level 1 Routines and Functions and Sparse BLAS Level 2 Routines and Level 3 routines and functions operate on sparse vectors and matrices. These routines perform vector operations similar to the BLAS Level 1, 2, and 3 routines. The Sparse BLAS routines take advantage of vector and matrix sparsity: they allow you to store only non-zero elements of vectors and matrices. Intel MKL also supports Fortran 95 interface to Sparse BLAS routines.

LAPACK Routines

The Intel® Math Kernel Library fully supports LAPACK 3.1 set of computational, driver, auxiliary and utility routines.

The original versions of LAPACK from which that part of Intel MKL was derived can be obtained from http://www.netlib.org/lapack/index.html. The authors of LAPACK are E. Anderson, Z. Bai, C. Bischof, S. Blackford, J. Demmel, J. Dongarra, J. Du Croz, A. Greenbaum, S. Hammarling, A. McKenney, and D. Sorensen.

The LAPACK routines can be divided into the following groups according to the operations they perform:

- Routines for solving systems of linear equations, factoring and inverting matrices, and estimating condition numbers (see Chapter 3).
- Routines for solving least squares problems, eigenvalue and singular value problems, and Sylvester's equations (see Chapter 4).
- Auxiliary and utility routines used to perform certain subtasks, common low-level computation or related tasks (see Chapter 5).

Starting from release 8.0, Intel MKL also supports Fortran 95 interface to LAPACK computational and driver routines. This interface provides an opportunity for simplified calls of LAPACK routines with fewer required arguments.

ScaLAPACK Routines

The ScaLAPACK package (included only with the Intel® MKL versions for Linux* and Windows* operating systems, see Chapter 6 and Chapter 7) runs on distributed-memory architectures and includes routines for solving systems of linear equations, solving linear least squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

The original versions of ScaLAPACK from which that part of Intel MKL was derived can be obtained from http://www.netlib.org/scalapack/index.html. The authors of ScaLAPACK are L. Blackford, J. Choi, A.Cleary, E. D'Azevedo, J. Demmel, I. Dhillon, J. Dongarra, S. Hammarling, G. Henry, A. Petitet, K.Stanley, D. Walker, and R. Whaley.

The Intel MKL version of ScaLAPACK is optimized for Intel® processors and uses MPICH version of MPI as well as Intel MPI.

PBLAS Routines

The PBLAS routines perform operations with distributed vectors and matrices.

- PBLAS Level 1 Routines perform operations of both addition and reduction on vectors of data. Typical operations include scaling and dot products.
- PBLAS Level 2 Routines perform distributed matrix-vector operations, such as matrix-vector multiplication, rank-1 and rank-2 matrix updates, and solution of triangular systems.
- PBLAS Level 3 Routines perform distributed matrix-matrix operations, such as matrix-matrix multiplication, rank-k update, and solution of triangular systems.

Intel MKL provides the PBLAS routines with interface similar to the interface used in the Netlib PBLAS (part of the ScaLAPACK package, see http://www.netlib.org/scalapack/html/pblas_qref.html).

Sparse Solver Routines

Direct sparse solver routines in Intel MKL (see Chapter 8) solve symmetric and symmetrically-structured sparse matrices with real or complex coefficients. For symmetric matrices, these Intel MKL subroutines can solve both positive-definite and indefinite systems. Intel MKL includes the PARDISO* sparse solver interface as well as an alternative set of user callable direct sparse solver routines.

If you use the sparse solver PARDISO* from Intel MKL, please cite:

O.Schenk and K.Gärtner. Solving unsymmetric sparse systems of linear equations with PARDISO. J. of Future Generation Computer Systems, 20(3):475-487, 2004.

Intel MKL provides also an iterative sparse solver (see Chapter 8) that uses Sparse BLAS level 2 and 3 routines and works with different sparse data formats.

VML Functions

The Vector Mathematical Library (VML) functions (see Chapter 9) include a set of highly optimized implementations of certain computationally expensive core mathematical functions (power, trigonometric, exponential, hyperbolic, etc.) that operate on vectors of real and complex numbers.

Application programs that might significantly improve performance with VML include nonlinear programming software, integrals computation, and many others. VML provides interfaces both for Fortran and C languages.

Statistical Functions

The Vector Statistical Library (VSL) contains two sets of functions (see Chapter 10):

- The first set includes a collection of pseudo- and quasi-random number generator subroutines implementing basic continuous and discrete distributions. To provide best performance, the VSL subroutines use calls to highly optimized Basic Random Number Generators (BRNGs) and a library of vector mathematical functions.
- The second set includes a collection of routines that implement a wide variety of convolution and correlation operations.

Fourier Transform Functions

The Intel® MKL multidimensional Fast Fourier Transform (FFT) functions with mixed radix support (see Chapter 11) provide uniformity of discrete Fourier transform computation and combine functionality with ease of use. Both Fortran and C interface specification are given. There is also a cluster version of FFT functions, which runs on distributed-memory architectures and is provided only in Intel MKL versions for the Linux* and Windows* operating systems.

The FFT functions provide fast computation via the FFT algorithms for arbitrary lengths. See *the Intel MKL User's Guide* for the specific radices supported.

Partial Differential Equations Support

Intel® MKL provides tools for solving Partial Differential Equations (PDE) (see Chapter 13). These tools are Trigonometric Transform interface routines and Poisson Library.

The Trigonometric Transform routines may be helpful to users who implement their own solvers similar to the solver that the Poisson Library provides. The users can improve performance of their solvers by using fast sine, cosine, and staggered cosine transforms implemented in the Trigonometric Transform interface.

The Poisson Library is designed for fast solving of simple Helmholtz, Poisson, and Laplace problems. The Trigonometric Transform interface, which underlies the solver, is based on the Intel MKL FFT interface (refer to Chapter 11), optimized for Intel® processors.

Nonlinear Optimization Problem Solvers

Intel® MKL provides Nonlinear Optimization Problem Solver routines (see Chapter 14) that can be used to solve nonlinear least squares problems with or without linear (bound) constraints through the Trust-Region (TR) algorithms and compute Jacobi matrix by central differences.

Support Functions

The Intel® MKL support functions (see Chapter 15) are used to support the operation of the Intel MKL software and provide basic information on the library and library operation, such as the current library version, timing, setting and measuring of CPU frequency, error handling, and memory allocation.

Starting from release 10.0, the Intel MKL support functions provide additional threading control.

Starting from release 10.1, Intel MKL selectively supports a *Progress Routine* feature to track progress of a lengthy computation and/or interrupt the computation using a callback function mechanism. The user application can define a function called `mkl_progress` that is regularly called from the Intel MKL routine supporting the progress routine feature. See the Progress Routines section in Chapter 15 for reference. Refer to a specific LAPACK or DSS/PARDISO function description to see whether the function supports this feature or not.

BLACS Routines

The Intel® Math Kernel Library implements routines from the BLACS (Basic Linear Algebra Communication Subprograms) package (see Chapter 16) that are used to support a linear algebra oriented message passing interface that may be implemented efficiently and uniformly across a large range of distributed memory platforms.

The original versions of BLACS from which that part of Intel MKL was derived can be obtained from http://www.netlib.org/blacs/index.html. The authors of BLACS are Jack Dongarra and R. Clint Whaley.

GMP Arithmetic Functions

Intel® MKL implementation of GMP arithmetic functions includes arbitrary precision arithmetic operations on integer numbers. The interfaces of such functions fully match the GNU Multiple Precision (GMP) Arithmetic Library.

Performance Enhancements

The Intel® Math Kernel Library has been optimized by exploiting both processor and system features and capabilities. Special care has been given to those routines that most profit from cache-management techniques. These especially include matrix-matrix operation routines such as `dgemm()`.

In addition, code optimization techniques have been applied to minimize dependencies of scheduling integer and floating-point units on the results within the processor.

The major optimization techniques used throughout the library include:

- Loop unrolling to minimize loop management costs
- Blocking of data to improve data reuse opportunities
- Copying to reduce chances of data eviction from cache
- Data prefetching to help hide memory latency
- Multiple simultaneous operations (for example, dot products in `dgemm`) to eliminate stalls due to arithmetic unit pipelines
- Use of hardware features such as the SIMD arithmetic units, where appropriate

These are techniques from which the arithmetic code benefits the most.

Parallelism

In addition to the performance enhancements discussed above, Intel® MKL offers performance gains through parallelism provided by the symmetric multiprocessing performance (SMP) feature. You can obtain improvements from SMP in the following ways:

- One way is based on user-managed threads in the program and further distribution of the operations over the threads based on data decomposition, domain decomposition, control decomposition, or some other parallelizing technique. Each thread can use any of the Intel MKL functions (except for the deprecated `?lacon` LAPACK routine) because the library has been designed to be thread-safe.
- Another method is to use the FFT and BLAS level 3 routines. They have been parallelized and require no alterations of your application to gain the performance enhancements of multiprocessing. Performance using multiple processors on the level 3 BLAS shows excellent scaling. Since the threads are called and managed within the library, the application does not need to be recompiled thread-safe (see also Fortran 95 Interface Conventions in Chapter 2).
- Yet another method is to use *tuned LAPACK routines*. Currently these include the single- and double precision flavors of routines for *QR* factorization of general matrices, triangular factorization of general and symmetric positive-definite matrices, solving systems of equations with such matrices, as well as solving symmetric eigenvalue problems.

For instructions on setting the number of available processors for the BLAS level 3 and LAPACK routines, see *Intel® MKL User's Guide*.

2 BLAS and Sparse BLAS Routines

This chapter describes the Intel® Math Kernel Library implementation of the BLAS and Sparse BLAS routines, and BLAS-like extensions. The routine descriptions are arranged in several sections according to the BLAS level of operation:

- BLAS Level 1 Routines (vector-vector operations)
- BLAS Level 2 Routines (matrix-vector operations)
- BLAS Level 3 Routines (matrix-matrix operations)
- Sparse BLAS Level 1 Routines (vector-vector operations).
- Sparse BLAS Level 2 and Level 3 Routines (matrix-vector and matrix-matrix operations)
- BLAS-like Extensions

Each section presents the routine and function group descriptions in alphabetical order by routine or function group name; for example, the `?asum` group, the `?axpy` group. The question mark in the group name corresponds to different character codes indicating the data type (`s`, `d`, `c`, and `z` or their combination); see *Routine Naming Conventions*.

When BLAS or Sparse BLAS routines encounter an error, they call the error reporting routine `xerbla`.

In BLAS Level 1 groups `i?amax` and `i?amin`, an "`i`" is placed before the data-type indicator and corresponds to the index of an element in the vector. These groups are placed in the end of the BLAS Level 1 section.

BLAS Routines

Routine Naming Conventions

BLAS routine names have the following structure:

<character> <name> <mod> ( )

The *<character>* field indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

Some routines and functions can have combined character codes, such as `sc` or `dz`.

For example, the function `scasum` uses a complex input array and returns a real value.

The <*name*> field, in BLAS level 1, indicates the operation type. For example, the BLAS level 1 routines ?dot, ?rot, ?swap compute a vector dot product, vector rotation, and vector swap, respectively.

In BLAS level 2 and 3, <*name*> reflects the matrix argument type:

ge	general matrix
gb	general band matrix
sy	symmetric matrix
sp	symmetric matrix (packed storage)
sb	symmetric band matrix
he	Hermitian matrix
hp	Hermitian matrix (packed storage)
hb	Hermitian band matrix
tr	triangular matrix
tp	triangular matrix (packed storage)
tb	triangular band matrix.

The <*mod*> field, if present, provides additional details of the operation. BLAS level 1 names can have the following characters in the <*mod*> field:

c	conjugated vector
u	unconjugated vector
g	Givens rotation.

BLAS level 2 names can have the following characters in the <*mod*> field:

mv	matrix-vector product
sv	solving a system of linear equations with matrix-vector operations
r	rank-1 update of a matrix
r2	rank-2 update of a matrix.

BLAS level 3 names can have the following characters in the <*mod*> field:

mm	matrix-matrix product
sm	solving a system of linear equations with matrix-matrix operations
rk	rank-*k* update of a matrix
r2k	rank-2*k* update of a matrix.

The examples below illustrate how to interpret BLAS routine names:

ddot	<d> <dot>: double-precision real vector-vector dot product
cdotc	<c> <dot> <c>: complex vector-vector dot product, conjugated
scasum	<sc> <asum>: sum of magnitudes of vector elements, single precision real output and single precision complex input
cdotu	<c> <dot> <u>: vector-vector dot product, unconjugated, complex
sgemv	<s> <ge> <mv>: matrix-vector product, general matrix, single precision
ztrmm	<z> <tr> <mm>: matrix-matrix product, triangular matrix, double-precision complex.

Sparse BLAS level 1 naming conventions are similar to those of BLAS level 1. For more information, see "Naming Conventions".

Fortran 95 Interface Conventions

Fortran 95 interface to BLAS and Sparse BLAS Level 1 routines is implemented through wrappers that call respective FORTRAN 77 routines. This interface uses such features of Fortran 95 as assumed-shape arrays and optional arguments to provide simplified calls to BLAS and Sparse BLAS Level 1 routines with fewer parameters.

NOTE. For BLAS, Intel MKL offers two types of Fortran 95 interfaces:

- using `mkl_blas.fi` only through `include 'mkl_blas_subroutine.fi'` statement. Such interfaces allow you to make use of the original LAPACK routines with all their arguments
- using `blas.f90` that includes improved interfaces. This file is used to generate the module files `blas95.mod` and `f95_precision.mod`. The module files `mkl95_blas.mod` and `mkl95_precision.mod` are also generated. See also section "Fortran 95 interfaces and wrappers to LAPACK and BLAS" of *Intel® MKL User's Guide* for details. The module files are used to process the FORTRAN use clauses referencing the BLAS interface: `use blas95` (or an equivalent `use mkl95_blas`) and `use f95_precision` (or an equivalent `use mkl95_precision`).

The main conventions used in Fortran 95 interface are as follows:

- The names of parameters used in Fortran 95 interface are typically the same as those used for the respective generic (FORTRAN 77) interface. In rare cases formal argument names may be different. Note that these changes of the formal parameter names have no impact on program semantics and follow the conventions of names unification.
- Some input parameters such as array dimensions are not required in Fortran 95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.
- A parameter can be skipped if its value is completely defined by the presence or absence of another parameter in the calling sequence, and the restored value is the only meaningful value for the skipped parameter.
- Parameters specifying the increment values *incx* and *incy* are skipped. In most cases their values are equal to 1. In Fortran 95 an increment with different value can be directly established in the corresponding parameter.
- Some generic parameters are declared as optional in Fortran 95 interface and may or may not be present in the calling sequence. A parameter can be declared optional if it satisfies one of the following conditions:

  1. It can take only a few possible values. The default value of such parameter typically is the first value in the list; all exceptions to this rule are explicitly stated in the routine description.
  2. It has a natural default value.

  Optional parameters are given in square brackets in Fortran 95 call syntax.

The particular rules used for reconstructing the values of omitted optional parameters are specific for each routine and are detailed in the respective "Fortran 95 Notes" subsection at the end of routine specification section. If this subsection is omitted, the Fortran 95 interface for the given routine does not differ from the corresponding FORTRAN 77 interface.

Note that this interface is not implemented in the current version of Sparse BLAS Level 2 and Level 3 routines. Fortran 95 interface for each of these routines is given in the "Interfaces - Fortran 95" subsection at the end of the respective routine specification section.

Matrix Storage Schemes

Matrix arguments of BLAS routines can use the following storage schemes:

- *Full storage*: a matrix *A* is stored in a two-dimensional array *a*, with the matrix element a_{ij} stored in the array element *a*(*i*,*j*).
- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- *Band storage*: a band matrix is stored compactly in a two-dimensional array: columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.

For more information on matrix storage schemes, see "Matrix Arguments" in Appendix B.

BLAS Level 1 Routines and Functions

BLAS Level 1 includes routines and functions, which perform vector-vector operations. Table 2-1 lists the BLAS Level 1 routine and function groups and the data types associated with them.

Table 2-1 BLAS Level 1 Routine and Function Groups and Their Data Types

Routine or Function Group	Data Types	Description
?asum	s, d, sc, dz	Sum of vector magnitudes (functions)
?axpy	s, d, c, z	Scalar-vector product (routines)
?copy	s, d, c, z	Copy vector (routines)
?dot	s, d	Dot product (functions)
?sdot	sd, d	Dot product with extended precision (functions)
?dotc	c, z	Dot product conjugated (functions)
?dotu	c, z	Dot product unconjugated (functions)
?nrm2	s, d, sc, dz	Vector 2-norm (Euclidean norm) (functions)
?rot	s, d, cs, zd	Plane rotation of points (routines)
?rotg	s, d, c, z	Givens rotation of points (routines)
?rotm	s, d	Modified plane rotation of points (routines)
?rotmg	s, d	Givens modified plane rotation of points (routines)
?scal	s, d, c, z, cs, zd	Vector-scalar product (routines)
?swap	s, d, c, z	Vector-vector swap (routines)

Routine or Function Group	Data Types	Description
i?amax	s, d, c, z	Index of the maximum absolute value element of a vector (functions)
i?amin	s, d, c, z	Index of the minimum absolute value element of a vector (functions)
?cabs1	s, d	Auxiliary functions, compute the absolute value of a complex number ofsingle or double precision

?asum

Computes the sum of magnitudes of the vector elements.

Syntax

FORTRAN 77:

res = sasum(*n*, *x*, *incx*)

res = scasum(*n*, *x*, *incx*)

res = dasum(*n*, *x*, *incx*)

res = dzasum(*n*, *x*, *incx*)

Fortran 95:

res = asum(*x*)

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?asum routine computes the sum of the magnitudes of elements of a real vector, or the sum of magnitudes of the real and imaginary parts of elements of a complex vector:

res = |Re *x*(1)| + |Im *x*(1)| + |Re *x*(2)| + |Im *x*(2)|+ ... + |Re *x*(*n*)| + |Im *x*(*n*)|,

where *x* is a vector with a number of elements that equals *n*.

Input Parameters

n	INTEGER. Specifies the number of elements in vector *x*.
x	REAL for sasum DOUBLE PRECISION for dasum COMPLEX for scasum DOUBLE COMPLEX for dzasum Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for indexing vector *x*.

Output Parameters

res	REAL for sasum DOUBLE PRECISION for dasum REAL for scasum DOUBLE PRECISION for dzasum Contains the sum of magnitudes of real and imaginary parts of all elements of the vector.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine asum interface are the following:

x	Holds the array of size *n*.

?axpy

Computes a vector-scalar product and adds the result to a vector.

Syntax

FORTRAN 77:

```
call saxpy(n, a, x, incx, y, incy)
call daxpy(n, a, x, incx, y, incy)
call caxpy(n, a, x, incx, y, incy)
call zaxpy(n, a, x, incx, y, incy)
```

Fortran 95:

```
call axpy(x, y [,a])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?axpy routines perform a vector-vector operation defined as

*y := a*x + y*

where:

a is a scalar

x and *y* are vectors each with a number of elements that equals *n*.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.

a	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Specifies the scalar *a*.
x	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for saxpy DOUBLE PRECISION for daxpy COMPLEX for caxpy DOUBLE COMPLEX for zaxpy Array, DIMENSION at least (1 + (*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y	Contains the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine axpy interface are the following:

x	Holds the array of size *n*.
y	Holds the array of size *n*.
a	The default value is 1.

?copy

Copies vector to another vector.

Syntax

FORTRAN 77:

```
call scopy(n, x, incx, y, incy)
call dcopy(n, x, incx, y, incy)
call ccopy(n, x, incx, y, incy)
call zcopy(n, x, incx, y, incy)
```

Fortran 95:

```
call copy(x, y)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?copy` routines perform a vector-vector operation defined as

$y = x$,

where x and y are vectors.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for scopy DOUBLE PRECISION for dcopy COMPLEX for ccopy DOUBLE COMPLEX for zcopy Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for scopy DOUBLE PRECISION for dcopy COMPLEX for ccopy DOUBLE COMPLEX for zcopy Array, DIMENSION at least (1 + (*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

y	Contains a copy of the vector *x* if *n* is positive. Otherwise, parameters are unaltered.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine copy interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?dot

Computes a vector-vector dot product.

Syntax

FORTRAN 77:

res = sdot(*n*, *x*, *incx*, *y*, *incy*)

res = ddot(*n*, *x*, *incx*, *y*, *incy*)

Fortran 95:

res = dot(*x*, *y*)

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?dot` routines perform a vector-vector reduction operation defined as

res = ∑(*x***y*),

where *x* and *y* are vectors.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for sdot DOUBLE PRECISION for ddot Array, DIMENSION at least (1+(*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for sdot DOUBLE PRECISION for ddot Array, DIMENSION at least (1+(*n*-1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

res	REAL for sdot DOUBLE PRECISION for ddot Contains the result of the dot product of *x* and *y*, if *n* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `dot` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?sdot

Computes a vector-vector dot product with extended precision.

Syntax

FORTRAN 77:

res = sdsdot(*n*, *sb*, *sx*, *incx*, *sy*, *incy*)

res = dsdot(*n*, *sx*, *incx*, *sy*, *incy*)

Fortran 95:

res = sdot(*sx*, *sy*)

res = sdot(*sx*, *sy*, *sb*)

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?sdot` routines compute the inner product of two vectors with extended precision. Both routines use extended precision accumulation of the intermediate results, but the `sdsdot` routine outputs the final result in single precision, whereas the `dsdot` routine outputs the double precision result. The function `sdsdot` also adds scalar value *sb* to the inner product.

Input Parameters

n	`INTEGER`. Specifies the number of elements in the input vectors *sx* and *sy*.
sb	`REAL`. Single precision scalar to be added to inner product (for the function `sdsdot` only).
sx, *sy*	`REAL`. Arrays, `DIMENSION` at least `(1+(`*n* `-1)*abs(`*incx*`))` and `(1+(`*n*`-1)*abs(`*incy*`))`, respectively. Contain the input single precision vectors.
incx	`INTEGER`. Specifies the increment for the elements of *sx*.
incy	`INTEGER`. Specifies the increment for the elements of *sy*.

Output Parameters

res	`REAL` for `sdsdot`
	`DOUBLE PRECISION` for `dsdot`
	Contains the result of the dot product of *sx* and *sy* (with *sb* added for `sdsdot`), if *n* is positive. Otherwise, *res* contains *sb* for `sdsdot` and `0` for `dsdot`.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sdot` interface are the following:

sx	Holds the vector with the number of elements *n*.
sy	Holds the vector with the number of elements *n*.

NOTE. Note that scalar parameter *sb* is declared as a required parameter in Fortran 95 interface for the function `sdot` to distinguish between function flavors that output final result in different precision.

?dotc

Computes a dot product of a conjugated vector with another vector.

Syntax

FORTRAN 77:

res = cdotc(*n*, *x*, *incx*, *y*, *incy*)

res = zdotc(*n*, *x*, *incx*, *y*, *incy*)

Fortran 95:

res = dotc(*x*, *y*)

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?dotc` routines perform a vector-vector operation defined as

res = ∑(conjg(*x*)*y)

where *x* and *y* are *n*-element vectors.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	COMPLEX for cdotc DOUBLE COMPLEX for zdotc Array, DIMENSION at least (1 + (*n* -1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	COMPLEX for cdotc DOUBLE COMPLEX for zdotc

	Array, DIMENSION at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

res	COMPLEX for cdotc DOUBLE COMPLEX for zdotc Contains the result of the dot product of the conjugated *x* and unconjugated *y*, if *n* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine dotc interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?dotu

Computes a vector-vector dot product.

Syntax

FORTRAN 77:

res = cdotu(*n*, *x*, *incx*, *y*, *incy*)

res = zdotu(*n*, *x*, *incx*, *y*, *incy*)

Fortran 95:

res = dotu(*x*, *y*)

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?dotu routines perform a vector-vector reduction operation defined as

res = $\sum(x*y)$

where *x* and *y* are *n*-element complex vectors.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Array, DIMENSION at least (1 + (*n* -1)*abs(*incx*)).

incx	INTEGER. Specifies the increment for the elements of *x*.
y	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Array, DIMENSION at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.

Output Parameters

res	COMPLEX for cdotu DOUBLE COMPLEX for zdotu Contains the result of the dot product of *x* and *y*, if *n* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine dotu interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?nrm2

Computes the Euclidean norm of a vector.

Syntax

FORTRAN 77:

res = snrm2(*n*, *x*, *incx*)

res = dnrm2(*n*, *x*, *incx*)

res = scnrm2(*n*, *x*, *incx*)

res = dznrm2(*n*, *x*, *incx*)

Fortran 95:

res = nrm2(*x*)

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?nrm2 routines perform a vector reduction operation defined as

res = ||*x*||,

where:

x is a vector,

res is a value containing the Euclidean norm of the elements of *x*.

Input Parameters

n	INTEGER. Specifies the number of elements in vector *x*.
x	REAL for snrm2 DOUBLE PRECISION for dnrm2 COMPLEX for scnrm2 DOUBLE COMPLEX for dznrm2 Array, DIMENSION at least (1 + (*n* -1)*abs (*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

res	REAL for snrm2 DOUBLE PRECISION for dnrm2 REAL for scnrm2 DOUBLE PRECISION for dznrm2 Contains the Euclidean norm of the vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine nrm2 interface are the following:

x	Holds the vector with the number of elements *n*.

?rot

Performs rotation of points in the plane.

Syntax

FORTRAN 77:

```
call srot(n, x, incx, y, incy, c, s)
call drot(n, x, incx, y, incy, c, s)
call csrot(n, x, incx, y, incy, c, s)
call zdrot(n, x, incx, y, incy, c, s)
```

Fortran 95:

```
call rot(x, y, c, s)
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

Given two complex vectors *x* and *y*, each vector element of these vectors is replaced as follows:

```
x(i) = c*x(i) + s*y(i)
y(i) = c*y(i) - s*x(i)
```

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for srot DOUBLE PRECISION for drot COMPLEX for csrot DOUBLE COMPLEX for zdrot Array, DIMENSION at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.
c	REAL for srot DOUBLE PRECISION for drot REAL for csrot DOUBLE PRECISION for zdrot A scalar.
s	REAL for srot DOUBLE PRECISION for drot REAL for csrot DOUBLE PRECISION for zdrot A scalar.

Output Parameters

x	Each element is replaced by *c*x + s*y*.
y	Each element is replaced by *c*y - s*x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine rot interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?rotg

Computes the parameters for a Givens rotation.

Syntax

FORTRAN 77:

```
call srotg(a, b, c, s)
call drotg(a, b, c, s)
call crotg(a, b, c, s)
call zrotg(a, b, c, s)
```

Fortran 95:

```
call rotg(a, b, c, s)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

Given the Cartesian coordinates (*a*, *b*) of a point p, these routines return the parameters *a*, *b*, *c*, and *s* associated with the Givens rotation that zeros the *y*-coordinate of the point.

See a more accurate LAPACK version `?lartg`.

Input Parameters

a	`REAL` for `srotg`
	`DOUBLE PRECISION` for `drotg`
	`COMPLEX` for `crotg`
	`DOUBLE COMPLEX` for `zrotg`
	Provides the *x*-coordinate of the point p.

b	`REAL` for `srotg`
	`DOUBLE PRECISION` for `drotg`
	`COMPLEX` for `crotg`
	`DOUBLE COMPLEX` for `zrotg`
	Provides the *y*-coordinate of the point p.

Output Parameters

a	Contains the parameter *r* associated with the Givens rotation.
b	Contains the parameter *z* associated with the Givens rotation.

c	`REAL` for `srotg`
	`DOUBLE PRECISION` for `drotg`
	`REAL` for `crotg`
	`DOUBLE PRECISION` for `zrotg`
	Contains the parameter *c* associated with the Givens rotation.

s	`REAL` for `srotg`

DOUBLE PRECISION for drotg
COMPLEX for crotg
DOUBLE COMPLEX for zrotg
Contains the parameter *s* associated with the Givens rotation.

?rotm

Performs rotation of points in the modified plane.

Syntax

FORTRAN 77:

```
call srotm(n, x, incx, y, incy, param)
call drotm(n, x, incx, y, incy, param)
```

Fortran 95:

```
call rotm(x, y, param)
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

Given two complex vectors *x* and *y*, each vector element of these vectors is replaced as follows:

```
x(i) = H*x(i) + H*y(i)
y(i) = H*y(i) - H*x(i)
```

where *H* is a modified Givens transformation matrix whose values are stored in the *param(2)* through *param(5)* array. See discussion on the *param* argument.

Input Parameters

n	INTEGER. Specifies the number of elements in vectors *x* and *y*.
x	REAL for srotm DOUBLE PRECISION for drotm Array, DIMENSION at least (1 + (*n* -1)*abs(*incx*)).
incx	INTEGER. Specifies the increment for the elements of *x*.
y	REAL for srotm DOUBLE PRECISION for drotm Array, DIMENSION at least (1 + (*n* -1)*abs(*incy*)).
incy	INTEGER. Specifies the increment for the elements of *y*.
param	REAL for srotm DOUBLE PRECISION for drotm Array, DIMENSION 5. The elements of the *param* array are: *param(1)* contains a switch, *flag*. *param(2-5)* contain *h11*, *h21*, *h12*, and *h22*, respectively, the components of the array *H*.

Depending on the values of *flag*, the components of *H* are set as follows:

$$flag = -1. : H = \begin{bmatrix} h11 & h12 \\ h21 & h22 \end{bmatrix}$$

$$flag = 0. : H = \begin{bmatrix} 1. & h12 \\ h21 & 1. \end{bmatrix}$$

$$flag = 1. : H = \begin{bmatrix} h11 & 1. \\ -1 & h22 \end{bmatrix}$$

$$flag = -2. : H = \begin{bmatrix} 1. & 0. \\ 0. & 1. \end{bmatrix}$$

In the last three cases, the matrix entries of 1., -1., and 0. are assumed based on the value of *flag* and are not required to be set in the *param* vector.

Output Parameters

x	Each element is replaced by *h11*x + h12*y*.
y	Each element is replaced by *h21*x + h22*y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `rotm` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

?rotmg

Computes the parameters for a modified Givens rotation.

Syntax

FORTRAN 77:

```
call srotmg(d1, d2, x1, y1, param)
```

```
call drotmg(d1, d2, x1, y1, param)
```

Fortran 95:

```
call rotmg(d1, d2, x1, y1, param)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

Given Cartesian coordinates (*x1*, *y1*) of an input vector, these routines compute the components of a modified Givens transformation matrix *H* that zeros the *y*-component of the resulting vector:

$$\begin{bmatrix} x \\ 0 \end{bmatrix} = H \begin{bmatrix} \mathrm{sqrt}(d_1)x_1 \\ \mathrm{sqrt}(d_2)y_1 \end{bmatrix}$$

Input Parameters

d1
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Provides the scaling factor for the *x*-coordinate of the input vector.

d2
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Provides the scaling factor for the *y*-coordinate of the input vector.

x1
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Provides the *x*-coordinate of the input vector.

y1
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Provides the *y*-coordinate of the input vector.

Output Parameters

d1
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Provides the first diagonal element of the updated matrix.

d2
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Provides the second diagonal element of the updated matrix.

x1
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Provides the *x*-coordinate of the rotated vector before scaling.

param
REAL for `srotmg`
DOUBLE PRECISION for `drotmg`
Array, DIMENSION 5.
The elements of the *param* array are:

param(1) contains a switch, *flag*. *param(2-5)* contain *h11*, *h21*, *h12*, and *h22*, respectively, the components of the array *H*.
Depending on the values of *flag*, the components of *H* are set as follows:

$$flag = -1. : H = \begin{bmatrix} h11 & h12 \\ h21 & h22 \end{bmatrix}$$

$$flag = 0. : H = \begin{bmatrix} 1. & h12 \\ h21 & 1. \end{bmatrix}$$

$$flag = 1. : H = \begin{bmatrix} h11 & 1. \\ -1 & h22 \end{bmatrix}$$

$$flag = -2. : H = \begin{bmatrix} 1. & 0. \\ 0. & 1. \end{bmatrix}$$

In the last three cases, the matrix entries of 1., -1., and 0. are assumed based on the value of *flag* and are not required to be set in the *param* vector.

?scal

Computes the product of a vector by a scalar.

Syntax

FORTRAN 77:

```
call sscal(n, a, x, incx)
call dscal(n, a, x, incx)
call cscal(n, a, x, incx)
call zscal(n, a, x, incx)
call csscal(n, a, x, incx)
call zdscal(n, a, x, incx)
```

Fortran 95:

```
call scal(x, a)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?scal` routines perform a vector operation defined as

*x = a*x*

where:

a is a scalar, *x* is an *n*-element vector.

Input Parameters

n	`INTEGER`. Specifies the number of elements in vector *x*.

a	`REAL` for `sscal` and `csscal`
	`DOUBLE PRECISION` for `dscal` and `zdscal`
	`COMPLEX` for `cscal`
	`DOUBLE COMPLEX` for `zscal`
	Specifies the scalar *a*.

x	`REAL` for `sscal`
	`DOUBLE PRECISION` for `dscal`
	`COMPLEX` for `cscal` and `csscal`
	`DOUBLE COMPLEX` for `zscal` and `zdscal`
	Array, `DIMENSION` at least `(1 + (`*n* `-1)*abs(`*incx*`))`.

incx	`INTEGER`. Specifies the increment for the elements of *x*.

Output Parameters

x	Updated vector x.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `scal` interface are the following:

x	Holds the vector with the number of elements *n*.

?swap

Swaps a vector with another vector.

Syntax

FORTRAN 77:

```
call sswap(n, x, incx, y, incy)
call dswap(n, x, incx, y, incy)
```

```
call cswap(n, x, incx, y, incy)
call zswap(n, x, incx, y, incy)
```

Fortran 95:

```
call swap(x, y)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

Given two vectors *x* and *y*, the `?swap` routines return vectors *y* and *x* swapped, each replacing the other.

Input Parameters

n	`INTEGER`. Specifies the number of elements in vectors *x* and *y*.

x	`REAL` for `sswap`
	`DOUBLE PRECISION` for `dswap`
	`COMPLEX` for `cswap`
	`DOUBLE COMPLEX` for `zswap`
	Array, `DIMENSION` at least `(1 + (n-1)*abs(incx))`.

incx	`INTEGER`. Specifies the increment for the elements of *x*.

y	`REAL` for `sswap`
	`DOUBLE PRECISION` for `dswap`
	`COMPLEX` for `cswap`
	`DOUBLE COMPLEX` for `zswap`
	Array, `DIMENSION` at least `(1 + (n-1)*abs(incy))`.

incy	`INTEGER`. Specifies the increment for the elements of *y*.

Output Parameters

x	Contains the resultant vector *x*, that is, the input vector *y*.
y	Contains the resultant vector *y*, that is, the input vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `swap` interface are the following:

x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.

i?amax

Finds the index of the element with maximum absolute value.

Syntax

FORTRAN 77:

```
index = isamax(n, x, incx)
index = idamax(n, x, incx)
index = icamax(n, x, incx)
index = izamax(n, x, incx)
```

Fortran 95:

```
index = iamax(x)
```

Description

This function is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

Given a vector *x*, the `i?amax` functions return the position of the vector element *x*(*i*) that has the largest absolute value for real flavors, or the largest sum |Re(*x*(*i*))|+|Im(*x*(*i*))| for complex flavors.

If *n* is not positive, `0` is returned.

If more than one vector element is found with the same largest absolute value, the index of the first one encountered is returned.

Input Parameters

n	`INTEGER`. Specifies the number of elements in vector *x*.

x	`REAL` for `isamax`
	`DOUBLE PRECISION` for `idamax`
	`COMPLEX` for `icamax`
	`DOUBLE COMPLEX` for `izamax`
	Array, `DIMENSION` at least `(1+(`*n*`-1)*abs(`*incx*`))`.

incx	`INTEGER`. Specifies the increment for the elements of *x*.

Output Parameters

index	`INTEGER`. Contains the position of vector element *x* that has the largest absolute value.

Fortran 95 Interface Notes

Functions and routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the function `iamax` interface are the following:

x	Holds the vector with the number of elements *n*.

i?amin

Finds the index of the element with the smallest absolute value.

Syntax

FORTRAN 77:

```
index = isamin(n, x, incx)
index = idamin(n, x, incx)
index = icamin(n, x, incx)
index = izamin(n, x, incx)
```

Fortran 95:

```
index = iamin(x)
```

Description

This function is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

Given a vector *x*, the `i?amin` functions return the position of the vector element *x*(*i*) that has the smallest absolute value for real flavors, or the smallest sum |Re(*x*(*i*))|+|Im(*x*(*i*))| for complex flavors.

If *n* is not positive, `0` is returned.

If more than one vector element is found with the same smallest absolute value, the index of the first one encountered is returned.

Input Parameters

n	INTEGER. On entry, *n* specifies the number of elements in vector *x*.
x	REAL for `isamin` DOUBLE PRECISION for `idamin` COMPLEX for `icamin` DOUBLE COMPLEX for `izamin` Array, DIMENSION at least `(1+(n-1)*abs(incx))`.
incx	INTEGER. Specifies the increment for the elements of *x*.

Output Parameters

index	INTEGER. Contains the position of vector element *x* that has the smallest absolute value.

Fortran 95 Interface Notes

Functions and routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the function `iamin` interface are the following:

x	Holds the vector with the number of elements *n*.

?cabs1

Computes absolute value of complex number.

Syntax

FORTRAN 77:

res = scabs1(*z*)

res = dcabs1(*z*)

Fortran 95:

res = cabs1(*z*)

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?cabs1` is an auxiliary routine for a few BLAS Level 1 routines. This routine performs an operation defined as

res=|Re(*z*)|+|Im(*z*)|,

where *z* is a scalar, and *res* is a value containing the absolute value of a complex number *z*.

Input Parameters

z	COMPLEX scalar for scabs1. DOUBLE COMPLEX scalar for dcabs1.

Output Parameters

res	REAL for scabs1. DOUBLE PRECISION for dcabs1. Contains the absolute value of a complex number *z*.

BLAS Level 2 Routines

This section describes BLAS Level 2 routines, which perform matrix-vector operations. Table 2-2 lists the BLAS Level 2 routine groups and the data types associated with them.

Table 2-2 BLAS Level 2 Routine Groups and Their Data Types

Routine Groups	Data Types	Description
?gbmv	s, d, c, z	Matrix-vector product using a general band matrix
?gemv	s, d, c, z	Matrix-vector product using a general matrix
?ger	s, d	Rank-1 update of a general matrix
?gerc	c, z	Rank-1 update of a conjugated general matrix
?geru	c, z	Rank-1 update of a general matrix, unconjugated
?hbmv	c, z	Matrix-vector product using a Hermitian band matrix
?hemv	c, z	Matrix-vector product using a Hermitian matrix
?her	c, z	Rank-1 update of a Hermitian matrix
?her2	c, z	Rank-2 update of a Hermitian matrix
?hpmv	c, z	Matrix-vector product using a Hermitian packed matrix
?hpr	c, z	Rank-1 update of a Hermitian packed matrix
?hpr2	c, z	Rank-2 update of a Hermitian packed matrix
?sbmv	s, d	Matrix-vector product using symmetric band matrix
?spmv	s, d	Matrix-vector product using a symmetric packed matrix
?spr	s, d	Rank-1 update of a symmetric packed matrix
?spr2	s, d	Rank-2 update of a symmetric packed matrix
?symv	s, d	Matrix-vector product using a symmetric matrix
?syr	s, d	Rank-1 update of a symmetric matrix
?syr2	s, d	Rank-2 update of a symmetric matrix
?tbmv	s, d, c, z	Matrix-vector product using a triangular band matrix
?tbsv	s, d, c, z	Solution of a linear system of equations with a triangular band matrix
?tpmv	s, d, c, z	Matrix-vector product using a triangular packed matrix
?tpsv	s, d, c, z	Solution of a linear system of equations with a triangular packed matrix
?trmv	s, d, c, z	Matrix-vector product using a triangular matrix

Routine Groups	Data Types	Description
?trsv	s, d, c, z	Solution of a linear system of equations with a triangular matrix

?gbmv

Computes a matrix-vector product using a general band matrix

Syntax

FORTRAN 77:

```
call sgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call dgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call cgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
call zgbmv(trans, m, n, kl, ku, alpha, a, lda, x, incx, beta, y, incy)
```

Fortran 95:

```
call gbmv(a, x, y [,kl] [,m] [,alpha] [,beta] [,trans])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?gbmv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*

or

y := *alpha***A*'**x* + *beta***y*,

or

y := *alpha* *conjg(*A*')**x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* band matrix, with *kl* sub-diagonals and *ku* super-diagonals.

Input Parameters

trans	CHARACTER*1. Specifies the operation: If *trans*= 'N' or 'n', then *y* := *alpha***A***x* + *beta***y* If *trans*= 'T' or 't', then *y* := *alpha***A*'**x* + *beta***y* If *trans*= 'C' or 'c', then *y* := *alpha* *conjg(*A*')**x* + *beta***y*
m	INTEGER. Specifies the number of rows of the matrix *A*.

The value of *m* must be at least zero.

n INTEGER. Specifies the number of columns of the matrix *A*.
The value of *n* must be at least zero.

kl INTEGER. Specifies the number of sub-diagonals of the matrix *A*.
The value of *kl* must satisfy $0 \le kl$.

ku INTEGER. Specifies the number of super-diagonals of the matrix *A*.
The value of *ku* must satisfy $0 \le ku$.

alpha REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Specifies the scalar *alpha*.

a REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Array, DIMENSION (*lda*, *n*).
Before entry, the leading (*kl* + *ku* + 1) by *n* part of the array *a* must contain the matrix of coefficients. This matrix must be supplied column-by-column, with the leading diagonal of the matrix in row (*ku* + 1) of the array, the first super-diagonal starting at position 2 in row *ku*, the first sub-diagonal starting at position 1 in row (*ku* + 2), and so on. Elements in the array *a* that do not correspond to elements in the band matrix (such as the top left *ku* by *ku* triangle) are not referenced.
The following program segment transfers a band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
 k = ku + 1 - j
   do 10, i = max(1, j-ku), min(m, j+kl)
   a(k+i, j) = matrix(i,j)
 10 continue
20 continue
```

lda INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*kl* + *ku* + 1).

x REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)) when *trans* = 'N' or 'n', and at least (1 + (*m* - 1)*abs(*incx*)) otherwise.
Before entry, the array *x* must contain the vector *x*.

incx INTEGER. Specifies the increment for the elements of *x*. *incx* must not be zero.

beta REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Specifies the scalar beta. When *beta* is equal to zero, then *y* need not be set on input.

y REAL for sgbmv
DOUBLE PRECISION for dgbmv
COMPLEX for cgbmv
DOUBLE COMPLEX for zgbmv
Array, DIMENSION at least (1 +(*m* - 1)*abs(*incy*)) when *trans* = 'N' or 'n' and at least (1 +(*n* - 1)*abs(*incy*)) otherwise. Before entry, the incremented array *y* must contain the vector *y*.

incy INTEGER. Specifies the increment for the elements of *y*.
The value of *incy* must not be zero.

Output Parameters

y Updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gbmv interface are the following:

a Holds the array *a* of size (*kl*+*ku*+1, *n*). Contains a banded matrix *m***n*with *kl* lower diagonal and *ku* upper diagonal.

x Holds the vector with the number of elements *rx*, where *rx* = *n* if *trans* = 'N',*rx* = *m* otherwise.

y Holds the vector with the number of elements *ry*, where *ry* = *m* if *trans* = 'N',*ry* = *n* otherwise.

trans Must be 'N', 'C', or 'T'.
The default value is 'N'.

kl If omitted, assumed *kl* = *ku*, that is, the number of lower diagonals equals the number of the upper diagonals.

ku Restored as *ku* = *lda*-*kl*-1, where *lda* is the first dimension of matrix *A*.

m If omitted, assumed *m* = *n*, that is, a square matrix.

alpha The default value is 1.

beta The default value is 0.

?gemv

Computes a matrix-vector product using a general matrix

Syntax

FORTRAN 77:

```
call sgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call dgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call cgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
call zgemv(trans, m, n, alpha, a, lda, x, incx, beta, y, incy)
```

Fortran 95:

```
call gemv(a, x, y [,alpha][,beta] [,trans])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?gemv routines perform a matrix-vector operation defined as

`y := alpha*A*x + beta*y`,

or

`y := alpha*A'*x + beta*y`,

or

`y := alpha*conjg(A')*x + beta*y`,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*n* matrix.

Input Parameters

trans	CHARACTER*1. Specifies the operation: if *trans*= 'N' or 'n', then *y* := *alpha***A***x* + *beta***y*; if *trans*= 'T' or 't', then *y* := *alpha***A*'**x* + *beta***y*; if *trans*= 'C' or 'c', then *y* := *alpha* *conjg(*A*')**x* + *beta***y*.
m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for sgemv DOUBLE PRECISION for dgemv COMPLEX for cgemv

	DOUBLE COMPLEX for zgemv Specifies the scalar *alpha*.
a	REAL for sgemv DOUBLE PRECISION for dgemv COMPLEX for cgemv DOUBLE COMPLEX for zgemv Array, DIMENSION (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).
x	REAL for sgemv DOUBLE PRECISION for dgemv COMPLEX for cgemv DOUBLE COMPLEX for zgemv Array, DIMENSION at least (1+(*n*-1)*abs(*incx*)) when *trans* = 'N' or 'n' and at least (1+(*m* - 1)*abs(*incx*)) otherwise. Before entry, the incremented array *x* must contain the vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	REAL for sgemv DOUBLE PRECISION for dgemv COMPLEX for cgemv DOUBLE COMPLEX for zgemv Specifies the scalar *beta*. When *beta* is set to zero, then *y* need not be set on input.
y	REAL for sgemv DOUBLE PRECISION for dgemv COMPLEX for cgemv DOUBLE COMPLEX for zgemv Array, DIMENSION at least (1 +(*m* - 1)*abs(*incy*)) when *trans* = 'N' or 'n' and at least (1 +(*n* - 1)*abs(*incy*)) otherwise. Before entry with non-zero *beta*, the incremented array *y* must contain the vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gemv interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x	Holds the vector with the number of elements *rx* where *rx* = *n* if *trans* = 'N', *rx* = *m* otherwise.
y	Holds the vector with the number of elements *ry* where *ry* = *m* if *trans* = 'N', *ry* = *n* otherwise.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?ger

Performs a rank-1 update of a general matrix.

Syntax

FORTRAN 77:

```
call sger(m, n, alpha, x, incx, y, incy, a, lda)
call dger(m, n, alpha, x, incx, y, incy, a, lda)
```

Fortran 95:

```
call ger(a, x, y [,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?ger` routines perform a matrix-vector operation defined as

A := *alpha***x***y*'+ *A*,

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* general matrix.

Input Parameters

m	INTEGER. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for sger DOUBLE PRECISION for dger Specifies the scalar *alpha*.

x	REAL for sger DOUBLE PRECISION for dger Array, DIMENSION at least (1 + (*m* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *m*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	REAL for sger DOUBLE PRECISION for dger Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	REAL for sger DOUBLE PRECISION for dger Array, DIMENSION (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

a	Overwritten by the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ger interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x	Holds the vector with the number of elements *m*.
y	Holds the vector with the number of elements *n*.
alpha	The default value is 1.

?gerc

Performs a rank-1 update (conjugated) of a general matrix.

Syntax

FORTRAN 77:

```
call cgerc(m, n, alpha, x, incx, y, incy, a, lda)
call zgerc(m, n, alpha, x, incx, y, incy, a, lda)
```

Fortran 95:

```
call gerc(a, x, y [,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?gerc` routines perform a matrix-vector operation defined as

`A := alpha*x*conjg(y') + A`,

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* matrix.

Input Parameters

m	`INTEGER`. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.
n	`INTEGER`. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.

alpha	`COMPLEX` for `cgerc`
	`DOUBLE COMPLEX` for `zgerc`
	Specifies the scalar *alpha*.

x	`COMPLEX` for `cgerc`
	`DOUBLE COMPLEX` for `zgerc`
	Array, `DIMENSION` at least `(1 + (m - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *m*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

y	`COMPLEX` for `cgerc`
	`DOUBLE COMPLEX` for `zgerc`
	Array, `DIMENSION` at least `(1 + (n - 1)*abs(incy))`. Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

a	`COMPLEX` for `cgerc`
	`DOUBLE COMPLEX` for `zgerc`
	Array, `DIMENSION (lda, n)`.
	Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.

lda	`INTEGER`. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least `max(1, m)`.

Output Parameters

a	Overwritten by the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gerc` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x	Holds the vector with the number of elements *m*.
y	Holds the vector with the number of elements *n*.
alpha	The default value is 1.

?geru

Performs a rank-1 update (unconjugated) of a general matrix.

Syntax

FORTRAN 77:

```
call cgeru(m, n, alpha, x, incx, y, incy, a, lda)
call zgeru(m, n, alpha, x, incx, y, incy, a, lda)
```

Fortran 95:

```
call geru(a, x, y [,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?geru` routines perform a matrix-vector operation defined as

A := *alpha***x***y* ' + *A*,

where:

alpha is a scalar,

x is an *m*-element vector,

y is an *n*-element vector,

A is an *m*-by-*n* matrix.

Input Parameters

m	`INTEGER`. Specifies the number of rows of the matrix *A*. The value of *m* must be at least zero.

n	INTEGER. Specifies the number of columns of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for cgeru DOUBLE COMPLEX for zgeru Specifies the scalar *alpha*.
x	COMPLEX for cgeru DOUBLE COMPLEX for zgeru Array, DIMENSION at least (1 + (*m* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *m*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for cgeru DOUBLE COMPLEX for zgeru Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	COMPLEX for cgeru DOUBLE COMPLEX for zgeru Array, DIMENSION (*lda*, *n*). Before entry, the leading *m*-by-*n* part of the array *a* must contain the matrix of coefficients.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *m*).

Output Parameters

a	Overwritten by the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine geru interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
x	Holds the vector with the number of elements *m*.
y	Holds the vector with the number of elements *n*.
alpha	The default value is 1.

?hbmv

Computes a matrix-vector product using a Hermitian band matrix.

Syntax

FORTRAN 77:

```
call chbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call zhbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
```

Fortran 95:

```
call hbmv(a, x, y [,uplo][,alpha] [,beta])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?hbmv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian band matrix, with *k* super-diagonals.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian band matrix *A* is used: If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
k	INTEGER. Specifies the number of super-diagonals of the matrix *A*. The value of *k* must satisfy $0 \le k$.
alpha	COMPLEX for chbmv DOUBLE COMPLEX for zhbmv Specifies the scalar *alpha*.
a	COMPLEX for chbmv DOUBLE COMPLEX for zhbmv Array, DIMENSION (*lda*, *n*).

Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the Hermitian matrix. The matrix must be supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers the upper triangular part of a Hermitian band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
 m = k + 1 - j
 do 10, i = max(1, j - k), j
  a(m + i, j) = matrix(i, j)
 10 continue
20 continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the Hermitian matrix, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers the lower triangular part of a Hermitian band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
 m = 1 - j
 do 10, i = j, min( n, j + k )
  a( m + i, j ) = matrix( i, j )
 10 continue
20 continue
```

The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — COMPLEX for chbmv
DOUBLE COMPLEX for zhbmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

beta — COMPLEX for chbmv

	DOUBLE COMPLEX for zhbmv Specifies the scalar *beta*.
y	COMPLEX for chbmv DOUBLE COMPLEX for zhbmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbmv interface are the following:

a	Holds the array *a* of size (*k+1, n*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?hemv

Computes a matrix-vector product using a Hermitian matrix.

Syntax

FORTRAN 77:

```
call chemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call zhemv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
```

Fortran 95:

```
call hemv(a, x, y [,uplo][,alpha] [,beta])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?hemv routines perform a matrix-vector operation defined as

*y := alpha*A*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = 'U' or 'u', then the upper triangular of the array *a* is used. If *uplo* = 'L' or 'l', then the low triangular of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for chemv DOUBLE COMPLEX for zhemv Specifies the scalar *alpha*.
a	COMPLEX for chemv DOUBLE COMPLEX for zhemv Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).
x	COMPLEX for chemv DOUBLE COMPLEX for zhemv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	COMPLEX for chemv DOUBLE COMPLEX for zhemv Specifies the scalar *beta*. When *beta* is supplied as zero then *y* need not be set on input.
y	COMPLEX for chemv DOUBLE COMPLEX for zhemv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*.

	The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hemv interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?her

Performs a rank-1 update of a Hermitian matrix.

Syntax

FORTRAN 77:

```
call cher(uplo, n, alpha, x, incx, a, lda)
call zher(uplo, n, alpha, x, incx, a, lda)
```

Fortran 95:

```
call her(a, x [,uplo] [, alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?her routines perform a matrix-vector operation defined as

`A := alpha*x*conjg(x') + A`,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = 'U' or 'u', then the upper triangular of the array *a* is used. If *uplo* = 'L' or 'l', then the low triangular of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for cher DOUBLE PRECISION for zher Specifies the scalar *alpha*.
x	COMPLEX for cher DOUBLE COMPLEX for zher Array, dimension at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
a	COMPLEX for cher DOUBLE COMPLEX for zher Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine her interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?her2

Performs a rank-2 update of a Hermitian matrix.

Syntax

FORTRAN 77:

```
call cher2(uplo, n, alpha, x, incx, y, incy, a, lda)
call zher2(uplo, n, alpha, x, incx, y, incy, a, lda)
```

Fortran 95:

```
call her2(a, x, y [,uplo][,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?her2 routines perform a matrix-vector operation defined as

A := *alpha* *x*conjg(*y'*) + conjg(*alpha*)**y* *conjg(*x'*) + *A*,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = 'U' or 'u', then the upper triangular of the array *a* is used. If *uplo* = 'L' or 'l', then the low triangular of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	COMPLEX for cher2 DOUBLE COMPLEX for zher2 Specifies the scalar *alpha*.
x	COMPLEX for cher2 DOUBLE COMPLEX for zher2 Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	COMPLEX for cher2 DOUBLE COMPLEX for zher2 Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	COMPLEX for cher2 DOUBLE COMPLEX for zher2 Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *a* is not referenced. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine her2 interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?hpmv

Computes a matrix-vector product using a Hermitian packed matrix.

Syntax

FORTRAN 77:

`call chpmv(uplo, n, alpha, ap, x, incx, beta, y, incy)`

`call zhpmv(uplo, n, alpha, ap, x, incx, beta, y, incy)`

Fortran 95:

`call hpmv(ap, x, y [,uplo][,alpha] [,beta])`

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?hpmv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = `'U'` or `'u'`, then the upper triangular part of the matrix *A* is supplied in the packed array *ap* . If *uplo* = `'L'` or `'l'`, then the low triangular part of the matrix *A* is supplied in the packed array *ap* .
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha	`COMPLEX` for `chpmv`
	`DOUBLE COMPLEX` for `zhpmv`
	Specifies the scalar *alpha*.

ap	`COMPLEX` for `chpmv`
	`DOUBLE COMPLEX` for `zhpmv`
	Array, `DIMENSION` at least `((`*n*`*(`*n* `+ 1))/2)`. Before entry with *uplo* = `'U'` or `'u'`, the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*`(1)` contains *a*`(1, 1)`, *ap*`(2)` and *ap*`(3)` contain *a*`(1, 2)` and *a*`(2, 2)` respectively, and so on. Before entry with *uplo* = `'L'` or `'l'`, the

	array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.
x	COMPLEX for chpmv DOUBLE PRECISION COMPLEX for zhpmv Array, DIMENSION at least (1 +(*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	COMPLEX for chpmv DOUBLE COMPLEX for zhpmv Specifies the scalar *beta*. When *beta* is equal to zero then *y* need not be set on input.
y	COMPLEX for chpmv DOUBLE COMPLEX for zhpmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpmv interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?hpr

Performs a rank-1 update of a Hermitian packed matrix.

Syntax

FORTRAN 77:

```
call chpr(uplo, n, alpha, x, incx, ap)
call zhpr(uplo, n, alpha, x, incx, ap)
```

Fortran 95:

```
call hpr(ap, x [,uplo] [, alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?hpr` routines perform a matrix-vector operation defined as

`A := alpha*x*conjg(x') + A`,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = `'U'` or `'u'`, the upper triangular part of the matrix *A* is supplied in the packed array *ap* . If *uplo* = `'L'` or `'l'`, the low triangular part of the matrix *A* is supplied in the packed array *ap* .
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha	`REAL` for `chpr`
	`DOUBLE PRECISION` for `zhpr`
	Specifies the scalar *alpha*.

x	`COMPLEX` for `chpr`
	`DOUBLE COMPLEX` for `zhpr`
	Array, `DIMENSION` at least `(1 + (n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. *incx* must not be zero.
ap	`COMPLEX` for `chpr` `DOUBLE COMPLEX` for `zhpr`

Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(1, 2) and *a*(2, 2) respectively, and so on.
Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, 1), *ap*(2) and *ap*(3) contain *a*(2, 1) and *a*(3, 1) respectively, and so on.
The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

Output Parameters

ap — With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.
The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpr interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?hpr2

Performs a rank-2 update of a Hermitian packed matrix.

Syntax

FORTRAN 77:

```
call chpr2(uplo, n, alpha, x, incx, y, incy, ap)
call zhpr2(uplo, n, alpha, x, incx, y, incy, ap)
```

Fortran 95:

```
call hpr2(ap, x, y [,uplo][,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?hpr2` routines perform a matrix-vector operation defined as

`A := alpha*x*conjg(y') + conjg(alpha)*y*conjg(x') + A`,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* Hermitian matrix, supplied in packed form.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = `'U'` or `'u'`, then the upper triangular part of the matrix *A* is supplied in the packed array *ap* . If *uplo* = `'L'` or `'l'`, then the low triangular part of the matrix *A* is supplied in the packed array *ap* .
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha	`COMPLEX` for `chpr2`
	`DOUBLE COMPLEX` for `zhpr2`
	Specifies the scalar *alpha*.

x	`COMPLEX` for `chpr2`
	`DOUBLE COMPLEX` for `zhpr2`
	Array, dimension at least `(1 +(n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

y	`COMPLEX` for `chpr2`
	`DOUBLE COMPLEX` for `zhpr2`
	Array, `DIMENSION` at least `(1 +(n - 1)*abs(incy))`. Before entry, the incremented array *y* must contain the *n*-element vector *y*.

incy	`INTEGER`. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

ap	`COMPLEX` for `chpr2`
	`DOUBLE COMPLEX` for `zhpr2`
	Array, `DIMENSION` at least `((n*(n + 1))/2)`. Before entry with *uplo* = `'U'` or `'u'`, the array *ap* must contain the upper triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*`(1)` contains *a*`(1,1)`, *ap*`(2)` and *ap*`(3)` contain *a*`(1,2)` and *a*`(2,2)` respectively, and so on.

	Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the Hermitian matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on. The imaginary parts of the diagonal elements need not be set and are assumed to be zero.

Output Parameters

ap	With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements need are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpr2 interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?sbmv

Computes a matrix-vector product using a symmetric band matrix.

Syntax

FORTRAN 77:

```
call ssbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
call dsbmv(uplo, n, k, alpha, a, lda, x, incx, beta, y, incy)
```

Fortran 95:

```
call sbmv(a, x, y [,uplo][,alpha] [,beta])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?sbmv routines perform a matrix-vector operation defined as

*y := alpha*A*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric band matrix, with *k* super-diagonals.

Input Parameters

uplo — CHARACTER*1. Specifies whether the upper or lower triangular part of the band matrix *A* is used:
if *uplo* = 'U' or 'u' - upper triangular part;
if *uplo* = 'L' or 'l' - low triangular part.

n — INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

k — INTEGER. Specifies the number of super-diagonals of the matrix *A*.
The value of *k* must satisfy $0 \le k$.

alpha — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Specifies the scalar *alpha*.

a — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers the upper triangular part of a symmetric band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
  m = k + 1 - j
  do 10, i = max( 1, j - k ), j
    a( m + i, j ) = matrix( i, j )
   10 continue
20 continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the symmetric matrix, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers the lower triangular part of a symmetric band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
  m = 1 - j
  do 10, i = j, min( n, j + k )
    a( m + i, j ) = matrix( i, j )
  10 continue
20 continue
```

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

beta — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Specifies the scalar *beta*.

y — REAL for ssbmv
DOUBLE PRECISION for dsbmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the vector *y*.

incy — INTEGER. Specifies the increment for the elements of *y*.
The value of *incy* must not be zero.

Output Parameters

y — Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbmv interface are the following:

a — Holds the array *a* of size (*k*+1, *n*).

x — Holds the vector with the number of elements *n*.

y — Holds the vector with the number of elements *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

alpha — The default value is 1.

beta	The default value is 0.

?spmv

Computes a matrix-vector product using a symmetric packed matrix.

Syntax

FORTRAN 77:

```
call sspmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
call dspmv(uplo, n, alpha, ap, x, incx, beta, y, incy)
```

Fortran 95:

```
call spmv(ap, x, y [,uplo][,alpha] [,beta])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?spmv` routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = `'U'` or `'u'`, then the upper triangular part of the matrix *A* is supplied in the packed array *ap* . If *uplo* = `'L'` or `'l'`, then the low triangular part of the matrix *A* is supplied in the packed array *ap* .
n	`INTEGER`. Specifies the order of the matrix *a*. The value of *n* must be at least zero.

alpha	`REAL` for `sspmv`
	`DOUBLE PRECISION` for `dspmv`
	Specifies the scalar *alpha*.

ap	`REAL` for `sspmv`
	`DOUBLE PRECISION` for `dspmv`
	Array, `DIMENSION` at least `((n*(n + 1))/2)`.

	Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2, 2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.
x	REAL for sspmv DOUBLE PRECISION for dspmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	REAL for sspmv DOUBLE PRECISION for dspmv Specifies the scalar *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
y	REAL for sspmv DOUBLE PRECISION for dspmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spmv interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?spr

Performs a rank-1 update of a symmetric packed matrix.

Syntax

FORTRAN 77:

```
call sspr(uplo, n, alpha, x, incx, ap)
call dspr(uplo, n, alpha, x, incx, ap)
```

Fortran 95:

```
call spr(ap, x [,uplo] [, alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?spr` routines perform a matrix-vector operation defined as

a:= *alpha***x***x*'+ *A*,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = `'U'` or `'u'`, then the upper triangular part of the matrix *A* is supplied in the packed array *ap* . If *uplo* = `'L'` or `'l'`, then the low triangular part of the matrix *A* is supplied in the packed array *ap* .
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha	`REAL` for `sspr`
	`DOUBLE PRECISION` for `dspr`
	Specifies the scalar *alpha*.

x	`REAL` for `sspr`
	`DOUBLE PRECISION` for `dspr`
	Array, `DIMENSION` at least `(1 + (`*n*` - 1)*abs(`*incx*`))`. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
ap	`REAL` for `sspr` `DOUBLE PRECISION` for `dspr`

Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on.
Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on.

Output Parameters

ap — With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spr interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?spr2

Performs a rank-2 update of a symmetric packed matrix.

Syntax

FORTRAN 77:

```
call sspr2(uplo, n, alpha, x, incx, y, incy, ap)
call dspr2(uplo, n, alpha, x, incx, y, incy, ap)
```

Fortran 95:

```
call spr2(ap, x, y [,uplo][,alpha])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?spr2 routines perform a matrix-vector operation defined as

A:= *alpha*x*y'+ alpha*y*x'* + *A*,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix, supplied in packed form.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the matrix *A* is supplied in the packed array *ap*. If *uplo* = 'U' or 'u', then the upper triangular part of the matrix *A* is supplied in the packed array *ap* . If *uplo* = 'L' or 'l', then the low triangular part of the matrix *A* is supplied in the packed array *ap* .
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for sspr2 DOUBLE PRECISION for dspr2 Specifies the scalar *alpha*.
x	REAL for sspr2 DOUBLE PRECISION for dspr2 Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	REAL for sspr2 DOUBLE PRECISION for dspr2 Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
ap	REAL for sspr2 DOUBLE PRECISION for dspr2 Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular part of the symmetric matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a* (2,1) and *a*(3,1) respectively, and so on.

Output Parameters

ap	With *uplo* = 'U' or 'u', overwritten by the upper triangular part of the updated matrix.

With *uplo* = 'L' or 'l', overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spr2 interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?symv

Computes a matrix-vector product for a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
call dsymv(uplo, n, alpha, a, lda, x, incx, beta, y, incy)
```

Fortran 95:

```
call symv(a, x, y [,uplo][,alpha] [,beta])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?symv routines perform a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used.

	If *uplo* = 'U' or 'u', then the upper triangular part of the array *a* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *a*. The value of *n* must be at least zero.
alpha	REAL for ssymv DOUBLE PRECISION for dsymv Specifies the scalar *alpha*.
a	REAL for ssymv DOUBLE PRECISION for dsymv Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix *A* and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix *A* and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).
x	REAL for ssymv DOUBLE PRECISION for dsymv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
beta	REAL for ssymv DOUBLE PRECISION for dsymv Specifies the scalar *beta*. When *beta* is supplied as zero, then *y* need not be set on input.
y	REAL for ssymv DOUBLE PRECISION for dsymv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.

Output Parameters

y	Overwritten by the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine symv interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
y	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?syr

Performs a rank-1 update of a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssyr(uplo, n, alpha, x, incx, a, lda)
call dsyr(uplo, n, alpha, x, incx, a, lda)
```

Fortran 95:

```
call syr(a, x [,uplo] [, alpha])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?syr routines perform a matrix-vector operation defined as

*A := alpha*x*x' + A*,

where:

alpha is a real scalar,

x is an *n*-element vector,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *a* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *a* is used.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
alpha	REAL for ssyr DOUBLE PRECISION for dsyr

	Specifies the scalar *alpha*.
x	REAL for ssyr DOUBLE PRECISION for dsyr Array, DIMENSION at least (1 + (*n*-1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
a	REAL for ssyr DOUBLE PRECISION for dsyr Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix *A* and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix *A* and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine syr interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?syr2

Performs a rank-2 update of symmetric matrix.

Syntax

FORTRAN 77:

```
call ssyr2(uplo, n, alpha, x, incx, y, incy, a, lda)
call dsyr2(uplo, n, alpha, x, incx, y, incy, a, lda)
```

Fortran 95:

```
call syr2(a, x, y [,uplo][,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?syr2` routines perform a matrix-vector operation defined as

`A := alpha*x*y'+ alpha*y*x' + A`,

where:

alpha is a scalar,

x and *y* are *n*-element vectors,

A is an *n*-by-*n* symmetric matrix.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the upper or lower triangular part of the array *a* is used. If *uplo* = `'U'` or `'u'`, then the upper triangular part of the array *a* is used. If *uplo* = `'L'` or `'l'`, then the low triangular part of the array *a* is used.
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

alpha	`REAL` for `ssyr2`
	`DOUBLE PRECISION` for `dsyr2`
	Specifies the scalar *alpha*.

x	`REAL` for `ssyr2`
	`DOUBLE PRECISION` for `dsyr2`
	Array, `DIMENSION` at least `(1 + (n - 1)*abs(incx))`. Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx	`INTEGER`. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.
y	`REAL` for `ssyr2` `DOUBLE PRECISION` for `dsyr2`

	Array, DIMENSION at least (1 + (*n* - 1)*abs(*incy*)). Before entry, the incremented array *y* must contain the *n*-element vector *y*.
incy	INTEGER. Specifies the increment for the elements of *y*. The value of *incy* must not be zero.
a	REAL for ssyr2 DOUBLE PRECISION for dsyr2 Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).

Output Parameters

a	With *uplo* = 'U' or 'u', the upper triangular part of the array *a* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *a* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine syr2 interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector *x* of length *n*.
y	Holds the vector *y* of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.

?tbmv

Computes a matrix-vector product using a triangular band matrix.

Syntax

FORTRAN 77:

```
call stbmv(uplo, trans, diag, n, k, a, lda, x, incx)
```

```
call dtbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call ctbmv(uplo, trans, diag, n, k, a, lda, x, incx)
call ztbmv(uplo, trans, diag, n, k, a, lda, x, incx)
```

Fortran 95:

```
call tbmv(a, x [,uplo] [, trans] [,diag])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?tbmv` routines perform one of the matrix-vector operations defined as

`x := A*x`, or `x := A'*x`, or `x := conjg(A')*x`,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular band matrix, with `(k +1)` diagonals.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *x* := *A*x*; if *trans* = 'T' or 't', then *x* := *A'*x*; if *trans* = 'C' or 'c', then *x* := conjg(*A'*x*.
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
k	INTEGER. On entry with *uplo* = 'U' or 'u', *k* specifies the number of super-diagonals of the matrix *A*. On entry with *uplo* = 'L' or 'l', *k* specifies the number of sub-diagonals of the matrix *a*. The value of *k* must satisfy $0 \le k$.
a	REAL for stbmv DOUBLE PRECISION for dtbmv COMPLEX for ctbmv DOUBLE COMPLEX for ztbmv Array, DIMENSION (*lda*, *n*). Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal

starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced. The following program segment transfers an upper triangular band matrix from conventional full matrix storage to band storage:

```
            do 20, j = 1, n
             m = k + 1 - j
do 10, i = max(1, j - k), j
              a(m + i, j) = matrix(i, j)
         10 continue
        20 continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced. The following program segment transfers a lower triangular band matrix from conventional full matrix storage to band storage:

```
            do 20, j = 1, n
             m = 1 - j
                 do 10, i = j, min(n, j + k)
               a(m + i, j) = matrix (i, j)
          10 continue
         20 continue
```

Note that when *diag* = 'U' or 'u', the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — REAL for stbmv
DOUBLE PRECISION for dtbmv
COMPLEX for ctbmv
DOUBLE COMPLEX for ztbmv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.

incx — INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

Output Parameters

x — Overwritten with the transformed vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `tbmv` interface are the following:

a	Holds the array *a* of size (*k*+1, *n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

?tbsv

Solves a system of linear equations whose coefficients are in a triangular band matrix.

Syntax

FORTRAN 77:

```
call stbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call dtbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call ctbsv(uplo, trans, diag, n, k, a, lda, x, incx)
call ztbsv(uplo, trans, diag, n, k, a, lda, x, incx)
```

Fortran 95:

```
call tbsv(a, x [,uplo] [, trans] [,diag])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?tbsv` routines solve one of the following systems of equations:

*A*x = b*, or *A'*x = b*, or conj(*A'*)*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular band matrix, with (*k* + 1) diagonals.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo CHARACTER*1. Specifies whether the matrix *A* is an upper or lower triangular matrix:
if *uplo* = 'U' or 'u' the matrix is upper triangular;
if *uplo* = 'L' or 'l', the matrix is low triangular.

trans CHARACTER*1. Specifies the system of equations:
if *trans* = 'N' or 'n', then *A***x* = *b*;
if *trans* = 'T' or 't', then *A*'**x* = *b*;
if *trans* = 'C' or 'c', then conjg(*A*')**x* = *b*.

diag CHARACTER*1. Specifies whether the matrix *A* is unit triangular:
if *diag* = 'U' or 'u' then the matrix is unit triangular;
if *diag* = 'N' or 'n', then the matrix is not unit triangular.

n INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

k INTEGER. On entry with *uplo* = 'U' or 'u', *k* specifies the number of super-diagonals of the matrix *A*. On entry with *uplo* = 'L' or 'l', *k* specifies the number of sub-diagonals of the matrix *A*.
The value of *k* must satisfy $0 \le k$.

a REAL for stbsv
DOUBLE PRECISION for dtbsv
COMPLEX for ctbsv
DOUBLE COMPLEX for ztbsv
Array, DIMENSION (*lda*, *n*).
Before entry with *uplo* = 'U' or 'u', the leading (*k* + 1) by *n* part of the array *a* must contain the upper triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row (*k* + 1) of the array, the first super-diagonal starting at position 2 in row *k*, and so on. The top left *k* by *k* triangle of the array *a* is not referenced.
The following program segment transfers an upper triangular band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
  m = k + 1 - j
  do 10, i = max(1, j - k), jl
    a(m + i, j) = matrix (i, j)
   10 continue
20 continue
```

Before entry with *uplo* = 'L' or 'l', the leading (*k* + 1) by *n* part of the array *a* must contain the lower triangular band part of the matrix of coefficients, supplied column-by-column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right *k* by *k* triangle of the array *a* is not referenced.

The following program segment transfers a lower triangular band matrix from conventional full matrix storage to band storage:

```
do 20, j = 1, n
   m = 1 - j
   do 10, i = j, min(n, j + k)
    a(m + i, j) = matrix (i, j)
  10 continue
20 continue
```

When *diag* = 'U' or 'u', the elements of the array *a* corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least (*k* + 1).

x — REAL for stbsv
DOUBLE PRECISION for dtbsv
COMPLEX for ctbsv
DOUBLE COMPLEX for ztbsv
Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.

incx — INTEGER. Specifies the increment for the elements of *x*.
The value of *incx* must not be zero.

Output Parameters

x — Overwritten with the solution vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tbsv interface are the following:

a — Holds the array *a* of size (*k*+1, *n*).

x — Holds the vector with the number of elements *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

trans — Must be 'N', 'C', or 'T'.
The default value is 'N'.

diag — Must be 'N' or 'U'. The default value is 'N'.

?tpmv

Computes a matrix-vector product using a triangular packed matrix.

Syntax

FORTRAN 77:

```
call stpmv(uplo, trans, diag, n, ap, x, incx)
call dtpmv(uplo, trans, diag, n, ap, x, incx)
call ctpmv(uplo, trans, diag, n, ap, x, incx)
call ztpmv(uplo, trans, diag, n, ap, x, incx)
```

Fortran 95:

```
call tpmv(ap, x [,uplo] [, trans] [,diag])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?tpmv` routines perform one of the matrix-vector operations defined as

`x := A*x`, or `x := A'*x`, or `x := conjg(A')*x`,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *x* := *A*x*; if *trans* = 'T' or 't', then *x* := *A'*x*; if *trans* = 'C' or 'c', then *x* := conjg(*A'*)*x*.
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
ap	REAL for stpmv DOUBLE PRECISION for dtpmv COMPLEX for ctpmv

	DOUBLE COMPLEX for ztpmv Array, DIMENSION at least ((*n**(*n* + 1))/2). Before entry with *uplo* = 'U' or 'u', the array *ap* must contain the upper triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(1,2) and *a*(2,2) respectively, and so on. Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1,1), *ap*(2) and *ap*(3) contain *a*(2,1) and *a*(3,1) respectively, and so on. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced, but are assumed to be unity.
x	REAL for stpmv DOUBLE PRECISION for dtpmv COMPLEX for ctpmv DOUBLE COMPLEX for ztpmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the transformed vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tpmv interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?tpsv

Solves a system of linear equations whose coefficients are in a triangular packed matrix.

Syntax

FORTRAN 77:

```
call stpsv(uplo, trans, diag, n, ap, x, incx)
call dtpsv(uplo, trans, diag, n, ap, x, incx)
```

```
call ctpsv(uplo, trans, diag, n, ap, x, incx)
call ztpsv(uplo, trans, diag, n, ap, x, incx)
```

Fortran 95:

```
call tpsv(ap, x [,uplo] [, trans] [,diag])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?tpsv` routines solve one of the following systems of equations

*A*x = b*, or *A'*x = b*, or `conjg(`*A'*`)`*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

This routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo	`CHARACTER*1`. Specifies whether the matrix *A* is upper or lower triangular: if *uplo* = `'U'` or `'u'`, then the matrix is upper triangular; if *uplo* = `'L'` or `'l'`, then the matrix is low triangular.
trans	`CHARACTER*1`. Specifies the system of equations: if *trans* = `'N'` or `'n'`, then *A*x = b*; if *trans* = `'T'` or `'t'`, then *A'*x = b*; if *trans* = `'C'` or `'c'`, then `conjg(`*A'*`)`*x = b*.
diag	`CHARACTER*1`. Specifies whether the matrix *A* is unit triangular: if *diag* = `'U'` or `'u'` then the matrix is unit triangular; if *diag* = `'N'` or `'n'`, then the matrix is not unit triangular.
n	`INTEGER`. Specifies the order of the matrix *A*. The value of *n* must be at least zero.

ap	`REAL` for `stpsv`
	`DOUBLE PRECISION` for `dtpsv`
	`COMPLEX` for `ctpsv`
	`DOUBLE COMPLEX` for `ztpsv`
	Array, `DIMENSION` at least `((`*n*`*(`*n* `+ 1))/2)`. Before entry with *uplo* = `'U'` or `'u'`, the array *ap* must contain the upper triangular matrix packed sequentially, column-by-column, so that *ap*`(1)` contains *a*`(1, 1)`, *ap*`(2)` and *ap*`(3)` contain *a*`(1, 2)` and *a*`(2, 2)` respectively, and so on.

	Before entry with *uplo* = 'L' or 'l', the array *ap* must contain the lower triangular matrix packed sequentially, column-by-column, so that *ap*(1) contains *a*(1, +1), *ap*(2) and *ap*(3) contain *a*(2, +1) and *a*(3, +1) respectively, and so on. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced, but are assumed to be unity.
x	REAL for stpsv DOUBLE PRECISION for dtpsv COMPLEX for ctpsv DOUBLE COMPLEX for ztpsv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tpsv interface are the following:

ap	Holds the array *ap* of size (*n*(n+1)/2).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?trmv

Computes a matrix-vector product using a triangular matrix.

Syntax

FORTRAN 77:

```
call strmv(uplo, trans, diag, n, a, lda, x, incx)
call dtrmv(uplo, trans, diag, n, a, lda, x, incx)
call ctrmv(uplo, trans, diag, n, a, lda, x, incx)
call ztrmv(uplo, trans, diag, n, a, lda, x, incx)
```

Fortran 95:

`call trmv(a, x [,uplo] [, trans] [,diag])`

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?trmv` routines perform one of the following matrix-vector operations defined as

`x := A*x`, or `x := A'*x`, or `x := conjg(A')*x`,

where:

x is an *n*-element vector,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *x* := *A*x*; if *trans* = 'T' or 't', then *x* := *A'*x*; if *trans* = 'C' or 'c', then *x* := conjg(*A'*x*.
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
a	REAL for strmv DOUBLE PRECISION for dtrmv COMPLEX for ctrmv DOUBLE COMPLEX for ztrmv Array, DIMENSION (*lda*,*n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).
x	REAL for strmv DOUBLE PRECISION for dtrmv

	COMPLEX for ctrmv DOUBLE COMPLEX for ztrmv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element vector *x*.
incx	INTEGER. Specifies the increment for the elements of *x*. The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the transformed vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trmv interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

?trsv

Solves a system of linear equations whose coefficients are in a triangular matrix.

Syntax

FORTRAN 77:

```
call strsv(uplo, trans, diag, n, a, lda, x, incx)
call dtrsv(uplo, trans, diag, n, a, lda, x, incx)
call ctrsv(uplo, trans, diag, n, a, lda, x, incx)
call ztrsv(uplo, trans, diag, n, a, lda, x, incx)
```

Fortran 95:

```
call trsv(a, x [,uplo] [, trans] [,diag])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?trsv routines solve one of the systems of equations:

*A*x = b*, or *A'*x = b*, or conjg(*A'*)*x = b*,

where:

b and *x* are *n*-element vectors,

A is an *n*-by-*n* unit, or non-unit, upper or lower triangular matrix.

The routine does not test for singularity or near-singularity.

Such tests must be performed before calling this routine.

Input Parameters

uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
trans	CHARACTER*1. Specifies the systems of equations: if *trans* = 'N' or 'n', then *A*x = b*; if *trans* = 'T' or 't', then *A'*x = b*; if *trans* = 'C' or 'c', then oconjg(*A'*)*x = b*.
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
n	INTEGER. Specifies the order of the matrix *A*. The value of *n* must be at least zero.
a	REAL for strsv DOUBLE PRECISION for dtrsv COMPLEX for ctrsv DOUBLE COMPLEX for ztrsv Array, DIMENSION (*lda*,*n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. The value of *lda* must be at least max(1, *n*).
x	REAL for strsv DOUBLE PRECISION for dtrsv COMPLEX for ctrsv DOUBLE COMPLEX for ztrsv Array, DIMENSION at least (1 + (*n* - 1)*abs(*incx*)). Before entry, the incremented array *x* must contain the *n*-element right-hand side vector *b*.
incx	INTEGER. Specifies the increment for the elements of *x*.

	The value of *incx* must not be zero.

Output Parameters

x	Overwritten with the solution vector *x*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `trsv` interface are the following:

a	Holds the matrix *a* of size (*n*,*n*).
x	Holds the vector with the number of elements *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
diag	Must be `'N'` or `'U'`. The default value is `'N'`.

BLAS Level 3 Routines

BLAS Level 3 routines perform matrix-matrix operations. Table 2-3 lists the BLAS Level 3 routine groups and the data types associated with them.

Table 2-3 BLAS Level 3 Routine Groups and Their Data Types

Routine Group	Data Types	Description
`?gemm`	s, d, c, z	Matrix-matrix product of general matrices
`?hemm`	c, z	Matrix-matrix product of Hermitian matrices
`?herk`	c, z	Rank-k update of Hermitian matrices
`?her2k`	c, z	Rank-2k update of Hermitian matrices
`?symm`	s, d, c, z	Matrix-matrix product of symmetric matrices
`?syrk`	s, d, c, z	Rank-k update of symmetric matrices
`?syr2k`	s, d, c, z	Rank-2k update of symmetric matrices
`?trmm`	s, d, c, z	Matrix-matrix product of triangular matrices
`?trsm`	s, d, c, z	Linear matrix-matrix solution for triangular matrices

Symmetric Multiprocessing Version of Intel® MKL

Many applications spend considerable time for executing BLAS level 3 routines. This time can be scaled by the number of processors available on the system through using the symmetric multiprocessing(SMP) feature built into the Intel MKL Library. The performance enhancements based on the parallel use of the processors are available without any programming effort on your part.

To enhance performance, the library uses the following methods:

- The operation of BLAS level 3 matrix-matrix functions permits to restructure the code in a way which increases the localization of data reference, enhances cache memory use, and reduces the dependency on the memory bus.
- Once the code has been effectively blocked as described above, one of the matrices is distributed across the processors to be multiplied by the second matrix. Such distribution ensures effective cache management which reduces the dependency on the memory bus performance and brings good scaling results.

?gemm

Computes a scalar-matrix-matrix product and adds the result to a scalar-matrix product.

Syntax

FORTRAN 77:

```
call sgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call cgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call scgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dzgemm(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

Fortran 95:

```
call gemm(a, b, c [,transa][,transb] [,alpha][,beta])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?gemm routines perform a matrix-matrix operation with general matrices. The operation is defined as

`C := alpha*op(A)*op(B) + beta*C`,

where:

`op(x)` is one of `op(x) = x`, or `op(x) = x'`, or `op(x) = conjg(x')`,

alpha and *beta* are scalars,

A, *B* and *C* are matrices:

`op(A)` is an *m*-by-*k* matrix,

op(*B*) is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

See also ?gemm3m, BLAS-like extension routines, that use matrix multiplication for similar matrix-matrix operations.

Input Parameters

transa	CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication: if *transa* = 'N' or 'n', then op(*A*) = *A*; if *transa* = 'T' or 't', then op(*A*) = *A*'; if *transa* = 'C' or 'c', then op(*A*) = conjg(*A*').
transb	CHARACTER*1. Specifies the form of op(*B*) used in the matrix multiplication: if *transb* = 'N' or 'n', then op(*B*) = *B*; if *transb* = 'T' or 't', then op(*B*) = *B*'; if *transb* = 'C' or 'c', then op(*B*) = conjg(*B*').
m	INTEGER. Specifies the number of rows of the matrix op(*A*) and of the matrix *C*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix op(*B*) and the number of columns of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. Specifies the number of columns of the matrix op(*A*) and the number of rows of the matrix op(*B*). The value of *k* must be at least zero.
alpha	REAL for sgemm DOUBLE PRECISION for dgemm COMPLEX for cgemm, scgemm DOUBLE COMPLEX for zgemm, dzgemm Specifies the scalar *alpha*.
a	REAL for sgemm, scgemm DOUBLE PRECISION for dgemm, dzgemm COMPLEX for cgemm DOUBLE COMPLEX for zgemm Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *transa* = 'N' or 'n', and is *m* otherwise. Before entry with *transa* = 'N' or 'n', the leading *m*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *transa* = 'N' or 'n', then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *k*).
b	REAL for sgemm DOUBLE PRECISION for dgemm COMPLEX for cgemm, scgemm DOUBLE COMPLEX for zgemm, dzgemm

	Array, DIMENSION (*ldb*, *kb*), where *kb* is *n* when *transb* = 'N' or 'n', and is *k* otherwise. Before entry with *transb* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. When *transb* = 'N' or 'n', then *ldb* must be at least max(1, *k*), otherwise *ldb* must be at least max(1, *n*).
beta	REAL for sgemm DOUBLE PRECISION for dgemm COMPLEX for cgemm, scgemm DOUBLE COMPLEX for zgemm, dzgemm Specifies the scalar *beta*. When *beta* is equal to zero, then *c* need not be set on input.
c	REAL for sgemm DOUBLE PRECISION for dgemm COMPLEX for cgemm, scgemm DOUBLE COMPLEX for zgemm, dzgemm Array, DIMENSION (*ldc*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *m*).

Output Parameters

c	Overwritten by the *m*-by-*n* matrix (*alpha**op(*A*)*op(*B*) + *beta***C*).

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gemm interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *transa*= 'N', *ka* = *m* otherwise, *ma* = *m* if *transa*= 'N', *ma* = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *n* if *transb* = 'N', *kb* = *k* otherwise, *mb* = *k* if *transb* = 'N', *mb* = *n* otherwise.
c	Holds the matrix *C* of size (*m*,*n*).
transa	Must be 'N', 'C', or 'T'.

	The default value is 'N'.
transb	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?hemm

Computes a scalar-matrix-matrix product (either one of the matrices is Hermitian) and adds the result to scalar-matrix product.

Syntax

FORTRAN 77:

`call chemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)`

`call zhemm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)`

Fortran 95:

`call hemm(a, b, c [,side][,uplo] [,alpha][,beta])`

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?hemm routines perform a matrix-matrix operation using Hermitian matrices. The operation is defined as

C := *alpha***A***B* + *beta***C*

or

C := *alpha***B***A* + *beta***C*,

where:

alpha and *beta* are scalars,

A is an Hermitian matrix,

B and *C* are *m*-by-*n* matrices.

Input Parameters

side	CHARACTER*1. Specifies whether the Hermitian matrix *A* appears on the left or right in the operation as follows: if *side* = 'L' or 'l', then *C* := *alpha***A***B* + *beta***C*; if *side* = 'R' or 'r', then *C* := *alpha***B***A* + *beta***C*.
uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the Hermitian matrix *A* is used: If *uplo* = 'U' or 'u', then the upper triangular part of the Hermitian matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangular part of the Hermitian matrix *A* is used.

m — INTEGER. Specifies the number of rows of the matrix *C*.
The value of *m* must be at least zero.

n — INTEGER. Specifies the number of columns of the matrix *C*.
The value of *n* must be at least zero.

alpha — COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Specifies the scalar *alpha*.

a — COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Array, DIMENSION (*lda*,*ka*), where *ka* is *m* when *side* = 'L' or 'l' and is *n* otherwise. Before entry with *side* = 'L' or 'l', the *m*-by-*m* part of the array *a* must contain the Hermitian matrix, such that when *uplo* = 'U' or 'u', the leading *m*-by-*m* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *m*-by-*m* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of *a* is not referenced.
Before entry with *side* = 'R' or 'r', the *n*-by-*n* part of the array *a* must contain the Hermitian matrix, such that when *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the Hermitian matrix, and the strictly upper triangular part of *a* is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub) program. When *side* = 'L' or 'l' then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1,*n*).

b — COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Array, DIMENSION (*ldb*,*n*).
Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, *m*).

beta — COMPLEX for chemm
DOUBLE COMPLEX for zhemm
Specifies the scalar *beta*.
When *beta* is supplied as zero, then *c* need not be set on input.

c — COMPLEX for chemm
DOUBLE COMPLEX for zhemm

	Array, DIMENSION (*c*, *n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is zero, in which case *c* need not be set on entry.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *m*).

Output Parameters

c	Overwritten by the *m*-by-*n* updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hemm interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?herk

Performs a rank-k update of a Hermitian matrix.

Syntax

FORTRAN 77:

```
call cherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call zherk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
```

Fortran 95:

```
call herk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?herk routines perform a matrix-matrix operation using Hermitian matrices. The operation is defined as

C := *alpha***A**conjg(*A*') + *beta***C*,

or

C := *alpha**conjg(*A*')**A* + *beta***C*,

where:

alpha and *beta* are real scalars,

C is an *n*-by-*n* Hermitian matrix,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *C* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *C* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *C* is used.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *C*:= *alpha***A**conjg(*A*')+*beta***C*; if *trans* = 'C' or 'c', then *C*:= *alpha**conjg(*A*')**A*+*beta***C*.
n	INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. With *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *A*, and with *trans* = 'C' or 'c', *k* specifies the number of rows of the matrix *A*. The value of *k* must be at least zero.
alpha	REAL for cherk DOUBLE PRECISION for zherk Specifies the scalar *alpha*.
a	COMPLEX for cherk DOUBLE COMPLEX for zherk Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *a*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).
beta	REAL for cherk DOUBLE PRECISION for zherk Specifies the scalar *beta*.
c	COMPLEX for cherk DOUBLE COMPLEX for zherk Array, DIMENSION (*ldc*,*n*).

	Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *c* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *c* is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine herk interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *transa*= 'N', *ka* = *n* otherwise, *ma* = *n* if *transa*= 'N', *ma* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?her2k

Performs a rank-2k update of a Hermitian matrix.

Syntax

FORTRAN 77:

```
call cher2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

call zher2k(*uplo*, *trans*, *n*, *k*, *alpha*, *a*, *lda*, *b*, *ldb*, *beta*, *c*, *ldc*)

Fortran 95:

call her2k(*a*, *b*, *c* [,*uplo*][,*trans*] [,*alpha*][,*beta*])

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The ?her2k routines perform a rank-2k matrix-matrix operation using Hermitian matrices. The operation is defined as

C := *alpha***A**conjg(*B*') + conjg(*alpha*)**B**conjg(*A*') + *beta***C*,

or

C := *alpha* *conjg(*B*')**A* + conjg(*alpha*) *conjg(*A*')**B* + *beta***C*,

where:

alpha is a scalar and *beta* is a real scalar,

C is an *n*-by-*n* Hermitian matrix,

A and *B* are *n*-by-*k* matrices in the first case and *k*-by-*n* matrices in the second case.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u', then the upper triangular of the array *c* is used. If *uplo* = 'L' or 'l', then the low triangular of the array *c* is used.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *C*:=*alpha***A**conjg(*B*') + *alpha***B**conjg(*A*') + *beta***C*; if *trans* = 'C' or 'c', then *C*:=*alpha**conjg(*A*')**B* + *alpha**conjg(*B*')**A* + *beta***C*.
n	INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. With *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *A*, and with *trans* = 'C' or 'c', *k* specifies the number of rows of the matrix *A*. The value of *k* must be at least equal to zero.
alpha	COMPLEX for cher2k DOUBLE COMPLEX for zher2k Specifies the scalar *alpha*.
a	COMPLEX for cher2k DOUBLE COMPLEX for zher2k Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).
beta	REAL for cher2k DOUBLE PRECISION for zher2k Specifies the scalar *beta*.
b	COMPLEX for cher2k DOUBLE COMPLEX for zher2k Array, DIMENSION (*ldb*, *kb*), where *kb* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *b* must contain the matrix *B*, otherwise the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *ldb* must be at least max(1, *n*), otherwise *ldb* must be at least max(1, *k*).
c	COMPLEX for cher2k DOUBLE COMPLEX for zher2k Array, DIMENSION (*ldc*,*n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the Hermitian matrix and the strictly lower triangular part of *c* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the Hermitian matrix and the strictly upper triangular part of *c* is not referenced. The imaginary parts of the diagonal elements need not be set, they are assumed to be zero.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix. The imaginary parts of the diagonal elements are set to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine her2k interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *trans* = 'N',

	ka = *n* otherwise, *ma* = *n* if *trans* = 'N', *ma* = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *k* if *trans* = 'N', *kb* = *n* otherwise, *mb* = *n* if *trans* = 'N', *mb* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?symm

Performs a scalar-matrix-matrix product(one matrix operand is symmetric) and adds the result to a scalar-matrix product.

Syntax

FORTRAN 77:

```
call ssymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call dsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call csymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
call zsymm(side, uplo, m, n, alpha, a, lda, b, ldb, beta, c, ldc)
```

Fortran 95:

```
call symm(a, b, c [,side][,uplo] [,alpha][,beta])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?symm` routines perform a matrix-matrix operation using symmetric matrices. The operation is defined as

*C := alpha*A*B + beta*C*,

or

*C := alpha*B*A + beta*C*,

where:

alpha and *beta* are scalars,

A is a symmetric matrix,

B and *C* are *m*-by-*n* matrices.

Input Parameters

side	CHARACTER*1. Specifies whether the symmetric matrix *A* appears on the left or right in the operation: if *side* = 'L' or 'l', then *C* := *alpha***A***B* + *beta***C*; if *side* = 'R' or 'r', then *C* := *alpha***B***A* + *beta***C*.
uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the symmetric matrix *A* is used: if *uplo* = 'U' or 'u', then the upper triangular part is used; if *uplo* = 'L' or 'l', then the lower triangular part is used.
m	INTEGER. Specifies the number of rows of the matrix *C*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix *C*. The value of *n* must be at least zero.
alpha	REAL for ssymm DOUBLE PRECISION for dsymm COMPLEX for csymm DOUBLE COMPLEX for zsymm Specifies the scalar *alpha*.
a	REAL for ssymm DOUBLE PRECISION for dsymm COMPLEX for csymm DOUBLE COMPLEX for zsymm Array, DIMENSION (*lda*, *ka*), where *ka* is *m* when *side* = 'L' or 'l' and is *n* otherwise. Before entry with *side* = 'L' or 'l', the *m*-by-*m* part of the array *a* must contain the symmetric matrix, such that when *uplo* = 'U' or 'u', the leading *m*-by-*m* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *m*-by-*m* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced. Before entry with *side* = 'R' or 'r', the *n*-by-*n* part of the array *a* must contain the symmetric matrix, such that when *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *a* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *a* is not referenced, and when *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *a* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *a* is not referenced.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l' then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *n*).
b	REAL for ssymm

	DOUBLE PRECISION for dsymm COMPLEX for csymm DOUBLE COMPLEX for zsymm Array, DIMENSION (*ldb*,*n*). Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, *m*).
beta	REAL for ssymm DOUBLE PRECISION for dsymm COMPLEX for csymm DOUBLE COMPLEX for zsymm Specifies the scalar *beta*. When *beta* is set to zero, then *c* need not be set on input.
c	REAL for ssymm DOUBLE PRECISION for dsymm COMPLEX for csymm DOUBLE COMPLEX for zsymm Array, DIMENSION (*ldc*,*n*). Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when beta is zero, in which case *c* need not be set on entry.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *m*).

Output Parameters

c	Overwritten by the *m*-by-*n* updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine symm interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
alpha	The default value is 1.
beta	The default value is 0.

?syrk

Performs a rank-n update of a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call dsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call csyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
call zsyrk(uplo, trans, n, k, alpha, a, lda, beta, c, ldc)
```

Fortran 95:

```
call syrk(a, c [,uplo] [, trans] [,alpha][,beta])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?syrk` routines perform a matrix-matrix operation using symmetric matrices. The operation is defined as

`C := alpha*A*A' + beta*C`,

or

`C := alpha*A'*A + beta*C`,

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix,

A is an *n*-by-*k* matrix in the first case and a *k*-by-*n* matrix in the second case.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *c* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *c* is used.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *C* := *alpha*A*A' + *beta*C*; if *trans* = 'T' or 't', then *C* := *alpha*A'*A + *beta*C*; if *trans* = 'C' or 'c', then *C* := *alpha*A'*A + *beta*C*.
n	INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.

k INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrix *a*, and on entry with *trans* = 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the matrix *a*.
The value of *k* must be at least zero.

alpha REAL for ssyrk
DOUBLE PRECISION for dsyrk
COMPLEX for csyrk
DOUBLE COMPLEX for zsyrk
Specifies the scalar *alpha*.

a REAL for ssyrk
DOUBLE PRECISION for dsyrk
COMPLEX for csyrk
DOUBLE COMPLEX for zsyrk
Array, DIMENSION (*lda*,*ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.

lda INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1,*n*), otherwise *lda* must be at least max(1, *k*).

beta REAL for ssyrk
DOUBLE PRECISION for dsyrk
COMPLEX for csyrk
DOUBLE COMPLEX for zsyrk
Specifies the scalar *beta*.

c REAL for ssyrk
DOUBLE PRECISION for dsyrk
COMPLEX for csyrk
DOUBLE COMPLEX for zsyrk
Array, DIMENSION (*ldc*,*n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced.
Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.

ldc INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix.
With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `syrk` interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *transa*= 'N', *ka* = *n* otherwise, *ma* = *n* if *transa*= 'N', *ma* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?syr2k

Performs a rank-2k update of a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call dsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call csyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
call zsyr2k(uplo, trans, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

Fortran 95:

```
call syr2k(a, b, c [,uplo][,trans] [,alpha][,beta])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?syr2k` routines perform a rank-2k matrix-matrix operation using symmetric matrices. The operation is defined as

*C := alpha*A*B' + alpha*B*A' + beta*C*,

or

*C := alpha*a'*B + alpha*B'*A + beta*C*,

where:

alpha and *beta* are scalars,

C is an *n*-by-*n* symmetric matrix,

A and *B* are *n*-by-*k* matrices in the first case, and *k*-by-*n* matrices in the second case.

Input Parameters

uplo	CHARACTER*1. Specifies whether the upper or lower triangular part of the array *c* is used. If *uplo* = 'U' or 'u', then the upper triangular part of the array *c* is used. If *uplo* = 'L' or 'l', then the low triangular part of the array *c* is used.
trans	CHARACTER*1. Specifies the operation: if *trans* = 'N' or 'n', then *C* := *alpha***A***B*'+*alpha***B***A*'+*beta***C*; if *trans* = 'T' or 't', then *C* := *alpha***A*'**B* +*alpha***B*'**A* +*beta***C*; if *trans* = 'C' or 'c', then *C* := *alpha***A*'**B* +*alpha***B*'**A* +*beta***C*.
n	INTEGER. Specifies the order of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. On entry with *trans* = 'N' or 'n', *k* specifies the number of columns of the matrices *A* and *B*, and on entry with *trans* = 'T' or 't' or 'C' or 'c', *k* specifies the number of rows of the matrices *A* and *B*. The value of *k* must be at least zero.
alpha	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Specifies the scalar *alpha*.
a	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *trans* = 'N' or 'n', and is *n* otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*n* part of the array *a* must contain the matrix *A*.
lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *lda* must be at least max(1, *n*), otherwise *lda* must be at least max(1, *k*).
b	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k

	Array, DIMENSION (*ldb, kb)* where *kb* is *k* when *trans* = 'N' or 'n' and is 'n' otherwise. Before entry with *trans* = 'N' or 'n', the leading *n*-by-*k* part of the array *b* must contain the matrix *B*, otherwise the leading *k*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *trans* = 'N' or 'n', then *ldb* must be at least max(1, *n*), otherwise *ldb* must be at least max(1, *k*).
beta	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Specifies the scalar *beta*.
c	REAL for ssyr2k DOUBLE PRECISION for dsyr2k COMPLEX for csyr2k DOUBLE COMPLEX for zsyr2k Array, DIMENSION (*ldc*,*n*). Before entry with *uplo* = 'U' or 'u', the leading *n*-by-*n* upper triangular part of the array *c* must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of *c* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *n*-by-*n* lower triangular part of the array *c* must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of *c* is not referenced.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *n*).

Output Parameters

c	With *uplo* = 'U' or 'u', the upper triangular part of the array *c* is overwritten by the upper triangular part of the updated matrix. With *uplo* = 'L' or 'l', the lower triangular part of the array *c* is overwritten by the lower triangular part of the updated matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine syr2k interface are the following:

a	Holds the matrix *A* of size (*ma*,*ka*) where *ka* = *k* if *trans* = 'N', *ka* = *n* otherwise, *ma* = *n* if *trans* = 'N', *ma* = *k* otherwise.
b	Holds the matrix *B* of size (*mb*,*kb*) where *kb* = *k* if *trans* = 'N',

	kb = *n* otherwise, *mb* = *n* if *trans* = 'N', *mb* = *k* otherwise.
c	Holds the matrix *C* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 0.

?trmm

Computes a scalar-matrix-matrix product (one matrix operand is triangular).

Syntax

FORTRAN 77:

```
call strmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call dtrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ctrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ztrmm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
```

Fortran 95:

```
call trmm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?trmm` routines perform a matrix-matrix operation using triangular matrices. The operation is defined as

B := *alpha**op(*A*)**B*

or

B := *alpha***B**op(*A*)

where:

alpha is a scalar,

B is an *m*-by-*n* matrix,

A is a unit, or non-unit, upper or lower triangular matrix

op(*A*) is one of op(*A*) = *A*, or op(A) = *A*', or op(*A*) = conjg(*A*').

Input Parameters

side	CHARACTER*1. Specifies whether op(*A*) appears on the left or right of *B* in the operation: if *side* = 'L' or 'l', then *B* := *alpha**op(*A*)**B*; if *side* = 'R' or 'r', then *B* := *alpha***B**op(*A*).
uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
transa	CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication: if *transa* = 'N' or 'n', then op(*A*) = *A*; if *transa* = 'T' or 't', then op(*A*) = *A*'; if *transa* = 'C' or 'c', then op(*A*) = conjg(*A*').
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
m	INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.
alpha	REAL for strmm DOUBLE PRECISION for dtrmm COMPLEX for ctrmm DOUBLE COMPLEX for ztrmm Specifies the scalar *alpha*. When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.
a	REAL for strmm DOUBLE PRECISION for dtrmm COMPLEX for ctrmm DOUBLE COMPLEX for ztrmm Array, DIMENSION (*lda*,*k*), where *k* is *m* when *side* = 'L' or 'l' and is *n* when *side* = 'R' or 'r'. Before entry with *uplo* = 'U' or 'u', the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced. Before entry with *uplo* = 'L' or 'l', the leading *k* by *k* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced. When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda	INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l', then *lda* must be at least max(1, *m*), when *side* = 'R' or 'r', then *lda* must be at least max(1, *n*).
b	REAL for strmm DOUBLE PRECISION for dtrmm COMPLEX for ctrmm DOUBLE COMPLEX for ztrmm Array, DIMENSION (*ldb*,*n*). Before entry, the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, *m*).

Output Parameters

b	Overwritten by the transformed matrix.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trmm interface are the following:

a	Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.
b	Holds the matrix *B* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.
alpha	The default value is 1.

?trsm

Solves a matrix equation (one matrix operand is triangular).

Syntax

FORTRAN 77:

```
call strsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call dtrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
```

```
call ctrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
call ztrsm(side, uplo, transa, diag, m, n, alpha, a, lda, b, ldb)
```

Fortran 95:

```
call trsm(a, b [,side] [, uplo] [,transa][,diag] [,alpha])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?trsm` routines solve one of the following matrix equations:

`op(A)*X = alpha*B`,

or

`X*op(A) = alpha*B`,

where:

alpha is a scalar,

X and *B* are *m*-by-*n* matrices,

A is a unit, or non-unit, upper or lower triangular matrix

op(*A*) is one of op(*A*) = *A*, or op(*A*) = *A*', or op(*A*) = conjg(*A*').

The matrix *B* is overwritten by the solution matrix *X*.

Input Parameters

side	CHARACTER*1. Specifies whether op(*A*) appears on the left or right of *X* in the equation: if *side* = 'L' or 'l', then op(*A*)*X = *alpha*B; if *side* = 'R' or 'r', then X*op(*A*) = *alpha*B.
uplo	CHARACTER*1. Specifies whether the matrix *A* is upper or lower triangular: if *uplo* = 'U' or 'u', then the matrix is upper triangular; if *uplo* = 'L' or 'l', then the matrix is low triangular.
transa	CHARACTER*1. Specifies the form of op(*A*) used in the matrix multiplication: if *transa* = 'N' or 'n', then op(*A*) = *A*; if *transa* = 'T' or 't', then op(*A*) = *A*'; if *transa* = 'C' or 'c', then op(*A*) = conjg(*A*').
diag	CHARACTER*1. Specifies whether the matrix *A* is unit triangular: if *diag* = 'U' or 'u' then the matrix is unit triangular; if *diag* = 'N' or 'n', then the matrix is not unit triangular.
m	INTEGER. Specifies the number of rows of *B*. The value of *m* must be at least zero.
n	INTEGER. Specifies the number of columns of *B*. The value of *n* must be at least zero.

alpha — REAL for strsm
DOUBLE PRECISION for dtrsm
COMPLEX for ctrsm
DOUBLE COMPLEX for ztrsm
Specifies the scalar *alpha*.
When *alpha* is zero, then *a* is not referenced and *b* need not be set before entry.

a — REAL for strsm
DOUBLE PRECISION for dtrsm
COMPLEX for ctrsm
DOUBLE COMPLEX for ztrsm
Array, DIMENSION (*lda*, *k*), where *k* is *m* when *side* = 'L' or 'l' and is *n* when *side* = 'R' or 'r'. Before entry with *uplo* = 'U' or 'u', the leading *k* by *k* upper triangular part of the array *a* must contain the upper triangular matrix and the strictly lower triangular part of *a* is not referenced.
Before entry with *uplo* = 'L' or 'l', the leading *k* by *k* lower triangular part of the array *a* must contain the lower triangular matrix and the strictly upper triangular part of *a* is not referenced.
When *diag* = 'U' or 'u', the diagonal elements of *a* are not referenced either, but are assumed to be unity.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *side* = 'L' or 'l', then *lda* must be at least max(1, *m*), when *side* = 'R' or 'r', then *lda* must be at least max(1, *n*).

b — REAL for strsm
DOUBLE PRECISION for dtrsm
COMPLEX for ctrsm
DOUBLE COMPLEX for ztrsm
Array, DIMENSION (*ldb*,*n*). Before entry, the leading *m*-by-*n* part of the array *b* must contain the right-hand side matrix *B*.

ldb — INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. The value of *ldb* must be at least max(1, +*m*).

Output Parameters

b — Overwritten by the solution matrix *X*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trsm interface are the following:

a — Holds the matrix *A* of size (*k*,*k*) where *k* = *m* if *side* = 'L', *k* = *n* otherwise.

b — Holds the matrix *B* of size (*m*,*n*).

side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.
alpha	The default value is 1.

Sparse BLAS Level 1 Routines

This section describes Sparse BLAS Level 1, an extension of BLAS Level 1 included in the Intel® Math Kernel Library beginning with the Intel MKL release 2.1. Sparse BLAS Level 1 is a group of routines and functions that perform a number of common vector operations on sparse vectors stored in compressed form.

Sparse vectors are those in which the majority of elements are zeros. Sparse BLAS routines and functions are specially implemented to take advantage of vector sparsity. This allows you to achieve large savings in computer time and memory. If *nz* is the number of non-zero vector elements, the computer time taken by Sparse BLAS operations will be $O(nz)$.

Vector Arguments

Compressed sparse vectors. Let *a* be a vector stored in an array, and assume that the only non-zero elements of *a* are the following:

$a(k_1), a(k_2), a(k_3) \ldots a(k_{nz}),$

where *nz* is the total number of non-zero elements in *a*.

In Sparse BLAS, this vector can be represented in compressed form by two FORTRAN arrays, *x* (values) and *indx* (indices). Each array has *nz* elements:

$x(1)=a(k_1), x(2)=a(k_2), \ldots x(nz)= a(k_{nz}),$

$indx(1)=k_1, indx(2)=k_2, \ldots indx(nz)= k_{nz}.$

Thus, a sparse vector is fully determined by the triple (*nz*, *x*, *indx*). If you pass a negative or zero value of *nz* to Sparse BLAS, the subroutines do not modify any arrays or variables.

Full-storage vectors. Sparse BLAS routines can also use a vector argument fully stored in a single FORTRAN array (a full-storage vector). If *y* is a full-storage vector, its elements must be stored contiguously: the first element in $y(1)$, the second in $y(2)$, and so on. This corresponds to an increment $incy = 1$ in BLAS Level 1. No increment value for full-storage vectors is passed as an argument to Sparse BLAS routines or functions.

Naming Conventions

Similar to BLAS, the names of Sparse BLAS subprograms have prefixes that determine the data type involved: *s* and *d* for single- and double-precision real; *c* and *z* for single- and double-precision complex respectively.

If a Sparse BLAS routine is an extension of a "dense" one, the subprogram name is formed by appending the suffix *i* (standing for *indexed*) to the name of the corresponding "dense" subprogram. For example, the Sparse BLAS routine `saxpyi` corresponds to the BLAS routine `saxpy`, and the Sparse BLAS function `cdotci` corresponds to the BLAS function `cdotc`.

Routines and Data Types

Routines and data types supported in the Intel MKL implementation of Sparse BLAS are listed in Table 2-4 .

Table 2-4 Sparse BLAS Routines and Their Data Types

Routine/Function	Data Types	Description
?axpyi	s, d, c, z	Scalar-vector product plus vector (routines)
?doti	s, d	Dot product (functions)
?dotci	c, z	Complex dot product conjugated (functions)
?dotui	c, z	Complex dot product unconjugated (functions)
?gthr	s, d, c, z	Gathering a full-storage sparse vector into compressed form *nz*, *x*, *indx* (routines)
?gthrz	s, d, c, z	Gathering a full-storage sparse vector into compressed form and assigning zeros to gathered elements in the full-storage vector (routines)
?roti	s, d	Givens rotation (routines)
?sctr	s, d, c, z	Scattering a vector from compressed form to full-storage form (routines)

BLAS Level 1 Routines That Can Work With Sparse Vectors

The following BLAS Level 1 routines will give correct results when you pass to them a compressed-form array *x*(with the increment *incx*=1):

?asum	sum of absolute values of vector elements
?copy	copying a vector
?nrm2	Euclidean norm of a vector
?scal	scaling a vector
i?amax	index of the element with the largest absolute value for real flavors, or the largest sum |Re(*x*(*i*))|+|Im(*x*(*i*))| for complex flavors.
i?amin	index of the element with the smallest absolute value for real flavors, or the smallest sum |Re(*x*(*i*))|+|Im(*x*(*i*))| for complex flavors.

The result *i* returned by i?amax and i?amin should be interpreted as index in the compressed-form array, so that the largest (smallest) value is *x*(*i*); the corresponding index in full-storage array is *indx*(*i*).

You can also call ?roti to compute the parameters of Givens rotation and then pass these parameters to the Sparse BLAS routines ?roti.

?axpyi

Adds a scalar multiple of compressed sparse vector to a full-storage vector.

Syntax

FORTRAN 77:

```
call saxpyi(nz, a, x, indx, y)
call daxpyi(nz, a, x, indx, y)
call caxpyi(nz, a, x, indx, y)
call zaxpyi(nz, a, x, indx, y)
```

Fortran 95:

```
call axpyi(x, indx, y [, a])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?axpyi` routines perform a vector-vector operation defined as

y := *a***x* + *y*

where:

a is a scalar,

x is a sparse vector stored in compressed form,

y is a vector in full storage form.

The `?axpyi` routines reference or modify only the elements of *y* whose indices are listed in the array *indx*.

The values in *indx* must be distinct.

Input Parameters

nz	`INTEGER`. The number of elements in *x* and *indx*.

a	`REAL` for `saxpyi`
	`DOUBLE PRECISION` for `daxpyi`
	`COMPLEX` for `caxpyi`
	`DOUBLE COMPLEX` for `zaxpyi`
	Specifies the scalar *a*.

x	`REAL` for `saxpyi`
	`DOUBLE PRECISION` for `daxpyi`
	`COMPLEX` for `caxpyi`
	`DOUBLE COMPLEX` for `zaxpyi`
	Array, `DIMENSION` at least *nz*.

indx	`INTEGER`. Specifies the indices for the elements of *x*.

	Array, DIMENSION at least *nz*.
y	REAL for saxpyi DOUBLE PRECISION for daxpyi COMPLEX for caxpyi DOUBLE COMPLEX for zaxpyi Array, DIMENSION at least max(*indx*(i)).

Output Parameters

y	Contains the updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine axpyi interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.
a	The default value is 1.

?doti

Computes the dot product of a compressed sparse real vector by a full-storage real vector.

Syntax

FORTRAN 77:

```
res = sdoti(nz, x, indx, y )
res = ddoti(nz, x, indx, y )
```

Fortran 95:

```
res = doti(x, indx, y)
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?doti routines return the dot product of *x* and *y* defined as

```
res = x(1)*y(indx(1)) + x(2)*y(indx(2)) +...+ x(nz)*y(indx(nz))
```

where the triple (*nz*, *x*, *indx*) defines a sparse real vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx* .
x	REAL for sdoti DOUBLE PRECISION for ddoti Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	REAL for sdoti DOUBLE PRECISION for ddoti Array, DIMENSION at least max(*indx(i)*).

Output Parameters

res	REAL for sdoti DOUBLE PRECISION for ddoti Contains the dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine doti interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?dotci

Computes the conjugated dot product of a compressed sparse complex vector with a full-storage complex vector.

Syntax

FORTRAN 77:

```
res = cdotci(nz, x, indx, y )
res = zdotci(nz, x, indx, y )
```

Fortran 95:

```
res = dotci(x, indx, y)
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?dotci routines return the dot product of *x* and *y* defined as

conj(*x*(1))*y*(*indx*(1)) + ... + conj(*x*(*nz*))*y*(*indx*(*nz*))

where the triple (*nz*, *x*, *indx*) defines a sparse complex vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx* .
x	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Array, DIMENSION at least max(*indx(i)*).

Output Parameters

res	COMPLEX for cdotci DOUBLE COMPLEX for zdotci Contains the conjugated dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine dotci interface are the following:

x	Holds the vector with the number of elements (*nz*).
indx	Holds the vector with the number of elements (*nz*).
y	Holds the vector with the number of elements (*nz*).

?dotui

Computes the dot product of a compressed sparse complex vector by a full-storage complex vector.

Syntax

FORTRAN 77:

res = cdotui(*nz*, *x*, *indx*, *y*)

res = zdotui(*nz*, *x*, *indx*, *y*)

Fortran 95:

```
res = dotui(x, indx, y)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?dotui` routines return the dot product of *x* and *y* defined as

`res = x(1)*y(indx(1)) + x(2)*y(indx(2)) +...+ x(nz)*y(indx(nz))`

where the triple (*nz*, *x*, *indx*) defines a sparse complex vector stored in compressed form, and *y* is a real vector in full storage form. The functions reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	`INTEGER`. The number of elements in *x* and *indx* .

x	`COMPLEX` for `cdotui`
	`DOUBLE COMPLEX` for `zdotui`
	Array, `DIMENSION` at least *nz*.

indx	`INTEGER`. Specifies the indices for the elements of *x*. Array, `DIMENSION` at least *nz*.

y	`COMPLEX` for `cdotui`
	`DOUBLE COMPLEX` for `zdotui`
	Array, `DIMENSION` at least max(*indx(i)*).

Output Parameters

res	`COMPLEX` for `cdotui`
	`DOUBLE COMPLEX` for `zdotui`
	Contains the dot product of *x* and *y*, if *nz* is positive. Otherwise, *res* contains `0`.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `dotui` interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?gthr

Gathers a full-storage sparse vector's elements into compressed form.

Syntax

FORTRAN 77:

```
call sgthr(nz, y, x, indx )
call dgthr(nz, y, x, indx )
call cgthr(nz, y, x, indx )
call zgthr(nz, y, x, indx )
```

Fortran 95:

```
res = gthr(x, indx, y)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?gthr` routines gather the specified elements of a full-storage sparse vector *y* into compressed form(*nz*, *x*, *indx*). The routines reference only the elements of *y* whose indices are listed in the array *indx*:

`x(i) = y(indx(i))`, for *i*=1,2,... +*nz*.

Input Parameters

nz	INTEGER. The number of elements of *y* to be gathered.
indx	INTEGER. Specifies indices of elements to be gathered. Array, DIMENSION at least *nz*.
y	REAL for sgthr DOUBLE PRECISION for dgthr COMPLEX for cgthr DOUBLE COMPLEX for zgthr Array, DIMENSION at least max(*indx(i)*).

Output Parameters

x	REAL for sgthr DOUBLE PRECISION for dgthr COMPLEX for cgthr DOUBLE COMPLEX for zgthr Array, DIMENSION at least *nz*. Contains the vector converted to the compressed form.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gthr` interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?gthrz

Gathers a sparse vector's elements into compressed form, replacing them by zeros.

Syntax

FORTRAN 77:

```
call sgthrz(nz, y, x, indx )
call dgthrz(nz, y, x, indx )
call cgthrz(nz, y, x, indx )
call zgthrz(nz, y, x, indx )
```

Fortran 95:

```
res = gthrz(x, indx, y)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?gthrz` routines gather the elements with indices specified by the array *indx* from a full-storage vector *y* into compressed form (*nz*, *x*, *indx*) and overwrite the gathered elements of *y* by zeros. Other elements of *y* are not referenced or modified (see also `?gthr`).

Input Parameters

nz	`INTEGER`. The number of elements of *y* to be gathered.
indx	`INTEGER`. Specifies indices of elements to be gathered. Array, `DIMENSION` at least *nz*.

y	`REAL` for `sgthrz`
	`DOUBLE PRECISION` for `dgthrz`
	`COMPLEX` for `cgthrz`
	`DOUBLE COMPLEX` for `zgthrz`
	Array, `DIMENSION` at least max(*indx(i)*).

Output Parameters

x	REAL for sgthrz DOUBLE PRECISION for d gthrz COMPLEX for cgthrz DOUBLE COMPLEX for zgthrz Array, DIMENSION at least *nz*. Contains the vector converted to the compressed form.
y	The updated vector *y*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gthrz interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?roti

Applies Givens rotation to sparse vectors one of which is in compressed form.

Syntax

FORTRAN 77:

```
call sroti(nz, x, indx, y, c, s)
call droti(nz, x, indx, y, c, s)
```

Fortran 95:

```
call roti(x, indx, y, c, s)
```

Description

This routine is declared in mkl_blas.fi for FORTRAN 77 interface, in blas.f90 for Fortran 95 interface, and in mkl_blas.h for C interface.

The ?roti routines apply the Givens rotation to elements of two real vectors, *x* (in compressed form *nz*, *x*, *indx*) and *y* (in full storage form):

```
x(i) = c*x(i) + s*y(indx(i))
y(indx(i)) = c*y(indx(i))- s*x(i)
```

The routines reference only the elements of *y* whose indices are listed in the array *indx*. The values in *indx* must be distinct.

Input Parameters

nz	INTEGER. The number of elements in *x* and *indx*.
x	REAL for sroti DOUBLE PRECISION for droti Array, DIMENSION at least *nz*.
indx	INTEGER. Specifies the indices for the elements of *x*. Array, DIMENSION at least *nz*.
y	REAL for sroti DOUBLE PRECISION for droti Array, DIMENSION at least max(*indx(i)*).
c	A scalar: REAL for sroti DOUBLE PRECISION for droti.
s	A scalar: REAL for sroti DOUBLE PRECISION for droti.

Output Parameters

x and *y*	The updated arrays.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine roti interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

?sctr

Converts compressed sparse vectors into full storage form.

Syntax

FORTRAN 77:

```
call ssctr(nz, x, indx, y )
call dsctr(nz, x, indx, y )
call csctr(nz, x, indx, y )
call zsctr(nz, x, indx, y )
```

Fortran 95:

```
call sctr(x, indx, y)
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?sctr` routines scatter the elements of the compressed sparse vector (*nz*, *x*, *indx*) to a full-storage vector *y*. The routines modify only the elements of *y* whose indices are listed in the array *indx*:

y(*indx*(*i*)) = *x*(*i*), for *i*=1,2,... +*nz*.

Input Parameters

nz	INTEGER. The number of elements of *x* to be scattered.
indx	INTEGER. Specifies indices of elements to be scattered. Array, DIMENSION at least *nz*.
x	REAL for ssctr DOUBLE PRECISION for dsctr COMPLEX for csctr DOUBLE COMPLEX for zsctr Array, DIMENSION at least *nz*. Contains the vector to be converted to full-storage form.

Output Parameters

y	REAL for ssctr DOUBLE PRECISION for dsctr COMPLEX for csctr DOUBLE COMPLEX for zsctr Array, DIMENSION at least max(*indx(i)*). Contains the vector *y* with updated elements.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sctr` interface are the following:

x	Holds the vector with the number of elements *nz*.
indx	Holds the vector with the number of elements *nz*.
y	Holds the vector with the number of elements *nz*.

Sparse BLAS Level 2 and Level 3 Routines

This section describes Sparse BLAS Level 2 and Level 3 routines included in the Intel® Math Kernel Library (Intel® MKL) . Sparse BLAS Level 2 is a group of routines and functions that perform operations between a sparse matrix and dense vectors. Sparse BLAS Level 3 is a group of routines and functions that perform operations between a sparse matrix and dense matrices.

The terms and concepts required to understand the use of the Intel MKL Sparse BLAS Level 2 and Level 3 routines are discussed in the Linear Solvers Basics appendix.

This Sparse BLAS routines can be useful to implement iterative methods for solving large sparse systems of equations or eigenvalue problems. For example, these routines can be considered as building blocks for "Iterative Sparse Solvers based on Reverse Communication Interface (RCI ISS)" described in the Chapter 8 of the manual.

Intel MKL provides Sparse BLAS Level 2 and Level 3 routines with typical (or conventional) interface similar to the interface used in the NIST* Sparse BLAS library [Rem05].

Some software packages and libraries (the PARDISO* Solver used in Intel MKL, *Sparskit 2* [Saad94], the Compaq* Extended Math Library (CXML)[CXML01]) use different (early) variation of the compressed sparse row (CSR) format and support only Level 2 operations with simplified interfaces. Intel MKL provides an additional set of Sparse BLAS Level 2 routines with similar simplified interfaces. Each of these routines operates only on a matrix of the fixed type.

The routines described in this section support both one-based indexing and zero-based indexing of the input data (see details in the section One-based and Zero-based Indexing).

Naming Conventions in Sparse BLAS Level 2 and Level 3

Each Sparse BLAS Level 2 and Level 3 routine has a six- or eight-character base name preceded by the prefix `mkl_` or `mkl_cspblas_` .

The routines with typical (conventional) interface have six-character base names in accordance with the template:
`mkl_<character > <data> <operation>( )`

The routines with simplified interfaces have eight-character base names in accordance with the templates:
`mkl_<character > <data> <mtype> <operation>( )`

for routines with one-based indexing; and
`mkl_cspblas_<character> <data> <mtype> <operation>( )`

for routines with zero-based indexing.

The <*character*> field indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

The <*data*> field indicates the sparse matrix storage format (see section Sparse Matrix Storage Formats):

coo	coordinate format
csr	compressed sparse row format and its variations
csc	compressed sparse column format and its variations
dia	diagonal format
sky	skyline storage format
bsr	block sparse row format and its variations

The <*operation*> field indicates the type of operation:

mv	matrix-vector product (Level 2)
mm	matrix-matrix product (Level 3)

`sv`	solving a single triangular system (Level 2)
`sm`	solving triangular systems with multiple right-hand sides (Level 3)

The field <*mtype*> indicates the matrix type:

`ge`	sparse representation of a general matrix
`sy`	sparse representation of the upper or lower triangle of a symmetric matrix
`tr`	sparse representation of a triangular matrix

Sparse Matrix Storage Formats

The current version of Intel MKL Sparse BLAS Level 2 and Level 3 routines support the following point entry [Duff86] storage formats for sparse matrices:

- *compressed sparse row* format (CSR) and its variations;
- *compressed sparse column* format (CSC);
- *coordinate* format;
- *diagonal* format;
- *skyline* storage format;

and one block entry storage format:

- *block sparse row* format (BSR) and its variations.

For more information see "Sparse Matrix Storage Formats" in the Appendix A ".

Intel MKL provides auxiliary routines - matrix converters - that convert sparse matrix from one storage format to another.

Routines and Supported Operations

This section describes operations supported by the Intel Sparse BLAS Level 2 and Level 3 routines. The following notations are used here:

A is a sparse matrix;

B and *C* are dense matrices;

D is a diagonal scaling matrix;

x and *y* are dense vectors;

alpha and *beta* are scalars;

`op(`*A*`)` is one of the possible operations:

`op(`*A*`) = `*A*;

`op(`*A*`) = `*A*`'` - transpose of *A*;

`op(`*A*`) = conj(`*A*`')` - conjugated transpose of *A*.

`inv(op(`*A*`))` denotes the inverse of `op(`*A*`)`.

Intel MKL Sparse BLAS Level 2 and Level 3 routines support the following operations:

- computing the vector product between a sparse matrix and a dense vector:
  `y := alpha*op(A)*x + beta*y`
- solving a single triangular system:
  `y := alpha*inv(op(A))*x`
- computing a product between sparse matrix and dense matrix:
  `C := alpha*op(A)*B + beta*C`
- solving a sparse triangular system with multiple right-hand sides:
  `C := alpha*inv(op(A))*B`

Intel MKL provides an additional set of Sparse BLAS Level 2 routines with *simplified interfaces*. Each of these routines operates on a matrix of the fixed type. The following operations are supported:

- computing the vector product between a sparse matrix and a dense vector (for general and symmetric matrices):
  `y := op(A)*x`
- solving a single triangular system (for triangular matrices):
  `y := inv(op(A))*x`

Matrix type is indicated by the field <*mtype*> in the routine name (see section Naming Conventions in Sparse BLAS Level 2 and Level 3).

NOTE. The routines with simplified interfaces support only four sparse matrix storage formats, specifically:

CSR format in the 3-array variation accepted in the direct sparse solvers and in the CXML;

diagonal format accepted in the CXML;

coordinate format;

BSR format in the 3-array variation.

Note that routines with both typical (conventional) and simplified interfaces use the same computational kernels that work with certain internal data structures.

CAUTION. Intel Sparse BLAS Level 2 and Level 3 routines do not support in-place operations.

Complete list of all routines is given in the Table 2-9 .

Interface Consideration

One-Based and Zero-Based Indexing

The Intel MKL Sparse BLAS Leve2 and Level 3 routines support one-based and zero-based indexing of data arrays.

Routines with typical interfaces support zero-based indexing for the following sparse data storage formats: CSR, CSC, BSR, and COO. Routines with simplified interfaces support zero based indexing for the following sparse data storage formats: CSR, BSR, and COO. See the complete list of Sparse BLAS Level 2 and Level 3 Routines .

The one-based indexing uses the convention of starting array indices at 1. The zero-based indexing uses the convention of starting array indices at 0. For example, indices of the 5-element array *x* can be presented in case of one-based indexing as follows:

```
Element index:    1      2      3       4      5
Element value:    1.0   5.0    7.0     8.0    9.0
```

and in case of zero-based indexing as follows:

```
Element index:    0      1       2      3      4
Element value:    1.0   5.0     7.0    8.0    9.0
```

The detailed descriptions of the one-based and zero-based variants of the sparse data storage formats are given in the "Sparse Matrix Storage Formats" in Appendix A

Most parameters of the routines are identical for both one-based and zero-based indexing, but some of them have certain differences. The following table lists all these differences.

Parameter	One-based Indexing	Zero-based Indexing
val	Array containing non-zero elements of the matrix *A*, its length is *pntre*(m) - *pntrb*(1).	Array containing non-zero elements of the matrix *A*, its length is *pntre*(m–1) - *pntrb*(0).
pntrb	Array of length *m*. This array contains row indices, such that *pntrb*(*I*) - *pntrb*(1)+1 is the first index of row *I* in the arrays *val* and *indx*	Array of length *m*. This array contains row indices, such that *pntrb*(*I*) - *pntrb*(0) is the first index of row *I* in the arrays *val* and *indx*.
pntre	Array of length *m*. This array contains row indices, such that *pntre*(*I*) - *pntrb*(1) is the last index of row *I* in the arrays *val* and *indx*.	Array of length *m*. This array contains row indices, such that *pntre*(*I*) - *pntrb*(0)-1 is the last index of row *I* in the arrays *val* and *indx*.

Parameter	One-based Indexing	Zero-based Indexing
ia	Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one.	Array of length *m*+1, containing indices of elements in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m*) is equal to the number of non-zeros.
ldb	Specifies the first dimension of *b* as declared in the calling (sub)program.	Specifies the second dimension of *b* as declared in the calling (sub)program.
ldc	Specifies the first dimension of *c* as declared in the calling (sub)program.	Specifies the second dimension of *c* as declared in the calling (sub)program.

Difference Between Fortran and C Interfaces

Intel MKL provides both Fortran and C interfaces to all Sparse BLAS Leve2 and Level 3 routines. Parameter descriptions are common for both interfaces with the exception of data types that refer to the FORTRAN 77 standard types. Correspondence between data types specific to the Fortran and C interfaces are given below:

Fortran	C
REAL*4	float
REAL*8	double
INTEGER*4	int
INTEGER*8	long long int
CHARACTER	char

For routines with C interfaces all parameters (including scalars) must be passed by references.

Another difference is how two-dimensional arrays are represented. In Fortran the column-major order is used, and in C - row-major order. This changes the meaning of the parameters *ldb* and *ldc* (see the table above).

Differences Between Intel MKL and NIST* Interfaces

The Intel MKL Sparse BLAS Level 3 routines have the following conventional interfaces:

mkl_xyyymm(*transa*, *m*, *n*, *k*, *alpha*, *matdescra*, arg(*A*), *b*, *ldb*, *beta*, *c*, *ldc*), for matrix-matrix product;

mkl_xyyysm(*transa*, *m*, *n*, *alpha*, *matdescra*, arg(*A*), *b*, *ldb*, *c*, *ldc*), for triangular solvers with multiple right-hand sides.

Here x denotes data type, and *yyy* - sparse matrix data structure (storage format).

The analogous NIST* Sparse BLAS (NSB) library routines have the following interfaces:

xyyymm(*transa*, *m*, *n*, *k*, *alpha*, *descra*, arg(*A*), *b*, *ldb*, *beta*, *c*, *ldc*, *work*, *lwork*), for matrix-matrix product;

xyyysm(*transa*, *m*, *n*, *unitd*, *dv*, *alpha*, *descra*, arg(*A*), *b*, *ldb*, *beta*, *c*, *ldc*, *work*, *lwork*), for triangular solvers with multiple right-hand sides.

Some similar arguments are used in both libraries. The argument *transa* indicates what operation is performed and is slightly different in the NSB library (see Table 2-5). The arguments *m* and *k* are the number of rows and column in the matrix *A*, respectively, *n* is the number of columns in the matrix *C*. The arguments *alpha* and *beta* are scalar *alpha* and *beta* respectively (*beta* is not used in the Intel MKL triangular solvers.) The arguments *b* and *c* are rectangular arrays with the first dimension *ldb* and *ldc*, respectively. arg(*A*) denotes the list of arguments that describe the sparse representation of *A*.

Table 2-5 Parameter *transa*

	MKL interface	NSB interface	Operation
data type	CHARACTER*1	INTEGER	
value	N or n	0	op(*A*) = *A*
	T or t	1	op(*A*) = *A*'
	C or c	2	op(*A*) = *A*'

Parameter matdescra

The parameter *matdescra* describes the relevant characteristic of the matrix *A*. This manual describes *matdescra* as an array of six elements in line with the NIST* implementation. However, only the first four elements of the array are used in the current versions of the Intel MKL Sparse BLAS routines. Elements *matdescra* (5) and *matdescra*(6) are reserved for future use. Note that whether *matdescra* is described in the user's program as an array of length 6 or 4 is of no importance because the array is declared as a pointer in the Intel MKL routines. To learn more about declaration of the *matdescra* array see Sparse BLAS examples located in the following subdirectory of the Intel MKL installation directory: examples/spblas/. The table below list elements of the parameter *matdescra*, their values and meanings. The parameter *matdescra* corresponds to the argument *descra* from NSB library.

Table 2-6 Possible Values of the Parameter *matdescra* (*descra*)

	MKL interface		NSB interface	Matrix characteristics
	one-based indexing	zero-based indexing		
data type	CHARACTER	Char	INTEGER	
1st element	*matdescra*(1)	*matdescra*(0)	*descra*(1)	matrix structure
value	G	G	0	general
	S	S	1	symmetric (*A* = *A*')
	H	H	2	Hermitian (*A*=conjg(*A*'))
	T	T	3	triangular

	MKL interface		NSB interface	Matrix characteristics
	A	A	4	skew(anti)-symmetric (*A*=-*A*')
	D	D	5	diagonal
2nd element	*matdescra*(2)	*matdescra*(1)	*descra*(2)	upper/lower triangular indicator
value	L	L	1	lower
	U	U	2	upper
3rd element	*matdescra*(3)	*matdescra*(2)	*descra*(3)	main diagonal type
value	N	N	0	non-unit
	U	U	1	unit
4th element	*matdescra*(4)	*matdescra*(3)		type of indexing
value	F			one-based indexing
		C		zero-based indexing

In some cases possible element values of the parameter matdescra depend on the values of other elements. The Table 2-7 "Possible Combinations of Element Values of the Parameter *matdescra*" lists all possible combinations of element values for both multiplication routines and triangular solvers.

Table 2-7 Possible Combinations of Element Values of the Parameter *matdescra*

Routines	matdescra(1)	matdescra(2)	matdescra(3)	matdescra(4)
Multiplication Routines	G	ignored	ignored	**F** (default) or C
	S or H	**L** (default)	**N** (default)	**F** (default) or C
	S or H	**L** (default)	U	**F** (default) or C
	S or H	U	**N** (default)	**F** (default) or C
	S or H	U	U	**F** (default) or C
	A	**L** (default)	ignored	**F** (default) or C
	A	U	ignored	**F** (default) or C
Multiplication Routines and Triangular Solvers	T	L	U	**F** (default) or C
	T	L	N	**F** (default) or C
	T	U	U	**F** (default) or C
	T	U	N	**F** (default) or C
	D	ignored	**N** (default)	**F** (default) or C
	D	ignored	U	**F** (default) or C

For a matrix in the skyline format with main diagonal declared to be unit, diagonal elements must be stored in the sparse representation even if they are zero. In all other formats diagonal elements can be stored (if needed) in the sparse representation if they are not zero.

Operations with Partial Matrices

One of the distinctive feature of the Intel MKL Sparse BLAS routines is a possibility to perform operations only on partial matrices composed of certain parts (triangles and main diagonal) of the input sparse matrix. It can be done by setting properly first three elements of the parameter *matdescra*.

An arbitrary sparse matrix *A* can be decomposed as

A = L + D + U

where *L* is the strict lower triangle of *A*, *U* is the strict upper triangle of *A*, *D* is the main diagonal.

Table 2-8 shows correspondence between the output matrices and values of the parameter *matdescra* for the sparse matrix *A* for multiplication routines.

Table 2-8 Output Matrices for Multiplication Routines

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
G	ignored	ignored	*alpha**op(*A*)**x* + *beta***y* *alpha**op(*A*)**B* + *beta***C*
S or H	L	N	*alpha**op(*L+D+L'*)**x* + *beta***y* *alpha**op(*L+D+L'*)**B* + *beta***C*
S or H	L	U	*alpha**op(*L+I+L'*)**x* + *beta***y* *alpha**op(*L+I+L'*)**B* + *beta***C*
S or H	U	N	*alpha**op(*U'+D+U*)**x* + *beta***y* *alpha**op(*U'+D+U*)**B* + *beta***C*
S or H	U	U	*alpha**op(*U'+I+U*)**x* + *beta***y* *alpha**op(*U'+I+U*)**B* + *beta***C*
T	L	U	*alpha**op(*L+I*)**x* + *beta***y* *alpha**op(*L+I*)**B* + *beta***C*
T	L	N	*alpha**op(*L+D*)**x* + *beta***y* *alpha**op(*L+D*)**B* + *beta***C*
T	U	U	*alpha**op(*U+I*)**x* + *beta***y* *alpha**op(*U+I*)**B* + *beta***C*
T	U	N	*alpha**op(*U+D*)**x* + *beta***y* *alpha**op(*U+D*)**B* + *beta***C*
A	L	ignored	*alpha**op(*L-L'*)**x* + *beta***y* *alpha**op(*L-L'*)**B* + *beta***C*
A	U	ignored	*alpha**op(*U-U'*)**x* + *beta***y*

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
			*alpha**op(*U-U'*)**B* + *beta***C*
D	ignored	N	*alpha*D*x + beta*y* *alpha*D*B + beta*C*
D	ignored	U	*alpha*x + beta*y* *alpha*B + beta*C*

Table 2-9 shows correspondence between the output matrices and values of the parameter *matdescra* for the sparse matrix *A* for triangular solvers.

Table 2-9 Output Matrices for Triangular Solvers

matdescra(1)	matdescra(2)	matdescra(3)	Output Matrix
T	L	N	*alpha**inv(op(*L+L*))**x* *alpha**inv(op(*L+L*))**B*
T	L	U	*alpha**inv(op(*L+L*))**x* *alpha**inv(op(*L+L*))**B*
T	U	N	*alpha**inv(op(*U+U*))**x* *alpha**inv(op(*U+U*))**B*
T	U	U	*alpha**inv(op(*U+U*))**x* *alpha**inv(op(*U+U*))**B*
D	ignored	N	*alpha**inv(*D*)**x* *alpha**inv(*D*)**B*
D	ignored	U	*alpha*x* *alpha*B*

Sparse BLAS Level 2 and Level 3 Routines.

Table 2-9 lists the sparse BLAS Level 2 and Level 3 routines described in more detail later in this section.

Table 2-9 Sparse BLAS Level 2 and Level 3 Routines

Routine/Function	Description
Simplified interface, one-based indexing	
mkl_?csrgemv	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation)

Routine/Function	Description
mkl_?bsrgemv	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation).
mkl_?coogemv	Computes matrix - vector product of a sparse general matrix in the coordinate format.
mkl_?diagemv	Computes matrix - vector product of a sparse general matrix in the diagonal format.
mkl_?csrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation)
mkl_?bsrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation).
mkl_?coosymv	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format.
mkl_?diasymv	Computes matrix - vector product of a sparse symmetrical matrix in the diagonal format.
mkl_?csrtrsv	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation).
mkl_?bsrtrsv	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation).
mkl_?cootrsv	Triangular solvers with simplified interface for a sparse matrix in the coordinate format.
mkl_?diatrsv	Triangular solvers with simplified interface for a sparse matrix in the diagonal format.
Simplified interface, zero-based indexing	
mkl_cspblas_?csrgemv	Computes matrix - vector product of a sparse general matrix in the CSR format (3-array variation) with zero-based indexing.
mkl_cspblas_?bsrgemv	Computes matrix - vector product of a sparse general matrix in the BSR format (3-array variation)with zero-based indexing.
mkl_cspblas_?coogemv	Computes matrix - vector product of a sparse general matrix in the coordinate format with zero-based indexing.
mkl_cspblas_?csrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the CSR format (3-array variation) with zero-based indexing
mkl_cspblas_?bsrsymv	Computes matrix - vector product of a sparse symmetrical matrix in the BSR format (3-array variation) with zero-based indexing.

Routine/Function	Description
mkl_cspblas_?coosymv	Computes matrix - vector product of a sparse symmetrical matrix in the coordinate format with zero-based indexing.
mkl_cspblas_?csrtrsv	Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with zero-based indexing.
mkl_cspblas_?bsrtrsv	Triangular solver with simplified interface for a sparse matrix in the BSR format (3-array variation) with zero-based indexing.
mkl_cspblas_?cootrsv	Triangular solver with simplified interface for a sparse matrix in the coordinate format with zero-based indexing.
Typical (conventional) interface, one-based and zero-based indexing	
mkl_?csrmv	Computes matrix - vector product of a sparse matrix in the CSR format.
mkl_?bsrmv	Computes matrix - vector product of a sparse matrix in the BSR format.
mkl_?cscmv	Computes matrix - vector product for a sparse matrix in the CSC format.
mkl_?coomv	Computes matrix - vector product for a sparse matrix in the coordinate format.
mkl_?csrsv	Solves a system of linear equations for a sparse matrix in the CSR format.
mkl_?bsrsv	Solves a system of linear equations for a sparse matrix in the BSR format.
mkl_?cscsv	Solves a system of linear equations for a sparse matrix in the CSC format.
mkl_?coosv	Solves a system of linear equations for a sparse matrix in the coordinate format.
mkl_?csrmm	Computes matrix - matrix product of a sparse matrix in the CSR format
mkl_?bsrmm	Computes matrix - matrix product of a sparse matrix in the BSR format.
mkl_?cscmm	Computes matrix - matrix product of a sparse matrix in the CSC format
mkl_?coomm	Computes matrix - matrix product of a sparse matrix in the coordinate format.

Routine/Function	Description
mkl_?csrsm	Solves a system of linear matrix equations for a sparse matrix in the CSR format.
mkl_?bsrsm	Solves a system of linear matrix equations for a sparse matrix in the BSR format.
mkl_?cscsm	Solves a system of linear matrix equations for a sparse matrix in the CSC format.
mkl_?coosm	Solves a system of linear matrix equations for a sparse matrix in the coordinate format.
Typical (conventional) interface, one-based indexing	
mkl_?diamv	Computes matrix - vector product of a sparse matrix in the diagonal format.
mkl_?skymv	Computes matrix - vector product for a sparse matrix in the skyline storage format.
mkl_?diasv	Solves a system of linear equations for a sparse matrix in the diagonal format.
mkl_?skysv	Solves a system of linear equations for a sparse matrix in the skyline format.
mkl_?diamm	Computes matrix - matrix product of a sparse matrix in the diagonal format.
mkl_?skymm	Computes matrix - matrix product of a sparse matrix in the skyline storage format.
mkl_?diasm	Solves a system of linear matrix equations for a sparse matrix in the diagonal format.
mkl_?skysm	Solves a system of linear matrix equations for a sparse matrix in the skyline storage format.
Auxiliary routines	
Matrix converters	
mkl_ddnscsr	Converts a sparse matrix in the dense representation to the CSR format (3-array variation).
mkl_dcsrcoo	Converts a sparse matrix in the CSR format (3-array variation) to the coordinate format and vice versa.
mkl_dcsrbsr	Converts a sparse matrix in the CSR format to the BSR format (3-array variations) and vice versa.

Routine/Function	Description
mkl_dcsrcsc	Converts a sparse matrix in the CSR format to the CSC and vice versa (3-array variations).
mkl_dcsrdia	Converts a sparse matrix in the CSR format (3-array variation) to the diagonal format and vice versa.
mkl_dcsrsky	Converts a sparse matrix in the CSR format (3-array variation) to the sky line format and vice versa.
Operations on sparse matrices	
mkl_?csradd	Computes the sum of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.
mkl_?csrmultcsr	Computes the product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing.
mkl_?csrmultd	Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix.

mkl_?csrgemv

Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with one-based indexing.

Syntax

Fortran:

```
call mkl_scsrgemv(transa, m, a, ia, ja, x, y)
call mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
call mkl_ccsrgemv(transa, m, a, ia, ja, x, y)
call mkl_zcsrgemv(transa, m, a, ia, ja, x, y)
```

C:

```
mkl_scsrgemv(&transa, &m, a, ia, ja, x, y);
mkl_dcsrgemv(&transa, &m, a, ia, ja, x, y);
mkl_ccsrgemv(&transa, &m, a, ia, ja, x, y);
mkl_zcsrgemv(&transa, &m, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The mkl_?csrgemv routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the CSR format (3-array variation), *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then as *y* := *A***x* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *A*'**x*,
m	INTEGER. Number of rows of the matrix *A*.
a	REAL for mkl_scsrgemv. DOUBLE PRECISION for mkl_dcsrgemv. COMPLEX for mkl_ccsrgemv. DOUBLE COMPLEX for mkl_zcsrgemv. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
ja	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
x	REAL for mkl_scsrgemv. DOUBLE PRECISION for mkl_dcsrgemv. COMPLEX for mkl_ccsrgemv. DOUBLE COMPLEX for mkl_zcsrgemv. Array, DIMENSION is *m*. On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_scsrgemv. DOUBLE PRECISION for mkl_dcsrgemv. COMPLEX for mkl_ccsrgemv. DOUBLE COMPLEX for mkl_zcsrgemv. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL       a(*), x(*), y(*)
SUBROUTINE mkl_dcsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)
SUBROUTINE mkl_ccsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)
SUBROUTINE mkl_zcsrgemv(transa, m, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER           m
   INTEGER           ia(*), ja(*)
   DOUBLE COMPLEX    a(*), x(*), y(*)
```

C:

```
void mkl_scsrgemv(char *transa, int *m, float *a,
int *ia, int *ja, float *x, float *y);
void mkl_dcsrgemv(char *transa, int *m, double *a,
int *ia, int *ja, double *x, double *y);
void mkl_ccsrgemv(char *transa, int *m, MKL_Complex8 *a,
int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zcsrgemv(char *transa, int *m, MKL_Complex16 *a,
int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?bsrgemv

Computes matrix - vector product of a sparse general matrix stored in the BSR format (3-array variation) with one-based indexing.

Syntax

Fortran:

```
call mkl_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_zbsrgemv(transa, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_sbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
mkl_dbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
mkl_cbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
mkl_zbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?bsrgemv` routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* block sparse square matrix in the BSR format (3-array variation), *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A*x* If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *A'*x*,
m	INTEGER. Number of block rows of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
a	REAL for mkl_sbsrgemv. DOUBLE PRECISION for mkl_dbsrgemv. COMPLEX for mkl_cbsrgemv. DOUBLE COMPLEX for mkl_zbsrgemv. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to *values* array description in BSR Format for more details.
ia	INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.
ja	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.
x	REAL for mkl_sbsrgemv. DOUBLE PRECISION for mkl_dbsrgemv. COMPLEX for mkl_cbsrgemv. DOUBLE COMPLEX for mkl_zbsrgemv. Array, DIMENSION (*m*lb*). On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_sbsrgemv. DOUBLE PRECISION for mkl_dbsrgemv. COMPLEX for mkl_cbsrgemv. DOUBLE COMPLEX for mkl_zbsrgemv. Array, DIMENSION at least (*m*lb*). On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
   CHARACTER*1  transa
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)

int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?coogemv

Computes matrix-vector product of a sparse general matrix stored in the coordinate format with one-based indexing.

Syntax

Fortran:

```
call mkl_scoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_ccoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_zcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_scoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
mkl_dcoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
mkl_ccoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
mkl_zcoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?coogemv` routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the coordinate format, *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x*

	If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *A*'**x*,
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for mkl_scoogemv. DOUBLE PRECISION for mkl_dcoogemv. COMPLEX for mkl_ccoogemv. DOUBLE COMPLEX for mkl_zcoogemv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL for mkl_scoogemv. DOUBLE PRECISION for mkl_dcoogemv. COMPLEX for mkl_ccoogemv. DOUBLE COMPLEX for mkl_zcoogemv. Array, DIMENSION is *m*. One entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_scoogemv. DOUBLE PRECISION for mkl_dcoogemv. COMPLEX for mkl_ccoogemv. DOUBLE COMPLEX for mkl_zcoogemv. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scoogemv(transa, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   transa
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  REAL            val(*), x(*), y(*)
SUBROUTINE mkl_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   transa
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE PRECISION      val(*), x(*), y(*)
SUBROUTINE mkl_ccoogemv(transa, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   transa
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  COMPLEX     val(*), x(*), y(*)
SUBROUTINE mkl_zcoogemv(transa, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   transa
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE COMPLEX        val(*), x(*), y(*)
```

C:

```
void mkl_scoogemv(char *transa, int *m, float  *val, int *rowind,
int *colind, int *nnz, float *x, float *y);
void mkl_dcoogemv(char *transa, int *m, double  *val, int *rowind,
int *colind, int *nnz, double *x, double *y);
void mkl_ccoogemv(char *transa, int *m, MKL_Complex8  *val, int *rowind,
int *colind, int *nnz, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zcoogemv(char *transa, int *m, MKL_Complex16  *val, int *rowind,
int *colind, int *nnz, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?diagemv

Computes matrix - vector product of a sparse general matrix stored in the diagonal format with one-based indexing.

Syntax

Fortran:

```
call mkl_sdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
call mkl_ddiagemv(transa, m, val, lval, idiag, ndiag, x, y)
call mkl_cdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
call mkl_zdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_sdiagemv(&transa, &m, val, &lval, idiag, &ndiag, x, y);
mkl_ddiagemv(&transa, &m, val, &lval, idiag, &ndiag, x, y);
mkl_cdiagemv(&transa, &m, val, &lval, idiag, &ndiag, x, y);
mkl_zdiagemv(&transa, &m, val, &lval, idiag, &ndiag, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?diagemv` routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the diagonal storage format, *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *y* := *A***x* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *A*'**x*,

m	INTEGER. Number of rows of the matrix *A*.
val	REAL for mkl_sdiagemv. DOUBLE PRECISION for mkl_ddiagemv. COMPLEX for mkl_ccsrgemv. DOUBLE COMPLEX for mkl_zdiagemv. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL for mkl_sdiagemv. DOUBLE PRECISION for mkl_ddiagemv. COMPLEX for mkl_ccsrgemv. DOUBLE COMPLEX for mkl_zdiagemv. Array, DIMENSION is *m*. On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_sdiagemv. DOUBLE PRECISION for mkl_ddiagemv. COMPLEX for mkl_ccsrgemv. DOUBLE COMPLEX for mkl_zdiagemv. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   transa
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  REAL           val(lval,*), x(*), y(*)
SUBROUTINE mkl_ddiagemv(transa, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   transa
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  DOUBLE PRECISION       val(lval,*), x(*), y(*)
SUBROUTINE mkl_cdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   transa
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  COMPLEX    val(lval,*), x(*), y(*)
SUBROUTINE mkl_zdiagemv(transa, m, val, lval, idiag, ndiag, x, y)
  CHARACTER*1   transa
  INTEGER       m, lval, ndiag
  INTEGER      idiag(*)
  DOUBLE COMPLEX        val(lval,*), x(*), y(*)
```

C:

```
void mkl_sdiagemv(char *transa, int *m, float  *val, int *lval,
int *idiag, int *ndiag, float *x, float *y);
void mkl_ddiagemv(char *transa, int *m, double  *val, int *lval,
int *idiag, int *ndiag, double *x, double *y);
void mkl_cdiagemv(char *transa, int *m, MKL_Complex8  *val, int *lval,
int *idiag, int *ndiag, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zdiagemv(char *transa, int *m, MKL_Complex16  *val, int *lval,
int *idiag, int *ndiag, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?csrsymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the CSR format (3-array variation) with one-based indexing.

Syntax

Fortran:

```
call mkl_scsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_dcsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_ccsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_zcsrsymv(uplo, m, a, ia, ja, x, y)
```

C:

```
mkl_scsrsymv(&uplo, &m, a, ia, ja, x, y);
mkl_dcsrsymv(&uplo, &m, a, ia, ja, x, y);
mkl_ccsrsymv(&uplo, &m, a, ia, ja, x, y);
mkl_zcsrsymv(&uplo, &m, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csrsymv` routine performs a matrix-vector operation defined as

y := *A***x*

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (3-array variation).

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.

a REAL for mkl_scsrsymv.
DOUBLE PRECISION for mkl_dcsrsymv.
COMPLEX for mkl_ccsrsymv.
DOUBLE COMPLEX for mkl_zcsrsymv.
Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ia INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.
Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

x REAL for mkl_scsrsymv.
DOUBLE PRECISION for mkl_dcsrsymv.
COMPLEX for mkl_ccsrsymv.
DOUBLE COMPLEX for mkl_zcsrsymv.
Array, DIMENSION is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_scsrsymv.
DOUBLE PRECISION for mkl_dcsrsymv.
COMPLEX for mkl_ccsrsymv.
DOUBLE COMPLEX for mkl_zcsrsymv.
Array, DIMENSION at least *m*.
On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL           a(*), x(*), y(*)
SUBROUTINE mkl_dcsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)
SUBROUTINE mkl_ccsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)
SUBROUTINE mkl_zcsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

C:

```
void mkl_scsrsymv(char *uplo, int *m, float *a,
 int *ia, int *ja, float *x, float *y);
void mkl_dcsrsymv(char *uplo, int *m, double *a,
 int *ia, int *ja, double *x, double *y);
void mkl_ccsrsymv(char *uplo, int *m, MKL_Complex8 *a,
 int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zcsrsymv(char *uplo, int *m, MKL_Complex16 *a,
 int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?bsrsymv

Computes matrix-vector product of a sparse symmetrical matrix stored in the BSR format (3-array variation) with one-based indexing.

Syntax

Fortran:

```
call mkl_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_cbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_sbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
mkl_dbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
mkl_cbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
mkl_zbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?bsrsymv` routine performs a matrix-vector operation defined as

y := *A***x*

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the BSR format (3-array variation).

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.
m	INTEGER. Number of block rows of the matrix *A*.

lb	INTEGER. Size of the block in the matrix *A*.
a	REAL for mkl_sbsrsymv. DOUBLE PRECISION for mkl_dbsrsymv. COMPLEX for mkl_cbsrsymv. DOUBLE COMPLEX for mkl_zcsrgemv. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to *values* array description in BSR Format for more details.
ia	INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.
ja	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.
x	REAL for mkl_sbsrsymv. DOUBLE PRECISION for mkl_dbsrsymv. COMPLEX for mkl_cbsrsymv. DOUBLE COMPLEX for mkl_zcsrgemv. Array, DIMENSION (*m*lb*). On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_sbsrsymv. DOUBLE PRECISION for mkl_dbsrsymv. COMPLEX for mkl_cbsrsymv. DOUBLE COMPLEX for mkl_zcsrgemv. Array, DIMENSION at least (*m*lb*). On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)
SUBROUTINE mkl_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)
SUBROUTINE mkl_cbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   COMPLEX    a(*), x(*), y(*)
SUBROUTINE mkl_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

C:

```
void mkl_sbsrsymv(char *uplo, int *m, int *lb,
float *a, int *ia, int *ja, float *x, float *y);
void mkl_dbsrsymv(char *uplo, int *m, int *lb,
double *a, int *ia, int *ja, double *x, double *y);
void mkl_cbsrsymv(char *uplo, int *m, int *lb,
MKL_Complex8 *a, int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zbsrsymv(char *uplo, int *m, int *lb,
MKL_Complex16 *a, int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?coosymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the coordinate format with one-based indexing.

Syntax

Fortran:

```
call mkl_scoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_ccoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_zcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_scoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
mkl_dcoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
mkl_ccoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
mkl_zcoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?coosymv` routine performs a matrix-vector operation defined as

y := *A***x*

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the coordinate format.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for `mkl_scoosymv`.

	DOUBLE PRECISION for mkl_dcoosymv. COMPLEX for mkl_ccoosymv. DOUBLE COMPLEX for mkl_zcoosymv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL for mkl_scoosymv. DOUBLE PRECISION for mkl_dcoosymv. COMPLEX for mkl_ccoosymv. DOUBLE COMPLEX for mkl_zcoosymv. Array, DIMENSION is *m*. On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_scoosymv. DOUBLE PRECISION for mkl_dcoosymv. COMPLEX for mkl_ccoosymv. DOUBLE COMPLEX for mkl_zcoosymv. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```

  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE COMPLEX        val(*), x(*), y(*)
```

C:

```
void mkl_scoosymv(char *uplo, int *m, float  *val, int *rowind,
int *colind, int *nnz, float *x, float *y);
void mkl_dcoosymv(char *uplo, int *m, double  *val, int *rowind,
int *colind, int *nnz, double *x, double *y);
void mkl_ccoosymv(char *uplo, int *m, MKL_Complex8  *val, int *rowind,
int *colind, int *nnz, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zcoosymv(char *uplo, int *m, MKL_Complex16  *val, int *rowind,
int *colind, int *nnz, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?diasymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the diagonal format with one-based indexing.

Syntax

Fortran:

```
call mkl_sdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
call mkl_ddiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
call mkl_cdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
call mkl_zdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_sdiasymv(&uplo, &m, val, &lval, idiag, &ndiag, x, y);
mkl_ddiasymv(&uplo, &m, val, &lval, idiag, &ndiag, x, y);
mkl_cdiasymv(&uplo, &m, val, &lval, idiag, &ndiag, x, y);
mkl_zdiasymv(&uplo, &m, val, &lval, idiag, &ndiag, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?diasymv` routine performs a matrix-vector operation defined as

y := *A***x*

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for `mkl_sdiasymv`.

	DOUBLE PRECISION for mkl_ddiasymv. COMPLEX for mkl_cdiasymv. DOUBLE COMPLEX for mkl_zdiasymv. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval* ≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL for mkl_sdiasymv. DOUBLE PRECISION for mkl_ddiasymv. COMPLEX for mkl_cdiasymv. DOUBLE COMPLEX for mkl_zdiasymv. Array, DIMENSION is *m*. On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_sdiasymv. DOUBLE PRECISION for mkl_ddiasymv. COMPLEX for mkl_cdiasymv. DOUBLE COMPLEX for mkl_zdiasymv. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdiasymv(uplo, m, val, lval, idiag, ndiag, x, y)

void mkl_ddiasymv(char *uplo, int *m, double  *val, int *lval,
int *idiag, int *ndiag, double *x, double *y);
void mkl_cdiasymv(char *uplo, int *m, MKL_Complex8  *val, int *lval,
int *idiag, int *ndiag, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zdiasymv(char *uplo, int *m, MKL_Complex16  *val, int *lval,
int *idiag, int *ndiag, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?csrtrsv

Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with one-based indexing.

Syntax

Fortran:

```
call mkl_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

C:

```
mkl_scsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
mkl_dcsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
mkl_ccsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
mkl_zcsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3 array variation):

*A*y = x*

or

*A'*y = x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *A***y* = *x*
If *transa* = 'T' or 't' or 'C' or 'c', then *A*'**y* = *x*,

diag CHARACTER*1. Specifies whether *A* is unit triangular.
If *diag* = 'U' or 'u', then *A* is a unit triangular.
If *diag* = 'N' or 'n', then *A* is not unit triangular.

m INTEGER. Number of rows of the matrix *A*.

a REAL for mkl_scsrtrmv.
DOUBLE PRECISION for mkl_dcsrtrmv.
COMPLEX for mkl_ccsrtrmv.
DOUBLE COMPLEX for mkl_zcsrtrmv.
Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.
Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

NOTE. Column indices must be sorted in increasing order for each row.

x REAL for mkl_scsrtrmv.
DOUBLE PRECISION for mkl_dcsrtrmv.
COMPLEX for mkl_ccsrtrmv.
DOUBLE COMPLEX for mkl_zcsrtrmv.
Array, DIMENSION is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_scsrtrmv. DOUBLE PRECISION for mkl_dcsrtrmv. COMPLEX for mkl_ccsrtrmv. DOUBLE COMPLEX for mkl_zcsrtrmv. Array, DIMENSION at least *m*. Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)
SUBROUTINE mkl_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION     a(*), x(*), y(*)
SUBROUTINE mkl_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX     a(*), x(*), y(*)
SUBROUTINE mkl_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX      a(*), x(*), y(*)
```

C:

```
void mkl_scsrtrsv(char *uplo, char *transa, char *diag, int *m,
float *a, int *ia, int *ja, float *x, float *y);
void mkl_dcsrtrsv(char *uplo, char *transa, char *diag, int *m,
double *a, int *ia, int *ja, double *x, double *y);
void mkl_ccsrtrsv(char *uplo, char *transa, char *diag, int *m,
MKL_Complex8 *a, int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zcsrtrsv(char *uplo, char *transa, char *diag, int *m,
MKL_Complex16 *a, int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?bsrtrsv

Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with one-based indexing.

Syntax

Fortran:

```
call mkl_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_sbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
mkl_dbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
mkl_cbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
mkl_zbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?bsrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the BSR format (3-array variation) :

$y := A*x$

or

$y := A'*x$,

where:

x and y are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo
CHARACTER*1. Specifies the upper or low triangle of the matrix *A* is used.
If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.
If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa
CHARACTER*1. Specifies the operation.
If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x*
If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *A'***x*.

diag
CHARACTER*1. Specifies whether *A* is a unit triangular matrix.
If *diag* = 'U' or 'u', then *A* is a unit triangular.
If *diag* = 'N' or 'n', then *A* is not a unit triangular.

m
INTEGER. Number of block rows of the matrix *A*.

lb
INTEGER. Size of the block in the matrix *A*.

a
REAL for mkl_sbsrtrsv.
DOUBLE PRECISION for mkl_dbsrtrsv.
COMPLEX for mkl_cbsrtrsv.
DOUBLE COMPLEX for mkl_zbsrtrsv.
Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia
INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.

ja INTEGER.
Array containing the column indices for each non-zero block in the matrix *A*.
Its length is equal to the number of non-zero blocks of the matrix *A*.
Refer to *columns* array description in BSR Format for more details.

x REAL for mkl_sbsrtrsv.
DOUBLE PRECISION for mkl_dbsrtrsv.
COMPLEX for mkl_cbsrtrsv.
DOUBLE COMPLEX for mkl_zbsrtrsv.
Array, DIMENSION (*m***lb*).
On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_sbsrtrsv.
DOUBLE PRECISION for mkl_dbsrtrsv.
COMPLEX for mkl_cbsrtrsv.
DOUBLE COMPLEX for mkl_zbsrtrsv.
Array, DIMENSION at least (*m***lb*).
On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)
SUBROUTINE mkl_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)
SUBROUTINE mkl_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)
SUBROUTINE mkl_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

C:

```
void mkl_sbsrtrsv(char *uplo, char *transa, char *diag, int *m,
 int *lb, float *a, int *ia, int *ja, float *x, float *y);
void mkl_dbsrtrsv(char *uplo, char *transa, char *diag, int *m,
 int *lb, double *a, int *ia, int *ja, double *x, double *y);
void mkl_cbsrtrsv(char *uplo, char *transa, char *diag, int *m,
 int *lb, MKL_Complex8 *a, int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zbsrtrsv(char *uplo, char *transa, char *diag, int *m,
 int *lb, MKL_Complex16 *a, int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?cootrsv

Triangular solvers with simplified interface for a sparse matrix in the coordinate format with one-based indexing.

Syntax

Fortran:

```
call mkl_scootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_dcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_ccootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_zcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_scootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
mkl_dcootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
mkl_ccootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
mkl_zcootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?cootrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format:

*A*y = x*

or

*A'*y = x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo — CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered.
If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.
If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa	CHARACTER*1. Specifies the system of linear equations. If *transa* = 'N' or 'n', then *A*y = x* If *transa* = 'T' or 't' or 'C' or 'c', then *A'*y = x*,
diag	CHARACTER*1. Specifies whether *A* is unit triangular. If *diag* = 'U' or 'u', then *A* is unit triangular. If *diag* = 'N' or 'n', then *A* is not unit triangular.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for mkl_scootrsv. DOUBLE PRECISION for mkl_dcootrsv. COMPLEX for mkl_ccootrsv. DOUBLE COMPLEX for mkl_zcootrsv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL for mkl_scootrsv. DOUBLE PRECISION for mkl_dcootrsv. COMPLEX for mkl_ccootrsv. DOUBLE COMPLEX for mkl_zcootrsv. Array, DIMENSION is *m*. On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_scootrsv. DOUBLE PRECISION for mkl_dcootrsv. COMPLEX for mkl_ccootrsv. DOUBLE COMPLEX for mkl_zcootrsv. Array, DIMENSION at least *m*. Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo, transa, diag
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)

double  *val, int *rowind,   int *colind, int *nnz, double *x, double *y);
void mkl_ccootrsv(char *uplo, char *transa, char *diag, int *m,
MKL_Complex8  *val, int *rowind,  int *colind, int *nnz, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zcootrsv(char *uplo, char *transa, char *diag, int *m,
MKL_Complex16  *val, int *rowind,  int *colind, int *nnz, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?diatrsv

Triangular solvers with simplified interface for a sparse matrix in the diagonal format with one-based indexing.

Syntax

Fortran:

```
call mkl_sdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_ddiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_cdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
call mkl_zdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_sdiatrsv(&uplo, &transa, &diag, &m, val, &lval, idiag, &ndiag, x, y);
mkl_ddiatrsv(&uplo, &transa, &diag, &m, val, &lval, idiag, &ndiag, x, y);
mkl_cdiatrsv(&uplo, &transa, &diag, &m, val, &lval, idiag, &ndiag, x, y);
mkl_zdiatrsv(&uplo, &transa, &diag, &m, val, &lval, idiag, &ndiag, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?diatrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

*A*y = x*

or

*A'*y = x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo — CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used.
If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.
If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *A*y* = *x*
If *transa* = 'T' or 't' or 'C' or 'c', then *A'*y* = *x*,

diag CHARACTER*1. Specifies whether *A* is unit triangular.
If *diag* = 'U' or 'u', then *A* is unit triangular.
If *diag* = 'N' or 'n', then *A* is not unit triangular.

m INTEGER. Number of rows of the matrix *A*.

val REAL for mkl_sdiatrsv.
DOUBLE PRECISION for mkl_ddiatrsv.
COMPLEX for mkl_cdiatrsv.
DOUBLE COMPLEX for mkl_zdiatrsv.
Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

NOTE. All elements of this array must be sorted in increasing order.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

x REAL for mkl_sdiatrsv.
DOUBLE PRECISION for mkl_ddiatrsv.
COMPLEX for mkl_cdiatrsv.
DOUBLE COMPLEX for mkl_zdiatrsv.
Array, DIMENSION is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_sdiatrsv.
DOUBLE PRECISION for mkl_ddiatrsv.
COMPLEX for mkl_cdiatrsv.
DOUBLE COMPLEX for mkl_zdiatrsv.
Array, DIMENSION at least *m*.
Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sdiatrsv(uplo, transa, diag, m, val, lval, idiag, ndiag, x, y)

  INTEGER       indiag(*)
  DOUBLE COMPLEX        val(lval,*), x(*), y(*)
```

C:

```
void mkl_sdiatrsv(char *uplo, char *transa, char *diag, int *m, float
  *val, int *lval, int *idiag, int *ndiag, float *x, float *y);
void mkl_ddiatrsv(char *uplo, char *transa, char *diag, int *m, double

  *val, int *lval, int *idiag, int *ndiag, double *x, double *y);
void mkl_cdiatrsv(char *uplo, char *transa, char *diag, int *m, MKL_Complex8

  *val, int *lval, int *idiag, int *ndiag, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_zdiatrsv(char *uplo, char *transa, char *diag, int *m, MKL_Complex16

  *val, int *lval, int *idiag, int *ndiag, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?csrgemv

Computes matrix - vector product of a sparse general matrix stored in the CSR format (3-array variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_scsrgemv(transa, m, a, ia, ja, x, y)
call mkl_cspblas_dcsrgemv(transa, m, a, ia, ja, x, y)
call mkl_cspblas_ccsrgemv(transa, m, a, ia, ja, x, y)
call mkl_cspblas_zcsrgemv(transa, m, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_scsrgemv(&transa, &m, a, ia, ja, x, y);
mkl_cspblas_dcsrgemv(&transa, &m, a, ia, ja, x, y);
mkl_cspblas_ccsrgemv(&transa, &m, a, ia, ja, x, y);
mkl_cspblas_zcsrgemv(&transa, &m, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?csrgemv` routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* sparse square matrix in the CSR format (3-array variation) with zero-based indexing, *A*' is the transpose of *A*.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x*

	If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *A*'**x*,
m	INTEGER. Number of rows of the matrix *A*.
a	REAL for mkl_cspblas_scsrgemv. DOUBLE PRECISION for mkl_cspblas_dcsrgemv. COMPLEX for mkl_cspblas_ccsrgemv. DOUBLE COMPLEX for mkl_cspblas_zcsrgemv. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m*) is equal to the number of non-zeros. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
ja	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
x	REAL for mkl_cspblas_scsrgemv. DOUBLE PRECISION for mkl_cspblas_dcsrgemv. COMPLEX for mkl_cspblas_ccsrgemv. DOUBLE COMPLEX for mkl_cspblas_zcsrgemv. Array, DIMENSION is *m*. One entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_scsrgemv. DOUBLE PRECISION for mkl_cspblas_dcsrgemv. COMPLEX for mkl_cspblas_ccsrgemv. DOUBLE COMPLEX for mkl_cspblas_zcsrgemv. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scsrgemv(transa, m, a, ia, ja, x, y)

int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?bsrgemv

Computes matrix - vector product of a sparse general matrix stored in the BSR format (3-array variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_sbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_dbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_cbsrgemv(transa, m, lb, a, ia, ja, x, y)
call mkl_cspblas_zbsrgemv(transa, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_sbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_dbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_cbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_zbsrgemv(&transa, &m, &lb, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?bsrgemv` routine performs a matrix-vector operation defined as

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is an *m*-by-*m* block sparse square matrix in the BSR format (3-array variation) with zero-based indexing, *A*' is the transpose of *A*.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x*

	If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *A*'**x*,
m	INTEGER. Number of block rows of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
a	REAL for mkl_cspblas_sbsrgemv. DOUBLE PRECISION for mkl_cspblas_dbsrgemv. COMPLEX for mkl_cspblas_cbsrgemv. DOUBLE COMPLEX for mkl_cspblas_zbsrgemv. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.
ia	INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks. Refer to *rowIndex* array description in BSR Format for more details.
ja	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.
x	REAL for mkl_cspblas_sbsrgemv. DOUBLE PRECISION for mkl_cspblas_dbsrgemv. COMPLEX for mkl_cspblas_cbsrgemv. DOUBLE COMPLEX for mkl_cspblas_zbsrgemv. Array, DIMENSION (*m***lb*). On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_sbsrgemv. DOUBLE PRECISION for mkl_cspblas_dbsrgemv. COMPLEX for mkl_cspblas_cbsrgemv. DOUBLE COMPLEX for mkl_cspblas_zbsrgemv. Array, DIMENSION at least (*m***lb*). On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```

float *a, int *ia, int *ja, float *x, float *y);
void mkl_cspblas_dbsrgemv(char *transa, int *m, int *lb,
double *a, int *ia, int *ja, double *x, double *y);
void mkl_cspblas_cbsrgemv(char *transa, int *m, int *lb,
MKL_Complex8 *a, int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_cspblas_zbsrgemv(char *transa, int *m, int *lb,
MKL_Complex16 *a, int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?coogemv

Computes matrix - vector product of a sparse general matrix stored in the coordinate format with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_scoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_dcoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_ccoogemv(transa, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_zcoogemv(transa, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_cspblas_scoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_dcoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_ccoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_zcoogemv(&transa, &m, val, rowind, colind, &nnz, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_dcoogemv` routine performs a matrix-vector operation defined as

$y := A*x$

or

$y := A'*x$,

where:

x and y are vectors,

A is an m-by-m sparse square matrix in the coordinate format with zero-based indexing, A' is the transpose of A.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as $y := A*x$

	If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *A*'**x*,
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for mkl_cspblas_scoogemv. DOUBLE PRECISION for mkl_cspblas_dcoogemv. COMPLEX for mkl_cspblas_ccoogemv. DOUBLE COMPLEX for mkl_cspblas_zcoogemv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL for mkl_cspblas_scoogemv. DOUBLE PRECISION for mkl_cspblas_dcoogemv. COMPLEX for mkl_cspblas_ccoogemv. DOUBLE COMPLEX for mkl_cspblas_zcoogemv. Array, DIMENSION is *m*. On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_scoogemv. DOUBLE PRECISION for mkl_cspblas_dcoogemv. COMPLEX for mkl_cspblas_ccoogemv. DOUBLE COMPLEX for mkl_cspblas_zcoogemv. Array, DIMENSION at least *m*. On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scoogemv(transa, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   transa
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)

void mkl_cspblas_ccoogemv(char *transa, int *m, MKL_Complex8  *val, int *rowind,
int *colind, int *nnz, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_cspblas_zcoogemv(char *transa, int *m, MKL_Complex16  *val, int *rowind,
int *colind, int *nnz, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?csrsymv

Computes matrix-vector product of a sparse symmetrical matrix stored in the CSR format (3-array variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_scsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_cspblas_dcsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_cspblas_ccsrsymv(uplo, m, a, ia, ja, x, y)
call mkl_cspblas_zcsrsymv(uplo, m, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_scsrsymv(&uplo, &m, a, ia, ja, x, y);
mkl_cspblas_dcsrsymv(&uplo, &m, a, ia, ja, x, y);
mkl_cspblas_ccsrsymv(&uplo, &m, a, ia, ja, x, y);
mkl_cspblas_zcsrsymv(&uplo, &m, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?csrsymv` routine performs a matrix-vector operation defined as

y := *A***x*

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the CSR format (3-array variation) with zero-based indexing.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

m INTEGER. Number of rows of the matrix *A*.

a REAL for mkl_cspblas_scsrsymv.
DOUBLE PRECISION for mkl_cspblas_dcsrsymv.
COMPLEX for mkl_cspblas_ccsrsymv.
DOUBLE COMPLEX for mkl_cspblas_zcsrsymv.
Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ia INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.
Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

x REAL for mkl_cspblas_scsrsymv.
DOUBLE PRECISION for mkl_cspblas_dcsrsymv.
COMPLEX for mkl_cspblas_ccsrsymv.
DOUBLE COMPLEX for mkl_cspblas_zcsrsymv.
Array, DIMENSION is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y REAL for mkl_cspblas_scsrsymv.
DOUBLE PRECISION for mkl_cspblas_dcsrsymv.
COMPLEX for mkl_cspblas_ccsrsymv.
DOUBLE COMPLEX for mkl_cspblas_zcsrsymv.
Array, DIMENSION at least *m*.
On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scsrsymv(uplo, m, a, ia, ja, x, y)
   CHARACTER*1  uplo

int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_cspblas_zcsrsymv(char *uplo, int *m, MKL_Complex16 *a,
int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?bsrsymv

Computes matrix-vector product of a sparse symmetrical matrix stored in the BSR format (3-arrays variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_cspblas_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_cspblas_cbsrsymv(uplo, m, lb, a, ia, ja, x, y)
call mkl_cspblas_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_sbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_dbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_cbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_zbsrsymv(&uplo, &m, &lb, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?bsrsymv` routine performs a matrix-vector operation defined as

y := *A***x*

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the BSR format (3-array variation) with zero-based indexing.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo — CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used.
If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.
If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

m	INTEGER. Number of block rows of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
a	REAL for mkl_cspblas_sbsrsymv. DOUBLE PRECISION for mkl_cspblas_dbsrsymv. COMPLEX for mkl_cspblas_cbsrsymv. DOUBLE COMPLEX for mkl_cspblas_zbsrsymv. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to *values* array description in BSR Format for more details.
ia	INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.
ja	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.
x	REAL for mkl_cspblas_sbsrsymv. DOUBLE PRECISION for mkl_cspblas_dbsrsymv. COMPLEX for mkl_cspblas_cbsrsymv. DOUBLE COMPLEX for mkl_cspblas_zbsrsymv. Array, DIMENSION (*m*lb*). On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_sbsrsymv. DOUBLE PRECISION for mkl_cspblas_dbsrsymv. COMPLEX for mkl_cspblas_cbsrsymv. DOUBLE COMPLEX for mkl_cspblas_zbsrsymv. Array, DIMENSION at least (*m*lb*). On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_sbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL           a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_dbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)

   INTEGER      ia(*), ja(*)
   COMPLEX    a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_zbsrsymv(uplo, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX    a(*), x(*), y(*)
```

C:

```
void mkl_cspblas_sbsrsymv(char *uplo, int *m, int *lb,
float *a, int *ia, int *ja, float *x, float *y);
void mkl_cspblas_dbsrsymv(char *uplo, int *m, int *lb,
double *a, int *ia, int *ja, double *x, double *y);
void mkl_cspblas_cbsrsymv(char *uplo, int *m, int *lb,
MKL_Complex8 *a, int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_cspblas_zbsrsymv(char *uplo, int *m, int *lb,
MKL_Complex16 *a, int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?coosymv

Computes matrix - vector product of a sparse symmetrical matrix stored in the coordinate format with zero-based indexing .

Syntax

Fortran:

```
call mkl_cspblas_scoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_ccoosymv(uplo, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_zcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_cspblas_scoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_dcoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_ccoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_zcoosymv(&uplo, &m, val, rowind, colind, &nnz, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?coosymv` routine performs a matrix-vector operation defined as

y := *A***x*

where:

x and *y* are vectors,

A is an upper or lower triangle of the symmetrical sparse matrix in the coordinate format with zero-based indexing.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is used. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used. If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.
m	INTEGER. Number of rows of the matrix *A*.
val	REAL for `mkl_cspblas_scoosymv`.

DOUBLE PRECISION for mkl_cspblas_dcoosymv.
COMPLEX for mkl_cspblas_ccoosymv.
DOUBLE COMPLEX for mkl_cspblas_zcoosymv.
Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.
Refer to *values* array description in Coordinate Format for more details.

rowind — INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.
Refer to *rows* array description in Coordinate Format for more details.

colind — INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz — INTEGER. Specifies the number of non-zero element of the matrix *A*.
Refer to *nnz* description in Coordinate Format for more details.

x — REAL for mkl_cspblas_scoosymv.
DOUBLE PRECISION for mkl_cspblas_dcoosymv.
COMPLEX for mkl_cspblas_ccoosymv.
DOUBLE COMPLEX for mkl_cspblas_zcoosymv.
Array, DIMENSION is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y — REAL for mkl_cspblas_scoosymv.
DOUBLE PRECISION for mkl_cspblas_dcoosymv.
COMPLEX for mkl_cspblas_ccoosymv.
DOUBLE COMPLEX for mkl_cspblas_zcoosymv.
Array, DIMENSION at least *m*.
On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  REAL           val(*), x(*), y(*)
SUBROUTINE mkl_cspblas_dcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE PRECISION        val(*), x(*), y(*)
SUBROUTINE mkl_cspblas_ccoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  COMPLEX     val(*), x(*), y(*)
SUBROUTINE mkl_cspblas_zcoosymv(uplo, m, val, rowind, colind, nnz, x, y)
  CHARACTER*1   uplo
  INTEGER       m, nnz
  INTEGER       rowind(*), colind(*)
  DOUBLE COMPLEX      val(*), x(*), y(*)
```

C:

```
void mkl_cspblas_scoosymv(char *uplo, int *m, float  *val, int *rowind,
int *colind, int *nnz, float *x, float *y);
void mkl_cspblas_dcoosymv(char *uplo, int *m, double  *val, int *rowind,
int *colind, int *nnz, double *x, double *y);
void mkl_cspblas_ccoosymv(char *uplo, int *m, MKL_Complex8  *val, int *rowind,
int *colind, int *nnz, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_cspblas_zcoosymv(char *uplo, int *m, MKL_Complex16  *val, int *rowind,
int *colind, int *nnz, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?csrtrsv

Triangular solvers with simplified interface for a sparse matrix in the CSR format (3-array variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_cspblas_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_cspblas_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
call mkl_cspblas_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_scsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
mkl_cspblas_dcsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
mkl_cspblas_ccsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
mkl_cspblas_zcsrtrsv(&uplo, &transa, &diag, &m, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?csrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the CSR format (3-array variation) with zero-based indexing:

*A*y = x*

or

*A'*y = x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo — `CHARACTER*1`. Specifies whether the upper or low triangle of the matrix *A* is used.
If *uplo* = `'U'` or `'u'`, then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa — CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *A*y* = *x*
If *transa* = 'T' or 't' or 'C' or 'c', then *A'*y* = *x*,

diag — CHARACTER*1. Specifies whether matrix *A* is unit triangular.
If *diag* = 'U' or 'u', then *A* is unit triangular.
If *diag* = 'N' or 'n', then *A* is not unit triangular.

m — INTEGER. Number of rows of the matrix *A*.

a — REAL for mkl_cspblas_scsrtrsv.
DOUBLE PRECISION for mkl_cspblas_dcsrtrsv.
COMPLEX for mkl_cspblas_ccsrtrsv.
DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv.
Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia — INTEGER. Array of length *m*+1, containing indices of elements in the array *a*, such that *ia*(*i*) is the index in the array *a* of the first non-zero element from the row *i*. The value of the last element *ia*(*m*) is equal to the number of non-zeros. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

ja — INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.
Its length is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

NOTE. Column indices must be sorted in increasing order for each row.

x — REAL for mkl_cspblas_scsrtrsv.
DOUBLE PRECISION for mkl_cspblas_dcsrtrsv.
COMPLEX for mkl_cspblas_ccsrtrsv.
DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv.
Array, DIMENSION is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_scsrtrsv. DOUBLE PRECISION for mkl_cspblas_dcsrtrsv. COMPLEX for mkl_cspblas_ccsrtrsv. DOUBLE COMPLEX for mkl_cspblas_zcsrtrsv. Array, DIMENSION at least *m*. Contains the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_scsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_dcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION     a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_ccsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_zcsrtrsv(uplo, transa, diag, m, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX       a(*), x(*), y(*)
```

C:

```
void mkl_cspblas_scsrtrsv(char *uplo, char *transa, char *diag, int *m,
float *a, int *ia, int *ja, float *x, float *y);
void mkl_cspblas_dcsrtrsv(char *uplo, char *transa, char *diag, int *m,
double *a, int *ia, int *ja, double *x, double *y);
void mkl_cspblas_ccsrtrsv(char *uplo, char *transa, char *diag, int *m,
MKL_Complex8 *a, int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_cspblas_zcsrtrsv(char *uplo, char *transa, char *diag, int *m,
MKL_Complex16 *a, int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?bsrtrsv

Triangular solver with simplified interface for a sparse matrix stored in the BSR format (3-array variation) with zero-based indexing.

Syntax

Fortran:

```
call mkl_cspblas_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cspblas_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cspblas_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
call mkl_cspblas_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
```

C:

```
mkl_cspblas_sbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_dbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_cbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
mkl_cspblas_zbsrtrsv(&uplo, &transa, &diag, &m, &lb, a, ia, ja, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?bsrtrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the BSR format (3-array variation) with zero-based indexing:

y := *A***x*

or

y := *A*'**x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo
CHARACTER*1. Specifies the upper or low triangle of the matrix *A* is used.
If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.
If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa
CHARACTER*1. Specifies the operation.
If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *A***x*
If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *A'***x*.

diag
CHARACTER*1. Specifies whether matrix *A* is unit triangular or not.
If *diag* = 'U' or 'u', *A* is unit triangular.
If *diag* = 'N' or 'n', *A* is not unit triangular.

m
INTEGER. Number of block rows of the matrix *A*.

lb
INTEGER. Size of the block in the matrix *A*.

a
REAL for mkl_cspblas_sbsrtrmv.
DOUBLE PRECISION for mkl_cspblas_dbsrtrmv.
COMPLEX for mkl_cspblas_cbsrtrmv.
DOUBLE COMPLEX for mkl_cspblas_zbsrtrmv.
Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to *values* array description in BSR Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

ia
INTEGER. Array of length (*m* + 1), containing indices of block in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zero blocks. Refer to *rowIndex* array description in BSR Format for more details.

ja	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.
x	REAL for mkl_cspblas_sbsrtrmv. DOUBLE PRECISION for mkl_cspblas_dbsrtrmv. COMPLEX for mkl_cspblas_cbsrtrmv. DOUBLE COMPLEX for mkl_cspblas_zbsrtrmv. Array, DIMENSION (*m***lb*). On entry, the array *x* must contain the vector *x*.

Output Parameters

y	REAL for mkl_cspblas_sbsrtrmv. DOUBLE PRECISION for mkl_cspblas_dbsrtrmv. COMPLEX for mkl_cspblas_cbsrtrmv. DOUBLE COMPLEX for mkl_cspblas_zbsrtrmv. Array, DIMENSION at least (*m***lb*). On exit, the array *y* must contain the vector *y*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_cspblas_sbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   REAL          a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_dbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE PRECISION       a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_cbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   COMPLEX       a(*), x(*), y(*)
SUBROUTINE mkl_cspblas_zbsrtrsv(uplo, transa, diag, m, lb, a, ia, ja, x, y)
   CHARACTER*1  uplo, transa, diag
   INTEGER      m, lb
   INTEGER      ia(*), ja(*)
   DOUBLE COMPLEX      a(*), x(*), y(*)
```

C:

```
void mkl_cspblas_sbsrtrsv(char *uplo, char *transa, char *diag, int *m,
int *lb, float *a, int *ia, int *ja, float *x, float *y);
void mkl_cspblas_dbsrtrsv(char *uplo, char *transa, char *diag, int *m,
int *lb, double *a, int *ia, int *ja, double *x, double *y);
void mkl_cspblas_cbsrtrsv(char *uplo, char *transa, char *diag, int *m,
int *lb, MKL_Complex8 *a, int *ia, int *ja, MKL_Complex8 *x, MKL_Complex8 *y);
void mkl_cspblas_zbsrtrsv(char *uplo, char *transa, char *diag, int *m,
int *lb, MKL_Complex16 *a, int *ia, int *ja, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_cspblas_?cootrsv

Triangular solvers with simplified interface for a sparse matrix in the coordinate format with zero-based indexing

.

Syntax

Fortran:

```
call mkl_cspblas_scootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_dcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_ccootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
call mkl_cspblas_zcootrsv(uplo, transa, diag, m, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_cspblas_scootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_dcootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_ccootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
mkl_cspblas_zcootrsv(&uplo, &transa, &diag, &m, val, rowind, colind, &nnz, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_cspblas_?cootrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the coordinate format with zero-based indexing:

*A*y = x*

or

*A'*y = x*,

where:

x and *y* are vectors,

A is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only zero-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

uplo	CHARACTER*1. Specifies whether the upper or low triangle of the matrix *A* is considered. If *uplo* = 'U' or 'u', then the upper triangle of the matrix *A* is used.

If *uplo* = 'L' or 'l', then the low triangle of the matrix *A* is used.

transa — CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *A*y* = *x*
If *transa* = 'T' or 't' or 'C' or 'c', then *A'*y* = *x*,

diag — CHARACTER*1. Specifies whether *A* is unit triangular.
If *diag* = 'U' or 'u', then *A* is unit triangular.
If *diag* = 'N' or 'n', then *A* is not unit triangular.

m — INTEGER. Number of rows of the matrix *A*.

val — REAL for mkl_cspblas_scootrsv.
DOUBLE PRECISION for mkl_cspblas_dcootrsv.
COMPLEX for mkl_cspblas_ccootrsv.
DOUBLE COMPLEX for mkl_cspblas_zcootrsv.
Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order.
Refer to *values* array description in Coordinate Format for more details.

rowind — INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.
Refer to *rows* array description in Coordinate Format for more details.

colind — INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

nnz — INTEGER. Specifies the number of non-zero element of the matrix *A*.
Refer to *nnz* description in Coordinate Format for more details.

x — REAL for mkl_cspblas_scootrsv.
DOUBLE PRECISION for mkl_cspblas_dcootrsv.
COMPLEX for mkl_cspblas_ccootrsv.
DOUBLE COMPLEX for mkl_cspblas_zcootrsv.
Array, DIMENSION is *m*.
On entry, the array *x* must contain the vector *x*.

Output Parameters

y — REAL for mkl_cspblas_scootrsv.
DOUBLE PRECISION for mkl_cspblas_dcootrsv.
COMPLEX for mkl_cspblas_ccootrsv.
DOUBLE COMPLEX for mkl_cspblas_zcootrsv.
Array, DIMENSION at least *m*.
Contains the vector *y*.

Interfaces

```

mkl_?csrmv

Computes matrix - vector product of a sparse matrix stored in the CSR format.

Syntax

Fortran:

```
call mkl_scsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_dcsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_ccsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_zcsrmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

C:

```
mkl_scsrmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
mkl_dcsrmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
mkl_ccsrmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
mkl_zcsrmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csrmv` routine performs a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*

or

y := *alpha***A*'**x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in the CSR format, *A*' is the transpose of *A*.

NOTE. This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *y* := *alpha***A***x* + *beta***y*

	If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**A'*x* + *beta**y*,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for mkl_scsrmv. DOUBLE PRECISION for mkl_dcsrmv. COMPLEX for mkl_ccsrmv. DOUBLE COMPLEX for mkl_zcsrmv. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_scsrmv. DOUBLE PRECISION for mkl_dcsrmv. COMPLEX for mkl_ccsrmv. DOUBLE COMPLEX for mkl_zcsrmv. Array containing non-zero elements of the matrix *A*. For one-based indexing its length is *pntre*(m) - *pntrb*(1). For zero-based indexing its length is *pntre*(m-1) - *pntrb*(0). Refer to *values* array description in CSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.Its length is equal to length of the *val* array. Refer to *columns* array description in CSR Format for more details.
pntrb	INTEGER. Array of length *m*. For one-based indexing this array contains row indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of row *i* in the arrays *val* and *indx*. For zero-based indexing this array contains row indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSR Format for more details.
pntre	INTEGER. Array of length *m*. For one-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*. For zero-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(0)-1 is the last index of row *i* in the arrays *val* and *indx*.Refer to *pointerE* array description in CSR Format for more details.
x	REAL for mkl_scsrmv. DOUBLE PRECISION for mkl_dcsrmv. COMPLEX for mkl_ccsrmv. DOUBLE COMPLEX for mkl_zcsrmv.

Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta
REAL for mkl_scsrmv.
DOUBLE PRECISION for mkl_dcsrmv.
COMPLEX for mkl_ccsrmv.
DOUBLE COMPLEX for mkl_zcsrmv.
Specifies the scalar *beta*.

y
REAL for mkl_scsrmv.
DOUBLE PRECISION for mkl_dcsrmv.
COMPLEX for mkl_ccsrmv.
DOUBLE COMPLEX for mkl_zcsrmv.
Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

 *y);
```

mkl_?bsrmv

Computes matrix - vector product of a sparse matrix stored in the BSR format.

Syntax

Fortran:

```
call mkl_sbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_dbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_cbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_zbsrmv(transa, m, k, lb, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

C:

```
mkl_sbsrmv(&transa, &m, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta,
y);
mkl_dbsrmv(&transa, &m, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta,
y);
mkl_cbsrmv(&transa, &m, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta,
y);
mkl_zbsrmv(&transa, &m, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta,
y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?bsrmv` routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

*y := alpha*A'*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* block sparse matrix in the BSR format, *A'* is the transpose of *A*.

NOTE. This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-vector product is computed as *y* := *alpha*A*x* + *beta*y* If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *y* := *alpha*A'*x* + *beta*y*,
m	INTEGER. Number of block rows of the matrix *A*.
k	INTEGER. Number of block columns of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
alpha	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv. COMPLEX for mkl_cbsrmv. DOUBLE COMPLEX for mkl_zbsrmv. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv. COMPLEX for mkl_cbsrmv. DOUBLE COMPLEX for mkl_zbsrmv. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to *values* array description in BSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A*. Refer to *columns* array description in BSR Format for more details.
pntrb	INTEGER. Array of length *m*.

	For one-based indexing: this array contains row indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of block row *i* in the array *indx*. For zero-based indexing: this array contains row indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of block row *i* in the array *indx* Refer to *pointerB* array description in BSR Format for more details.
pntre	INTEGER. Array of length *m*. For one-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of block row *i* in the array *indx*. For zero-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(0)-1 is the last index of block row *i* in the array *indx*. Refer to *pointerE* array description in BSR Format for more details.
x	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv. COMPLEX for mkl_cbsrmv. DOUBLE COMPLEX for mkl_zbsrmv. Array, DIMENSION at least (*k***lb*) if *transa* = 'N' or 'n', and at least (*m***lb*) otherwise. On entry, the array *x* must contain the vector *x*.
beta	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv. COMPLEX for mkl_cbsrmv. DOUBLE COMPLEX for mkl_zbsrmv. Specifies the scalar *beta*.
y	REAL for mkl_sbsrmv. DOUBLE PRECISION for mkl_dbsrmv. COMPLEX for mkl_cbsrmv. DOUBLE COMPLEX for mkl_zbsrmv. Array, DIMENSION at least (*m***lb*) if *transa* = 'N' or 'n', and at least (*k***lb*) otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

```

mkl_?cscmv

Computes matrix-vector product for a sparse matrix in the CSC format.

Syntax

Fortran:

```
call mkl_scscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_dcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_ccscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
call mkl_zcscmv(transa, m, k, alpha, matdescra, val, indx, pntrb, pntre, x, beta, y)
```

C:

```
mkl_scscmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
mkl_dcscmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
mkl_ccscmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
mkl_zcscmv(&transa, &m, &k, &alpha, matdescra, val, indx, pntrb, pntre, x, &beta, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?cscmv` routine performs a matrix-vector operation defined as

y := *alpha***A***x* + *beta***y*

or

y := *alpha***A*'**x* + *beta***y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed sparse column (CSC) format, *A*' is the transpose of *A*.

NOTE. This routine supports CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *y* := *alpha***A***x* + *beta***y* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha***A*'**x* + *beta***y*,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for `mkl_scscmv`. DOUBLE PRECISION for `mkl_dcscmv`. COMPLEX for `mkl_ccscmv`. DOUBLE COMPLEX for `mkl_zcscmv`. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for `mkl_scscmv`. DOUBLE PRECISION for `mkl_dcscmv`. COMPLEX for `mkl_ccscmv`. DOUBLE COMPLEX for `mkl_zcscmv`. Array containing non-zero elements of the matrix *A*. For one-based indexing its length is `pntre(`*k*`) - `*pntrb*`(1)`. For zero-based indexing its length is *pntre*(*m*-1) - *pntrb*(0). Refer to *values* array description in CSC Format for more details.

indx INTEGER. Array containing the row indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array.
Refer to *rows* array description in CSC Format for more details.

pntrb INTEGER. Array of length *k*.
For one-based indexing this array contains column indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of column *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains column indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of column *i* in the arrays *val* and *indx*.
Refer to *pointerb* array description in CSC Format for more details.

pntre INTEGER. Array of length *k*.
For one-based indexing this array contains column indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains column indices, such that *pntre*(*i*) - *pntrb*(1)-1 is the last index of column *i* in the arrays *val* and *indx*.
Refer to *pointerE* array description in CSC Format for more details.

x REAL for mkl_scscmv.
DOUBLE PRECISION for mkl_dcscmv.
COMPLEX for mkl_ccscmv.
DOUBLE COMPLEX for mkl_zcscmv.
Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta REAL for mkl_scscmv.
DOUBLE PRECISION for mkl_dcscmv.
COMPLEX for mkl_ccscmv.
DOUBLE COMPLEX for mkl_zcscmv.
Specifies the scalar *beta*.

y REAL for mkl_scscmv.
DOUBLE PRECISION for mkl_dcscmv.
COMPLEX for mkl_ccscmv.
DOUBLE COMPLEX for mkl_zcscmv.
Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

```

```

mkl_?coomv

Computes matrix - vector product for a sparse matrix in the coordinate format.

Syntax

Fortran:

```
call mkl_scoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_dcoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_ccoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
call mkl_zcoomv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, beta, y)
```

C:

```
mkl_scoomv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, &beta, y);
mkl_dcoomv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, &beta, y);
mkl_ccoomv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, &beta, y);
mkl_zcoomv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, &beta, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?coomv` routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

*y := alpha*A'*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix in compressed coordinate format, *A'* is the transpose of *A*.

NOTE. This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *y* := *alpha*A*x* + *beta*y* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha*A'*x* + *beta*y*,
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.

x	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv. Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.
beta	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv. Specifies the scalar *beta*.
y	REAL for mkl_scoomv. DOUBLE PRECISION for mkl_dcoomv. COMPLEX for mkl_ccoomv. DOUBLE COMPLEX for mkl_zcoomv. Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

mkl_?csrsv

Solves a system of linear equations for a sparse matrix in the CSR format.

Syntax

Fortran:

```
call mkl_scsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_dcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_ccsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_zcsrsv(transa, m, alpha, matdescra, val, indx, pntrb, pntre, x, y)
```

C:

```
mkl_scsrsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_dcsrsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_ccsrsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_zcsrsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSR format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')**x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x*
If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(*A'*)**x*,

m
INTEGER. Number of columns of the matrix *A*.

alpha
REAL for mkl_scsrsv.
DOUBLE PRECISION for mkl_dcsrsv.
COMPLEX for mkl_ccsrsv.
DOUBLE COMPLEX for mkl_zcsrsv.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

val
REAL for mkl_scsrsv.
DOUBLE PRECISION for mkl_dcsrsv.
COMPLEX for mkl_ccsrsv.
DOUBLE COMPLEX for mkl_zcsrsv.
Array containing non-zero elements of the matrix *A*.
For one-based indexing its length is *pntre*(m) - *pntrb*(1).
For zero-based indexing its length is *pntre*(m-1) - *pntrb*(0).
Refer to *values* array description in CSR Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx
INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array.
Refer to *columns* array description in CSR Format for more details.

NOTE. Column indices must be sorted in increasing order for each row.

pntrb INTEGER. Array of length *m*.
For one-based indexing this array contains row indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of row *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains row indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSR Format for more details.

pntre INTEGER. Array of length *m*.
For one-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(0)-1 is the last index of row *i* in the arrays *val* and *indx*.Refer to *pointerE* array description in CSR Format for more details.

x REAL for mkl_scsrsv.
DOUBLE PRECISION for mkl_dcsrsv.
COMPLEX for mkl_ccsrsv.
DOUBLE COMPLEX for mkl_zcsrsv.
Array, DIMENSION at least *m*.
On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y REAL for mkl_scsrsv.
DOUBLE PRECISION for mkl_dcsrsv.
COMPLEX for mkl_ccsrsv.
DOUBLE COMPLEX for mkl_zcsrsv.
Array, DIMENSION at least *m*.
On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y Contains solution vector *x*.

```

mkl_?bsrsv

Solves a system of linear equations for a sparse matrix in the BSR format.

Syntax

Fortran:

```
call mkl_sbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_dbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_cbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
call mkl_zbsrsv(transa, m, lb, alpha, matdescra, val, indx, pntrb, pntre, x, y)
```

C:

```
mkl_sbsrsv(&transa, &m, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_dbsrsv(&transa, &m, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_cbsrsv(&transa, &m, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_zbsrsv(&transa, &m, &lb, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?bsrsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the BSR format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')* *x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa — CHARACTER*1. Specifies the operation.
If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x*
If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(*A'*)* *x*,

m — INTEGER. Number of block columns of the matrix *A*.

lb — INTEGER. Size of the block in the matrix *A*.

alpha — REAL for mkl_sbsrsv.
DOUBLE PRECISION for mkl_dbsrsv.
COMPLEX for mkl_cbsrsv.
DOUBLE COMPLEX for mkl_zbsrsv.
Specifies the scalar *alpha*.

matdescra — CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

val — REAL for mkl_sbsrsv.
DOUBLE PRECISION for mkl_dbsrsv.
COMPLEX for mkl_cbsrsv.
DOUBLE COMPLEX for mkl_zbsrsv.
Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*.
Refer to the *values* array description in BSR Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx — INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A*.
Refer to the *columns* array description in BSR Format for more details.

pntrb — INTEGER. Array of length *m*.

	For one-based indexing: this array contains row indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of block row *i* in the array *indx*. For zero-based indexing: this array contains row indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of block row *i* in the array *indx* Refer to *pointerB* array description in BSR Format for more details.
pntre	INTEGER. Array of length *m*. For one-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of block row *i* in the array *indx*. For zero-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(0)-1 is the last index of block row *i* in the array *indx*. Refer to *pointerE* array description in BSR Format for more details.
x	REAL for mkl_sbsrsv. DOUBLE PRECISION for mkl_dbsrsv. COMPLEX for mkl_cbsrsv. DOUBLE COMPLEX for mkl_zbsrsv. Array, DIMENSION at least (*m***lb*). On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL for mkl_sbsrsv. DOUBLE PRECISION for mkl_dbsrsv. COMPLEX for mkl_cbsrsv. DOUBLE COMPLEX for mkl_zbsrsv. Array, DIMENSION at least (*m***lb*). On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

mkl_dcscsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_ccscsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
mkl_zcscsv(&transa, &m, &alpha, matdescra, val, indx, pntrb, pntre, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?cscsv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the CSC format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')* *x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports a CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa — CHARACTER*1. Specifies the operation.
If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x*
If *transa*= 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(*A*')* *x*,

m — INTEGER. Number of columns of the matrix *A*.

alpha — REAL for mkl_scscsv.
DOUBLE PRECISION for mkl_dcscsv.
COMPLEX for mkl_ccscsv.
DOUBLE COMPLEX for mkl_zcscsv.
Specifies the scalar *alpha*.

matdescra — CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

val — REAL for mkl_scscsv.
DOUBLE PRECISION for mkl_dcscsv.
COMPLEX for mkl_ccscsv.
DOUBLE COMPLEX for mkl_zcscsv.
Array containing non-zero elements of the matrix *A*.
For one-based indexing its length is *pntre*(*m*) - *pntrb*(1).
For zero-based indexing its length is *pntre*(*m*-1) - *pntrb*(0).
Refer to *values* array description in CSC Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx — INTEGER. Array containing the row indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array.
Refer to *columns* array description in CSC Format for more details.

NOTE. Row indices must be sorted in increasing order for each column.

pntrb INTEGER. Array of length *m*.
For one-based indexing this array contains column indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of column *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains column indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of column *i* in the arrays *val* and *indx*.
Refer to *pointerb* array description in CSC Format for more details.

pntre INTEGER. Array of length *m*.
For one-based indexing this array contains column indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains column indices, such that *pntre*(*i*) - *pntrb*(1)-1 is the last index of column *i* in the arrays *val* and *indx*.
Refer to *pointerE* array description in CSC Format for more details.

x REAL for mkl_scscsv.
DOUBLE PRECISION for mkl_dcscsv.
COMPLEX for mkl_ccscsv.
DOUBLE COMPLEX for mkl_zcscsv.
Array, DIMENSION at least *m*.
On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.

y REAL for mkl_scscsv.
DOUBLE PRECISION for mkl_dcscsv.
COMPLEX for mkl_ccscsv.
DOUBLE COMPLEX for mkl_zcscsv.
Array, DIMENSION at least *m*.
On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y Contains the solution vector *x*.

```

mkl_?coosv

Solves a system of linear equations for a sparse matrix in the coordinate format.

Syntax

Fortran:

```
call mkl_scoosv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, y)
call mkl_dcoosv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, y)
call mkl_ccoosv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, y)
call mkl_zcoosv(transa, m, k, alpha, matdescra, val, rowind, colind, nnz, x, y)
```

C:

```
mkl_scoosv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, y);
mkl_dcoosv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, y);
mkl_ccoosv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, y);
mkl_zcoosv(&transa, &m, &k, &alpha, matdescra, val, rowind, colind, &nnz, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?coosv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the coordinate format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')**x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the system of linear equations. If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x* If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(*A'*)* *x*,
m	INTEGER. Number of rows of the matrix *A*.
alpha	REAL for mkl_scoosv. DOUBLE PRECISION for mkl_dcoosv. COMPLEX for mkl_ccoosv. DOUBLE COMPLEX for mkl_zcoosv. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_scoosv. DOUBLE PRECISION for mkl_dcoosv. COMPLEX for mkl_ccoosv. DOUBLE COMPLEX for mkl_zcoosv. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
x	REAL for mkl_scoosv. DOUBLE PRECISION for mkl_dcoosv. COMPLEX for mkl_ccoosv. DOUBLE COMPLEX for mkl_zcoosv. Array, DIMENSION at least *m*. On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL for mkl_scoosv.

DOUBLE PRECISION for mkl_dcoosv.
COMPLEX for mkl_ccoosv.
DOUBLE COMPLEX for mkl_zcoosv.
Array, DIMENSION at least *m*.
On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?csrmm

Computes matrix - matrix product of a sparse matrix stored in the CSR format.

Syntax

Fortran:

```
call mkl_scsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
call mkl_dcsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
call mkl_ccsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
call mkl_zcsrmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
```

C:

```
mkl_scsrmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
mkl_dcsrmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
mkl_ccsrmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
mkl_zcsrmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csrmm` routine performs a matrix-matrix operation defined as

`C := alpha*A*B + beta*C`

or

`C := alpha*A'*B + beta*C`,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse row (CSR) format, *A'* is the transpose of *A*.

NOTE. This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *C* := *alpha*A*B* + *beta*C* If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha*A'*B* + *beta*C*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for `mkl_scsrmm`. DOUBLE PRECISION for `mkl_dcsrmm`. COMPLEX for `mkl_ccsrmm`. DOUBLE COMPLEX for `mkl_zcsrmm`. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for `mkl_scsrmm`. DOUBLE PRECISION for `mkl_dcsrmm`. COMPLEX for `mkl_ccsrmm`. DOUBLE COMPLEX for `mkl_zcsrmm`. Array containing non-zero elements of the matrix *A*. For one-based indexing its length is *pntre*(m) - *pntrb*(1). For zero-based indexing its length is *pntre*(–1) - *pntrb*(0). Refer to *values* array description in CSR Format for more details.

indx INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array. Refer to *columns* array description in CSR Format for more details.

pntrb INTEGER. Array of length *m*.
For one-based indexing this array contains row indices, such that *pntrb*(*I*) - *pntrb*(1)+1 is the first index of row *I* in the arrays *val* and *indx*.
For zero-based indexing this array contains row indices, such that *pntrb*(*I*) - *pntrb*(0) is the first index of row *I* in the arrays *val* and *indx*.
Refer to *pointerb* array description in CSR Format for more details.

pntre INTEGER. Array of length *m*.
For one-based indexing this array contains row indices, such that *pntre*(*I*) - *pntrb*(1) is the last index of row *I* in the arrays *val* and *indx*.
For zero-based indexing this array contains row indices, such that *pntre*(*I*) - *pntrb*(0)-1 is the last index of row *I* in the arrays *val* and *indx*.
Refer to *pointerE* array description in CSR Format for more details.

b REAL for mkl_scsrmm.
DOUBLE PRECISION for mkl_dcsrmm.
COMPLEX for mkl_ccsrmm.
DOUBLE COMPLEX for mkl_zcsrmm.
Array, DIMENSION (*ldb*, at least *n* for non-transposed matrix *A* and at least *m* for transposed) for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing.
On entry with *transa*= 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the first dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

beta REAL for mkl_scsrmm.
DOUBLE PRECISION for mkl_dcsrmm.
COMPLEX for mkl_ccsrmm.
DOUBLE COMPLEX for mkl_zcsrmm.
Specifies the scalar *beta*.

c REAL for mkl_scsrmm.
DOUBLE PRECISION for mkl_dcsrmm.
COMPLEX for mkl_ccsrmm.
DOUBLE COMPLEX for mkl_zcsrmm.
Array, DIMENSION (*ldc*, *n*) for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

	On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha***A***B* + *beta** *C*) or (*alpha***A*'**B* + *beta***C*).

Interfaces

FORTRAN 77:

```

```

mkl_?bsrmm

Computes matrix - matrix product of a sparse matrix stored in the BSR format.

Syntax

Fortran:

```
call mkl_sbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
call mkl_dbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
call mkl_cbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
call mkl_zbsrmm(transa, m, n, k, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb,
beta, c, ldc)
```

C:

```
mkl_sbsrmm(&transa, &m, &n, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb,
&beta, c, &ldc);
mkl_dbsrmm(&transa, &m, &n, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb,
&beta, c, &ldc);
mkl_cbsrmm(&transa, &m, &n, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb,
&beta, c, &ldc);
mkl_zbsrmm(&transa, &m, &n, &k, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb,
&beta, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?bsrmm` routine performs a matrix-matrix operation defined as

`C := alpha*A*B + beta*C`

or

`C := alpha*A'*B + beta*C`,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in block sparse row (BSR) format, *A'* is the transpose of *A*.

NOTE. This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-matrix product is computed as *C* := *alpha*A*B* + *beta*C* If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *C* := *alpha*A'*B* + *beta*C*,
m	INTEGER. Number of block rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of block columns of the matrix *A*.
lb	INTEGER. Size of the block in the matrix *A*.
alpha	REAL for `mkl_sbsrmm`. DOUBLE PRECISION for `mkl_dbsrmm`. COMPLEX for `mkl_cbsrmm`. DOUBLE COMPLEX for `mkl_zbsrmm`. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for `mkl_sbsrmm`. DOUBLE PRECISION for `mkl_dbsrmm`. COMPLEX for `mkl_cbsrmm`. DOUBLE COMPLEX for `mkl_zbsrmm`.

	Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *lb*lb*. Refer to the *values* array description in BSR Format for more details.
indx	INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A*. Refer to the *columns* array description in BSR Format for more details.
pntrb	INTEGER. Array of length *m*. For one-based indexing: this array contains row indices, such that *pntrb*(*I*) - *pntrb*(1)+1 is the first index of block row *I* in the array *indx*. For zero-based indexing: this array contains row indices, such that *pntrb*(*I*) - *pntrb*(0) is the first index of block row *I* in the array *indx*. Refer to *pointerB* array description in BSR Format for more details.
pntre	INTEGER. Array of length *m*. For one-based indexing this array contains row indices, such that *pntre*(*I*) - *pntrb*(1) is the last index of block row *I* in the array *indx*. For zero-based indexing this array contains row indices, such that *pntre*(*I*) - *pntrb*(0)-1 is the last index of block row *I* in the array *indx*. Refer to *pointerE* array description in BSR Format for more details.
b	REAL for mkl_sbsrmm. DOUBLE PRECISION for mkl_dbsrmm. COMPLEX for mkl_cbsrmm. DOUBLE COMPLEX for mkl_zbsrmm. Array, DIMENSION (*ldb*, at least *n* for non-transposed matrix *A* and at least *m* for transposed) for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing. On entry with *transa*= 'N' or 'n', the leading *n*-by-*k* block part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* block part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension (in blocks) of *b* as declared in the calling (sub)program.
beta	REAL for mkl_sbsrmm. DOUBLE PRECISION for mkl_dbsrmm. COMPLEX for mkl_cbsrmm. DOUBLE COMPLEX for mkl_zbsrmm. Specifies the scalar *beta*.
c	REAL for mkl_sbsrmm. DOUBLE PRECISION for mkl_dbsrmm. COMPLEX for mkl_cbsrmm. DOUBLE COMPLEX for mkl_zbsrmm.

	Array, DIMENSION (*ldc*, *n*) for one-based indexing, DIMENSION (*k*, *ldc*) for zero-based indexing. On entry, the leading *m*-by-*n* block part of the array *c* must contain the matrix *C*, otherwise the leading *n*-by-*k* block part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension (in blocks) of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha***A***B* + *beta***C*) or (*alpha***A*'**B* + *beta***C*).

Interfaces

```

mkl_?cscmm

Computes matrix-matrix product of a sparse matrix stored in the CSC format.

Syntax

Fortran:

```
call mkl_scscmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
call mkl_dcscmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
call mkl_ccscmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
call mkl_zcscmm(transa, m, n, k, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, beta, c, ldc)
```

C:

```
mkl_scscmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
mkl_dcscmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
mkl_ccscmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
mkl_zcscmm(&transa, &m, &n, &k, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, &beta, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?cscmm` routine performs a matrix-matrix operation defined as

`C := alpha*A*B + beta*C`

or

`C := alpha*A'*B + beta*C`,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in compressed sparse column (CSC) format, *A'* is the transpose of *A*.

NOTE. This routine supports CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *C* := *alpha*A** B + *beta*C* If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha*A'*B* + *beta*C*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for `mkl_scscmm`. DOUBLE PRECISION for `mkl_dcscmm`. COMPLEX for `mkl_ccscmm`. DOUBLE COMPLEX for `mkl_zcscmm`. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for `mkl_scscmm`. DOUBLE PRECISION for `mkl_dcscmm`. COMPLEX for `mkl_ccscmm`. DOUBLE COMPLEX for `mkl_zcscmm`. Array containing non-zero elements of the matrix *A*. For one-based indexing its length is `pntre(k) - pntrb(1)`. For zero-based indexing its length is *pntre*(*m*-1) - *pntrb*(0). Refer to *values* array description in CSC Format for more details.

indx	INTEGER. Array containing the row indices for each non-zero element of the matrix *A*.Its length is equal to length of the *val* array. Refer to *rows* array description in CSC Format for more details.
pntrb	INTEGER. Array of length *k*. For one-based indexing this array contains column indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of column *i* in the arrays *val* and *indx*. For zero-based indexing this array contains column indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of column *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSC Format for more details.
pntre	INTEGER. Array of length *k*. For one-based indexing this array contains column indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of column *i* in the arrays *val* and *indx*. For zero-based indexing this array contains column indices, such that *pntre*(*i*) - *pntrb*(1)-1 is the last index of column *i* in the arrays *val* and *indx*. Refer to *pointerE* array description in CSC Format for more details.
b	REAL for mkl_scscmm. DOUBLE PRECISION for mkl_dcscmm. COMPLEX for mkl_ccscmm. DOUBLE COMPLEX for mkl_zcscmm. Array, DIMENSION (*ldb*, at least *n* for non-transposed matrix *A* and at least *m* for transposed) for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing. On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.
beta	REAL*8. Specifies the scalar *beta*.
c	REAL for mkl_scscmm. DOUBLE PRECISION for mkl_dcscmm. COMPLEX for mkl_ccscmm. DOUBLE COMPLEX for mkl_zcscmm. Array, DIMENSION (*ldc*, *n*) for one-based indexing, and (*m*, *ldc*) for zero-based indexing. On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha**A*B + *beta** C) or (*alpha**A'*B + *beta**C).

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scscmm(transa, m, n, k, alpha, matdescra, val, indx,

MKL_Complex16 *beta, MKL_Complex16 *c, int *ldc);
```

mkl_?coomm

Computes matrix-matrix product of a sparse matrix stored in the coordinate format.

Syntax

Fortran:

```
call mkl_scoomm(transa, m, n, k, alpha, matdescra, val, rowind, colind, nnz, b, ldb,
beta, c, ldc)
call mkl_dcoomm(transa, m, n, k, alpha, matdescra, val, rowind, colind, nnz, b, ldb,
beta, c, ldc)
call mkl_ccoomm(transa, m, n, k, alpha, matdescra, val, rowind, colind, nnz, b, ldb,
beta, c, ldc)
call mkl_zcoomm(transa, m, n, k, alpha, matdescra, val, rowind, colind, nnz, b, ldb,
beta, c, ldc)
```

C:

```
mkl_scoomm(&transa, &m, &n, &k, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb,
&beta, c, &ldc);
```

```
mkl_dcoomm(&transa, &m, &n, &k, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, &beta, c, &ldc);
mkl_ccoomm(&transa, &m, &n, &k, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, &beta, c, &ldc);
mkl_zcoomm(&transa, &m, &n, &k, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, &beta, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?coomm` routine performs a matrix-matrix operation defined as

C := *alpha***A***B* + *beta***C*

or

C := *alpha***A*'**B* + *beta***C*,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the coordinate format, *A*' is the transpose of *A*.

NOTE. This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *C* := *alpha***A***B* + *beta***C* If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha***A*'**B* + *beta***C*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for `mkl_scoomm`. DOUBLE PRECISION for `mkl_dcoomm`. COMPLEX for `mkl_ccoomm`. DOUBLE COMPLEX for `mkl_zcoomm`. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

val	REAL for mkl_scoomm. DOUBLE PRECISION for mkl_dcoomm. COMPLEX for mkl_ccoomm. DOUBLE COMPLEX for mkl_zcoomm. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.
colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
b	REAL for mkl_scoomm. DOUBLE PRECISION for mkl_dcoomm. COMPLEX for mkl_ccoomm. DOUBLE COMPLEX for mkl_zcoomm. Array, DIMENSION (*ldb*, at least *n* for non-transposed matrix *A* and at least *m* for transposed) for one-based indexing, and (at least *k* for non-transposed matrix *A* and at least *m* for transposed, *ldb*) for zero-based indexing. On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.
beta	REAL for mkl_scoomm. DOUBLE PRECISION for mkl_dcoomm. COMPLEX for mkl_ccoomm. DOUBLE COMPLEX for mkl_zcoomm. Specifies the scalar *beta*.
c	REAL for mkl_scoomm. DOUBLE PRECISION for mkl_dcoomm. COMPLEX for mkl_ccoomm. DOUBLE COMPLEX for mkl_zcoomm. Array, DIMENSION (*ldc*, *n*) for one-based indexing, and (*m*, *ldc*) for zero-based indexing. On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha**A*B + *beta**C*) or (*alpha**A'*B + *beta**C*).

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_scoomm(transa, m, n, k, alpha, matdescra, val,

```

mkl_?csrsm

Solves a system of linear matrix equations for a sparse matrix in the CSR format.

Syntax

Fortran:

```
call mkl_scsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_dcsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_ccsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_zcsrsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
```

C:

```
mkl_scsrsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
mkl_dcsrsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
mkl_ccsrsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
mkl_zcsrsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csrsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSR format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports a CSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the system of linear equations. If *transa* = 'N' or 'n', then *C* := *alpha**inv(*A*)**B* If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha**inv(*A*')**B*,
m	INTEGER. Number of columns of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL for mkl_scsrsm. DOUBLE PRECISION for mkl_dcsrsm. COMPLEX for mkl_ccsrsm. DOUBLE COMPLEX for mkl_zcsrsm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_scsrsm. DOUBLE PRECISION for mkl_dcsrsm. COMPLEX for mkl_ccsrsm. DOUBLE COMPLEX for mkl_zcsrsm. Array containing non-zero elements of the matrix *A*. For one-based indexing its length is *pntre*(m) - *pntrb*(1). For zero-based indexing its length is *pntre*(m-1) - *pntrb*(0). Refer to *values* array description in CSR Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array. Refer to *columns* array description in CSR Format for more details.

NOTE. Column indices must be sorted in increasing order for each row.

pntrb INTEGER. Array of length *m*.
For one-based indexing this array contains row indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of row *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains row indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of row *i* in the arrays *val* and *indx*. Refer to *pointerb* array description in CSR Format for more details.

pntre INTEGER. Array of length *m*.
For one-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of row *i* in the arrays *val* and *indx*.
For zero-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(0)-1 is the last index of row *i* in the arrays *val* and *indx*.Refer to *pointerE* array description in CSR Format for more details.

b REAL for mkl_scsrsm.
DOUBLE PRECISION for mkl_dcsrsm.
COMPLEX for mkl_ccsrsm.
DOUBLE COMPLEX for mkl_zcsrsm.
Array, DIMENSION (*ldb*, *n*)for one-based indexing, and (*m*, *ldb*) for zero-based indexing.
On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the first dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

ldc INTEGER. Specifies the first dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c REAL*8.
Array, DIMENSION (*ldc*, *n*) for one-based indexing, and (*m*, *ldc*) for zero-based indexing.
The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

```

mkl_?cscsm

Solves a system of linear matrix equations for a sparse matrix in the CSC format.

Syntax

Fortran:

```
call mkl_scscsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_dcscsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_ccscsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
call mkl_zcscsm(transa, m, n, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c, ldc)
```

C:

```
mkl_scscsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
mkl_dcscsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
mkl_ccscsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
mkl_zcscsm(&transa, &m, &n, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?cscsm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the CSC format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports a CSC format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the system of equations. If *transa* = 'N' or 'n', then *C* := *alpha**inv(*A*)**B* If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha**inv(*A*')**B*,
m	INTEGER. Number of columns of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL for mkl_scscsm. DOUBLE PRECISION for mkl_dcscsm. COMPLEX for mkl_ccscsm. DOUBLE COMPLEX for mkl_zcscsm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_scscsm. DOUBLE PRECISION for mkl_dcscsm. COMPLEX for mkl_ccscsm. DOUBLE COMPLEX for mkl_zcscsm. Array containing non-zero elements of the matrix *A*. For one-based indexing its length is pntre(*k*) - *pntrb*(1). For zero-based indexing its length is *pntre*(*m*-1) - *pntrb*(0). Refer to *values* array description in CSC Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx INTEGER. Array containing the row indices for each non-zero element of the matrix *A*. Its length is equal to length of the *val* array.
Refer to *rows* array description in CSC Format for more details.

NOTE. Row indices must be sorted in increasing order for each column.

pntrb INTEGER. Array of length *m*.
For one-based indexing this array contains column indices, such that *pntrb*(*I*) - *pntrb*(1)+1 is the first index of column *I* in the arrays *val* and *indx*.
For zero-based indexing this array contains column indices, such that *pntrb*(*I*) - *pntrb*(0) is the first index of column *I* in the arrays *val* and *indx*.
Refer to *pointerb* array description in CSC Format for more details.

pntre INTEGER. Array of length *m*.
For one-based indexing this array contains column indices, such that *pntre*(*I*) - *pntrb*(1) is the last index of column *I* in the arrays *val* and *indx*.
For zero-based indexing this array contains column indices, such that *pntre*(*I*) - *pntrb*(1)-1 is the last index of column *I* in the arrays *val* and *indx*.
Refer to *pointerE* array description in CSC Format for more details.

b REAL for mkl_scscsm.
DOUBLE PRECISION for mkl_dcscsm.
COMPLEX for mkl_ccscsm.
DOUBLE COMPLEX for mkl_zcscsm.
Array, DIMENSION (*ldb*, *n*) for one-based indexing, and (*m*, *ldb*) for zero-based indexing.
On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the first dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.

ldc INTEGER. Specifies the first dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_scscsm.
DOUBLE PRECISION for mkl_dcscsm.
COMPLEX for mkl_ccscsm.
DOUBLE COMPLEX for mkl_zcscsm.
Array, DIMENSION (*ldc*, *n*) for one-based indexing, and (*m*, *ldc*) for zero-based indexing.

The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

```

mkl_?coosm

Solves a system of linear matrix equations for a sparse matrix in the coordinate format.

Syntax

Fortran:

```
call mkl_scoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c, ldc)
call mkl_dcoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c, ldc)
call mkl_ccoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c, ldc)
call mkl_zcoosm(transa, m, n, alpha, matdescra, val, rowind, colind, nnz, b, ldb, c, ldc)
```

C:

```
mkl_scoosm(&transa, &m, &n, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, c,
&ldc);
mkl_dcoosm(&transa, &m, &n, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, c,
&ldc);
mkl_ccoosm(&transa, &m, &n, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, c,
&ldc);
mkl_zcoosm(&transa, &m, &n, &alpha, matdescra, val, rowind, colind, &nnz, b, &ldb, c,
&ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The mkl_?coosm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the coordinate format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports a coordinate format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the system of linear equations. If *transa* = 'N' or 'n', then the matrix-matrix product is computed as *C* := *alpha**inv(*A*)**B* If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *C* := *alpha**inv(*A*')**B*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL for mkl_scoosm. DOUBLE PRECISION for mkl_dcoosm. COMPLEX for mkl_ccoosm. DOUBLE COMPLEX for mkl_zcoosm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_scoosm. DOUBLE PRECISION for mkl_dcoosm. COMPLEX for mkl_ccoosm. DOUBLE COMPLEX for mkl_zcoosm. Array of length *nnz*, contains non-zero elements of the matrix *A* in the arbitrary order. Refer to *values* array description in Coordinate Format for more details.
rowind	INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*. Refer to *rows* array description in Coordinate Format for more details.

colind	INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.
nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
b	REAL for mkl_scoosm. DOUBLE PRECISION for mkl_dcoosm. COMPLEX for mkl_ccoosm. DOUBLE COMPLEX for mkl_zcoosm. Array, DIMENSION (*ldb*, *n*) for one-based indexing, and (*m*, *ldb*) for zero-based indexing. Before entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* for one-based indexing, and the second dimension of *b* for zero-based indexing, as declared in the calling (sub)program.
ldc	INTEGER. Specifies the first dimension of *c* for one-based indexing, and the second dimension of *c* for zero-based indexing, as declared in the calling (sub)program.

Output Parameters

c	REAL for mkl_scoosm. DOUBLE PRECISION for mkl_dcoosm. COMPLEX for mkl_ccoosm. DOUBLE COMPLEX for mkl_zcoosm. Array, DIMENSION (*ldc*, *n*) for one-based indexing, and (*m*, *ldc*) for zero-based indexing. The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

FORTRAN 77:

*ldc);
```

mkl_?bsrsm

Solves a system of linear matrix equations for a sparse matrix in the BSR format.

Syntax

Fortran:

```
call mkl_scsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c,
ldc)
call mkl_dcsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c,
ldc)
call mkl_ccsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c,
ldc)
call mkl_zcsrsm(transa, m, n, lb, alpha, matdescra, val, indx, pntrb, pntre, b, ldb, c,
ldc)
```

C:

```
mkl_scsrsm(&transa, &m, &n, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c,
&ldc);
mkl_dcsrsm(&transa, &m, &n, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c,
&ldc);
mkl_ccsrsm(&transa, &m, &n, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c,
&ldc);
mkl_zcsrsm(&transa, &m, &n, &lb, &alpha, matdescra, val, indx, pntrb, pntre, b, &ldb, c,
&ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The mkl_?bsrsm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the BSR format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports a BSR format both with one-based indexing and zero-based indexing.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then the matrix-matrix product is computed as *C* := *alpha**inv(*A*)**B*. If *transa* = 'T' or 't' or 'C' or 'c', then the matrix-vector product is computed as *C* := *alpha**inv(*A*')**B*.
m	INTEGER. Number of block columns of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
lb	INTEGER. Size of the block in the matrix *A*.
alpha	REAL for mkl_sbsrsm. DOUBLE PRECISION for mkl_dbsrsm. COMPLEX for mkl_cbsrsm. DOUBLE COMPLEX for mkl_zbsrsm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_sbsrsm. DOUBLE PRECISION for mkl_dbsrsm. COMPLEX for mkl_cbsrsm. DOUBLE COMPLEX for mkl_zbsrsm. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the *ABAB* number *ABAB* of non-zero blocks in the matrix *A* multiplied by *lb***lb*. Refer to the *values* array description in BSR Format for more details.

NOTE. The non-zero elements of the given row of the matrix must be stored in the same order as they appear in the row (from left to right).

No diagonal element can be omitted from a sparse storage if the solver is called with the non-unit indicator.

indx INTEGER. Array containing the column indices for each non-zero block in the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A*. Refer to the *columns* array description in BSR Format for more details.

pntrb INTEGER. Array of length *m*.
For one-based indexing: this array contains row indices, such that *pntrb*(*i*) - *pntrb*(1)+1 is the first index of block row *i* in the array *indx*.
For zero-based indexing: this array contains row indices, such that *pntrb*(*i*) - *pntrb*(0) is the first index of block row *i* in the array *indx*.
Refer to *pointerB* array description in BSR Format for more details.

pntre INTEGER. Array of length *m*.
For one-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(1) is the last index of block row *i* in the array *indx*.
For zero-based indexing this array contains row indices, such that *pntre*(*i*) - *pntrb*(0)-1 is the last index of block row *i* in the array *indx*.
Refer to *pointerE* array description in BSR Format for more details.

b REAL for mkl_sbsrsm.
DOUBLE PRECISION for mkl_dbsrsm.
COMPLEX for mkl_cbsrsm.
DOUBLE COMPLEX for mkl_zbsrsm.
Array, DIMENSION (*ldb*, *n*) for one-based indexing, DIMENSION (*m*, *ldb*) for zero-based indexing.
On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the first dimension (in blocks) of *b* as declared in the calling (sub)program.

ldc INTEGER. Specifies the first dimension (in blocks) of *c* as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_sbsrsm.
DOUBLE PRECISION for mkl_dbsrsm.
COMPLEX for mkl_cbsrsm.
DOUBLE COMPLEX for mkl_zbsrsm.

Array, DIMENSION (*ldc*, *n*) for one-based indexing, DIMENSION (*m*, *ldc*) for zero-based indexing.
The leading *m*-by-*n* part of the array *c* contains the output matrix *C*.

Interfaces

FORTRAN 77:

MKL_Complex16  *val, int *indx, int *pntrb, int *pntre, MKL_Complex16 *b, int *ldb, MKL_Complex16 *c, int
*ldc);
```

mkl_?diamv

Computes matrix - vector product for a sparse matrix in the diagonal format with one-based indexing.

Syntax

Fortran:

```
call mkl_sdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_ddiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_cdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
call mkl_zdiamv(transa, m, k, alpha, matdescra, val, lval, idiag, ndiag, x, beta, y)
```

C:

```
mkl_sdiamv(&transa, &m, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, x, &beta, y);
mkl_ddiamv(&transa, &m, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, x, &beta, y);
mkl_cdiamv(&transa, &m, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, x, &beta, y);
mkl_zdiamv(&transa, &m, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, x, &beta, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?diamv` routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

*y := alpha*A'*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix stored in the diagonal format, *A'* is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *y* := *alpha*A*x* + *beta*y*, If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha*A'*x* + *beta*y*.
m	INTEGER. Number of rows of the matrix *A*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for mkl_sdiamv. DOUBLE PRECISION for mkl_ddiamv. COMPLEX for mkl_cdiamv. DOUBLE COMPLEX for mkl_zdiamv. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_sdiamv. DOUBLE PRECISION for mkl_ddiamv. COMPLEX for mkl_cdiamv. DOUBLE COMPLEX for mkl_zdiamv. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval* ≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.
ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
x	REAL for mkl_sdiamv. DOUBLE PRECISION for mkl_ddiamv. COMPLEX for mkl_cdiamv. DOUBLE COMPLEX for mkl_zdiamv. Array, DIMENSION at least *k* if *transa* = 'N' or 'n', and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.

beta	REAL for mkl_sdiamv. DOUBLE PRECISION for mkl_ddiamv. COMPLEX for mkl_cdiamv. DOUBLE COMPLEX for mkl_zdiamv. Specifies the scalar *beta*.
y	REAL for mkl_sdiamv. DOUBLE PRECISION for mkl_ddiamv. COMPLEX for mkl_cdiamv. DOUBLE COMPLEX for mkl_zdiamv. Array, DIMENSION at least *m* if *transa* = 'N' or 'n', and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

```

void mkl_zdiamv(char *transa, int *m, int *k, MKL_Complex16 *alpha,
char *matdescra, MKL_Complex16  *val, int *lval, int *idiag,
int *ndiag, MKL_Complex16 *x, MKL_Complex16 *beta, MKL_Complex16 *y);
```

mkl_?skymv

Computes matrix - vector product for a sparse matrix in the skyline storage format with one-based indexing.

Syntax

Fortran:

```
call mkl_sskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
call mkl_dskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
call mkl_cskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
call mkl_zskymv(transa, m, k, alpha, matdescra, val, pntr, x, beta, y)
```

C:

```
mkl_sskymv(&transa, &m, &k, &alpha, matdescra, val, pntr, x, &beta, y);
mkl_dskymv(&transa, &m, &k, &alpha, matdescra, val, pntr, x, &beta, y);
mkl_cskymv(&transa, &m, &k, &alpha, matdescra, val, pntr, x, &beta, y);
mkl_zskymv(&transa, &m, &k, &alpha, matdescra, val, pntr, x, &beta, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?skymv` routine performs a matrix-vector operation defined as

*y := alpha*A*x + beta*y*

or

*y := alpha*A'*x + beta*y*,

where:

alpha and *beta* are scalars,

x and *y* are vectors,

A is an *m*-by-*k* sparse matrix stored using the skyline storage scheme, *A'* is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the operation.
If *transa* = 'N' or 'n', then *y* := *alpha***A***x* + *beta***y*
If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha***A'***x* + *beta***y*,

m
INTEGER. Number of rows of the matrix *A*.

k
INTEGER. Number of columns of the matrix *A*.

alpha
REAL for mkl_sskymv.
DOUBLE PRECISION for mkl_dskymv.
COMPLEX for mkl_cskymv.
DOUBLE COMPLEX for mkl_zskymv.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

NOTE. General matrices (*matdescra* (1)='G') is not supported.

val
REAL for mkl_sskymv.
DOUBLE PRECISION for mkl_dskymv.
COMPLEX for mkl_cskymv.
DOUBLE COMPLEX for mkl_zskymv.
Array containing the set of elements of the matrix *A* in the skyline profile form.
If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*.
If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*.
Refer to *values* array description in Skyline Storage Scheme for more details.

pntr	INTEGER. Array of length (*m*+*m*) for lower triangle, and (*k*+*k*) for upper triangle. It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.
x	REAL for mkl_sskymv. DOUBLE PRECISION for mkl_dskymv. COMPLEX for mkl_cskymv. DOUBLE COMPLEX for mkl_zskymv. Array, DIMENSION at least *k* if *transa* = 'N' or 'n' and at least *m* otherwise. On entry, the array *x* must contain the vector *x*.
beta	REAL for mkl_sskymv. DOUBLE PRECISION for mkl_dskymv. COMPLEX for mkl_cskymv. DOUBLE COMPLEX for mkl_zskymv. Specifies the scalar *beta*.
y	REAL for mkl_sskymv. DOUBLE PRECISION for mkl_dskymv. COMPLEX for mkl_cskymv. DOUBLE COMPLEX for mkl_zskymv. Array, DIMENSION at least *m* if *transa* = 'N' or 'n' and at least *k* otherwise. On entry, the array *y* must contain the vector *y*.

Output Parameters

y	Overwritten by the updated vector *y*.

Interfaces

FORTRAN 77:

void mkl_zskymv (char *transa, int *m, int *k, MKL_Complex16 *alpha, char *matdescra,
MKL_Complex16  *val, int *pntr, MKL_Complex16 *x, MKL_Complex16 *beta, MKL_Complex16 *y);
```

mkl_?diasv

Solves a system of linear equations for a sparse matrix in the diagonal format with one-based indexing.

Syntax

Fortran:

```
call mkl_sdiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
call mkl_ddiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
call mkl_cdiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
call mkl_zdiasv(transa, m, alpha, matdescra, val, lval, idiag, ndiag, x, y)
```

C:

```
mkl_sdiasv(&transa, &m, &alpha, matdescra, val, &lval, idiag, &ndiag, x, y);
mkl_ddiasv(&transa, &m, &alpha, matdescra, val, &lval, idiag, &ndiag, x, y);
mkl_cdiasv(&transa, &m, &alpha, matdescra, val, &lval, idiag, &ndiag, x, y);
mkl_zdiasv(&transa, &m, &alpha, matdescra, val, &lval, idiag, &ndiag, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?diasv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix stored in the diagonal format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')* *x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A'* is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x*
If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(*A'*)**x*,

m
INTEGER. Number of rows of the matrix *A*.

alpha
REAL for mkl_sdiasv.
DOUBLE PRECISION for mkl_ddiasv.
COMPLEX for mkl_cdiasv.
DOUBLE COMPLEX for mkl_zdiasv.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

val
REAL for mkl_sdiasv.
DOUBLE PRECISION for mkl_ddiasv.
COMPLEX for mkl_cdiasv.
DOUBLE COMPLEX for mkl_zdiasv.
Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.

lval
INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.

idiag
INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

NOTE. All elements of this array must be sorted in increasing order.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag
INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

x
REAL for mkl_sdiasv.
DOUBLE PRECISION for mkl_ddiasv.
COMPLEX for mkl_cdiasv.
DOUBLE COMPLEX for mkl_zdiasv.
Array, DIMENSION at least *m*.

	On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL for mkl_sdiasv. DOUBLE PRECISION for mkl_ddiasv. COMPLEX for mkl_cdiasv. DOUBLE COMPLEX for mkl_zdiasv. Array, DIMENSION at least *m*. On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

FORTRAN 77:

```

mkl_?skysv

Solves a system of linear equations for a sparse matrix in the skyline format with one-based indexing.

Syntax

Fortran:

```
call mkl_sskysv(transa, m, alpha, matdescra, val, pntr, x, y)
call mkl_dskysv(transa, m, alpha, matdescra, val, pntr, x, y)
call mkl_cskysv(transa, m, alpha, matdescra, val, pntr, x, y)
call mkl_zskysv(transa, m, alpha, matdescra, val, pntr, x, y)
```

C:

```
mkl_sskysv(&transa, &m, &alpha, matdescra, val, pntr, x, y);
mkl_dskysv(&transa, &m, &alpha, matdescra, val, pntr, x, y);
mkl_cskysv(&transa, &m, &alpha, matdescra, val, pntr, x, y);
mkl_zskysv(&transa, &m, &alpha, matdescra, val, pntr, x, y);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?skysv` routine solves a system of linear equations with matrix-vector operations for a sparse matrix in the skyline storage format:

y := *alpha**inv(*A*)**x*

or

y := *alpha**inv(*A*')**x*,

where:

alpha is scalar, *x* and *y* are vectors, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *y* := *alpha**inv(*A*)**x*
If *transa* = 'T' or 't' or 'C' or 'c', then *y* := *alpha**inv(*A*')**x*,

m
INTEGER. Number of rows of the matrix *A*.

alpha
REAL for mkl_sskysv.
DOUBLE PRECISION for mkl_dskysv.
COMPLEX for mkl_cskysv.
DOUBLE COMPLEX for mkl_zskysv.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

NOTE. General matrices (*matdescra* (1)='G') is not supported.

val
REAL for mkl_sskysv.
DOUBLE PRECISION for mkl_dskysv.
COMPLEX for mkl_cskysv.
DOUBLE COMPLEX for mkl_zskysv.
Array containing the set of elements of the matrix *A* in the skyline profile form.
If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*.
If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*.
Refer to *values* array description in Skyline Storage Scheme for more details.

pntr
INTEGER. Array of length (*m*+*m*) for lower triangle, and (*k*+*k*) for upper triangle.
It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.

x
REAL for mkl_sskysv.
DOUBLE PRECISION for mkl_dskysv.

	COMPLEX for mkl_cskysv. DOUBLE COMPLEX for mkl_zskysv. Array, DIMENSION at least *m*. On entry, the array *x* must contain the vector *x*. The elements are accessed with unit increment.
y	REAL for mkl_sskysv. DOUBLE PRECISION for mkl_dskysv. COMPLEX for mkl_cskysv. DOUBLE COMPLEX for mkl_zskysv. Array, DIMENSION at least *m*. On entry, the array *y* must contain the vector *y*. The elements are accessed with unit increment.

Output Parameters

y	Contains solution vector *x*.

Interfaces

MKL_Complex16 *val, int *pntr, MKL_Complex16 *x, MKL_Complex16 *y);
```

mkl_?diamm

Computes matrix-matrix product of a sparse matrix stored in the diagonal format with one-based indexing.

Syntax

Fortran:

```
call mkl_sdiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
call mkl_ddiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
call mkl_cdiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
call mkl_zdiamm(transa, m, n, k, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, beta, c, ldc)
```

C:

```
mkl_sdiamm(&transa, &m, &n, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, &beta, c, &ldc);
mkl_ddiamm(&transa, &m, &n, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, &beta, c, &ldc);
mkl_cdiamm(&transa, &m, &n, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, &beta, c, &ldc);
mkl_zdiamm(&transa, &m, &n, &k, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, &beta, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?diamm` routine performs a matrix-matrix operation defined as

*C := alpha*A*B + beta*C*

or

C := *alpha***A*'**B* + *beta***C*,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the diagonal format, *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *C* := *alpha***A***B* + *beta***C*, If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha***A*'**B* + *beta***C*.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for mkl_sdiamm. DOUBLE PRECISION for mkl_ddiamm. COMPLEX for mkl_cdiamm. DOUBLE COMPLEX for mkl_zdiamm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_sdiamm. DOUBLE PRECISION for mkl_ddiamm. COMPLEX for mkl_cdiamm. DOUBLE COMPLEX for mkl_zdiamm. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*. Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag	INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.
b	REAL for mkl_sdiamm. DOUBLE PRECISION for mkl_ddiamm. COMPLEX for mkl_cdiamm. DOUBLE COMPLEX for mkl_zdiamm. Array, DIMENSION (*ldb*, *n*). On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
beta	REAL for mkl_sdiamm. DOUBLE PRECISION for mkl_ddiamm. COMPLEX for mkl_cdiamm. DOUBLE COMPLEX for mkl_zdiamm. Specifies the scalar *beta*.
c	REAL for mkl_sdiamm. DOUBLE PRECISION for mkl_ddiamm. COMPLEX for mkl_cdiamm. DOUBLE COMPLEX for mkl_zdiamm. Array, DIMENSION (*ldc*, *n*). On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha***A***B* + *beta***C*) or (*alpha***A*'**B* + *beta***C*).

Interfaces

FORTRAN 77:

```

MKL_Complex16 *b, int *ldb, MKL_Complex16 *beta, MKL_Complex16 *c, int *ldc);
```

mkl_?skymm

Computes matrix-matrix product of a sparse matrix stored using the skyline storage scheme with one-based indexing.

Syntax

Fortran:

```
call mkl_sskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
call mkl_dskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
call mkl_cskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
call mkl_zskymm(transa, m, n, k, alpha, matdescra, val, pntr, b, ldb, beta, c, ldc)
```

C:

```
mkl_sskymm(&transa, &m, &n, &k, &alpha, matdescra, val, pntr, b, &ldb, &beta, c, &ldc);
mkl_dskymm(&transa, &m, &n, &k, &alpha, matdescra, val, pntr, b, &ldb, &beta, c, &ldc);
mkl_cskymm(&transa, &m, &n, &k, &alpha, matdescra, val, pntr, b, &ldb, &beta, c, &ldc);
mkl_zskymm(&transa, &m, &n, &k, &alpha, matdescra, val, pntr, b, &ldb, &beta, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?skymm` routine performs a matrix-matrix operation defined as

*C := alpha*A*B + beta*C*

or

C := *alpha***A*'**B* + *beta***C*,

where:

alpha and *beta* are scalars,

B and *C* are dense matrices, *A* is an *m*-by-*k* sparse matrix in the skyline storage format, *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the operation. If *transa* = 'N' or 'n', then *C* := *alpha***A***B* + *beta***C*, If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha***A*'**B* + *beta***C*,
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
k	INTEGER. Number of columns of the matrix *A*.
alpha	REAL for mkl_sskymm. DOUBLE PRECISION for mkl_dskymm. COMPLEX for mkl_cskymm. DOUBLE COMPLEX for mkl_zskymm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 . **NOTE.** General matrices (*matdescra* (1)='G') is not supported.
val	REAL for mkl_sskymm. DOUBLE PRECISION for mkl_dskymm. COMPLEX for mkl_cskymm. DOUBLE COMPLEX for mkl_zskymm. Array containing the set of elements of the matrix *A* in the skyline profile form. If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*.

	If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*. Refer to *values* array description in Skyline Storage Scheme for more details.
pntr	INTEGER. Array of length (*m*+*m*) for lower triangle, and (*k*+*k*) for upper triangle. It contains the indices specifying in the *val* the positions of the first element in each row (column) of the matrix *A*. Refer to *pointers* array description in Skyline Storage Scheme for more details.
b	REAL for mkl_sskymm. DOUBLE PRECISION for mkl_dskymm. COMPLEX for mkl_cskymm. DOUBLE COMPLEX for mkl_zskymm. Array, DIMENSION (*ldb*, *n*). On entry with *transa* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
beta	REAL for mkl_sskymm. DOUBLE PRECISION for mkl_dskymm. COMPLEX for mkl_cskymm. DOUBLE COMPLEX for mkl_zskymm. Specifies the scalar *beta*.
c	REAL for mkl_sskymm. DOUBLE PRECISION for mkl_dskymm. COMPLEX for mkl_cskymm. DOUBLE COMPLEX for mkl_zskymm. Array, DIMENSION (*ldc*, *n*). On entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, otherwise the leading *k*-by-*n* part of the array *c* must contain the matrix *C*.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	Overwritten by the matrix (*alpha***A***B* + *beta***C*) or (*alpha***A*'**B* + *beta***C*).

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_sskymm(transa, m, n, k, alpha, matdescra, val, pntr, b,
 ldb, beta, c, ldc)

MKL_Complex16 *beta, MKL_Complex16 *c, int *ldc);
```

mkl_?diasm

Solves a system of linear matrix equations for a sparse matrix in the diagonal format with one-based indexing.

Syntax

Fortran:

```
call mkl_sdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
call mkl_ddiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
call mkl_cdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
call mkl_zdiasm(transa, m, n, alpha, matdescra, val, lval, idiag, ndiag, b, ldb, c, ldc)
```

C:

```
mkl_ddiasm(&transa, &m, &n, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, c,
&ldc);
mkl_ddiasm(&transa, &m, &n, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, c,
&ldc);
mkl_ddiasm(&transa, &m, &n, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, c,
&ldc);
mkl_ddiasm(&transa, &m, &n, &alpha, matdescra, val, &lval, idiag, &ndiag, b, &ldb, c,
&ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The mkl_?diasm routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the diagonal format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa	CHARACTER*1. Specifies the system of linear equations. If *transa* = 'N' or 'n', then *C* := *alpha**inv(*A*)**B*, If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha**inv(*A*')**B*.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *C*.
alpha	REAL for mkl_sdiasm. DOUBLE PRECISION for mkl_ddiasm. COMPLEX for mkl_cdiasm. DOUBLE COMPLEX for mkl_zdiasm. Specifies the scalar *alpha*.
matdescra	CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .
val	REAL for mkl_sdiasm. DOUBLE PRECISION for mkl_ddiasm. COMPLEX for mkl_cdiasm. DOUBLE COMPLEX for mkl_zdiasm. Two-dimensional array of size *lval* by *ndiag*, contains non-zero diagonals of the matrix *A*. Refer to *values* array description in Diagonal Storage Scheme for more details.
lval	INTEGER. Leading dimension of *val*, *lval*≥*m*. Refer to *lval* description in Diagonal Storage Scheme for more details.
idiag	INTEGER. Array of length *ndiag*, contains the distances between main diagonal and each non-zero diagonals in the matrix *A*.

NOTE. All elements of this array must be sorted in increasing order.

Refer to *distance* array description in Diagonal Storage Scheme for more details.

ndiag INTEGER. Specifies the number of non-zero diagonals of the matrix *A*.

b REAL for mkl_sdiasm.
DOUBLE PRECISION for mkl_ddiasm.
COMPLEX for mkl_cdiasm.
DOUBLE COMPLEX for mkl_zdiasm.
Array, DIMENSION (*ldb*, *n*).
On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.

ldb INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.

ldc INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c REAL for mkl_sdiasm.
DOUBLE PRECISION for mkl_ddiasm.
COMPLEX for mkl_cdiasm.
DOUBLE COMPLEX for mkl_zdiasm.
Array, DIMENSION (*ldc*, *n*).
The leading *m*-by-*n* part of the array *c* contains the matrix *C*.

Interfaces

```

mkl_?skysm

Solves a system of linear matrix equations for a sparse matrix stored using the skyline storage scheme with one-based indexing.

Syntax

Fortran:

```
call mkl_sskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_dskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_cskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
call mkl_zskysm(transa, m, n, alpha, matdescra, val, pntr, b, ldb, c, ldc)
```

C:

```
mkl_sskysm(&transa, &m, &n, &alpha, matdescra, val, pntr, b, &ldb, c, &ldc);
mkl_dskysm(&transa, &m, &n, &alpha, matdescra, val, pntr, b, &ldb, c, &ldc);
mkl_cskysm(&transa, &m, &n, &alpha, matdescra, val, pntr, b, &ldb, c, &ldc);
mkl_zskysm(&transa, &m, &n, &alpha, matdescra, val, pntr, b, &ldb, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?skysm` routine solves a system of linear equations with matrix-matrix operations for a sparse matrix in the skyline storage format:

C := *alpha**inv(*A*)**B*

or

C := *alpha**inv(*A*')**B*,

where:

alpha is scalar, *B* and *C* are dense matrices, *A* is a sparse upper or lower triangular matrix with unit or non-unit main diagonal, *A*' is the transpose of *A*.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

transa
CHARACTER*1. Specifies the system of linear equations.
If *transa* = 'N' or 'n', then *C* := *alpha**inv(*A*)**B*,
If *transa* = 'T' or 't' or 'C' or 'c', then *C* := *alpha**inv(*A*')**B*,

m
INTEGER. Number of rows of the matrix *A*.

n
INTEGER. Number of columns of the matrix *C*.

alpha
REAL for mkl_sskysm.
DOUBLE PRECISION for mkl_dskysm.
COMPLEX for mkl_cskysm.
DOUBLE COMPLEX for mkl_zskysm.
Specifies the scalar *alpha*.

matdescra
CHARACTER. Array of six elements, specifies properties of the matrix used for operation. Only first four array elements are used, their possible values are given in Table 2-6 . Possible combinations of element values of this parameter are given in Table 2-7 .

NOTE. General matrices (*matdescra* (1)='G') is not supported.

val
REAL for mkl_sskysm.
DOUBLE PRECISION for mkl_dskysm.
COMPLEX for mkl_cskysm.
DOUBLE COMPLEX for mkl_zskysm.
Array containing the set of elements of the matrix *A* in the skyline profile form.
If *matdescrsa*(2)= 'L', then *val* contains elements from the low triangle of the matrix *A*.
If *matdescrsa*(2)= 'U', then *val* contains elements from the upper triangle of the matrix *A*.
Refer to *values* array description in Skyline Storage Scheme for more details.

pntr	INTEGER. Array of length (*m*+*m*). It contains the indices specifying in the *val* the positions of the first non-zero element of each *i*-row (column) of the matrix *A* such that *pointers*(*i*)- *pointers*(1)+1. Refer to *pointers* array description in Skyline Storage Scheme for more details.
b	REAL for mkl_sskysm. DOUBLE PRECISION for mkl_dskysm. COMPLEX for mkl_cskysm. DOUBLE COMPLEX for mkl_zskysm. Array, DIMENSION (*ldb*, *n*). On entry the leading *m*-by-*n* part of the array *b* must contain the matrix *B*.
ldb	INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program.
ldc	INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program.

Output Parameters

c	REAL for mkl_sskysm. DOUBLE PRECISION for mkl_dskysm. COMPLEX for mkl_cskysm. DOUBLE COMPLEX for mkl_zskysm. Array, DIMENSION (*ldc*, *n*). The leading *m*-by-*n* part of the array *c* contains the matrix *C*.

  CHARACTER     matdescra(*)
  INTEGER       m, n, ldb, ldc
  INTEGER       pntr(*)
  DOUBLE COMPLEX        alpha
  DOUBLE COMPLEX        val(*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_sskysm(char *transa, int *m, int *n, float *alpha, char *matdescra,
float *val, int *pntr, float *b, int *ldb, float *c, int *ldc);
void mkl_dskysm(char *transa, int *m, int *n, double *alpha, char *matdescra,
double *val, int *pntr, double *b, int *ldb, double *c, int *ldc);
void mkl_cskysm(char *transa, int *m, int *n, MKL_Complex8 *alpha, char *matdescra,
MKL_Complex8 *val, int *pntr, MKL_Complex8 *b, int *ldb, MKL_Complex8 *c, int *ldc);
void mkl_zskysm(char *transa, int *m, int *n, MKL_Complex16 *alpha, char *matdescra,
MKL_Complex16 *val, int *pntr, MKL_Complex16 *b, int *ldb, MKL_Complex16 *c, int *ldc);
```

mkl_ddnscsr

Convert a sparse matrix in dense representation to the CSR format and vice versa.

Syntax

Fortran:

```
call mkl_ddnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
```

C:

```
mkl_ddnscsr(job, &m, &n, adns, &lda, acsr, ja, ia, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

This routine converts an sparse matrix stored as a rectangular m-by-n matrix *A* (dense representation) to the compressed sparse row (CSR) format (3-array variation) and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job — INTEGER
Array, contains the following conversion parameters:
job(1)
If *job*(1)=0, the rectangular matrix *A* is converted to the CSR format;
if *job*(1)=1, the rectangular matrix *A* is restored from the CSR format.
job(2)
If *job*(2)=0, zero-based indexing for the rectangular matrix *A* is used;
if *job*(2)=1, one-based indexing for the rectangular matrix *A* is used.
job(3)
If *job*(3)=0, zero-based indexing for the matrix in CSR format is used;
if *job*(3)=1, one-based indexing for the matrix in CSR format is used.

	job(4) If *job*(4)=0, *adns* is a lower triangular part of matrix *A*; If *job*(4)=1, *adns* is an upper triangular part of matrix *A*; If *job*(4)=2, *adns* is a whole matrix *A*. *job*(5) *job*(5)=*nzmax* - maximum number of the non-zero elements allowed if *job*(1)=0. *job*(6) - job indicator for conversion to CSR format. If *job*(6)=0, only array *ia* is generated for the output storage. If *job*(6)>0, arrays *acsr*, *ia*, *ja* are generated for the output storage.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *A*.
adns	(input/output)DOUBLE PRECISION. Array containing non-zero elements of the matrix *A*.
lda	(input/output)INTEGER. Specifies the first dimension of *adns* as declared in the calling (sub)program, must be at least max(1, *m*).
acsr	(input/output)DOUBLE PRECISION. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja	(input/output)INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia	(input/output)INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*I*) is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

Output Parameters

info	INTEGER. Integer info indicator only for restoring the matrix *A* from the CSR format. If *info*=0, the execution is successful. If *info*=*i*, the routine is interrupted processing the *i*-th row because there is no space in the arrays *adns* and *ja* according to the value *nzmax*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_ddnscsr(job, m, n, adns, lda, acsr, ja, ia, info)
  INTEGER       job(8)
  INTEGER       m, n, lda, info
  INTEGER      ja(*), ia(m+1)
  DOUBLE PRECISION       adns(*), acsr(*)
```

C:

```
void mkl_ddnscsr(int *job, int *m, int *n, double *adns,
int *lda, double *acsr, int *ja, int *ia, int *info);
```

mkl_dcsrcoo

Converts a sparse matrix in the CSR format to the coordinate format and vice versa.

Syntax

Fortran:

```
call mkl_dcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
```

C:

```
mkl_dcsrcoo(job, &n, acsr, ja, ia, &nnz, acoo, rowind, colind, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to coordinate format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job	INTEGER Array, contains the following conversion parameters: *job*(1) If *job*(1)=0, the matrix in the CSR format is converted to the coordinate format; if *job*(1)=1, the matrix in the coordinate format is converted to the CSR format. *job*(2)

If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;
if *job*(2)=1, one-based indexing for the matrix in CSR format is used.
job(3)
If *job*(3)=0, zero-based indexing for the matrix in coordinate format is used;
if *job*(3)=1, one-based indexing for the matrix in coordinate format is used.
job(5)
job(5)=*nzmax* - maximum number of the non-zero elements allowed if *job*(1)=0.
job(5)=*nnz* - sets number of the non-zero elements of the matrix *A* if *job*(1)=1.
job(6) - job indicator.
For conversion to the coordinate format:
If *job*(6)=1, only array *rowind* is filled in for the output storage.
If *job*(6)=2, arrays *rowind*, *colind* are filled in for the output storage.
If *job*(6)=3, all arrays *rowind*, *colind*, *acoo* are filled in for the output storage.
For conversion to the CSR format:
If *job*(6)=0, all arrays *acsr*, *ja*, *ia* are filled in for the output storage.
If *job*(6)=1, only array *ia* is filled in for the output storage.
If *job*(6)=2, then it is assumed that the routine already has been called with the *job*(6)=1, and the user allocated the required space for storing the output arrays *acsr* and *ja*.

n — INTEGER. Dimension of the matrix *A*.

acsr — (input/output) DOUBLE PRECISION.
Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja — (input/output) INTEGER. Array containing the column indices for each non-zero element of the matrix *A*.
Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia — (input/output) INTEGER. Array of length *n* + 1, containing indices of elements in the array *acsr*, such that *ia*(*I*) is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the last element *ia*(*n* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

acoo — (input/output) DOUBLE PRECISION.
Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

rowind — (input/output)INTEGER. Array of length *nnz*, contains the row indices for each non-zero element of the matrix *A*.
Refer to *rows* array description in Coordinate Format for more details.

colind	(input/output) INTEGER. Array of length *nnz*, contains the column indices for each non-zero element of the matrix *A*. Refer to *columns* array description in Coordinate Format for more details.

Output Parameters

nnz	INTEGER. Specifies the number of non-zero element of the matrix *A*. Refer to *nnz* description in Coordinate Format for more details.
info	INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format. If *info*=0, the execution is successful. If *info*=1, the routine is interrupted because there is no space in the arrays *acoo*, *rowind*, *colind* according to the value *nzmax*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_dcsrcoo(job, n, acsr, ja, ia, nnz, acoo, rowind, colind, info)
  INTEGER      job(8)
  INTEGER      n, nnz, info
  INTEGER      ja(*), ia(n+1), rowind(*), colind(*)
  DOUBLE PRECISION       acsr(*), acoo(*)
```

C:

```
void mkl_dcsrcoo(int *job, int *n, double *acsr, int *ja,
int *ia, int *nnz, double *acoo, int *rowind, int *colind, int *info);
```

mkl_dcsrbsr

Converts a sparse matrix in the CSR format to the BSR format and vice versa.

Syntax

Fortran:

```
call mkl_dcsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
```

C:

```
mkl_dcsrbsr(job, &m, &mblk, &ldabsr, acsr, ja, ia, absr, jab, iab, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the block sparse row (BSR) format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job	INTEGER Array, contains the following conversion parameters: *job*(1) If *job*(1)=0, the matrix in the CSR format is converted to the BSR format; if *job*(1)=1, the matrix in the BSR format is converted to the CSR format. *job*(2) If *job*(2)=0, zero-based indexing for the matrix in CSR format is used; if *job*(2)=1, one-based indexing for the matrix in CSR format is used. *job*(3) If *job*(3)=0, zero-based indexing for the matrix in the BSR format is used; if *job*(3)=1, one-based indexing for the matrix in the BSR format is used. *job*(6) - job indicator. For conversion to the BSR format: If *job*(6)=0, only arrays *jab*, *iab* are generated for the output storage. If *job*(6)>0, all output arrays *absr*, *jab*, and *iab* are filled in for the output storage. If *job*(6)=-1, *iab*(1) returns the number of non-zero blocks. For conversion to the CSR format: If *job*(6)=0, only arrays *ja*, *ia* are generated for the output storage.
m	INTEGER. Actual row dimension of the matrix *A* for convert to the BSR format; block row dimension of the matrix *A* for convert to the CSR format.
mblk	INTEGER. Size of the block in the matrix *A*.
ldabsr	INTEGER. Leading dimension of the array *absr* as declared in the calling program. *ldabsr* must be greater than or equal to *mblk***mblk*.
acsr	(input/output) DOUBLE PRECISION. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja	(input/output) INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia	(input/output) INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*I*) is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the

	last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
absr	(input/output) DOUBLE PRECISION. Array containing elements of non-zero blocks of the matrix *A*. Its length is equal to the number of non-zero blocks in the matrix *A* multiplied by *mblk*mblk*. Refer to *values* array description in BSR Format for more details.
jab	(input/output) INTEGER. Array of length (*m* + 1), containing indices of block in the array *absr*, such that *ja*(*i*) is the index in the array *absr* of the first non-zero element from the *i*-th row . The value of the last element *jab*(*m* + 1) is equal to the number of non-zero blocks plus one. Refer to *rowIndex* array description in BSR Format for more details.
iab	(input/output) INTEGER. Array containing the column indices for each non-zero block of the matrix *A*. Its length is equal to the number of non-zero blocks of the matrix *A*. Refer to *columns* array description in BSR Format for more details.

Output Parameters

info	INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format. If *info*=0, the execution is successful. If *info*=1, it means that *mblk* is equal to 0. If *info*=2, it means that *ldabsr* is less than *mblk*mblk* and there is no space for all blocks.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_dcsrbsr(job, m, mblk, ldabsr, acsr, ja, ia, absr, jab, iab, info)
  INTEGER      job(8)
  INTEGER      m, mblk, ldabsr, info
  INTEGER      ja(*), ia(m+1), jab(*), iab(*)
  DOUBLE PRECISION       acsr(*), absr(ldabsr,*)
```

C:

```
void mkl_dcsrbsr(int *job, int *m, int *mblk, int *ldabsr, double *acsr, int *ja,
int *ia, double *absr, int *jab, int *iab, int *info);
```

mkl_dcsrcsc

Converts a square sparse matrix in the CSR format to the CSC format and vice versa.

Syntax

Fortran:

```
call mkl_dcsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
```

C:

```
mkl_dcsrcsc(job, &m, acsr, ja, ia, acsc, ja1, ia1, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

This routine converts a square sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the compressed sparse column (CSC) format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job INTEGER
Array, contains the following conversion parameters:
job(1)
If *job*(1)=0, the matrix in the CSR format is converted to the CSC format;
if *job*(1)=1, the matrix in the CSC format is converted to the CSR format.
job(2)
If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;
if *job*(2)=1, one-based indexing for the matrix in CSR format is used.
job(3)
If *job*(3)=0, zero-based indexing for the matrix in the CSC format is used;
if *job*(3)=1, one-based indexing for the matrix in the CSC format is used.
job(6) - job indicator.
For conversion to the CSC format:
If *job*(6)=0, only arrays *ja1*, *ia1* are filled in for the output storage.
If *job*(6)≠0, all output arrays *acsc*, *ja1*, and *ia1* are filled in for the output storage.
For conversion to the CSR format:
If *job*(6)=0, only arrays *ja*, *ia* are filled in for the output storage.
If *job*(6)≠0, all output arrays *acsr*, *ja*, and *ia* are filled in for the output storage.

m	INTEGER. Dimension of the square matrix *A*.
acsr	(input/output) DOUBLE PRECISION. Array containing non-zero elements of the square matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja	(input/output) INTEGER. Array containing the column indices for each non-zero element of the square matrix *A*. Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia	(input/output) INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*I*) is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
acsc	(input/output) DOUBLE PRECISION. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja1	(input/output) INTEGER. Array containing the row indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *acsc*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia1	(input/output) INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsc*, such that *ia1*(*I*) is the index in the array *acsc* of the first non-zero element from the column *I*. The value of the last element *ia1*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

Output Parameters

info	INTEGER. This parameter is not used now.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_dcsrcsc(job, m, acsr, ja, ia, acsc, ja1, ia1, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), ja1(*), ia1(m+1)
  DOUBLE PRECISION       acsr(*), acsc(*)
```

C:

```
void mkl_dcsrcsc(int *job, int *m, double *acsr, int *ja,
int *ia, double *acsc, int *ja1, int *ia1, int *info);
```

mkl_dcsrdia

Converts a sparse matrix in the CSR format to the diagonal format and vice versa.

Syntax

Fortran:

```
call mkl_dcsrdia(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem,
ia_rem, info)
```

C:

```
mkl_dcsrdia(job, &m, acsr, ja, ia, adia, &ngiag, distance, &idiag, acsr_rem, ja_rem,
ia_rem, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the diagonal format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job INTEGER
Array, contains the following conversion parameters:
job(1)
If *job*(1)=0, the matrix in the CSR format is converted to the diagonal format;
if *job*(1)=1, the matrix in the diagonal format is converted to the CSR format.
job(2)
If *job*(2)=0, zero-based indexing for the matrix in CSR format is used;
if *job*(2)=1, one-based indexing for the matrix in CSR format is used.
job(3)
If *job*(3)=0, zero-based indexing for the matrix in the diagonal format is used;
if *job*(3)=1, one-based indexing for the matrix in the diagonal format is used.
job(6) - job indicator.
For conversion to the diagonal format:

	If *job*(6)=0, diagonals are not selected internally, and *acsr_rem*, *ja_rem*, *ia_rem* are not filled in for the output storage. If *job*(6)=1, diagonals are not selected internally, and *acsr_rem*, *ja_rem*, *ia_rem* are filled in for the output storage. If *job*(6)=10, diagonals are selected internally, and *acsr_rem*, *ja_rem*, *ia_rem* are not filled in for the output storage. If *job*(6)=11, diagonals are selected internally, and *csr_rem*, *ja_rem*, *ia_rem* are filled in for the output storage. For conversion to the CSR format: If *job*(6)=0, each entry in the array *adia* is checked whether it is zero. Zero entries are not included in the array *acsr*. If *job*(6)≠0, each entry in the array *adia* is not checked whether it is zero.
m	INTEGER. Dimension of the matrix *A*.
acsr	(input/output) DOUBLE PRECISION. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja	(input/output) INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia	(input/output) INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*I*) is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
adia	(input/output) DOUBLE PRECISION. Array of size (*ndiag* x *idiag*) containing diagonals of the matrix *A*. The key point of the storage is that each element in the array *adia* retains the row number of the original matrix. To achieve this diagonals in the lower triangular part of the matrix are padded from the top, and those in the upper triangular part are padded from the bottom.
ndiag	INTEGER. Specifies the first dimension of the array *adia* as declared in the calling (sub)program, must be at least max(1, *m*).
distance	INTEGER. Array of length *idiag*, containing the distances between the main diagonal and each non-zero diagonal to be extracted. The distance is positive if the diagonal is above the main diagonal, and negative if the diagonal is below the main diagonal. The main diagonal has a distance equal to zero.
idiag	INTEGER. Number of diagonals to be extracted. For conversion to diagonal format on return this parameter may be modified.

acsr_rem, *ja_rem*, *ia_rem* Remainder of the matrix in the CSR format if it is needed for conversion to the diagonal format.

Output Parameters

info INTEGER. This parameter is not used now.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_dcsrcsc(job, m, acsr, ja, ia, adia, ndiag, distance, idiag, acsr_rem, ja_rem, ia_rem, info)
  INTEGER      job(8)
  INTEGER      m, info, ndiag, idiag
  INTEGER      ja(*), ia(m+1), distance(*), ja_rem(*), ia_rem(*)
  DOUBLE PRECISION       acsr(*), adia(*), acsr_rem(*)
```

C:

```
void mkl_dcsrdia(int *job, int *m, double *acsr, int *ja,
int *ia, double *adia, int *ndiag, int *distance, int *distance,
int *idiag, double *acsr_rem, int *ja_rem, int *ia_rem, int *info);
```

mkl_dcsrsky

Converts a sparse matrix in CSR format to the skyline format and vice versa.

Syntax

Fortran:

```
call mkl_dcsrsky(job, m, acsr, ja, ia, asky, pointers, info)
```

C:

```
mkl_dcsrsky(job, &m, acsr, ja, ia, asky, pointers, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

This routine converts a sparse matrix *A* stored in the compressed sparse row (CSR) format (3-array variation) to the skyline format and vice versa.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

job INTEGER

	Array, contains the following conversion parameters: *job*(1) If *job*(1)=0, the matrix in the CSR format is converted to the skyline format; if *job*(1)=1, the matrix in the skyline format is converted to the CSR format. *job*(2) If *job*(2)=0, zero-based indexing for the matrix in CSR format is used; if *job*(2)=1, one-based indexing for the matrix in CSR format is used. *job*(3) If *job*(3)=0, zero-based indexing for the matrix in the skyline format is used; if *job*(3)=1, one-based indexing for the matrix in the skyline format is used. *job*(4) For conversion to the skyline format: If *job*(4)=0, the upper part of the matrix *A* in the CSR format is converted. If *job*(4)=1, the lower part of the matrix *A* in the CSR format is converted. For conversion to the CSR format: If *job*(4)=0, the matrix is converted to the upper part of the matrix *A* in the CSR format. If *job*(4)=1, the matrix is converted to the lower part of the matrix *A* in the CSR format. *job*(5) *job*(5)=*nzmax* - maximum number od the non-zero elements of the matrix *A* if *job*(1)=0. *job*(6) - job indicator. Only for conversion to the skyline format: If *job*(6)=0, only arrays *pointers* is filled in for the output storage. If *job*(6)=1, all output arrays *asky* and *pointers* are filled in for the output storage.
m	INTEGER. Dimension of the matrix *A*.
acsr	(input/output) DOUBLE PRECISION. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja	(input/output) INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. Its length is equal to the length of the array *acsr*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia	(input/output) INTEGER. Array of length *m* + 1, containing indices of elements in the array *acsr*, such that *ia*(*I*) is the index in the array *acsr* of the first non-zero element from the row *I*. The value of the

last element *ia*(*m* + 1) is equal to the number of non-zeros plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

asky (input/output) DOUBLE PRECISION.
Array, for a lower triangular part of *A* it contains the set of elements from each row starting from the first none-zero element to and including the diagonal element. For an upper triangular matrix it contains the set of elements from each column of the matrix starting with the first non-zero element down to and including the diagonal element. Encountered zero elements are included in the sets. Refer to *values* array description in Skyline Storage Format for more details.

pointers (input/output) INTEGER.
Array with dimension (*m*+1), where *m* is number of rows for lower triangle (columns for upper triangle), *pointers*(*I*) - *pointers*(1)+1 gives the index of element in the array *asky* that is first non-zero element in row (column)*I* . The value of *pointers*(*m* +1) is set to*nnz* + *pointers*(1), where*nnz* is the number of elements in the array *asky*. Refer to *pointers* array description in Skyline Storage Format for more details

Output Parameters

info INTEGER. Integer info indicator only for converting the matrix *A* from the CSR format.
If *info*=0, the execution is successful.
If *info*=1, the routine is interrupted because there is no space in the array *asky* according to the value *nzmax*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_dcsrsky(job, m, acsr, ja, ia, asky, pointers, info)
  INTEGER      job(8)
  INTEGER      m, info
  INTEGER      ja(*), ia(m+1), pointers(m+1)
  DOUBLE PRECISION       acsr(*), asky(*)
```

C:

```
void mkl_dcsrsky(int *job, int *m, , double *acsr, int *ja,
     int *ia, double *asky, int *pointers, int *info);
```

mkl_?csradd

Computes the sum of two matrices stored in the CSR format (3-array variation) with one-based indexing.

Syntax

Fortran:

```
call mkl_scsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_dcsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_ccsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
call mkl_zcsradd(trans, request, sort, m, n, a, ja, ia, beta, b, jb, ib, c, jc, ic, nzmax, info)
```

C:

```
mkl_scsradd(&trans, &request, &sort, &m, &n, a, ja, ia, &beta, b, jb, ib, c, jc, ic, &nzmax, &info);
mkl_dcsradd(&trans, &request, &sort, &m, &n, a, ja, ia, &beta, b, jb, ib, c, jc, ic, &nzmax, &info);
mkl_ccsradd(&trans, &request, &sort, &m, &n, a, ja, ia, &beta, b, jb, ib, c, jc, ic, &nzmax, &info);
mkl_zcsradd(&trans, &request, &sort, &m, &n, a, ja, ia, &beta, b, jb, ib, c, jc, ic, &nzmax, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csradd` routine performs a matrix-matrix operation defined as

`C := A+beta*op(B)`

where:

A, *B*, *C* are the sparse matrices in the CSR format (3-array variation).

`op(B)` is one of `op(B) = B`, or `op(B) = B'`, or `op(A) = conjg(B')`

beta is a scalar.

The routine works correctly if and only if the column indices in sparse matrix representations of matrices *A* and *B* are arranged in the increasing order for each row. If not, use the parameter *sort* (see below) to reorder column indices and the corresponding elements of the input matrices.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

trans	CHARACTER*1. Specifies the operation. If *trans* = 'N' or 'n', then *C* := *A*+*beta***B* If *trans* = 'T' or 't' or 'C' or 'c', then *C* := *A*+*beta***B*'.
request	INTEGER. If *request*=0, the routine performs addition, the memory for the output arrays *ic*, *jc*, *c* must be allocated beforehand. If *request*=1, the routine computes only values of the array *ic* of length *m* + 1, the memory for this array must be allocated beforehand. On exit the value *ic*(*m*+1) - 1 is the actual number of the elements in the arrays *c* and *jc*. If *request*=2, the routine has been called previously with the parameter *request*=1, the output arrays *jc* and *c* are allocated in the calling program and they are of the length (*m*+1)-1 at least.
sort	INTEGER. Specifies the type of reordering. If this parameter is not set (default), the routine does not perform reordering. If *sort*=1, the routine arranges the column indices *ja* for each row in the increasing order and reorders the corresponding values of the matrix *A* in the array *a*. If *sort*=2, the routine arranges the column indices *jb* for each row in the increasing order and reorders the corresponding values of the matrix *B* in the array *b*. If *sort*=3, the routine performs reordering for both input matrices *A* and *B*.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *A*.
a	REAL for mkl_scsradd. DOUBLE PRECISION for mkl_dcsradd. COMPLEX for mkl_ccsradd. DOUBLE COMPLEX for mkl_zcsradd. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. For each row the column indices must be arranged in the increasing order. The length of this array is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1, containing indices of elements in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) is

	equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
beta	REAL for mkl_scsradd. DOUBLE PRECISION for mkl_dcsradd. COMPLEX for mkl_ccsradd. DOUBLE COMPLEX for mkl_zcsradd. Specifies the scalar *beta*.
b	REAL for mkl_scsradd. DOUBLE PRECISION for mkl_dcsradd. COMPLEX for mkl_ccsradd. DOUBLE COMPLEX for mkl_zcsradd. Array containing non-zero elements of the matrix *B*. Its length is equal to the number of non-zero elements in the matrix *B*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
jb	INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order. The length of this array is equal to the length of the array *b*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ib	INTEGER. Array of length *m* + 1 when *trans* = 'N' or 'n', or *n* + 1 otherwise. This array contains indices of elements in the array *b*, such that *ib*(*I*) is the index in the array *b* of the first non-zero element from the row *I*. The value of the last element *ib*(*m* + 1) or *ib*(*n* + 1) is equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
nzmax	INTEGER. The length of the arrays *c* and *jc*. This parameter is used only if *request*=0. The routine stops calculation if the number of elements in the result matrix *C* exceeds the specified value of *nzmax*.

Output Parameters

c	REAL for mkl_scsradd. DOUBLE PRECISION for mkl_dcsradd. COMPLEX for mkl_ccsradd. DOUBLE COMPLEX for mkl_zcsradd. Array containing non-zero elements of the result matrix *C*. Its length is equal to the number of non-zero elements in the matrix *C*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
jc	INTEGER. Array containing the column indices for each non-zero element of the matrix *C*.

	The length of this array is equal to the length of the array *c*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ic	INTEGER. Array of length *m* + 1, containing indices of elements in the array *c*, such that *ic*(*I*) is the index in the array *c* of the first non-zero element from the row *I*. The value of the last element *ic*(*m* + 1) is equal to the number of non-zero elements of the matrix *C* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
info	INTEGER. If *info*=0, the execution is successful. If *info*=*I*>0, the routine stops calculation in the *I*-th row of the matrix *C* because number of elements in *C* exceeds *nzmax*. If *info*=-1, the routine calculates only the size of the arrays *c* and *jc* and returns this value plus 1 as the last element of the array *ic*.

&nzmax, &info);

mkl_zcsrmultcsr(&trans, &request, &sort, &m, &n, &k, a, ja, ia, b, jb, ib, c, jc, ic,
&nzmax, &info);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The mkl_?csrmultcsr routine performs a matrix-matrix operation defined as

C := op(A)*B

where:

A, B, C are the sparse matrices in the CSR format (3-array variation);

op(A) is one of op(A) = A, or op(A) =A', or op(A) = conjg(A') .

The routine works correctly if and only if the column indices in sparse matrix representations of matrices A and B are arranged in the increasing order for each row. If not, use the parameter sort (see below) to reorder column indices and the corresponding elements of the input matrices.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

trans	CHARACTER*1. Specifies the operation. If *trans* = 'N' or 'n', then *C* := *A***B* If *trans* = 'T' or 't' or 'C' or 'c', then *C* := *A*'**B*.
request	INTEGER. If *request*=0, the routine performs multiplication, the memory for the output arrays *ic*, *jc*, *c* must be allocated beforehand. If *request*=1, the routine computes only values of the array *ic* of length *m* + 1, the memory for this array must be allocated beforehand. On exit the value *ic*(*m*+1) - 1 is the actual number of the elements in the arrays *c* and *jc*. If *request*=2, the routine has been called previously with the parameter *request*=1, the output arrays *jc* and *c* are allocated in the calling program and they are of the length *ic*(*m*+1) - 1 at least.
sort	INTEGER. Specifies the type of reordering. If this parameter is not set (default), the routine does not perform reordering. If *sort*=1, the routine arranges the column indices *ja* for each row in the increasing order and reorders the corresponding values of the matrix *A* in the array *a*. If *sort*=2, the routine arranges the column indices *jb* for each row in the increasing order and reorders the corresponding values of the matrix *B* in the array *b*. If *sort*=3, the routine performs reordering for both input matrices *A* and *B*.
m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *A*.
k	INTEGER. Number of columns of the matrix *B*.
a	REAL for mkl_scsrmultcsr.

DOUBLE PRECISION for mkl_dcsrmultcsr.
COMPLEX for mkl_ccsrmultcsr.
DOUBLE COMPLEX for mkl_zcsrmultcsr.
Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

ja INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. For each row the column indices must be arranged in the increasing order.
The length of this array is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ia INTEGER. Array of length *m* + 1 when *trans* = 'N' or 'n', or *n* + 1 otherwise.
This array contains indices of elements in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) or *ia*(*n* + 1) is equal to the number of non-zero elements of the matrix *A* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

b REAL for mkl_scsrmultcsr.
DOUBLE PRECISION for mkl_dcsrmultcsr.
COMPLEX for mkl_ccsrmultcsr.
DOUBLE COMPLEX for mkl_zcsrmultcsr.
Array containing non-zero elements of the matrix *B*. Its length is equal to the number of non-zero elements in the matrix *B*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

jb INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order.
The length of this array is equal to the length of the array *b*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ib INTEGER. Array of length *m* + 1.
This array contains indices of elements in the array *b*, such that *ib*(*I*) is the index in the array *b* of the first non-zero element from the row *I*. The value of the last element *ib*(*m* + 1) is equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

nzmax INTEGER. The length of the arrays *c* and *jc*.
This parameter is used only if *request*=0. The routine stops calculation if the number of elements in the result matrix *C* exceeds the specified value of *nzmax*.

Output Parameters

c REAL for mkl_scsrmultcsr.

DOUBLE PRECISION for mkl_dcsrmultcsr.
COMPLEX for mkl_ccsrmultcsr.
DOUBLE COMPLEX for mkl_zcsrmultcsr.
Array containing non-zero elements of the result matrix *C*. Its length is equal to the number of non-zero elements in the matrix *C*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.

jc INTEGER. Array containing the column indices for each non-zero element of the matrix *C*.
The length of this array is equal to the length of the array *c*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.

ic INTEGER. Array of length *m* + 1 when *trans* = 'N' or 'n', or *n* + 1 otherwise.
This array contains indices of elements in the array *c*, such that *ic*(*I*) is the index in the array *c* of the first non-zero element from the row *I*. The value of the last element *ic*(*m* + 1) or *ic*(*n* + 1) is equal to the number of non-zero elements of the matrix *C* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

info INTEGER.
If *info*=0, the execution is successful.
If *info*=*I*>0, the routine stops calculation in the *I*-th row of the matrix *C* because number of elements in *C* exceeds *nzmax*.
If *info*=-1, the routine calculates only the size of the arrays *c* and *jc* and returns this value plus 1 as the last element of the array *ic*.

```

mkl_?csrmultd

Computes product of two sparse matrices stored in the CSR format (3-array variation) with one-based indexing. The result is stored in the dense matrix.

Syntax

Fortran:

```
call mkl_scsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
call mkl_dcsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
call mkl_ccsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
call mkl_zcsrmultd(trans, m, n, k, a, ja, ia, b, jb, ib, c, ldc)
```

C:

```
mkl_scsrmultd(&trans, &m, &n, &k, a, ja, ia, b, jb, ib, c, &ldc);
mkl_dcsrmultd(&trans, &m, &n, &k, a, ja, ia, b, jb, ib, c, &ldc);
mkl_ccsrmultd(&trans, &m, &n, &k, a, ja, ia, b, jb, ib, c, &ldc);
mkl_zcsrmultd(&trans, &m, &n, &k, a, ja, ia, b, jb, ib, c, &ldc);
```

Description

This routine is declared in `mkl_spblas.fi` for FORTRAN 77 interface and in `mkl_spblas.h` for C interface.

The `mkl_?csrmultd` routine performs a matrix-matrix operation defined as

`C := op(A)*B`

where:

A, *B* are the sparse matrices in the CSR format (3-array variation), *C* is dense matrix;

`op(A)` is one of `op(A) = A`, or `op(A) =A'`, or `op(A) = conjg(A')` .

The routine works correctly if and only if the column indices in sparse matrix representations of matrices *A* and *B* are arranged in the increasing order for each row. If not, use the parameter *sort* (see below) to reorder column indices and the corresponding elements of the input matrices.

NOTE. This routine supports only one-based indexing of the input arrays.

Input Parameters

Parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

trans CHARACTER*1. Specifies the operation.
If *trans* = 'N' or 'n', then *C* := *A*B*
If *trans* = 'T' or 't' or 'C' or 'c', then *C* := *A'*B*.

m	INTEGER. Number of rows of the matrix *A*.
n	INTEGER. Number of columns of the matrix *A*.
k	INTEGER. Number of columns of the matrix *B*.
a	REAL for mkl_scsrmultd. DOUBLE PRECISION for mkl_dcsrmultd. COMPLEX for mkl_ccsrmultd. DOUBLE COMPLEX for mkl_zcsrmultd. Array containing non-zero elements of the matrix *A*. Its length is equal to the number of non-zero elements in the matrix *A*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
ja	INTEGER. Array containing the column indices for each non-zero element of the matrix *A*. For each row the column indices must be arranged in the increasing order. The length of this array is equal to the length of the array *a*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ia	INTEGER. Array of length *m* + 1 when *trans* = 'N' or 'n', or *n* + 1 otherwise. This array contains indices of elements in the array *a*, such that *ia*(*I*) is the index in the array *a* of the first non-zero element from the row *I*. The value of the last element *ia*(*m* + 1) or *ia*(*n* + 1) is equal to the number of non-zero elements of the matrix *A* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.
b	REAL for mkl_scsrmultd. DOUBLE PRECISION for mkl_dcsrmultd. COMPLEX for mkl_ccsrmultd. DOUBLE COMPLEX for mkl_zcsrmultd. Array containing non-zero elements of the matrix *B*. Its length is equal to the number of non-zero elements in the matrix *B*. Refer to *values* array description in Sparse Matrix Storage Formats for more details.
jb	INTEGER. Array containing the column indices for each non-zero element of the matrix *B*. For each row the column indices must be arranged in the increasing order. The length of this array is equal to the length of the array *b*. Refer to *columns* array description in Sparse Matrix Storage Formats for more details.
ib	INTEGER. Array of length *m* + 1. This array contains indices of elements in the array *b*, such that *ib*(*I*) is the index in the array *b* of the first non-zero element from the row *I*. The value of the last element *ib*(*m* + 1) is equal to the number of non-zero elements of the matrix *B* plus one. Refer to *rowIndex* array description in Sparse Matrix Storage Formats for more details.

Output Parameters

c	REAL for mkl_scsrmultd. DOUBLE PRECISION for mkl_dcsrmultd. COMPLEX for mkl_ccsrmultd. DOUBLE COMPLEX for mkl_zcsrmultd. Array containing non-zero elements of the result matrix *c*.
ldc	INTEGER. Specifies the first dimension of the dense matrix *c* as declared in the calling (sub)program. Must be at least max(*m*, 1) when *trans* = 'N' or 'n', or max(1, *n*) otherwise.

Interfaces

MKL_Complex16 *c, int *ldc);
```

BLAS-like Extensions

Intel MKL provides C and Fortran routines to perform certain data manipulation, including matrix in-place and out-of-place transposition operations combined with simple matrix arithmetic operations. Transposition operations are Copy As Is, Conjugate transpose, Transpose, and Conjugate. Each routine adds the possibility of scaling during the transposition operation by giving some *alpha* and/or *beta* parameters. Each routine supports both row-major orderings and column-major orderings.

There is also ?gemm3m, a routine that computes a matrix-matrix product of general complex matrices using matrix multiplication.

Table 2-10 lists these routines.

The <?> symbol in the routine short names is a precision prefix that indicates the data type:

s	REAL for Fortran interface, or `float` for C interface
d	DOUBLE PRECISION for Fortran interface, or `double` for C interface.
c	COMPLEX for Fortran interface, or `MKL_Complex8` for C interface.
z	DOUBLE COMPLEX for Fortran interface, or `MKL_Complex16` for C interface.

Table 2-10. BLAS-like Extensions

Routine	Data Types	Description
mkl_?imatcopy	s, d, c, z	Performs scaling and in-place transposition/copying of matrices.
mkl_?omatcopy	s, d, c, z	Performs scaling and out-of-place transposition/copying of matrices.
mkl_?omatcopy2	s, d, c, z	Performs two-strided scaling and out-of-place transposition/copying of matrices.
mkl_?omatadd	s, d, c, z	Performs scaling and sum of two matrices including their out-of-place transposition/copying.
?gemm3m	c, z	Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.

mkl_?imatcopy

Performs scaling and in-place transposition/copying of matrices.

Syntax

Fortran:

```
call mkl_simatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda)
call mkl_dimatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda)
call mkl_cimatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda)
call mkl_zimatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda)
```

C:

```
mkl_simatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda);
mkl_dimatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda);
mkl_cimatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda);
mkl_zimatcopy(ordering, trans, rows, cols, alpha, a, src_lda, dst_lda);
```

Description

This routine is declared in `mkl_trans.fi` for FORTRAN 77 interface and in `mkl_trans.h` for C interface. Always reference `mkl_trans.h` for C interface correct resolution.

The `mkl_?imatcopy` routine performs scaling and in-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

A := *alpha**op(*A*).

The routine parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

Note that different arrays should not overlap.

Input Parameters

ordering	CHARACTER*1. Ordering of the matrix storage. If *ordering* = 'R' or 'r', the ordering is row-major. If *ordering* = 'C' or 'c', the ordering is column-major.
trans	CHARACTER*1. Parameter that specifies the operation type. If *trans* = 'N' or 'n', op(*A*)=*A* and the matrix *A* is assumed unchanged on input. If *trans* = 'T' or 't', it is assumed that *A* should be transposed. If *trans* = 'C' or 'c', it is assumed that *A* should be conjugate transposed. If *trans* = 'R' or 'r', it is assumed that *A* should be only conjugated.

If the data is real, then *trans* = 'R' is the same as *trans* = 'N', and *trans* = 'C' is the same as *trans* = 'T'.

rows INTEGER. The number of matrix rows.

cols INTEGER. The number of matrix columns.

a REAL for mkl_simatcopy.
DOUBLE PRECISION for mkl_dimatcopy.
COMPLEX for mkl_cimatcopy.
DOUBLE COMPLEX for mkl_zimatcopy.
Array, DIMENSION *a*(*scr_lda*,*).

alpha REAL for mkl_simatcopy.
DOUBLE PRECISION for mkl_dimatcopy.
COMPLEX for mkl_cimatcopy.
DOUBLE COMPLEX for mkl_zimatcopy.
This parameter scales the input matrix by *alpha*.

src_lda INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix; measured in the number of elements.
This parameter must be at least max(1,*rows*) if *ordering* = 'C' or 'c', and max(1,*cols*) otherwise.

dst_lda INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix; measured in the number of elements.
To determine the minimum value of *dst_lda* on output, consider the following guideline:
If *ordering* = 'C' or 'c', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*rows*)
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*cols*)

If *ordering* = 'R' or 'r', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*cols*)
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*rows*)

Output Parameters

a REAL for mkl_simatcopy.
DOUBLE PRECISION for mkl_dimatcopy.
COMPLEX for mkl_cimatcopy.
DOUBLE COMPLEX for mkl_zimatcopy.

Array, DIMENSION at least *m*.
Contains the matrix *A*.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_simatcopy ( ordering, trans, rows, cols, alpha, a, src_lda, dst_lda )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   REAL a(*), alpha*

SUBROUTINE mkl_dimatcopy ( ordering, trans, rows, cols, alpha, a, src_lda, dst_lda )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   DOUBLE PRECISION a(*), alpha*

SUBROUTINE mkl_cimatcopy ( ordering, trans, rows, cols, alpha, a, src_lda, dst_lda )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   COMPLEX a(*), alpha*

SUBROUTINE mkl_zimatcopy ( ordering, trans, rows, cols, alpha, a, src_lda, dst_lda )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   DOUBLE COMPLEX a(*), alpha*
```

C:

```
void mkl_simatcopy(char ordering, char trans, size_t rows, size_t cols, float *alpha, float *a, size_t
src_lda, size_t dst_lda);

void mkl_dimatcopy(char ordering, char trans, size_t rows, size_t cols, double *alpha, float *a, size_t
src_lda, size_t dst_lda);

void mkl_cimatcopy(char ordering, char trans, size_t rows, size_t cols, MKL_Complex8 *alpha, MKL_Complex8
*a, size_t src_lda, size_t dst_lda);

void mkl_zimatcopy(char ordering, char trans, size_t rows, size_t cols, MKL_Complex16 *alpha, MKL_Complex16
 *a, size_t src_lda, size_t dst_lda);
```

mkl_?omatcopy

Performs scaling and out-place transposition/copying of matrices.

Syntax

Fortran:

```
call mkl_somatcopy(ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld)

call mkl_domatcopy(ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld)

call mkl_comatcopy(ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld)

call mkl_zomatcopy(ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld)
```

C:

```
mkl_somatcopy(ordering, trans, rows, cols, alpha, SRC, src_stride, DST, dst_stride);
mkl_domatcopy(ordering, trans, rows, cols, alpha, SRC, src_stride, DST, dst_stride);
mkl_comatcopy(ordering, trans, rows, cols, alpha, SRC, src_stride, DST, dst_stride);
mkl_zomatcopy(ordering, trans, rows, cols, alpha, SRC, src_stride, DST, dst_stride);
```

Description

This routine is declared in `mkl_trans.fi` for FORTRAN 77 interface and in `mkl_trans.h` for C interface. Always reference `mkl_trans.h` for C interface correct resolution.

The `mkl_?omatcopy` routine performs scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

B := *alpha**op(*A*)

The routine parameter descriptions are common for all implemented interfaces with the exception of data types that mostly refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

Note that different arrays should not overlap.

Input Parameters

ordering	CHARACTER*1. Ordering of the matrix storage. If *ordering* = 'R' or 'r', the ordering is row-major. If *ordering* = 'C' or 'c', the ordering is column-major.
trans	CHARACTER*1. Parameter that specifies the operation type. If *trans* = 'N' or 'n', op(*A*)=*A* and the matrix *A* is assumed unchanged on input. If *trans* = 'T' or 't', it is assumed that *A* should be transposed. If *trans* = 'C' or 'c', it is assumed that *A* should be conjugate transposed. If *trans* = 'R' or 'r', it is assumed that *A* should be only conjugated. If the data is real, then *trans* = 'R' is the same as *trans* = 'N', and *trans* = 'C' is the same as *trans* = 'T'.
rows	INTEGER. The number of matrix rows.
cols	INTEGER. The number of matrix columns.
alpha	REAL for mkl_somatcopy. DOUBLE PRECISION for mkl_domatcopy. COMPLEX for mkl_comatcopy. DOUBLE COMPLEX for mkl_zomatcopy. This parameter scales the input matrix by *alpha*.
src	REAL for mkl_somatcopy. DOUBLE PRECISION for mkl_domatcopy. COMPLEX for mkl_comatcopy. DOUBLE COMPLEX for mkl_zomatcopy.

Array, DIMENSION *src*(*scr_ld*,*).

src_ld INTEGER. (Fortran interface). Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix; measured in the number of elements.
This parameter must be at least max(1,*rows*) if *ordering* = 'C' or 'c', and max(1,*cols*) otherwise.

src_stride INTEGER. (C interface). Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix; measured in the number of elements.
This parameter must be at least max(1,*rows*) if *ordering* = 'C' or 'c', and max(1,*cols*) otherwise.

dst REAL for mkl_somatcopy.
DOUBLE PRECISION for mkl_domatcopy.
COMPLEX for mkl_comatcopy.
DOUBLE COMPLEX for mkl_zomatcopy.
Array, DIMENSION *dst*(*dst_ld*,*).

dst_ld INTEGER. (Fortran interface). Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix; measured in the number of elements.
To determine the minimum value of *dst_lda* on output, consider the following guideline:
If *ordering* = 'C' or 'c', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*rows*)
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*cols*)

If *ordering* = 'R' or 'r', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*cols*)
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*rows*)

dst_stride INTEGER. (C interface). Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix; measured in the number of elements.
To determine the minimum value of *dst_lda* on output, consider the following guideline:
If *ordering* = 'C' or 'c', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*rows*)

- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*cols*)

If *ordering* = 'R' or 'r', then

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*cols*)
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*rows*)

Output Parameters

dst REAL for mkl_somatcopy.
DOUBLE PRECISION for mkl_domatcopy.
COMPLEX for mkl_comatcopy.
DOUBLE COMPLEX for mkl_zomatcopy.
Array, DIMENSION at least *m*.
Contains the destination matrix.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_somatcopy ( ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_ld, dst_ld
   REAL alpha, dst(dst_ld,*), src(src_ld,*)

SUBROUTINE mkl_domatcopy ( ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_lda, dst_lda
   DOUBLE PRECISION alpha, dst(dst_ld,*), src(src_ld,*)

SUBROUTINE mkl_comatcopy ( ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_lda, dst_lda
   COMPLEX alpha, dst(dst_ld,*), src(src_ld,*)

SUBROUTINE mkl_zomatcopy ( ordering, trans, rows, cols, alpha, src, src_ld, dst, dst_ld )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_lda, dst_lda
   DOUBLE COMPLEX alpha, dst(dst_ld,*), src(src_ld,*)
```

C:

```
void mkl_somatcopy(char ordering, char trans, size_t rows, size_t cols, float alpha, float *SRC, size_t
src_stride, float *DST, size_t dst_stride);

void mkl_domatcopy(char ordering, char trans, size_t rows, size_t cols, double alpha, double *SRC, size_t
src_stride, double *DST, size_t dst_stride);

void mkl_comatcopy(char ordering, char trans, size_t rows, size_t cols, MKL_Complex8 alpha, MKL_Complex8
*SRC, size_t src_stride, MKL_Complex8 *DST, size_t dst_stride);

void mkl_zomatcopy(char ordering, char trans, size_t rows, size_t cols, MKL_Complex16 alpha, MKL_Complex16
 *SRC, size_t src_stride, MKL_Complex16 *DST, size_t dst_stride);
```

mkl_?omatcopy2

Performs two-strided scaling and out-of-place transposition/copying of matrices.

Syntax

Fortran:

```
call mkl_somatcopy2(ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col)
call mkl_domatcopy2(ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col)
call mkl_comatcopy2(ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col)
call mkl_zomatcopy2(ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col)
```

C:

```
mkl_somatcopy2(ordering, trans, rows, cols, alpha, SRC, src_row, src_col, DST, dst_row, dst_col);
mkl_domatcopy2(ordering, trans, rows, cols, alpha, SRC, src_row, src_col, DST, dst_row, dst_col);
mkl_comatcopy2(ordering, trans, rows, cols, alpha, SRC, src_row, src_col, DST, dst_row, dst_col);
mkl_zomatcopy2(ordering, trans, rows, cols, alpha, SRC, src_row, src_col, DST, dst_row, dst_col);
```

Description

This routine is declared in `mkl_trans.fi` for FORTRAN 77 interface and in `mkl_trans.h` for C interface. Always reference `mkl_trans.h` for C interface correct resolution.

The `mkl_?omatcopy2` routine performs two-strided scaling and out-of-place transposition/copying of matrices. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The operation is defined as follows:

B := *alpha**op(*A*)

Normally, matrices in the BLAS or LAPACK are specified by a single stride index. For instance, in the column-major order, *A*(2,1) is stored in memory one element away from *A*(1,1), but *A*(1,2) is a leading dimension away. The leading dimension in this case is the single stride. If a matrix has two strides, then both *A*(2,1) and *A*(1,2) may be an arbitrary distance from *A*(1,1).

The routine parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

Note that different arrays should not overlap.

Input Parameters

ordering	CHARACTER*1. Ordering of the matrix storage. If *ordering* = 'R' or 'r', the ordering is row-major. If *ordering* = 'C' or 'c', the ordering is column-major.
trans	CHARACTER*1. Parameter that specifies the operation type. If *trans* = 'N' or 'n', op(*A*)=*A* and the matrix *A* is assumed unchanged on input. If *trans* = 'T' or 't', it is assumed that *A* should be transposed. If *trans* = 'C' or 'c', it is assumed that *A* should be conjugate transposed. If *trans* = 'R' or 'r', it is assumed that *A* should be only conjugated. If the data is real, then *trans* = 'R' is the same as *trans* = 'N', and *trans* = 'C' is the same as *trans* = 'T'.
rows	INTEGER. The number of matrix rows.
cols	INTEGER. The number of matrix columns.
alpha	REAL for mkl_somatcopy2. DOUBLE PRECISION for mkl_domatcopy2. COMPLEX for mkl_comatcopy2. DOUBLE COMPLEX for mkl_zomatcopy2. This parameter scales the input matrix by *alpha*.
src	REAL for mkl_somatcopy2. DOUBLE PRECISION for mkl_domatcopy2. COMPLEX for mkl_comatcopy2. DOUBLE COMPLEX for mkl_zomatcopy2. Array, DIMENSION *src*(*).
src_row	INTEGER. Distance between the first elements in adjacent rows in the source matrix; measured in the number of elements. This parameter must be at least max(1,*rows*).
src_col	INTEGER. Distance between the first elements in adjacent columns in the source matrix; measured in the number of elements. This parameter must be at least max(1,*cols*).
dst	REAL for mkl_somatcopy2. DOUBLE PRECISION for mkl_domatcopy2. COMPLEX for mkl_comatcopy2. DOUBLE COMPLEX for mkl_zomatcopy2. Array, DIMENSION *dst*(*).
dst_row	INTEGER. Distance between the first elements in adjacent rows in the destination matrix; measured in the number of elements. To determine the minimum value of *dst_row* on output, consider the following guideline: • If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*cols*) • If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*rows*)

dst_col INTEGER. Distance between the first elements in adjacent columns in the destination matrix; measured in the number of elements.
To determine the minimum value of *dst_lda* on output, consider the following guideline:

- If *trans* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*rows*)
- If *trans* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*cols*)

Output Parameters

dst REAL for mkl_somatcopy2.
DOUBLE PRECISION for mkl_domatcopy2.
COMPLEX for mkl_comatcopy2.
DOUBLE COMPLEX for mkl_zomatcopy2.
Array, DIMENSION at least *m*.
Contains the destination matrix.

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_somatcopy2 ( ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col
 )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_row, src_col, dst_row, dst_col
   REAL  alpha, dst(*), src(*)

SUBROUTINE mkl_domatcopy2 ( ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col
 )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_row, src_col, dst_row, dst_col
   DOUBLE PRECISION alpha, dst(*), src(*)

SUBROUTINE mkl_comatcopy2 ( ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col
 )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_row, src_col, dst_row, dst_col
   COMPLEX alpha, dst(*), src(*)

SUBROUTINE mkl_zomatcopy2 ( ordering, trans, rows, cols, alpha, src, src_row, src_col, dst, dst_row, dst_col
 )
   CHARACTER*1 ordering, trans
   INTEGER rows, cols, src_row, src_col, dst_row, dst_col
   DOUBLE COMPLEX alpha, dst(*), src(*)
```

C:

```
void mkl_somatcopy2(char ordering, char trans, size_t rows, size_t cols, float *alpha, float *SRC, size_t
src_row, size_t src_col, float *DST, size_t dst_row, size_t dst_col);

void mkl_domatcopy2(char ordering, char trans, size_t rows, size_t cols, float *alpha, double *SRC, size_t
 src_row, size_t src_col, double *DST, size_t dst_row, size_t dst_col);

void mkl_comatcopy2(char ordering, char trans, size_t rows, size_t cols, MKL_Complex8 *alpha, MKL_Complex8
 *SRC, size_t src_row, size_t src_col, MKL_Complex8 *DST, size_t dst_row, size_t dst_col);

void mkl_zomatcopy2(char ordering, char trans, size_t rows, size_t cols, MKL_Complex16 *alpha, MKL_Complex16
 *SRC, size_t src_row, size_t src_col, MKL_Complex16 *DST, size_t dst_row, size_t dst_col);
```

mkl_?omatadd

Performs scaling and sum of two matrices including their out-of-place transposition/copying.

Syntax

Fortran:

```
call mkl_somatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)

call mkl_domatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)

call mkl_comatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)

call mkl_zomatadd(ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc)
```

C:

```
mkl_somatadd(ordering, transa, transb, m, n, alpha, A, lda, beta, B, ldb, C, ldc);

mkl_domatadd(ordering, transa, transb, m, n, alpha, A, lda, beta, B, ldb, C, ldc);

mkl_comatadd(ordering, transa, transb, m, n, alpha, A, lda, beta, B, ldb, C, ldc);

mkl_zomatadd(ordering, transa, transb, m, n, alpha, A, lda, beta, B, ldb, C, ldc);
```

Description

This routine is declared in `mkl_trans.fi` for FORTRAN 77 interface and in `mkl_trans.h` for C interface. Always reference `mkl_trans.h` for C interface correct resolution.

The `mkl_?omatadd` routine scaling and sum of two matrices including their out-of-place transposition/copying. A transposition operation can be a normal matrix copy, a transposition, a conjugate transposition, or just a conjugation. The following out-of-place memory movement is done:

```
C := alpha*op(A) + beta*op(B)
```

`op(A)` is either transpose, conjugate-transpose, or leave alone depending on *transa*. If no transposition of the source matrices is required, *m* is the number of rows and *n* is the number of columns in the source matrices *A* and *B*. In this case, the output matrix *C* is *m*-by-*n*.

The routine parameter descriptions are common for all implemented interfaces with the exception of data types that refer here to the FORTRAN 77 standard types. Data types specific to the different interfaces are described in the section **"Interfaces"** below.

Note that different arrays should not overlap.

Input Parameters

ordering	CHARACTER*1. Ordering of the matrix storage. If *ordering* = 'R' or 'r', the ordering is row-major. If *ordering* = 'C' or 'c', the ordering is column-major.
transa	CHARACTER*1. Parameter that specifies the operation type on matrix *A*. If *transa* = 'N' or 'n', op(*A*)=*A* and the matrix *A* is assumed unchanged on input. If *transa* = 'T' or 't', it is assumed that *A* should be transposed. If *transa* = 'C' or 'c', it is assumed that *A* should be conjugate transposed. If *transa* = 'R' or 'r', it is assumed that *A* should be only conjugated. If the data is real, then *transa* = 'R' is the same as *transa* = 'N', and *transa* = 'C' is the same as *transa* = 'T'.
transb	CHARACTER*1. Parameter that specifies the operation type on matrix *B*. If *transb* = 'N' or 'n', op(*B*)=*B* and the matrix *B* is assumed unchanged on input. If *transb* = 'T' or 't', it is assumed that *B* should be transposed. If *transb* = 'C' or 'c', it is assumed that *B* should be conjugate transposed. If *transb* = 'R' or 'r', it is assumed that *B* should be only conjugated. If the data is real, then *transb* = 'R' is the same as *transb* = 'N', and *transb* = 'C' is the same as *transb* = 'T'.
m	INTEGER. The number of matrix rows.
n	INTEGER. The number of matrix columns.
alpha	REAL for mkl_somatadd. DOUBLE PRECISION for mkl_domatadd. COMPLEX for mkl_comatadd. DOUBLE COMPLEX for mkl_zomatadd. This parameter scales the input matrix by *alpha*.
a	REAL for mkl_somatadd. DOUBLE PRECISION for mkl_domatadd. COMPLEX for mkl_comatadd. DOUBLE COMPLEX for mkl_zomatadd. Array, DIMENSION *a*(*lda*,*).
lda	INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix *A*; measured in the number of elements. This parameter must be at least max(1,*rows*) if *ordering* = 'C' or 'c', and max(1,*cols*) otherwise.
beta	REAL for mkl_somatadd.

	DOUBLE PRECISION for mkl_domatadd. COMPLEX for mkl_comatadd. DOUBLE COMPLEX for mkl_zomatadd. This parameter scales the input matrix by *beta*.
b	REAL for mkl_somatadd. DOUBLE PRECISION for mkl_domatadd. COMPLEX for mkl_comatadd. DOUBLE COMPLEX for mkl_zomatadd. Array, DIMENSION *b*(*ldb*,*).
ldb	INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the source matrix *B*; measured in the number of elements. This parameter must be at least max(1,*rows*) if *ordering* = 'C' or 'c', and max(1,*cols*) otherwise.

Output Parameters

c	REAL for mkl_somatadd. DOUBLE PRECISION for mkl_domatadd. COMPLEX for mkl_comatadd. DOUBLE COMPLEX for mkl_zomatadd. Array, DIMENSION *c*(*ldc*,*).

ldc	INTEGER. Distance between the first elements in adjacent columns (in the case of the column-major order) or rows (in the case of the row-major order) in the destination matrix *C*; measured in the number of elements.
	To determine the minimum value of *ldc*, consider the following guideline:
	If *ordering* = 'C' or 'c', then
	• If *transa* or *transb* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*rows*)
	• If *transa* or *transb* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*cols*)
	If *ordering* = 'R' or 'r', then
	• If *transa* or *transb* = 'T' or 't' or 'C' or 'c', this parameter must be at least max(1,*cols*)
	• If *transa* or *transb* = 'N' or 'n' or 'R' or 'r', this parameter must be at least max(1,*rows*)

Interfaces

FORTRAN 77:

```
SUBROUTINE mkl_somatadd ( ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc )
   CHARACTER*1 ordering, transa, transb
   INTEGER m, n, lda, ldb, ldc
   REAL alpha, beta
   REAL a(lda,*), b(ldb,*), c(ldc,*)

SUBROUTINE mkl_domatadd ( ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc )
   CHARACTER*1 ordering, transa, transb
   INTEGER m, n, lda, ldb, ldc
   DOUBLE PRECISION alpha, beta
   DOUBLE PRECISION a(lda,*), b(ldb,*), c(ldc,*)

SUBROUTINE mkl_comatadd ( ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc )
   CHARACTER*1 ordering, transa, transb
   INTEGER m, n, lda, ldb, ldc
   COMPLEX alpha, beta
   COMPLEX a(lda,*), b(ldb,*), c(ldc,*)

SUBROUTINE mkl_zomatadd ( ordering, transa, transb, m, n, alpha, a, lda, beta, b, ldb, c, ldc )
   CHARACTER*1 ordering, transa, transb
   INTEGER m, n, lda, ldb, ldc
   DOUBLE COMPLEX alpha, beta
   DOUBLE COMPLEX a(lda,*), b(ldb,*), c(ldc,*)
```

C:

```
void mkl_somatadd(char ordering, char transa, char transb, size_t m, size_t n, float *alpha, float *A, size_t
 lda, float *beta, float *B, size_t ldb, float *C, size_t ldc);

void mkl_domatadd(char ordering, char transa, char transb, size_t m, size_t n, double *alpha, double *A,
size_t lda, double *beta, float *B, size_t ldb, double *C, size_t ldc);

void mkl_comatadd(char ordering, char transa, char transb, size_t m, size_t n,
 MKL_Complex8 *alpha, MKL_Complex8 *A, size_t lda, float *beta, float *B, size_t ldb, MKL_Complex8 *C, size_t
 ldc);

void mkl_zomatadd(char ordering, char transa, char transb, size_t m, size_t n,
 MKL_Complex16 *alpha, MKL_Complex16 *A, size_t lda, float *beta, float *B, size_t ldb, MKL_Complex16 *C,
size_t ldc);
```

?gemm3m

Computes a scalar-matrix-matrix product using matrix multiplications and adds the result to a scalar-matrix product.

Syntax

FORTRAN 77:

```
call cgemm3m(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)

call zgemm3m(transa, transb, m, n, k, alpha, a, lda, b, ldb, beta, c, ldc)
```

Fortran 95:

```
call gemm3m(a, b, c [,transa][,transb] [,alpha][,beta])
```

Description

This routine is declared in `mkl_blas.fi` for FORTRAN 77 interface, in `blas.f90` for Fortran 95 interface, and in `mkl_blas.h` for C interface.

The `?gemm3m` routines perform a matrix-matrix operation with general complex matrices. These routines are similar to the `?gemm` routines, but they use matrix multiplications(see *Application Notes* below).

The operation is defined as

`C := alpha*op(A)*op(B) + beta*C`,

where:

`op(x)` is one of `op(x) = x`, or `op(x) = x'`, or `op(x) = conjg(x')`,

alpha and *beta* are scalars,

A, *B* and *C* are matrices:

`op(A)` is an *m*-by-*k* matrix,

`op(B)` is a *k*-by-*n* matrix,

C is an *m*-by-*n* matrix.

Input Parameters

transa	CHARACTER*1. Specifies the form of `op(A)` used in the matrix multiplication: if *transa* = 'N' or 'n', then `op(A) = A`; if *transa* = 'T' or 't', then `op(A) = A'`; if *transa* = 'C' or 'c', then `op(A) = conjg(A')`.
transb	CHARACTER*1. Specifies the form of `op(B)` used in the matrix multiplication: if *transb* = 'N' or 'n', then `op(B) = B`; if *transb* = 'T' or 't', then `op(B) = B'`; if *transb* = 'C' or 'c', then `op(B) = conjg(B')`.
m	INTEGER. Specifies the number of rows of the matrix `op(A)` and of the matrix *C*. The value of `m` must be at least zero.
n	INTEGER. Specifies the number of columns of the matrix `op(B)` and the number of columns of the matrix *C*. The value of *n* must be at least zero.
k	INTEGER. Specifies the number of columns of the matrix `op(A)` and the number of rows of the matrix `op(B)`. The value of *k* must be at least zero.
alpha	COMPLEX for cgemm3m DOUBLE COMPLEX for zgemm3m Specifies the scalar *alpha*.
a	COMPLEX for cgemm3m

DOUBLE COMPLEX for zgemm3m
Array, DIMENSION (*lda*, *ka*), where *ka* is *k* when *transa*= 'N' or 'n', and is *m* otherwise. Before entry with *transa*= 'N' or 'n', the leading *m*-by-*k* part of the array *a* must contain the matrix *A*, otherwise the leading *k*-by-*m* part of the array *a* must contain the matrix *A*.

lda — INTEGER. Specifies the first dimension of *a* as declared in the calling (sub)program. When *transa*= 'N' or 'n', then *lda* must be at least max(1, *m*), otherwise *lda* must be at least max(1, *k*).

b — COMPLEX for cgemm3m
DOUBLE COMPLEX for zgemm3m
Array, DIMENSION (*ldb*, *kb*), where *kb* is *n* when *transb* = 'N' or 'n', and is *k* otherwise. Before entry with *transb* = 'N' or 'n', the leading *k*-by-*n* part of the array *b* must contain the matrix *B*, otherwise the leading *n*-by-*k* part of the array *b* must contain the matrix *B*.

ldb — INTEGER. Specifies the first dimension of *b* as declared in the calling (sub)program. When *transb* = 'N' or 'n', then *ldb* must be at least max(1, *k*), otherwise *ldb* must be at least max(1, *n*).

beta — COMPLEX for cgemm3m
DOUBLE COMPLEX for zgemm3m
Specifies the scalar *beta*.
When *beta* is equal to zero, then *c* need not be set on input.

c — COMPLEX for cgemm3m
DOUBLE COMPLEX for zgemm3m
Array, DIMENSION (*ldc*, *n*).
Before entry, the leading *m*-by-*n* part of the array *c* must contain the matrix *C*, except when *beta* is equal to zero, in which case *c* need not be set on entry.

ldc — INTEGER. Specifies the first dimension of *c* as declared in the calling (sub)program. The value of *ldc* must be at least max(1, *m*).

Output Parameters

c — Overwritten by the *m*-by-*n* matrix (*alpha**op(*A*)*op(*B*) + *beta***C*).

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gemm3m interface are the following:

a — Holds the matrix *A* of size (*ma*,*ka*) where
ka = *k* if *transa*= 'N',
ka = *m* otherwise,
ma = *m* if *transa*= 'N',
ma = *k* otherwise.

b — Holds the matrix *B* of size (*mb*,*kb*) where

	kb = *n* if *transb* = 'N', *kb* = *k* otherwise, *mb* = *k* if *transb* = 'N', *mb* = *n* otherwise.
c	Holds the matrix *C* of size (*m*,*n*).
transa	Must be 'N', 'C', or 'T'. The default value is 'N'.
transb	Must be 'N', 'C', or 'T'. The default value is 'N'.
alpha	The default value is 1.
beta	The default value is 1.

Application Notes

These routines perform the complex multiplication by forming the real and imaginary parts of the input matrices. It allows to use three real matrix multiplications and five real matrix additions, instead of the conventional four real matrix multiplications and two real matrix additions. The use of three real matrix multiplications only gives a 25% reduction of time in matrix operations. This can result in significant savings in computing time for large matrices.

If the errors in the floating point calculations satisfy the following conditions:

$fl(x \text{ op } y)=(x \text{ op } y)(1+\delta), |\delta|\le u, \text{ op}=\times,/, \; fl(x\pm y)=x(1+\alpha)\pm y(1+\beta), \; |\alpha|,|\beta|\le u$

then for *n*-by-*n* matrix $=fl(C_1+iC_2)= fl((A_1+iA_2)(B_1+iB_2))= {}_1+i\ {}_2$ the following estimations are correct

$${}_1-C_2 \le 2(n+1)u\ A\ {}_\infty\ B\ {}_\infty+O(u^2),$$

$${}_2-C_1 \le 4(n+4)u\ A\ {}_\infty\ B\ {}_\infty+O(u^2),$$

where $A\ {}_\infty=\max(\ A_1\ {}_\infty,\ A_2\ {}_\infty)$, and $B\ {}_\infty=\max(\ B_1\ {}_\infty,\ B_2\ {}_\infty)$.

and hence the matrix multiplications are stable.

LAPACK Routines: Linear Equations 3

This chapter describes the Intel® Math Kernel Library implementation of routines from the LAPACK package that are used for solving systems of linear equations and performing a number of related computational tasks. The library includes LAPACK routines for both real and complex data. Routines are supported for systems of equations with the following types of matrices:

- general
- banded
- symmetric or Hermitian positive-definite (full, packed, and rectangular full packed (RFP) storage)
- symmetric or Hermitian positive-definite banded
- symmetric or Hermitian indefinite (both full and packed storage)
- symmetric or Hermitian indefinite banded
- triangular (full, packed, and RFP storage)
- triangular banded
- tridiagonal
- diagonally dominant tridiagonal.

For each of the above matrix types, the library includes routines for performing the following computations:

- factoring the matrix (except for triangular matrices)
- equilibrating the matrix (except for RFP matrices)
- solving a system of linear equations
- estimating the condition number of a matrix (except for RFP matrices)
- refining the solution of linear equations and computing its error bounds (except for RFP matrices)
- inverting the matrix.

To solve a particular problem, you can call two or more computational routines or call a corresponding driver routine that combines several tasks in one call. For example, to solve a system of linear equations with a general matrix, call `?getrf` (*LU* factorization) and then `?getrs` (computing the solution). Then, call `?gerfs` to refine the solution and get the error bounds. Alternatively, use the driver routine `?gesvx` that performs all these tasks in one call.

WARNING. LAPACK routines assume that input matrices do not contain IEEE 754 special values such as `INF` or `NaN` values. Using these special values may cause LAPACK to return unexpected results or become unstable.

Starting from release 8.0, Intel MKL along with FORTRAN 77 interface to LAPACK computational and driver routines also supports Fortran 95 interface which uses simplified routine calls with shorter argument lists. The syntax section of the routine description gives the calling sequence for Fortran 95 interface, where available, immediately after FORTRAN 77 calls.

Routine Naming Conventions

To call each routine introduced in this chapter from the FORTRAN 77 program, you can use the LAPACK name.

LAPACK names are listed in Table 3-1 and Table 3-2 , and have the structure ?yyzzz or ?yyzz, which is described below.

The initial symbol ? indicates the data type:

s	real, single precision
c	complex, single precision
d	real, double precision
z	complex, double precision

Some routines can have combined character codes, such as ds or zc.

The second and third letters yy indicate the matrix type and storage scheme:

ge	general
gb	general band
gt	general tridiagonal
dt	diagonally dominant tridiagonal
po	symmetric or Hermitian positive-definite
pp	symmetric or Hermitian positive-definite (packed storage)
pf	symmetric or Hermitian positive-definite (RFP storage)
pb	symmetric or Hermitian positive-definite band
pt	symmetric or Hermitian positive-definite tridiagonal
sy	symmetric indefinite
sp	symmetric indefinite (packed storage)
he	Hermitian indefinite
hp	Hermitian indefinite (packed storage)
tr	triangular
tp	triangular (packed storage)
tf	triangular (RFP storage)
tb	triangular band

The last three letters zzz indicate the computation performed:

trf	perform a triangular matrix factorization
trs	solve the linear system with a factored matrix
con	estimate the matrix condition number
rfs	refine the solution and compute error bounds
rfsx	refine the solution and compute error bounds using extra-precise iterative refinement

`tri`	compute the inverse matrix using the factorization
`equ, equb`	equilibrate a matrix.

For example, the `sgetrf` routine performs the triangular factorization of general real matrices in single precision; the corresponding routine for complex matrices is `cgetrf`.

Driver routine names can end with `-sv` (meaning a *simple* driver), or with `-svx` (meaning an *expert* driver) or with `-svxx` (meaning an extra-precise iterative refinement *expert* driver).

Fortran 95 interfaces to the LAPACK computational and driver routines are the same as the FORTRAN 77 names but without the first letter that indicates the data type. For example, the name of the routine that performs a triangular factorization of general real matrices in Fortran 95 is `getrf`. Different data types are handled through the definition of a specific internal parameter that refers to a module block with named constants for single and double precision.

Fortran 95 Interface Conventions

Intel® MKL implements the Fortran 95 interface to LAPACK through wrappers that call respective FORTRAN 77 routines. This interface uses such Fortran 95 features as assumed-shape arrays and optional arguments to provide simplified calls to LAPACK routines with fewer arguments.

NOTE. For LAPACK, Intel MKL offers two types of Fortran 95 interfaces:

- using `mkl_lapack.fi` only through the `include 'mkl_lapack.fi'` statement. Such interfaces allow you to make use of the original LAPACK routines with all their arguments
- using `lapack.f90` that includes improved interfaces. This file is used to generate the module files `lapack95.mod` and `f95_precision.mod`. The module files `mkl95_lapack.mod` and `mkl95_precision.mod` are also generated. See also the section "Fortran 95 interfaces and wrappers to LAPACK and BLAS" of *Intel® MKL User's Guide* for details. The module files are used to process the FORTRAN use clauses referencing the LAPACK interface: `use lapack95` (or an equivalent `use mkl95_lapack`) and `use f95_precision` (or an equivalent `use mkl95_precision`).

The main conventions for the Fortran 95 interface are as follows:

- The names of arguments used in Fortran 95 call are typically the same as for the respective generic (FORTRAN 77) interface. In rare cases formal argument names may be different. For instance, *`select`* instead of *`selctg`*.
- Input arguments such as array dimensions are not required in Fortran 95 and are skipped from the calling sequence. Array dimensions are reconstructed from the user data that must exactly follow the required array shape.

  Another type of generic arguments that are skipped in Fortran 95 interface are arguments that represent workspace arrays (such as *`work`*, *`rwork`*, and so on). The only exception are cases when workspace arrays return significant information on output.

  An argument can also be skipped if its value is completely defined by the presence or absence of another argument in the calling sequence, and the restored value is the only meaningful value for the skipped argument.
- Some generic arguments are declared as optional in Fortran 95 interface and may or may not be present in the calling sequence. An argument can be declared optional if it satisfies one of the following conditions:

  - If the argument value is completely defined by the presence or absence of another argument in the calling sequence, it can be declared as optional. The difference from the skipped argument in this case is that the optional argument can have some meaningful values that are distinct from the value reconstructed by default. For example, if some argument (like *jobz*) can take only two values and one of these values directly implies the use of another argument, then the value of *jobz* can be uniquely reconstructed from the actual presence or absence of this second argument, and *jobz* can be omitted.
  - If an input argument can take only a few possible values, it can be declared as optional. The default value of such argument is typically set as the first value in the list and all exceptions to this rule are explicitly stated in the routine description.
  - If an input argument has a natural default value, it can be declared as optional. The default value of such optional argument is set to its natural default value.

- Argument *info* is declared as optional in Fortran 95 interface. If it is present in the calling sequence, the value assigned to *info* is interpreted as follows:
  - If this value is more than -1000, its meaning is the same as in FORTRAN 77 routine.
  - If this value is equal to -1000, it means that there is not enough work memory.
  - If this value is equal to -1001, incompatible arguments are present in the calling sequence.
- Optional arguments are given in square brackets in Fortran 95 call syntax.

"Fortran 95 Notes" subsection at the end of the topic describing each routine details concrete rules for reconstructing the values of omitted optional parameters.

Intel® MKL Fortran 95 Interfaces for LAPACK Routines vs. Netlib Implementation

The following list presents general digressions of the Intel MKL LAPACK95 implementation from the Netlib analog:

- The Intel MKL Fortran 95 interfaces are provided for pure procedures.
- Names of interfaces do not contain the LA_ prefix.
- An optional array argument always has the `target` attribute.
- Functionality of the Intel MKL LAPACK95 wrapper is close to the FORTRAN 77 original implementation in the `getrf`, `gbtrf`, and `potrf` interfaces.
- If *jobz* argument value specifies presence or absence of *z* argument, then *z* is always declared as optional and *jobz* is restored depending on whether *z* is present or not. It is not always so in the Netlib version (see "Modified Netlib Interfaces" in Appendix E).
- To avoid double error checking, processing of the *info* argument is limited to checking of the allocated memory and disarranging of optional arguments.
- If an argument that is present in the list of arguments completely defines another argument, the latter is always declared as optional.

You can transform an application that uses the Netlib LAPACK interfaces to ensure its work with the Intel MKL interfaces providing that:

a. The application is correct, that is, unambiguous, compiler-independent, and contains no errors.

b. Each routine name denotes only one specific routine. If any routine name in the application coincides with a name of the original Netlib routine (for example, after removing the LA_ prefix) but denotes a routine different from the Netlib original routine, this name should be modified through context name replacement.

You should transform your application in the following cases (see Appendix E for specific differences of individual interfaces):

- When using the Netlib routines that differ from the Intel MKL routines only by the LA_ prefix or in the array attribute `target`. The only transformation required in this case is context name replacement. See "Interfaces Identical to Netlib" in Appendix E for details.
- When using Netlib routines that differ from the Intel MKL routines by the LA_ prefix, the `target` array attribute, and the names of formal arguments. In the case of positional passing of arguments, no additional transformation except context name replacement is required. In the case of the keywords passing of arguments, in addition to the context name replacement the names of mismatching keywords should also be modified. See "Interfaces with Replaced Argument Names" in Appendix E for details.
- When using the Netlib routines that differ from the respective Intel MKL routines by the LA_ prefix, the `target` array attribute, sequence of the arguments, arguments missing in Intel MKL but present in Netlib and, vice versa, present in Intel MKL but missing in Netlib. Remove the differences in the sequence and range of the arguments in process of all the transformations when you use the Netlib routines specified by this bullet and the preceding bullet. See "Modified Netlib Interfaces" in Appendix E for details.
- When using the `getrf`, `gbtrf`, and `potrf` interfaces, that is, new functionality implemented in Intel MKL but unavailable in the Netlib source. To override the differences, build the desired functionality explicitly with the Intel MKL means or create a new subroutine with the new functionality, using specific MKL interfaces corresponding to LAPACK 77 routines. You can call the LAPACK 77 routines directly but using the new Intel MKL interfaces is preferable. See "Interfaces Absent From Netlib" and "Interfaces of New Functionality"in Appendix E for details.
  Note that if the transformed application calls `getrf`, `gbtrf` or `potrf` without controlling arguments *rcond* and *norm*, just context name replacement is enough in modifying the calls into the Intel MKL interfaces, as described in the first bullet above. The Netlib functionality is preserved in such cases.
- When using the Netlib auxiliary routines. In this case, call a corresponding subroutine directly, using the MKL LAPACK 77 interfaces.

Transform your application as follows:

1. Make sure conditions a. and b. are met.
2. Select Netlib LAPACK 95 calls. For each call do the following:
   - Select the type of digression and do the required transformations.
   - Revise results to eliminate unneeded code or data, which may appear after several identical calls.
3. Make sure the transformations are correct and complete.

Matrix Storage Schemes

LAPACK routines use the following matrix storage schemes:

- *Full storage*: a matrix *A* is stored in a two-dimensional array *a*, with the matrix element a_{ij} stored in the array element *a*(*i*,*j*).
- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- *Band storage*: an *m*-by-*n* band matrix with *kl* sub-diagonals and *ku* superdiagonals is stored compactly in a two-dimensional array *ab* with *kl*+*ku*+1 rows and *n* columns. Columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.
- *Rectangular Full Packed (RFP) storage*: the upper or lower triangle of the matrix is packed combining the full and packed storage schemes. This combination enables using half of the full storage as packed storage while maintaining efficiency by using Level 3 BLAS/LAPACK kernels as the full storage.

In Chapters 4 and 5, arrays that hold matrices in packed storage have names ending in *p*; arrays with matrices in band storage have names ending in *b*; arrays with matrices in RFP storage have names ending in *fp*.

For more information on matrix storage schemes, see "Matrix Arguments" in Appendix B.

Mathematical Notation

Descriptions of LAPACK routines use the following notation:

$Ax = b$	A system of linear equations with an *n*-by-*n* matrix $A = \{a_{ij}\}$, a right-hand side vector $b = \{b_i\}$, and an unknown vector $x = \{x_i\}$.
$AX = B$	A set of systems with a common matrix *A* and multiple right-hand sides. The columns of *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.
$\|x\|$	the vector with elements $\|x_i\|$ (absolute values of x_i).
$\|A\|$	the matrix with elements $\|a_{ij}\|$ (absolute values of a_{ij}).
$\|\|x\|\|_\infty = \max_i \|x_i\|$	The *infinity-norm* of the vector *x*.
$\|\|A\|\|_\infty = \max_i \Sigma_j \|a_{ij}\|$	The *infinity-norm* of the matrix *A*.
$\|\|A\|\|_1 = \max_j \Sigma_i \|a_{ij}\|$	The *one-norm* of the matrix *A*. $\|\|A\|\|_1 = \|\|A^T\|\|_\infty = \|\|A^H\|\|_\infty$
$\kappa(A) = \|\|A\|\| \ \|\|A^{-1}\|\|$	The *condition number* of the matrix *A*.

Error Analysis

In practice, most computations are performed with rounding errors. Besides, you often need to solve a system $Ax = b$, where the data (the elements of *A* and *b*) are not known exactly. Therefore, it is important to understand how the data errors and rounding errors can affect the solution *x*.

Data perturbations. If *x* is the exact solution of $Ax = b$, and $x + \delta x$ is the exact solution of a perturbed problem $(A + \delta A)x = (b + \delta b)$, then

$$\frac{\|\delta x\|}{\|x\|} \leq \kappa(A)\left(\frac{\|\delta A\|}{\|A\|} + \frac{\|\delta b\|}{\|b\|}\right),$$

where

$$\kappa(A) = \|A\| \left\|A^{-1}\right\|.$$

In other words, relative errors in *A* or *b* may be amplified in the solution vector *x* by a factor $\kappa(A) = \|\|A\|\| \ \|\|A^{-1}\|\|$ called the *condition number* of *A*.

Rounding errors have the same effect as relative perturbations $c(n)\varepsilon$ in the original data. Here ε is the *machine precision*, and $c(n)$ is a modest function of the matrix order *n*. The corresponding solution error is

$||\delta x||/||x|| \leq c(n)\kappa(A)\varepsilon$. (The value of $c(n)$ is seldom greater than $10n$.)

Thus, if your matrix A is *ill-conditioned* (that is, its condition number $\kappa(A)$ is very large), then the error in the solution x is also large; you may even encounter a complete loss of precision. LAPACK provides routines that allow you to estimate $\kappa(A)$ (see Routines for Estimating the Condition Number) and also give you a more precise estimate for the actual solution error (see Refining the Solution and Estimating Its Error).

Computational Routines

Table 3-1 lists the LAPACK computational routines (FORTRAN 77 and Fortran 95 interfaces) for factorizing, equilibrating, and inverting *real* matrices, estimating their condition numbers, solving systems of equations with real matrices, refining the solution, and estimating its error. Table 3-2 lists similar routines for *complex* matrices. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 3-1 Computational Routines for Systems of Equations with Real Matrices

Matrix type, storage scheme	Factorize matrix	Equilibrate matrix	Solve system	Condition number	Estimate error	Invert matrix
general	?getrf	?geequ, ?geequb	?getrs	?gecon	?gerfs, ?gerfsx	?getri
general band	?gbtrf	?gbequ, ?gbequb	?gbtrs	?gbcon	?gbrfs, ?gbrfsx	
general tridiagonal	?gttrf		?gttrs	?gtcon	?gtrfs	
diagonally dominant tridiagonal	?dttrfb		?dttrsb			
symmetric positive-definite	?potrf	?poequ, ?poequb	?potrs	?pocon	?porfs, ?porfsx	?potri
symmetric positive-definite, packed storage	?pptrf	?ppequ	?pptrs	?ppcon	?pprfs	?pptri
symmetric positive-definite, RFP storage	?pftrf		?pftrs			?pftri

In the table above, ? stands for c (single precision complex) or z (double precision complex) for FORTRAN 77 interface.

Routines for Matrix Factorization

This section describes the LAPACK routines for matrix factorization. The following factorizations are supported:

- *LU* factorization
- Cholesky factorization of real symmetric positive-definite matrices
- Cholesky factorization of real symmetric positive-definite matrices with pivoting
- Cholesky factorization of Hermitian positive-definite matrices
- Cholesky factorization of Hermitian positive-definite matrices with pivoting
- Bunch-Kaufman factorization of real and complex symmetric matrices
- Bunch-Kaufman factorization of Hermitian matrices.

You can compute:

- the *LU* factorization using full and band storage of matrices
- the Cholesky factorization using full, packed, RFP, and band storage
- the Bunch-Kaufman factorization using full and packed storage.

?getrf

Computes the LU factorization of a general m-by-n matrix.

Syntax

FORTRAN 77:

```
call sgetrf( m, n, a, lda, ipiv, info )
call dgetrf( m, n, a, lda, ipiv, info )
call cgetrf( m, n, a, lda, ipiv, info )
call zgetrf( m, n, a, lda, ipiv, info )
```

Fortran 95:

```
call getrf( a [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the *LU* factorization of a general *m*-by-*n* matrix *A* as

*A = P*L*U*,

where *P* is a permutation matrix, *L* is lower triangular with unit diagonal elements (lower trapezoidal if $m > n$) and *U* is upper triangular (upper trapezoidal if $m < n$). The routine uses partial pivoting, with row interchanges.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A*; $n \geq 0$.
a	REAL for sgetrf DOUBLE PRECISION for dgetrf COMPLEX for cgetrf DOUBLE COMPLEX for zgetrf. Array, DIMENSION (*lda*,*). Contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of array *a*.

Output Parameters

a	Overwritten by *L* and *U*. The unit diagonal elements of *L* are not stored.
ipiv	INTEGER.

	Array, DIMENSION at least max(1,min(*m*, *n*)). The pivot indices; for $1 \le i \le \min(m, n)$, row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine getrf interface are as follows:

a	Holds the matrix *A* of size (*m*,*n*).
ipiv	Holds the vector of length min(*m*,*n*).

Application Notes

The computed *L* and *U* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \le c(\min(m,n))\varepsilon P|L||U|$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(2/3)n^3$	If $m = n$,
$(1/3)n^2(3m-n)$	If $m > n$,
$(1/3)m^2(3n-m)$	If $m < n$.

The number of operations for complex flavors is four times greater.

After calling this routine with $m = n$, you can call the following:

?getrs	to solve $A*X = B$ or $A^TX = B$ or $A^HX = B$
?gecon	to estimate the condition number of *A*
?getri	to compute the inverse of *A*.

- mkl_progress

?gbtrf

Computes the LU factorization of a general m-by-n band matrix.

Syntax

FORTRAN 77:

```
call sgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call dgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call cgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
call zgbtrf( m, n, kl, ku, ab, ldab, ipiv, info )
```

Fortran 95:

```
call gbtrf( ab [,kl] [,m] [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine forms the *LU* factorization of a general *m*-by-*n* band matrix *A* with *kl* non-zero subdiagonals and *ku* non-zero superdiagonals, that is,

*A = P*L*U*,

where *P* is a permutation matrix; *L* is lower triangular with unit diagonal elements and at most *kl* non-zero elements in each column; *U* is an upper triangular band matrix with *kl + ku* superdiagonals. The routine uses partial pivoting, with row interchanges (which creates the additional *kl* superdiagonals in *U*).

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

m	INTEGER. The number of rows in matrix *A*; $m \geq 0$.
n	INTEGER. The number of columns in matrix *A*; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.
ab	REAL for sgbtrf DOUBLE PRECISION for dgbtrf COMPLEX for cgbtrf DOUBLE COMPLEX for zgbtrf. Array, DIMENSION (*ldab*, *). The array *ab* contains the matrix *A* in band storage, in rows *kl* + 1 to 2**kl* + *ku* + 1; rows 1 to *kl* of the array need not be set. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

	ab(*kl* + *ku* + 1 + *i* - *j*, *j*) = *a*(*i*,*j*) for max(1,*j*-*ku*) ≤ *i* ≤ min(*m*,*j*+*kl*).
ldab	INTEGER. The first dimension of the array *ab*. (*ldab* ≥ 2**kl* + *ku* + 1)

Output Parameters

ab	Overwritten by *L* and *U*. *U* is stored as an upper triangular band matrix with *kl* + *ku* superdiagonals in rows 1 to *kl* + *ku* + 1, and the multipliers used during the factorization are stored in rows *kl* + *ku* + 2 to 2**kl* + *ku* + 1. See Application Notes below for further details.
ipiv	INTEGER. Array, DIMENSION at least max(1,min(*m*, *n*)). The pivot indices; for 1 ≤ *i* ≤ min(*m*, *n*) , row *i* was interchanged with row *ipiv*(*i*). .
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by 0 will occur if you use the factor *U* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gbtrf interface are as follows:

ab	Holds the array *A* of size (2**kl*+*ku*+1,*n*).
ipiv	Holds the vector of length min(*m*,*n*).
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-2**kl*-1.
m	If omitted, assumed *m* = *n*.

Application Notes

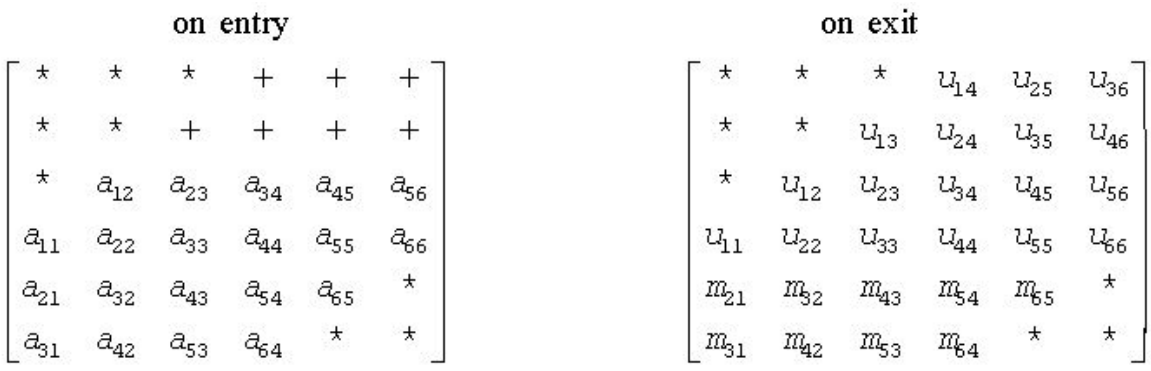
The computed *L* and *U* are the exact factors of a perturbed matrix *A* + *E*, where

|*E*| ≤ *c*(*kl*+*ku*+1) ε *P*|*L*||*U*|

c(*k*) is a modest linear function of *k*, and ε is the machine precision.

The total number of floating-point operations for real flavors varies between approximately 2*n*(*ku*+1)*kl* and 2*n*(*kl*+*ku*+1)*kl*. The number of operations for complex flavors is four times greater. All these estimates assume that *kl* and *ku* are much less than min(*m*,*n*).

The band storage scheme is illustrated by the following example, when *m* = *n* = 6, *kl* = 2, *ku* = 1:



Array elements marked * are not used by the routine; elements marked + need not be set on entry, but are required by the routine to store elements of*U* because of fill-in resulting from the row interchanges.

After calling this routine with *m* = *n*, you can call the following routines:

gbtrs	to solve *A*X* = *B* or A^T*X* = *B* or A^H*X* = *B*
gbcon	to estimate the condition number of *A*.

- mkl_progress

?gttrf

Computes the LU factorization of a tridiagonal matrix.

Syntax

FORTRAN 77:

```
call sgttrf( n, dl, d, du, du2, ipiv, info )
call dgttrf( n, dl, d, du, du2, ipiv, info )
call cgttrf( n, dl, d, du, du2, ipiv, info )
call zgttrf( n, dl, d, du, du2, ipiv, info )
```

Fortran 95:

```
call gttrf( dl, d, du, du2 [, ipiv] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes the *LU* factorization of a real or complex tridiagonal matrix *A* in the form

*A = P*L*U*,

where *P* is a permutation matrix; *L* is lower bidiagonal with unit diagonal elements; and *U* is an upper triangular matrix with nonzeroes in only the main diagonal and first two superdiagonals. The routine uses elimination with partial pivoting and row interchanges.

Input Parameters

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
dl, *d*, *du*	REAL for sgttrf DOUBLE PRECISION for dgttrf COMPLEX for cgttrf DOUBLE COMPLEX for zgttrf. Arrays containing elements of *A*. The array *dl* of dimension (*n* - 1) contains the subdiagonal elements of *A*. The array *d* of dimension *n* contains the diagonal elements of *A*. The array *du* of dimension (*n* - 1) contains the superdiagonal elements of *A*.

Output Parameters

dl	Overwritten by the (*n* -1) multipliers that define the matrix *L* from the *LU* factorization of *A*.
d	Overwritten by the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.
du	Overwritten by the (*n*-1) elements of the first superdiagonal of *U*.
du2	REAL for sgttrf DOUBLE PRECISION for dgttrf COMPLEX for cgttrf DOUBLE COMPLEX for zgttrf. Array, dimension (*n* -2). On exit, *du2* contains (*n*-2) elements of the second superdiagonal of *U*.
ipiv	INTEGER. Array, dimension (*n*). The pivot indices: for $1 \leq i \leq n$, row *i* was interchanged with row *ipiv*(*i*). *ipiv*(*i*) is always *i* or *i*+1; *ipiv*(*i*) = *i* indicates a row interchange was not required.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gttrf interface are as follows:

dl	Holds the vector of length (*n*-1).

d	Holds the vector of length *n*.
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length *n*.

Application Notes

?gbtrs	to solve $A*X = B$ or $A^T*X = B$ or $A^H*X = B$
?gbcon	to estimate the condition number of *A*.

?dttrfb

Computes the factorization of a diagonally dominant tridiagonal matrix.

Syntax

FORTRAN 77:

```
call sdttrfb( n, dl, d, du, info )
call ddttrfb( n, dl, d, du, info )
call cdttrfb( n, dl, d, du, info )
call zdttrfb( n, dl, d, du, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The `?dttrfb` routine computes the factorization of a real or complex diagonally dominant tridiagonal matrix *A* with the BABE (Burning At Both Ends) algorithm in the form

$A = L_1*U*L_2$

where

- L_1, L_2 are lower bidiagonal with unit diagonal elements corresponding to the Gaussian elimination taken from both ends of the matrix.
- *U* is an upper triangular matrix with nonzeroes in only the main diagonal and first two superdiagonals.

Input Parameters

n	`INTEGER`. The order of the matrix *A*; $n \geq 0$.

dl, *d*, *du*	`REAL` for `sdttrfb`
	`DOUBLE PRECISION` for `ddttrfb`
	`COMPLEX` for `cdttrfb`
	`DOUBLE COMPLEX` for `zdttrfb`.
	Arrays containing elements of *A*.
	The array *dl* of dimension (*n* - 1) contains the subdiagonal elements of *A*.
	The array *d* of dimension *n* contains the diagonal elements of *A*.

The array *du* of dimension (*n* - 1) contains the superdiagonal elements of *A*.

Output Parameters

dl	Overwritten by the (*n* -1) multipliers that define the matrix *L* from the *LU* factorization of *A*.
d	Overwritten by the *n* diagonal element reciprocals of the upper triangular matrix *U* from the factorization of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, u_{ii} is 0. The factorization has been completed, but *U* is exactly singular. Division by zero will occur if you use the factor *U* for solving a system of linear equations.

Application Notes

A diagonally dominant tridiagonal system is defined such that $|d_i| > |dl_{i-1}| + |du_i|$ for any i:

$1 < i < n$, and $|d_1| > |du_1|$, $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems are free from the numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see ?gttrf). The diagonally dominant systems are much faster than the canonical systems.

NOTE.

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
- Applying the ?dttrfb factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.

?potrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix.

Syntax

FORTRAN 77:

```
call spotrf( uplo, n, a, lda, info )
call dpotrf( uplo, n, a, lda, info )
call cpotrf( uplo, n, a, lda, info )
call zpotrf( uplo, n, a, lda, info )
```

Fortran 95:

```
call potrf( a [, uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
a	REAL for spotrf DOUBLE PRECISION for dpotrf COMPLEX for cpotrf DOUBLE COMPLEX for zpotrf. Array, DIMENSION (*lda*,*). The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `potrf` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If *uplo* = `'U'`, the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \le c(n)\varepsilon |U^H| |U|, |e_{ij}| \le c(n)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for *uplo* = `'L'`.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

`?potrs`	to solve *A*X* = *B*
`?pocon`	to estimate the condition number of *A*
`?potri`	to compute the inverse of *A*.

See Also

- `mkl_progress`

?pstrf

Computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix.

Syntax

FORTRAN 77:

```
call spstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call dpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call cpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
call zpstrf( uplo, n, a, lda, piv, rank, tol, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the Cholesky factorization with complete pivoting of a real symmetric (complex Hermitian) positive semidefinite matrix. The form of the factorization is:

`P' * A * P = U' * U`, if *uplo* = `'U'` for real flavors,

`conjg(P') * A * P = conjg(U') * U`, if *uplo* = `'U'` for complex flavors,

`P' * A * P = L * L'`, if *uplo* = `'L'` for real flavors,

`conjg(P') * A * P = L * conjg(L')`, if *uplo* = `'L'` for complex flavors,

where *P* is stored as vector *piv*, `'U'` and `'L'` are upper and lower triangular matrices respectively.

This algorithm does not attempt to check that *A* is positive semidefinite. This version of the algorithm calls level 3 BLAS.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = `'U'`, the array *a* stores the upper triangular part of the matrix *A*, and the strictly lower triangular part of the matrix is not referenced. If *uplo* = `'L'`, the array *a* stores the lower triangular part of the matrix *A*, and the strictly upper triangular part of the matrix is not referenced.
n	`INTEGER`. The order of matrix *A*; $n \geq 0$.

a, *work*	`REAL` for `spstrf`
	`DOUBLE PRECISION` for `dpstrf`
	`COMPLEX` for `cpstrf`
	`DOUBLE COMPLEX` for `zpstrf`.
	Array *a*, `DIMENSION (`*lda*`,*)`. The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least `max(1, `*n*`)`.
	work(*) is a workspace array. The dimension of *work* is at least `max(1,2*`*n*`)`.

tol	`REAL` for single precision flavors `DOUBLE PRECISION` for double precision flavors. User difined tolerance. If *tol* < 0, then `n*U*max(a(k,k))` will be used. The algorithm terminates at the `(k-1)`-th step, if the pivot ≤ *tol*.
lda	`INTEGER`. The first dimension of *a*; at least `max(1, `*n*`)`.

Output Parameters

a	If *info* = `0`, the factor `U` or `L` from the Cholesky factorization is as described in *Description*.
piv	`INTEGER`. Array, `DIMENSION` at least `max(1, `*n*`)`. The array *piv* is such that the nonzero entries are `p( piv(k),k ) = 1`.
rank	`INTEGER`.

The rank of *a* given by the number of steps the algorithm completed.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*k*, the *k*-th argument had an illegal value.
If *info* > 0, the matrix *A* is either rank deficient with a computed rank as returned in *rank*, or is indefinite.

?pftrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix using the Rectangular Full Packed (RFP) format .

Syntax

FORTRAN 77:

```
call spftrf( transr, uplo, n, a, info )
call dpftrf( transr, uplo, n, a, info )
call cpftrf( transr, uplo, n, a, info )
call zpftrf( transr, uplo, n, a, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, a Hermitian positive-definite matrix *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

The matrix *A* is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

This is the block version of the algorithm, calling Level 3 BLAS.

Input Parameters

transr CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).
If *transr* = 'N', the Normal *transr* of RFP *A* is stored.
If *transr* = 'T', the Transpose *transr* of RFP *A* is stored.
If *transr* = 'C', the Conjugate-Transpose *transr* of RFP *A* is stored.

uplo CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*.
If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.

n INTEGER. The order of the matrix *A*; $n \geq 0$.

a	REAL for spftrf DOUBLE PRECISION for dpftrf COMPLEX for cpftrf DOUBLE COMPLEX for zpftrf. Array, DIMENSION (*n**(*n*+1)/2). The array *a* contains the matrix *A* in the RFP format.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *info*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

?pptrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite matrix using packed storage.

Syntax

FORTRAN 77:

```
call spptrf( uplo, n, ap, info )
call dpptrf( uplo, n, ap, info )
call cpptrf( uplo, n, ap, info )
call zpptrf( uplo, n, ap, info )
```

Fortran 95:

```
call pptrf( ap [, uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite packed matrix *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is packed in the array *ap*, and how *A* is factored:
If *uplo* = 'U', the array *ap* stores the upper triangular part of the matrix *A*, and *A* is factored as U^H*U.
If *uplo* = 'L', the array *ap* stores the lower triangular part of the matrix *A*; *A* is factored as $L*L^H$.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

ap — REAL for spptrf
DOUBLE PRECISION for dpptrf
COMPLEX for cpptrf
DOUBLE COMPLEX for zpptrf.
Array, DIMENSION at least max(1, *n*(*n*+1)/2). The array *ap* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in packed storage (see Matrix Storage Schemes).

Output Parameters

ap — The upper or lower triangular part of *A* in packed storage is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info — INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pptrf interface are as follows:

ap — Holds the array *A* of size (*n**(*n*+1)/2).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \leq c(n)\varepsilon |U^H||U|, |e_{ij}| \leq c(n)\varepsilon\sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

?pptrs	to solve *A*X = B*
?ppcon	to estimate the condition number of *A*
?pptri	to compute the inverse of *A*.

- mkl_progress

?pbtrf

Computes the Cholesky factorization of a symmetric (Hermitian) positive-definite band matrix.

Syntax

FORTRAN 77:

```
call spbtrf( uplo, n, kd, ab, ldab, info )
call dpbtrf( uplo, n, kd, ab, ldab, info )
call cpbtrf( uplo, n, kd, ab, ldab, info )
call zpbtrf( uplo, n, kd, ab, ldab, info )
```

Fortran 95:

```
call pbtrf( ab [, uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine forms the Cholesky factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite band matrix *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data	if *uplo*='U'
$A = L*L^T$ for real data, $A = L*L^H$ for complex data	if *uplo*='L'

where *L* is a lower triangular matrix and *U* is upper triangular.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'.

Indicates whether the upper or lower triangular part of *A* is stored in the array *ab*, and how *A* is factored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

kd — INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.

ab — REAL for spbtrf
DOUBLE PRECISION for dpbtrf
COMPLEX for cpbtrf
DOUBLE COMPLEX for zpbtrf.
Array, DIMENSION (,*). The array *ab* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*).

ldab — INTEGER. The first dimension of the array *ab*. (*ldab* ≥ *kd* + 1)

Output Parameters

ab — The upper or lower triangular part of *A* (in band storage) is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*.

info — INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the factorization could not be completed. This may indicate an error in forming the matrix *A*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbtrf interface are as follows:

ab — Holds the array *A* of size (*kd*+1,*n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed factor *U* is the exact factor of a perturbed matrix *A* + *E*, where

$$|E| \leq c(kd+1)\varepsilon |U^H||U|, |e_{ij}| \leq c(kd+1)\varepsilon \sqrt{a_{ii}a_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'.

The total number of floating-point operations for real flavors is approximately $n(kd+1)^2$. The number of operations for complex flavors is 4 times greater. All these estimates assume that *kd* is much less than *n*.

After calling this routine, you can call the following routines:

?pbtrs	to solve *A*X = B*
?pbcon	to estimate the condition number of *A*.

- mkl_progress

?pttrf

Computes the factorization of a symmetric (Hermitian) positive-definite tridiagonal matrix.

Syntax

FORTRAN 77:

```
call spttrf( n, d, e, info )
call dpttrf( n, d, e, info )
call cpttrf( n, d, e, info )
call zpttrf( n, d, e, info )
```

Fortran 95:

```
call pttrf( d, e [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine forms the factorization of a symmetric positive-definite or, for complex data, Hermitian positive-definite tridiagonal matrix *A*:

*A = L*D*L'*,

where *D* is diagonal and *L* is unit lower bidiagonal. The factorization may also be regarded as having the form *A = U'*D*U*, where *D* is unit upper bidiagonal.

Input Parameters

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
d	REAL for sptrf, cpttrf DOUBLE PRECISION for dpttrf, zpttrf. Array, dimension (*n*). Contains the diagonal elements of *A*.
e	REAL for spttrf DOUBLE PRECISION for dpttrf COMPLEX for cpttrf

DOUBLE COMPLEX for zpttrf. Array, dimension (*n* -1). Contains the subdiagonal elements of *A*.

Output Parameters

d	Overwritten by the *n* diagonal elements of the diagonal matrix *D* from the *L*D*L'* factorization of *A*.
e	Overwritten by the (*n* - 1) off-diagonal elements of the unit bidiagonal factor *L* or *U* from the factorization of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite; if *i* < *n*, the factorization could not be completed, while if *i* = *n*, the factorization was completed, but *d*(*n*) ≤ 0.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pttrf interface are as follows:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).

?sytrf

Computes the Bunch-Kaufman factorization of a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call dsytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call csytrf( uplo, n, a, lda, ipiv, work, lwork, info )
call zsytrf( uplo, n, a, lda, ipiv, work, lwork, info )
```

Fortran 95:

```
call sytrf( a [, uplo] [,ipiv] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes the factorization of a real/complex symmetric matrix *A* using the Bunch-Kaufman diagonal pivoting method. The form of the factorization is:

if *uplo*='U', $A = P*U*D*U^T*P^T$

if *uplo*='L', $A = P*L*D*L^T*P^T$,

where *A* is the input matrix, *P* is a permutation matrix, *U* and *L* are upper and lower triangular matrices with unit diagonal, and *D* is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. *U* and *L* have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of *D*.

NOTE. This routine supports the Progress Routine feature. See Progress Routine section for details.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as $P*U*D*U^T*P^T$. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $P*L*D*L^T*P^T$.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
a	REAL for ssytrf DOUBLE PRECISION for dsytrf COMPLEX for csytrf DOUBLE COMPLEX for zsytrf. Array, DIMENSION (*lda*,*). The array *a* contains either the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
work	Same type as *a*. A workspace array, dimension at least max(1,*lwork*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	The upper or lower triangular part of *a* is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).
work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.

If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sytrf` interface are as follows:

a — holds the matrix *A* of size (*n*, *n*)

ipiv — holds the vector of length *n*

uplo — must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* =1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \le c(n)\varepsilon\ P|U||D||U^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision. A similar estimate holds for the computed L and D when `uplo = 'L'`.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

`?sytrs`	to solve `A*X = B`
`?sycon`	to estimate the condition number of `A`
`?sytri`	to compute the inverse of `A`.

?hetrf

Computes the Bunch-Kaufman factorization of a complex Hermitian matrix.

Syntax

FORTRAN 77:

```
call chetrf( uplo, n, a, lda, ipiv, work, lwork, info )
call zhetrf( uplo, n, a, lda, ipiv, work, lwork, info )
```

Fortran 95:

```
call hetrf( a [, uplo] [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the factorization of a complex Hermitian matrix `A` using the Bunch-Kaufman diagonal pivoting method:

if `uplo='U'`, $A = P*U*D*U^H*P^T$

if `uplo='L'`, $A = P*L*D*L^H*P^T$,

where `A` is the input matrix, P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and `D` is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of `D`.

NOTE. This routine supports the Progress Routine feature. See Progress Routine section for details.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:
If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*, and *A* is factored as $P*U*D*U^H*P^T$.
If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*, and *A* is factored as $P*L*D*L^H*P^T$.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

a, *work* — COMPLEX for chetrf
DOUBLE COMPLEX for zhetrf.
Arrays, DIMENSION *a*(*lda*,*), *work*(*).
The array *a* contains the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
work(*) is a workspace array of dimension at least max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

lwork — INTEGER. The size of the *work* array (*lwork* ≥ *n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

a — The upper or lower triangular part of *a* is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and the (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and the (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `hetrf` interface are as follows:

a	holds the matrix *A* of size (*n*, *n*)
ipiv	holds the vector of length *n*
uplo	must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

This routine is suitable for Hermitian matrices that are not known to be positive-definite. If *A* is in fact positive-definite, the routine does not perform interchanges, and no 2-by-2 diagonal blocks occur in *D*.

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* are stored in the corresponding columns of the array *a*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* =1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in the corresponding elements of the array *a*.

If *uplo* = `'U'`, the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \leq c(n)\varepsilon\ P|U||D||U^T|P^T$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

A similar estimate holds for the computed *L* and *D* when *uplo* = `'L'`.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

?hetrs	to solve *A***X* = *B*
?hecon	to estimate the condition number of *A*
?hetri	to compute the inverse of *A*.

- mkl_progress

?sptrf

Computes the Bunch-Kaufman factorization of a symmetric matrix using packed storage.

Syntax

FORTRAN 77:

```
call ssptrf( uplo, n, ap, ipiv, info )
call dsptrf( uplo, n, ap, ipiv, info )
call csptrf( uplo, n, ap, ipiv, info )
call zsptrf( uplo, n, ap, ipiv, info )
```

Fortran 95:

```
call sptrf( ap [,uplo] [,ipiv] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes the factorization of a real/complex symmetric matrix A stored in the packed format using the Bunch-Kaufman diagonal pivoting method. The form of the factorization is:

if uplo='U', $A = P*U*D*U^T*P^T$

if uplo='L', $A = P*L*D*L^T*P^T$,

where P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of D.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of A is packed in the array *ap* and how A is factored:
If uplo = 'U', the array *ap* stores the upper triangular part of the matrix A, and A is factored as $P*U*D*U^T*P^T$.
If uplo = 'L', the array *ap* stores the lower triangular part of the matrix A, and A is factored as $P*L*D*L^T*P^T$.

n
INTEGER. The order of matrix A; $n \geq 0$.

ap	REAL for ssptrf DOUBLE PRECISION for dsptrf COMPLEX for csptrf DOUBLE COMPLEX for zsptrf. Array, DIMENSION at least max(1, *n*(*n*+1)/2). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *packed storage* (see Matrix Storage Schemes).

Output Parameters

ap	The upper or lower triangle of *A* (as specified by *uplo*) is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and the (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and the (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sptrf interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of *U* and *L* are not stored. The remaining elements of *U* and *L* overwrite elements of the corresponding columns of the matrix *A*, but additional row interchanges are required to recover *U* or *L* explicitly (which is seldom necessary).

If *ipiv*(*i*) = *i* for all *i* = 1...*n*, then all off-diagonal elements of *U* (*L*) are stored explicitly in packed form.

If *uplo* = 'U', the computed factors *U* and *D* are the exact factors of a perturbed matrix *A* + *E*, where

$|E| \leq c(n)\varepsilon\ P|U||D||U^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision. A similar estimate holds for the computed L and D when `uplo = 'L'`.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors or $(4/3)n^3$ for complex flavors.

After calling this routine, you can call the following routines:

`?sptrs`	to solve `A*X = B`
`?spcon`	to estimate the condition number of `A`
`?sptri`	to compute the inverse of `A`.

- `mkl_progress`

?hptrf

Computes the Bunch-Kaufman factorization of a complex Hermitian matrix using packed storage.

Syntax

FORTRAN 77:

```
call chptrf( uplo, n, ap, ipiv, info )
call zhptrf( uplo, n, ap, ipiv, info )
```

Fortran 95:

```
call hptrf( ap [,uplo] [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the factorization of a complex Hermitian packed matrix `A` using the Bunch-Kaufman diagonal pivoting method:

if `uplo='U'`, $A = P*U*D*U^H*P^T$

if `uplo='L'`, $A = P*L*D*L^H*P^T$,

where `A` is the input matrix, P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a Hermitian block-diagonal matrix with 1-by-1 and 2-by-2 diagonal blocks. U and L have 2-by-2 unit diagonal blocks corresponding to the 2-by-2 blocks of `D`.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is packed and how *A* is factored: If *uplo* = 'U', the array *ap* stores the upper triangular part of the matrix *A*, and *A* is factored as $P*U*D*U^H*P^T$. If *uplo* = 'L', the array *ap* stores the lower triangular part of the matrix *A*, and *A* is factored as $P*L*D*L^H*P^T$.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
ap	COMPLEX for chptrf DOUBLE COMPLEX for zhptrf. Array, DIMENSION at least max(1, *n*(*n*+1)/2). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *packed storage* (see Matrix Storage Schemes).

Output Parameters

ap	The upper or lower triangle of *A* (as specified by *uplo*) is overwritten by details of the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and the (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and the (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular. Division by 0 will occur if you use *D* for solving a system of linear equations.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hptrf interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The 2-by-2 unit diagonal blocks and the unit diagonal elements of U and L are not stored. The remaining elements of U and L are stored in the corresponding columns of the array a, but additional row interchanges are required to recover U or L explicitly (which is seldom necessary).

If $ipiv(i) = i$ for all $i = 1...n$, then all off-diagonal elements of U (L) are stored explicitly in the corresponding elements of the array a.

If $uplo$ = 'U', the computed factors U and D are the exact factors of a perturbed matrix $A + E$, where

$|E| \le c(n)\varepsilon P|U||D||U^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for the computed L and D when $uplo$ = 'L'.

The total number of floating-point operations is approximately $(4/3)n^3$.

After calling this routine, you can call the following routines:

?hptrs	to solve $A*X = B$
?hpcon	to estimate the condition number of A
?hptri	to compute the inverse of A.

Routines for Solving Systems of Linear Equations

This section describes the LAPACK routines for solving systems of linear equations. Before calling most of these routines, you need to factorize the matrix of your system of equations (see Routines for Matrix Factorization in this chapter). However, the factorization is not necessary if your system of equations has a triangular matrix.

?getrs

Solves a system of linear equations with an LU-factored square matrix, with multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call dgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call cgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
call zgetrs( trans, n, nrhs, a, lda, ipiv, b, ldb, info )
```

Fortran 95:

```
call getrs( a, ipiv, b [, trans] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for *X* the following systems of linear equations:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Before calling this routine, you must call `?getrf` to compute the *LU* factorization of *A*.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then $A*X = B$ is solved for *X*. If *trans* = 'T', then $A^T*X = B$ is solved for *X*. If *trans* = 'C', then $A^H*X = B$ is solved for *X*.
n	INTEGER. The order of *A*; the number of rows in *B*($n \geq 0$).
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a, *b*	REAL for sgetrs DOUBLE PRECISION for dgetrs COMPLEX for cgetrs DOUBLE COMPLEX for zgetrs. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains *LU* factorization of matrix *A* resulting from the call of `?getrf` . The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *a* must be at least max(1,*n*), the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* $\geq$ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* $\geq$ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by `?getrf`.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `getrs` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon P|L||U|$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\, cond\,(A, x)\varepsilon$$

where $\text{cond}(A,x) = \| \, |A^{-1}||A| \, |x| \, \|_\infty / \||x|\|_\infty \le \||A^{-1}|\|_\infty \, \||A|\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector *b* is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?gecon`.

To refine the solution and estimate the error, call `?gerfs`.

?gbtrs

Solves a system of linear equations with an LU-factored band matrix, with multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call dgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call cgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call zgbtrs( trans, n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
```

Fortran 95:

```
call gbtrs( ab, b, ipiv,  [, kl] [, trans] [, info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for *X* the following systems of linear equations:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Here *A* is an *LU*-factored general band matrix of order *n* with *kl* non-zero subdiagonals and *ku* nonzero superdiagonals. Before calling this routine, call `?gbtrf` to compute the *LU* factorization of *A*.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'.
n	INTEGER. The order of *A*; the number of rows in *B*; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab, *b*	REAL for sgbtrs DOUBLE PRECISION for dgbtrs COMPLEX for cgbtrs DOUBLE COMPLEX for zgbtrs. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the matrix *A* in *band storage* (see Matrix Storage Schemes). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *ab* must be at least max(1, *n*), and the second dimension of *b* at least max(1,*nrhs*).
ldab	INTEGER. The leading dimension of the array *ab*; $ldab \geq 2*kl + ku + 1$.
ldb	INTEGER. The leading dimension of *b*; $ldb \geq \max(1, n)$.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by `?gbtrf`.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gbtrs` interface are as follows:

ab	Holds the array *A* of size (2**kl*+*ku*+1,*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length min(*m*, *n*).
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *lda*-2**kl*-1.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations (*A* + *E*)*x* = *b*, where

$|E| \le c(kl + ku + 1)\varepsilon P|L||U|$

$c(k)$ is a modest linear function of k, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(kl + ku + 1)\, cond\,(A, x)\varepsilon$$

where $\mathrm{cond}(A,x) = \| |A^{-1}||A|\,|x| \|_\infty / \||x|\|_\infty \le \||A^{-1}|\|_\infty \||A|\|_\infty = \kappa_\infty(A)$.

Note that $\mathrm{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector is $2n(ku + 2kl)$ for real flavors. The number of operations for complex flavors is 4 times greater. All these estimates assume that kl and ku are much less than $\min(m,n)$.

To estimate the condition number $\kappa_\infty(A)$, call `?gbcon`.

To refine the solution and estimate the error, call `?gbrfs`.

?gttrs

Solves a system of linear equations with a tridiagonal matrix using the LU factorization computed by ?gttrf.

Syntax

FORTRAN 77:

```
call sgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
call dgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
call cgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
call zgttrs( trans, n, nrhs, dl, d, du, du2, ipiv, b, ldb, info )
```

Fortran 95:

```
call gttrs( dl, d, du, du2, b, ipiv [, trans] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for X the following systems of linear equations with multiple right hand sides:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Before calling this routine, you must call ?gttrf to compute the LU factorization of A.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', then $A*X = B$ is solved for X. If *trans* = 'T', then $A^T*X = B$ is solved for X. If *trans* = 'C', then $A^H*X = B$ is solved for X.
n	INTEGER. The order of A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, that is, the number of columns in B; *nrhs* $\geq$ 0.
dl,*d*,*du*,*du2*,*b*	REAL for sgttrs DOUBLE PRECISION for dgttrs COMPLEX for cgttrs DOUBLE COMPLEX for zgttrs. Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *du2*(*n* -2), *b*(*ldb*,*nrhs*). The array *dl* contains the (*n* - 1) multipliers that define the matrix L from the LU factorization of A.

	The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. The array *du* contains the (*n* - 1) elements of the first superdiagonal of *U*. The array *du2* contains the (*n* - 2) elements of the second superdiagonal of *U*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION (*n*). The *ipiv* array, as returned by ?gttrf.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gttrs interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations (*A* + *E*)*x* = *b*, where

$|E| \le c(n)\varepsilon P|L||U|$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\, cond\,(A, x)\varepsilon$$

where $\text{cond}(A,x) = \| |A^{-1}||A|\,|x| \|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty \||A|\|_\infty = \kappa_\infty(A)$.

Note that cond(*A*,*x*) can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector *b* is 7*n* (including *n* divisions) for real flavors and 34*n* (including 2*n* divisions) for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?gtcon.

To refine the solution and estimate the error, call ?gtrfs.

?dttrsb

Solves a system of linear equations with a diagonally dominant tridiagonal matrix using the LU factorization computed by ?dttrfb.

Syntax

FORTRAN 77:

```
call sdttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
call ddttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
call cdttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
call zdttrsb( trans, n, nrhs, dl, d, du, b, ldb, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The ?dttrsb routine solves the following systems of linear equations with multiple right hand sides for *X*:

*A***X* = *B*	if *trans*='N',
A^T**X* = *B*	if *trans*='T',
A^H**X* = *B*	if *trans*='C' (for complex matrices only).

Before calling this routine, call ?dttrfb to compute the factorization of *A*.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations solved for *X*: If *trans* = 'N', then *A***X* = *B*. If *trans* = 'T', then A^T**X* = *B*. If *trans* = 'C', then A^H**X* = *B*.
n	INTEGER. The order of *A*; *n* ≥ 0.
nrhs	INTEGER. The number of right-hand sides, that is, the number of columns in *B*; *nrhs* ≥ 0.
dl, *d*, *du*, *b*	REAL for sdttrsb DOUBLE PRECISION for ddttrsb

COMPLEX for cdttrsb
DOUBLE COMPLEX for zdttrsb.
Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *b*(*ldb*,*nrhs*).
The array *dl* contains the (*n* - 1) multipliers that define the matrices L_1, L_2 from the factorization of *A*.
The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the factorization of *A*.
The array *du* contains the (*n* - 1) elements of the superdiagonal of *U*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.

ldb — INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b — Overwritten by the solution matrix *X*.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

?potrs

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite matrix.

Syntax

FORTRAN 77:

```
call spotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call dpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call cpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
call zpotrs( uplo, n, nrhs, a, lda, b, ldb, info )
```

Fortran 95:

```
call potrs( a, b [,uplo] [, info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for *X* the system of linear equations *A***X* = *B* with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A*, given the Cholesky factorization of *A*:

A = U^T**U* for real data, *A* = U^H**U* for complex data — If *uplo* = 'U'

A = *L**L^T for real data, *A* = *L**L^H for complex data — If *uplo* = 'L',

where *L* is a lower triangular matrix and *U* is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*.

Before calling this routine, you must call ?potrf to compute the Cholesky factorization of *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides ($nrhs \geq 0$).
a, *b*	REAL for spotrs DOUBLE PRECISION for dpotrs COMPLEX for cpotrs DOUBLE COMPLEX for zpotrs. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the factor *U* or *L* (see *uplo*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *a* must be at least max(1,*n*), the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine potrs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *uplo* = 'U', the computed solution for each right-hand side *b* is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ |U^H||U|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for *uplo* = 'L'. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon$$

where $\mathrm{cond}(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty\ \||A|\|_\infty = \kappa_\infty(A)$.

Note that $\mathrm{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$. The approximate number of floating-point operations for one right-hand side vector *b* is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?pocon.

To refine the solution and estimate the error, call ?porfs.

?pftrs

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite matrix using the Rectangular Full Packed (RFP) format.

Syntax

FORTRAN 77:

```
call spftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call dpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call cpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
call zpftrs( transr, uplo, n, nrhs, a, b, ldb, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine solves a system of linear equations A*X = B with a symmetric positive-definite or, for complex data, Hermitian positive-definite matrix *A* using the Cholesky factorization of *A*:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data — if *uplo*='U'

$A = L*L^T$ for real data, $A = L*L^H$ for complex data — if *uplo*='L'

computed by ?pftrf. *L* stands for a lower triangular matrix and *U* - for an upper triangular matrix.

The matrix *A* is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr	CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data). If *transr* = 'N', the Normal *transr* of RFP *A* is stored. If *transr* = 'T', the Transpose *transr* of RFP *A* is stored. If *transr* = 'C', the Conjugate-Transpose *transr* of RFP *A* is stored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of the RFP matrix *A* is stored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, that is, the number of columns of the matrix *B*; $nrhs \geq 0$.
a, *b*	REAL for spftrs DOUBLE PRECISION for dpftrs COMPLEX for cpftrs DOUBLE COMPLEX for zpftrs. Arrays: *a*(*n**(*n*+1)/2), *b*(*ldb*,*nrhs*). The array *a* contains the matrix *A* in the RFP format. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	The solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

?pptrs

Solves a system of linear equations with a packed Cholesky-factored symmetric (Hermitian) positive-definite matrix.

Syntax

FORTRAN 77:

```
call spptrs( uplo, n, nrhs, ap, b, ldb, info )
call dpptrs( uplo, n, nrhs, ap, b, ldb, info )
call cpptrs( uplo, n, nrhs, ap, b, ldb, info )
```

```
call zpptrs( uplo, n, nrhs, ap, b, ldb, info )
```

Fortran 95:

```
call pptrs( ap, b [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the system of linear equations $A*X = B$ with a packed symmetric positive-definite or, for complex data, Hermitian positive-definite matrix A, given the Cholesky factorization of A:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data If *uplo* = 'U'

$A = L*L^T$ for real data, $A = L*L^H$ for complex data If *uplo* = 'L',

where L is a lower triangular matrix and U is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix B.

Before calling this routine, you must call `?pptrf` to compute the Cholesky factorization of A.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides ($nrhs \geq 0$).
ap, *b*	REAL for spptrs DOUBLE PRECISION for dpptrs COMPLEX for cpptrs DOUBLE COMPLEX for zpptrs. Arrays: *ap*(*), *b*(*ldb*,*) The dimension of *ap* must be at least max(1,n(n+1)/2). The array *ap* contains the factor U or L, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes). The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix X.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `pptrs` interface are as follows:

ap	Holds the array *A* of size `(n*(n+1)/2)`.
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

If *uplo* = `'U'`, the computed solution for each right-hand side *b* is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ |U^H||U|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

A similar estimate holds for *uplo* = `'L'`.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon$$

where $cond(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty\ \||A|\|_\infty = \kappa_\infty(A)$.

Note that $cond(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector *b* is $2n^2$ for real flavors and $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?ppcon`.

To refine the solution and estimate the error, call `?pprfs`.

?pbtrs

Solves a system of linear equations with a Cholesky-factored symmetric (Hermitian) positive-definite band matrix.

Syntax

FORTRAN 77:

```
call spbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call dpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
```

```
call cpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call zpbtrs( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
```

Fortran 95:

```
call pbtrs( ab, b [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for real data a system of linear equations *A*X = B* with a symmetric positive-definite or, for complex data, Hermitian positive-definite *band* matrix *A*, given the Cholesky factorization of *A*:

A = U^T**U* for real data, *A = U*^{H}**U* for complex data If *uplo*='U'

*A = L*L*^{T} for real data, *A = L*L*^{H} for complex data If *uplo*='L',

where *L* is a lower triangular matrix and *U* is upper triangular. The system is solved with multiple right-hand sides stored in the columns of the matrix *B*.

Before calling this routine, you must call `?pbtrf` to compute the Cholesky factorization of *A* in the band storage form.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the upper triangular factor is stored in *ab*. If *uplo* = 'L', the lower triangular factor is stored in *ab*.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab, *b*	REAL for spbtrs DOUBLE PRECISION for dpbtrs COMPLEX for cpbtrs DOUBLE COMPLEX for zpbtrs. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the Cholesky factor, as returned by the factorization routine, in *band storage* form. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *ab* must be at least max(1, *n*), and the second dimension of *b* at least max(1,*nrhs*).
ldab	INTEGER. The first dimension of the array *ab*; $ldab \geq kd + 1$.
ldb	INTEGER. The first dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbtrs interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations (*A* + *E*)*x* = *b*, where

$|E| \le c(kd + 1)\varepsilon\ P|U^H||U|$ or $|E| \le c(kd + 1)\varepsilon\ P|L^H||L|$

$c(k)$ is a modest linear function of k, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(kd + 1)\, cond\,(A, x)\varepsilon$$

where $\mathrm{cond}(A,x) = || |A^{-1}||A|\,|x| ||_\infty / ||x||_\infty \le ||A^{-1}||_\infty\, ||A||_\infty = \kappa_\infty(A)$.

Note that $\mathrm{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector is $4n*kd$ for real flavors and $16n*kd$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?pbcon.

To refine the solution and estimate the error, call ?pbrfs.

?pttrs

Solves a system of linear equations with a symmetric (Hermitian) positive-definite tridiagonal matrix using the factorization computed by ?pttrf.

Syntax

FORTRAN 77:

```
call spttrs( n, nrhs, d, e, b, ldb, info )
call dpttrs( n, nrhs, d, e, b, ldb, info )
call cpttrs( uplo, n, nrhs, d, e, b, ldb, info )
call zpttrs( uplo, n, nrhs, d, e, b, ldb, info )
```

Fortran 95:

```
call pttrs( d, e, b [,info] )
call pttrs( d, e, b [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for *X* a system of linear equations *A*X = B* with a symmetric (Hermitian) positive-definite tridiagonal matrix *A*. Before calling this routine, call ?pttrf to compute the *L*D*L'* for real data and the *L*D*L'* or *U'*D*U* factorization of *A* for complex data.

Input Parameters

uplo	CHARACTER*1. Used for cpttrs/zpttrs only. Must be 'U' or 'L'. Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix *A* is stored and how *A* is factored: If *uplo* = 'U', the array *e* stores the superdiagonal of *A*, and *A* is factored as *U'*D*U*. If *uplo* = 'L', the array *e* stores the subdiagonal of *A*, and *A* is factored as *L*D*L'*.
n	INTEGER. The order of *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, that is, the number of columns of the matrix *B*; $nrhs \geq 0$.
d	REAL for spttrs, cpttrs DOUBLE PRECISION for dpttrs, zpttrs. Array, dimension (*n*). Contains the diagonal elements of the diagonal matrix *D* from the factorization computed by ?pttrf.
e, *b*	REAL for spttrs DOUBLE PRECISION for dpttrs COMPLEX for cpttrs DOUBLE COMPLEX for zpttrs.

	Arrays: *e*(*n* -1), *b*(*ldb*, *nrhs*). The array *e* contains the (*n* - 1) off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf (see *uplo*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
ldb	INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pttrs interface are as follows:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Used in complex flavors only. Must be 'U' or 'L'. The default value is 'U'.

?sytrs

Solves a system of linear equations with a UDU- or LDL-factored symmetric matrix.

Syntax

FORTRAN 77:

```
call ssytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call dsytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call csytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call zsytrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
```

Fortran 95:

```
call sytrs( a, b, ipiv [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for X the system of linear equations $A*X = B$ with a symmetric matrix A, given the Bunch-Kaufman factorization of A:

if $uplo$='U', $A = P*U*D*U^T*P^T$

if $uplo$='L', $A = P*L*D*L^T*P^T$,

where P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B. You must supply to this routine the factor U (or L) and the array $ipiv$ returned by the factorization routine ?sytrf.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the array *a* stores the upper triangular factor U of the factorization $A = P*U*D*U^T*P^T$. If *uplo* = 'L', the array *a* stores the lower triangular factor L of the factorization $A = P*L*D*L^T*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sytrf.
a, *b*	REAL for ssytrs DOUBLE PRECISION for dsytrs COMPLEX for csytrs DOUBLE COMPLEX for zsytrs. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the factor U or L (see *uplo*). The array *b* contains the matrix B whose columns are the right-hand sides for the system of equations. The second dimension of *a* must be at least max(1,*n*), and the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix X.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sytrs` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^T|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||U^T|P^T$

$c(n)$ is a modest linear function of *n*, and ε is the machine precision.

If x_0 is the true solution, the computed solution *x* satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon$$

where $\mathrm{cond}(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty\ \||A|\|_\infty = \kappa_\infty(A)$.

Note that $\mathrm{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?sycon`.

To refine the solution and estimate the error, call `?syrfs`.

?hetrs

Solves a system of linear equations with a UDU- or LDL-factored Hermitian matrix.

Syntax

FORTRAN 77:

```
call chetrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
call zhetrs( uplo, n, nrhs, a, lda, ipiv, b, ldb, info )
```

Fortran 95:

```
call hetrs( a, b, ipiv [, uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the system of linear equations $A*X = B$ with a Hermitian matrix A, given the Bunch-Kaufman factorization of A:

if $uplo$ = 'U' $A = P*U*D*U^H*P^T$

if $uplo$ = 'L' $A = P*L*D*L^H*P^T$,

where P is a permutation matrix, U and L are upper and lower triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B. You must supply to this routine the factor U (or L) and the array $ipiv$ returned by the factorization routine `?hetrf`.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If $uplo$ = 'U', the array a stores the upper triangular factor U of the factorization $A = P*U*D*U^H*P^T$. If $uplo$ = 'L', the array a stores the lower triangular factor L of the factorization $A = P*L*D*L^H*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ipiv	INTEGER. Array, DIMENSION at least max(1, n). The $ipiv$ array, as returned by `?hetrf`.
a, *b*	COMPLEX for chetrs DOUBLE COMPLEX for zhetrs. Arrays: a(lda,*), b(ldb,*). The array a contains the factor U or L (see $uplo$). The array b contains the matrix B whose columns are the right-hand sides for the system of equations. The second dimension of a must be at least max(1,n), the second dimension of b at least max(1,$nrhs$).
lda	INTEGER. The first dimension of a; $lda \geq$ max(1, n).
ldb	INTEGER. The first dimension of b; $ldb \geq$ max(1, n).

Output Parameters

b	Overwritten by the solution matrix X.
info	INTEGER. If $info$=0, the execution is successful. If $info$ = -i, the i-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `hetrs` interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^H|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||L^H|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon$$

where $\text{cond}(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty\ \||A|\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $8n^2$.

To estimate the condition number $\kappa_\infty(A)$, call `?hecon`.

To refine the solution and estimate the error, call `?herfs`.

?sptrs

Solves a system of linear equations with a UDU- or LDL-factored symmetric matrix using packed storage.

Syntax

FORTRAN 77:

```
call ssptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call dsptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call csptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

```
call zsptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call sptrs( ap, b, ipiv [, uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the system of linear equations $A*X = B$ with a symmetric matrix A, given the Bunch-Kaufman factorization of A:

if `uplo='U'`, $A = PUDU^TP^T$

if `uplo='L'`, $A = PLDL^TP^T$,

where P is a permutation matrix, U and L are upper and lower *packed* triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B. You must supply the factor U (or L) and the array *ipiv* returned by the factorization routine `?sptrf`.

Input Parameters

uplo
: `CHARACTER*1`. Must be `'U'` or `'L'`.
Indicates how the input matrix A has been factored:
If *uplo* = `'U'`, the array *ap* stores the packed factor U of the factorization $A = P*U*D*U^T*P^T$. If *uplo* = `'L'`, the array *ap* stores the packed factor L of the factorization $A = P*L*D*L^T*P^T$.

n
: `INTEGER`. The order of matrix A; $n \geq 0$.

nrhs
: `INTEGER`. The number of right-hand sides; $nrhs \geq 0$.

ipiv
: `INTEGER`.
Array, `DIMENSION` at least `max(1, n)`. The *ipiv* array, as returned by `?sptrf`.

ap, *b*
: `REAL` for `ssptrs`
`DOUBLE PRECISION` for `dsptrs`
`COMPLEX` for `csptrs`
`DOUBLE COMPLEX` for `zsptrs`.
Arrays: *ap*(*), *b*(*ldb*,*).
The dimension of *ap* must be at least max(1,n(n+1)/2). The array *ap* contains the factor U or L, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes).
The array *b* contains the matrix B whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least `max(1, nrhs)`.

ldb
: `INTEGER`. The first dimension of *b*; *ldb* ≥ `max(1, n)`.

Output Parameters

b
: Overwritten by the solution matrix X.

info
: `INTEGER`. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sptrs` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^T|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||L^T|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon$$

where $cond(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty\ \||A|\|_\infty = \kappa_\infty(A)$.

Note that $cond(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $2n^2$ for real flavors or $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?spcon`.

To refine the solution and estimate the error, call `?sprfs`.

?hptrs

Solves a system of linear equations with a UDU- or LDL-factored Hermitian matrix using packed storage.

Syntax

FORTRAN 77:

```
call chptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zhptrs( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call hptrs( ap, b, ipiv [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the system of linear equations $A*X = B$ with a Hermitian matrix A, given the Bunch-Kaufman factorization of A:

if *uplo*='U', $A = P*U*D*U^H*P^T$

if *uplo*='L', $A = P*L*D*L^H*P^T$,

where P is a permutation matrix, U and L are upper and lower *packed* triangular matrices with unit diagonal, and D is a symmetric block-diagonal matrix. The system is solved with multiple right-hand sides stored in the columns of the matrix B.

You must supply to this routine the arrays *ap* (containing U or L)and *ipiv* in the form returned by the factorization routine `?hptrf`.

Input Parameters

uplo
: `CHARACTER*1`. Must be `'U'` or `'L'`.
Indicates how the input matrix A has been factored:
If *uplo* = `'U'`, the array *ap* stores the packed factor U of the factorization $A = P*U*D*U^H*P^T$. If *uplo* = `'L'`, the array *ap* stores the packed factor L of the factorization $A = P*L*D*L^H*P^T$.

n
: `INTEGER`. The order of matrix A; $n \geq 0$.

nrhs
: `INTEGER`. The number of right-hand sides; $nrhs \geq 0$.

ipiv
: `INTEGER`. Array, `DIMENSION` at least `max(1, n)`. The *ipiv* array, as returned by `?hptrf`.

ap, *b*
: `COMPLEX` for `chptrs`
`DOUBLE COMPLEX` for `zhptrs`.
Arrays: *ap*`(*)`, *b*`(`*ldb*`,*)`.
The dimension of *ap* must be at least max(1,n(n+1)/2). The array *ap* contains the factor U or L, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes).
The array *b* contains the matrix B whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least `max(1, nrhs)`.

ldb
: `INTEGER`. The first dimension of *b*; *ldb* ≥ `max(1, n)`.

Output Parameters

b
: Overwritten by the solution matrix X.

info
: `INTEGER`. If *info* = `0`, the execution is successful.
If *info* = `-`*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `hptrs` interface are as follows:

ap	Holds the array *A* of size `(n*(n+1)/2)`.
b	Holds the matrix *B* of size (*n*, *nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$|E| \le c(n)\varepsilon\ P|U||D||U^H|P^T$ or $|E| \le c(n)\varepsilon\ P|L||D||L^H|P^T$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon$$

where $\text{cond}(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \||A^{-1}|\|_\infty\ \||A|\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$.

The total number of floating-point operations for one right-hand side vector is approximately $8n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?hpcon`.

To refine the solution and estimate the error, call `?hprfs`.

?trtrs

Solves a system of linear equations with a triangular matrix, with multiple right-hand sides.

Syntax

FORTRAN 77:

```
call strtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
call dtrtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
```

```
call ctrtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
call ztrtrs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, info )
```

Fortran 95:

```
call trtrs( a, b [,uplo] [, trans] [,diag] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the following systems of linear equations with a triangular matrix A, with multiple right-hand sides stored in B:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', then A is upper triangular. If *uplo* = 'L', then A is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trans* = 'N', then $A*X = B$ is solved for X. If *trans* = 'T', then $A^T*X = B$ is solved for X. If *trans* = 'C', then $A^H*X = B$ is solved for X.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then A is not a unit triangular matrix. If *diag* = 'U', then A is unit triangular: diagonal elements of A are assumed to be 1 and not referenced in the array *a*.
n	INTEGER. The order of A; the number of rows in B; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a, *b*	REAL for strtrs DOUBLE PRECISION for dtrtrs COMPLEX for ctrtrs DOUBLE COMPLEX for ztrtrs. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the matrix A. The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *a* must be at least max(1,*n*), the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `trtrs` interface are as follows:

a	Stands for argument *ap* in FORTRAN 77 interface. Holds the matrix *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations (*A* + *E*)*x* = *b*, where

$|E| \le c(n)\varepsilon\ |A|$

$c(n)$ is a modest linear function of n, and ε is the machine precision. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon \text{ provided } c(n)\ cond\ (A, x)\varepsilon < 1$$

where $\text{cond}(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is n^2 for real flavors and $4n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?trcon`.

To estimate the error in the solution, call `?trrfs`.

?tptrs

Solves a system of linear equations with a packed triangular matrix, with multiple right-hand sides.

Syntax

FORTRAN 77:

```
call stptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
call dtptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
call ctptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
call ztptrs( uplo, trans, diag, n, nrhs, ap, b, ldb, info )
```

Fortran 95:

```
call tptrs( ap, b [,uplo] [, trans] [,diag] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the following systems of linear equations with a packed triangular matrix A, with multiple right-hand sides stored in B:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', then A is upper triangular. If *uplo* = 'L', then A is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trans* = 'N', then $A*X = B$ is solved for X. If *trans* = 'T', then $A^T*X = B$ is solved for X. If *trans* = 'C', then $A^H*X = B$ is solved for X.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then A is not a unit triangular matrix. If *diag* = 'U', then A is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ap*.
n	INTEGER. The order of A; the number of rows in B; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ap, *b*	REAL for stptrs DOUBLE PRECISION for dtptrs

	COMPLEX for ctptrs DOUBLE COMPLEX for ztptrs. Arrays: *ap*(*), *b*(*ldb*,*). The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the matrix *A* in *packed storage* (see Matrix Storage Schemes). The array *b* contains the matrix *B* whose columns are the right-hand sides for the system of equations. The second dimension of *b* must be at least max(1, *nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tptrs interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations (*A* + *E*)*x* = *b*, where

$|E| \le c(n)\varepsilon\ |A|$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \le c(n)\ cond\ (A, x)\varepsilon \text{ provided } c(n)\ cond\ (A, x)\varepsilon < 1$$

where $\text{cond}(A,x) = \| |A^{-1}||A|\ |x|\ \|_\infty / \|x\|_\infty \le \|A^{-1}\|_\infty \|A\|_\infty = \kappa_\infty(A)$.

Note that $\text{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is n^2 for real flavors and $4n^2$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call ?tpcon.

To estimate the error in the solution, call ?tprfs.

?tbtrs

Solves a system of linear equations with a band triangular matrix, with multiple right-hand sides.

Syntax

FORTRAN 77:

```
call stbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call dtbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call ctbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
call ztbtrs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, info )
```

Fortran 95:

```
call tbtrs( ab, b [,uplo] [, trans] [,diag] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for X the following systems of linear equations with a band triangular matrix A, with multiple right-hand sides stored in B:

$A*X = B$	if *trans*='N',
$A^T*X = B$	if *trans*='T',
$A^H*X = B$	if *trans*='C' (for complex matrices only).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', then A is upper triangular. If *uplo* = 'L', then A is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trans* = 'N', then $A*X = B$ is solved for X. If *trans* = 'T', then $A^T*X = B$ is solved for X. If *trans* = 'C', then $A^H*X = B$ is solved for X.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then A is not a unit triangular matrix.

	If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ab*.
n	INTEGER. The order of *A*; the number of rows in *B*; $n \geq 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab, *b*	REAL for stbtrs DOUBLE PRECISION for dtbtrs COMPLEX for ctbtrs DOUBLE COMPLEX for ztbtrs. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the matrix *A* in *band storage* form. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *ab* must be at least max(1, *n*), the second dimension of *b* at least max(1,*nrhs*).
ldab	INTEGER. The first dimension of *ab*; $ldab \geq kd + 1$.
ldb	INTEGER. The first dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tbtrs interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*)
b	Holds the matrix *B* of size (*n*, *nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

For each right-hand side *b*, the computed solution is the exact solution of a perturbed system of equations $(A + E)x = b$, where

$$|E| \leq c(n)\varepsilon|A|$$

$c(n)$ is a modest linear function of n, and ε is the machine precision. If x_0 is the true solution, the computed solution x satisfies this error bound:

$$\frac{\|x - x_0\|_\infty}{\|x\|_\infty} \leq c(n)\, cond\,(A, x)\varepsilon \text{ provided } c(n)\, cond\,(A, x)\varepsilon < 1$$

where $\mathrm{cond}(A,x) = \| |A^{-1}||A|\,|x| \|_\infty / \||x|\|_\infty \leq \||A^{-1}|\|_\infty \||A|\|_\infty = \kappa_\infty(A)$.

Note that $\mathrm{cond}(A,x)$ can be much smaller than $\kappa_\infty(A)$; the condition number of A^T and A^H might or might not be equal to $\kappa_\infty(A)$.

The approximate number of floating-point operations for one right-hand side vector b is $2n*kd$ for real flavors and $8n*kd$ for complex flavors.

To estimate the condition number $\kappa_\infty(A)$, call `?tbcon`.

To estimate the error in the solution, call `?tbrfs`.

Routines for Estimating the Condition Number

This section describes the LAPACK routines for estimating the *condition number* of a matrix. The condition number is used for analyzing the errors in the solution of a system of linear equations (see Error Analysis). Since the condition number may be arbitrarily large when the matrix is nearly singular, the routines actually compute the *reciprocal* condition number.

?gecon

Estimates the reciprocal of the condition number of a general matrix in the 1-norm or the infinity-norm.

Syntax

FORTRAN 77:

```
call sgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call dgecon( norm, n, a, lda, anorm, rcond, work, iwork, info )
call cgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
call zgecon( norm, n, a, lda, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call gecon( a, anorm, rcond [,norm] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the reciprocal of the condition number of a general matrix A in the 1-norm or infinity-norm:

$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \sum_i |a_{ij}|$ or $||A||_\infty = \max_i \sum_j |a_{ij}|$)
- call ?getrf to compute the *LU* factorization of *A*.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for sgecon DOUBLE PRECISION for dgecon COMPLEX for cgecon DOUBLE COMPLEX for zgecon. Arrays: *a*(*lda*,*), *work*(*). The array *a* contains the *LU*-factored matrix *A*, as returned by ?getrf. The second dimension of *a* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 4*n) for real flavors and max(1, 2*n) for complex flavors.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix *A* (see Description).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgecon DOUBLE PRECISION for zgecon. Workspace array, DIMENSION at least max(1, 2*n).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gecon interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
norm	Must be '1', 'O', or 'I'. The default value is '1'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b* or A^H*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 2*n^2 floating-point operations for real flavors and 8*n^2 for complex flavors.

?gbcon

Estimates the reciprocal of the condition number of a band matrix in the 1-norm or the infinity-norm.

Syntax

FORTRAN 77:

```
call sgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, iwork, info )
call dgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, iwork, info )
call cgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, rwork, info )
call zgbcon( norm, n, kl, ku, ab, ldab, ipiv, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call gbcon( ab, ipiv, anorm, rcond [,kl] [,norm] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine estimates the reciprocal of the condition number of a general band matrix *A* in the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?gbtrf to compute the *LU* factorization of *A*.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.
ldab	INTEGER. The first dimension of the array *ab*. ($ldab \geq 2*kl + ku + 1$).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?gbtrf.
ab, *work*	REAL for sgbcon DOUBLE PRECISION for dgbcon COMPLEX for cgbcon DOUBLE COMPLEX for zgbcon. Arrays: *ab*(*ldab*,*), *work*(*). The array *ab* contains the factored band matrix *A*, as returned by ?gbtrf. The second dimension of *ab* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix *A* (see Description).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgbcon DOUBLE PRECISION for zgbcon. Workspace array, DIMENSION at least max(1, 2*n).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gbcon interface are as follows:

ab	Holds the array *A* of size (2**kl*+*ku*+1,*n*).
ipiv	Holds the vector of length *n*.
norm	Must be '1', 'O', or 'I'. The default value is '1'.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-2**kl*-1.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b* or A^H**x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 2*n*(*ku* + 2*kl*) floating-point operations for real flavors and 8*n*(*ku* + 2*kl*) for complex flavors.

?gtcon

Estimates the reciprocal of the condition number of a tridiagonal matrix using the factorization computed by ?gttrf*.*

Syntax

FORTRAN 77:

```
call sgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, iwork, info )
call dgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, iwork, info )
call cgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, info )
call zgtcon( norm, n, dl, d, du, du2, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call gtcon( dl, d, du, du2, ipiv, anorm, rcond [,norm] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine estimates the reciprocal of the condition number of a real or complex tridiagonal matrix *A* in the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1||A^{-1}||_1$

$\kappa_\infty(A) = ||A||_\infty||A^{-1}||_\infty$

An estimate is obtained for $||A^{-1}||$, and the reciprocal of the condition number is computed as *rcond* = 1 / ($||A||$ $||A^{-1}||$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?gttrf to compute the *LU* factorization of *A*.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
dl,*d*,*du*,*du2*	REAL for sgtcon DOUBLE PRECISION for dgtcon COMPLEX for cgtcon DOUBLE COMPLEX for zgtcon. Arrays: *dl*(*n* -1), *d*(*n*), *du*(*n* -1), *du2*(*n* -2). The array *dl* contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by ?gttrf. The array *d* contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. The array *du* contains the (*n* - 1) elements of the first superdiagonal of *U*. The array *du2* contains the (*n* - 2) elements of the second superdiagonal of *U*.
ipiv	INTEGER. Array, DIMENSION (*n*). The array of pivot indices, as returned by ?gttrf.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix *A* (see *Description*).
work	REAL for sgtcon DOUBLE PRECISION for dgtcon COMPLEX for cgtcon DOUBLE COMPLEX for zgtcon. Workspace array, DIMENSION (2**n*).
iwork	INTEGER. Workspace array, DIMENSION (*n*). Used for real flavors only.

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond*=0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gtcon interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
du	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length *n*.
norm	Must be '1', 'O', or 'I'. The default value is '1'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?pocon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite matrix.

Syntax

FORTRAN 77:

```
call spocon( uplo, n, a, lda, anorm, rcond, work, iwork, info )
call dpocon( uplo, n, a, lda, anorm, rcond, work, iwork, info )
call cpocon( uplo, n, a, lda, anorm, rcond, work, rwork, info )
call zpocon( uplo, n, a, lda, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call pocon( a, anorm, rcond [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?potrf to compute the Cholesky factorization of *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for spocon DOUBLE PRECISION for dpocon COMPLEX for cpocon DOUBLE COMPLEX for zpocon. Arrays: *a*(*lda*,*), *work*(*). The array *a* contains the factored matrix *A*, as returned by ?potrf. The second dimension of *a* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
anorm	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix *A* (see *Description*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cpocon DOUBLE PRECISION for zpocon. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pocon interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?ppcon

Estimates the reciprocal of the condition number of a packed symmetric (Hermitian) positive-definite matrix.

Syntax

FORTRAN 77:

```
call sppcon( uplo, n, ap, anorm, rcond, work, iwork, info )
call dppcon( uplo, n, ap, anorm, rcond, work, iwork, info )
call cppcon( uplo, n, ap, anorm, rcond, work, rwork, info )
call zppcon( uplo, n, ap, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call ppcon( ap, anorm, rcond [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine estimates the reciprocal of the condition number of a packed symmetric (Hermitian) positive-definite matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?pptrf to compute the Cholesky factorization of *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
ap, *work*	REAL for sppcon DOUBLE PRECISION for dppcon COMPLEX for cppcon DOUBLE COMPLEX for zppcon. Arrays: *ap*(*), *work*(*). The array *ap* contains the packed factored matrix *A*, as returned by ?pptrf. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
anorm	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix *A* (see *Description*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cppcon DOUBLE PRECISION for zppcon. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ppcon interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?pbcon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite band matrix.

Syntax

FORTRAN 77:

```
call spbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, iwork, info )
call dpbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, iwork, info )
call cpbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, rwork, info )
call zpbcon( uplo, n, kd, ab, ldab, anorm, rcond, work, rwork, info )
```

Fortran 95:

```
call pbcon( ab, anorm, rcond [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite band matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call `?pbtrf` to compute the Cholesky factorization of *A*.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates how the input matrix *A* has been factored: If *uplo* = `'U'`, the upper triangular factor is stored in *ab*. If *uplo* = `'L'`, the lower triangular factor is stored in *ab*.
n	`INTEGER`. The order of the matrix *A*; $n \geq 0$.
kd	`INTEGER`. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.
ldab	`INTEGER`. The first dimension of the array *ab*. ($ldab \geq kd + 1$).

ab, *work*	REAL for spbcon DOUBLE PRECISION for dpbcon COMPLEX for cpbcon DOUBLE COMPLEX for zpbcon. Arrays: *ab*(*ldab*,*), *work*(*). The array *ab* contains the factored matrix *A* in band form, as returned by ?pbtrf. The second dimension of *ab* must be at least max(1, *n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
anorm	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix *A* (see *Description*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cpbcon DOUBLE PRECISION for zpbcon. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbcon interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 4**n*(*kd* + 1) floating-point operations for real flavors and 16**n*(*kd* + 1) for complex flavors.

?ptcon

Estimates the reciprocal of the condition number of a symmetric (Hermitian) positive-definite tridiagonal matrix.

Syntax

FORTRAN 77:

```
call sptcon( n, d, e, anorm, rcond, work, info )
call dptcon( n, d, e, anorm, rcond, work, info )
call cptcon( n, d, e, anorm, rcond, work, info )
call zptcon( n, d, e, anorm, rcond, work, info )
```

Fortran 95:

```
call ptcon( d, e, anorm, rcond [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the reciprocal of the condition number (in the 1-norm) of a real symmetric or complex Hermitian positive-definite tridiagonal matrix using the factorization $A = L*D*L^T$ for real flavors and $A = L*D*L^H$ for complex flavors or $A = U^T*D*U$ for real flavors and $A = U^H*D*U$ for complex flavors computed by `?pttrf` :

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since A is symmetric or Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

The norm $||A^{-1}||$ is computed by a direct method, and the reciprocal of the condition number is computed as $rcond = 1 / (||A|| \ ||A^{-1}||)$.

Before calling this routine:

- compute *anorm* as $||A||_1 = \max_j \Sigma_i |a_{ij}|$
- call `?pttrf` to compute the factorization of A.

Input Parameters

n	`INTEGER`. The order of the matrix A; $n \geq 0$.
d, *work*	`REAL` for single precision flavors `DOUBLE PRECISION` for double precision flavors. Arrays, dimension (*n*). The array *d* contains the *n* diagonal elements of the diagonal matrix D from the factorization of A, as computed by `?pttrf` ; *work* is a workspace array.

e	`REAL` for `sptcon`
	`DOUBLE PRECISION` for `dptcon`
	`COMPLEX` for `cptcon`

DOUBLE COMPLEX for zptcon.
Array, DIMENSION (*n* -1).
Contains off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf .

anorm — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
The 1- norm of the *original* matrix *A* (see *Description*).

Output Parameters

rcond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gtcon interface are as follows:

d — Holds the vector of length *n*.

e — Holds the vector of length (*n*-1).

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 4**n*(*kd* + 1) floating-point operations for real flavors and 16**n*(*kd* + 1) for complex flavors.

?sycon

Estimates the reciprocal of the condition number of a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )
call dsycon( uplo, n, a, lda, ipiv, anorm, rcond, work, iwork, info )
```

```
call csycon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
call zsycon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call sycon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the reciprocal of the condition number of a symmetric matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is symmetric, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call `?sytrf` to compute the factorization of *A*.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates how the input matrix *A* has been factored: If *uplo* = `'U'`, the array *a* stores the upper triangular factor *U* of the factorization $A = P*U*D*U^T*P^T$. If *uplo* = `'L'`, the array *a* stores the lower triangular factor *L* of the factorization $A = P*L*D*L^T*P^T$.
n	`INTEGER`. The order of matrix *A*; $n \geq 0$.

a, *work*	`REAL` for `ssycon`
	`DOUBLE PRECISION` for `dsycon`
	`COMPLEX` for `csycon`
	`DOUBLE COMPLEX` for `zsycon`.
	Arrays: *a*(*lda*,*), *work*(*).
	The array *a* contains the factored matrix *A*, as returned by `?sytrf`. The second dimension of *a* must be at least `max(1,n)`.
	The array *work* is a workspace for the routine.
	The dimension of *work* must be at least `max(1, 2*n)`.

lda	`INTEGER`. The first dimension of *a*; *lda* ≥ `max(1, n)`.
ipiv	`INTEGER`. Array, `DIMENSION` at least `max(1, n)`. The array *ipiv*, as returned by `?sytrf`.
anorm	`REAL` for single precision flavors. `DOUBLE PRECISION` for double precision flavors. The norm of the *original* matrix *A* (see *Description*).
iwork	`INTEGER`. Workspace array, `DIMENSION` at least `max(1, n)`.

Output Parameters

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sycon interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?hecon

Estimates the reciprocal of the condition number of a Hermitian matrix.

Syntax

FORTRAN 77:

```
call checon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
call zhecon( uplo, n, a, lda, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call hecon( a, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine estimates the reciprocal of the condition number of a Hermitian matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since A is Hermitian, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?hetrf to compute the factorization of A.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix A has been factored: If *uplo* = 'U', the array *a* stores the upper triangular factor U of the factorization $A = P*U*D*U^H*P^T$. If *uplo* = 'L', the array *a* stores the lower triangular factor L of the factorization $A = P*L*D*L^H*P^T$.
n	INTEGER. The order of matrix A; $n \geq 0$.
a, *work*	COMPLEX for checon DOUBLE COMPLEX for zhecon. Arrays: *a*(*lda*,*), *work*(*). The array *a* contains the factored matrix A, as returned by ?hetrf. The second dimension of *a* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 2*n).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The array *ipiv*, as returned by ?hetrf.
anorm	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. The norm of the *original* matrix A (see *Description*).

Output Parameters

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hecon interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x = b*; the number is usually 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

?spcon

Estimates the reciprocal of the condition number of a packed symmetric matrix.

Syntax

FORTRAN 77:

```
call sspcon( uplo, n, ap, ipiv, anorm, rcond, work, iwork, info )
call dspcon( uplo, n, ap, ipiv, anorm, rcond, work, iwork, info )
call cspcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
call zspcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call spcon( ap, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the reciprocal of the condition number of a packed symmetric matrix *A*:

$\kappa_1(A) = ||A||_1 \; ||A^{-1}||_1$ (since *A* is symmetric, $\kappa_\infty(A) = \kappa_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?sptrf to compute the factorization of *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the array *ap* stores the packed upper triangular factor *U* of the factorization $A = P*U*D*U^T*P^T$.

If *uplo* = 'L', the array *ap* stores the packed lower triangular factor *L* of the factorization $A = P*L*D*L^T*P^T$.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

ap, *work* — REAL for sspcon
DOUBLE PRECISION for dspcon
COMPLEX for cspcon
DOUBLE COMPLEX for zspcon.
Arrays: *ap*(*), *work*(*).
The array *ap* contains the packed factored matrix *A*, as returned by ?sptrf. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2).
The array *work* is a workspace for the routine.
The dimension of *work* must be at least max(1, 2**n*).

ipiv — INTEGER. Array, DIMENSION at least max(1, *n*).
The array *ipiv*, as returned by ?sptrf.

anorm — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
The norm of the *original* matrix *A* (see *Description*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal of the condition number. The routine sets *rcond* = 0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spcon interface are as follows:

ap — Holds the array *A* of size (*n*(*n*+1)/2).

ipiv — Holds the vector of length *n*.

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A*x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors and $8n^2$ for complex flavors.

?hpcon

Estimates the reciprocal of the condition number of a packed Hermitian matrix.

Syntax

FORTRAN 77:

```
call chpcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
call zhpcon( uplo, n, ap, ipiv, anorm, rcond, work, info )
```

Fortran 95:

```
call hpcon( ap, ipiv, anorm, rcond [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the reciprocal of the condition number of a Hermitian matrix *A*:

$\kappa_1(A) = ||A||_1 \ ||A^{-1}||_1$ (since *A* is Hermitian, $\kappa_\infty(A) = k_1(A)$).

Before calling this routine:

- compute *anorm* (either $||A||_1 = \max_j \Sigma_i |a_{ij}|$ or $||A||_\infty = \max_i \Sigma_j |a_{ij}|$)
- call ?hptrf to compute the factorization of *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the array *ap* stores the packed upper triangular factor *U* of the factorization $A = P*U*D*U^T*P^T$. If *uplo* = 'L', the array *ap* stores the packed lower triangular factor *L* of the factorization $A = P*L*D*L^T*P^T$.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
ap, *work*	COMPLEX for chpcon DOUBLE COMPLEX for zhpcon. Arrays: *ap*(*), *work*(*). The array *ap* contains the packed factored matrix *A*, as returned by ?hptrf. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 2**n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The array *ipiv*, as returned by ?hptrf.
anorm	REAL for single precision flavors DOUBLE PRECISION for double precision flavors.

The norm of the *original* matrix *A* (see *Description*).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbcon interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length *n*.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

?trcon

Estimates the reciprocal of the condition number of a triangular matrix.

Syntax

FORTRAN 77:

```
call strcon( norm, uplo, diag, n, a, lda, rcond, work, iwork, info )
call dtrcon( norm, uplo, diag, n, a, lda, rcond, work, iwork, info )
call ctrcon( norm, uplo, diag, n, a, lda, rcond, work, rwork, info )
call ztrcon( norm, uplo, diag, n, a, lda, rcond, work, rwork, info )
```

Fortran 95:

```
call trcon( a, rcond [,uplo] [,diag] [,norm] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the reciprocal of the condition number of a triangular matrix *A* in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm	CHARACTER*1. Must be `'1'` or `'O'` or `'I'`. If *norm* = `'1'` or `'O'`, then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = `'I'`, then the routine estimates the condition number of matrix *A* in infinity-norm.
uplo	CHARACTER*1. Must be `'U'` or `'L'`. Indicates whether *A* is upper or lower triangular: If *uplo* = `'U'`, the array *a* stores the upper triangle of *A*, other array elements are not referenced. If *uplo* = `'L'`, the array *a* stores the lower triangle of *A*, other array elements are not referenced.
diag	CHARACTER*1. Must be `'N'` or `'U'`. If *diag* = `'N'`, then *A* is not a unit triangular matrix. If *diag* = `'U'`, then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *a*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for `strcon` DOUBLE PRECISION for `dtrcon` COMPLEX for `ctrcon` DOUBLE COMPLEX for `ztrcon`. Arrays: *a*(*lda*,*), *work*(*). The array *a* contains the matrix *A*. The second dimension of *a* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for `ctrcon` DOUBLE PRECISION for `ztrcon`. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors.

	DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trcon interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
norm	Must be '1', 'O', or 'I'. The default value is '1'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors and $4n^2$ operations for complex flavors.

?tpcon

Estimates the reciprocal of the condition number of a packed triangular matrix.

Syntax

FORTRAN 77:

```
call stpcon( norm, uplo, diag, n, ap, rcond, work, iwork, info )
call dtpcon( norm, uplo, diag, n, ap, rcond, work, iwork, info )
call ctpcon( norm, uplo, diag, n, ap, rcond, work, rwork, info )
call ztpcon( norm, uplo, diag, n, ap, rcond, work, rwork, info )
```

Fortran 95:

```
call tpcon( ap, rcond [,uplo] [,diag] [,norm] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine estimates the reciprocal of the condition number of a packed triangular matrix *A* in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether *A* is upper or lower triangular: If *uplo* = 'U', the array *ap* stores the upper triangle of *A* in packed form. If *uplo* = 'L', the array *ap* stores the lower triangle of *A* in packed form.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then *A* is not a unit triangular matrix. If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ap*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
ap, *work*	REAL for stpcon DOUBLE PRECISION for dtpcon COMPLEX for ctpcon DOUBLE COMPLEX for ztpcon. Arrays: *ap*(*), *work*(*). The array *ap* contains the packed matrix *A*. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3*n) for real flavors and max(1, 2*n) for complex flavors.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctpcon DOUBLE PRECISION for ztpcon. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `tpcon` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
norm	Must be '1', 'O', or 'I'. The default value is '1'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors and $4n^2$ operations for complex flavors.

?tbcon

Estimates the reciprocal of the condition number of a triangular band matrix.

Syntax

FORTRAN 77:

```
call stbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, iwork, info )
call dtbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, iwork, info )
call ctbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, rwork, info )
call ztbcon( norm, uplo, diag, n, kd, ab, ldab, rcond, work, rwork, info )
```

Fortran 95:

```
call tbcon( ab, rcond [,uplo] [,diag] [,norm] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the reciprocal of the condition number of a triangular band matrix *A* in either the 1-norm or infinity-norm:

$\kappa_1(A) = ||A||_1 \, ||A^{-1}||_1 = \kappa_\infty(A^T) = \kappa_\infty(A^H)$

$\kappa_\infty(A) = ||A||_\infty \, ||A^{-1}||_\infty = \kappa_1(A^T) = \kappa_1(A^H)$.

Input Parameters

norm	CHARACTER*1. Must be '1' or 'O' or 'I'. If *norm* = '1' or 'O', then the routine estimates the condition number of matrix *A* in 1-norm. If *norm* = 'I', then the routine estimates the condition number of matrix *A* in infinity-norm.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether *A* is upper or lower triangular: If *uplo* = 'U', the array *ap* stores the upper triangle of *A* in packed form. If *uplo* = 'L', the array *ap* stores the lower triangle of *A* in packed form.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then *A* is not a unit triangular matrix. If *diag* = 'U', then *A* is unit triangular: diagonal elements are assumed to be 1 and not referenced in the array *ab*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.
ab, *work*	REAL for stbcon DOUBLE PRECISION for dtbcon COMPLEX for ctbcon DOUBLE COMPLEX for ztbcon. Arrays: *ab*(*ldab*,*), *work*(*). The array *ab* contains the band matrix *A*. The second dimension of *ab* must be at least max(1,*n*). The array *work* is a workspace for the routine. The dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldab	INTEGER. The first dimension of the array *ab*. (*ldab* ≥ *kd* +1).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctbcon DOUBLE PRECISION for ztbcon. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

rcond	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal of the condition number. The routine sets *rcond* =0 if the estimate underflows; in this case the matrix is singular (to working precision). However, anytime *rcond* is small compared to 1.0, for the working precision, the matrix may be poorly conditioned or even singular.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `tbcon` interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
norm	Must be '1', 'O', or 'I'. The default value is '1'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed *rcond* is never less than *r* (the reciprocal of the true condition number) and in practice is nearly always less than 10*r*. A call to this routine involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately 2**n*(*kd* + 1) floating-point operations for real flavors and 8**n*(*kd* + 1) operations for complex flavors.

Refining the Solution and Estimating Its Error

This section describes the LAPACK routines for refining the computed solution of a system of linear equations and estimating the solution error. You can call these routines after factorizing the matrix of the system of equations and computing the solution (see Routines for Matrix Factorization and Routines for Solving Systems of Linear Equations).

?gerfs

Refines the solution of a system of linear equations with a general matrix and estimates its error.

Syntax

FORTRAN 77:

```
call sgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zgerfs( trans, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gerfs( a, af, ipiv, b, x [,trans] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a general matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|, \ |\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?getrf`
- call the solver routine `?getrs`.

Input Parameters

trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form $A*X = B$. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
n	INTEGER. The order of the matrix A; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
a,*af*,*b*,*x*,*work*	REAL for sgerfs DOUBLE PRECISION for dgerfs COMPLEX for cgerfs DOUBLE COMPLEX for zgerfs. Arrays: *a*(*lda*,*) contains the original matrix A, as supplied to `?getrf`. *af*(*ldaf*,*) contains the factored matrix A, as returned by `?getrf`. *b*(*ldb*,*) contains the right-hand side matrix B. *x*(*ldx*,*) contains the solution matrix X. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).

ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?getrf.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgerfs DOUBLE PRECISION for zgerfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gerfs interface are as follows:

a	Holds the matrix *A* of size (*n*, *n*).
af	Holds the matrix *AF* of size (*n*, *n*).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?gerfsx

Uses extra precise iterative refinement to improve the solution to the system of linear equations with a general matrix A and provides error bounds and backward error estimates.

Syntax

FORTRAN 77:

```
call sgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )

call dgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )

call cgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )

call zgerfsx( trans, equed, n, nrhs, a, lda, af, ldaf, ipiv, r, c, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed*, *r*, and *c* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

trans
CHARACTER*1. Must be 'N', 'T', or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).
If *trans* = 'T', the system has the form *A**T*X* = *B* (Transpose).
If *trans* = 'C', the system has the form *A**H*X* = *B* (Conjugate transpose = Transpose).

equed
CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.
Specifies the form of equilibration that was done to *A* before calling this routine.
If *equed* = 'N', no equilibration was done.
If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).
If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).

If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)*A***diag*(*c*). The right-hand side *B* has been changed accordingly.

n — INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work* — REAL for sgerfsx
DOUBLE PRECISION for dgerfsx
COMPLEX for cgerfsx
DOUBLE COMPLEX for zgerfsx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the original *n*-by-*n* matrix *A*.
The array *af* contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P***L***U* as computed by ?getrf.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains the pivot indices as computed by ?getrf; for row $1 \leq i \leq n$, row *i* of the matrix was interchanged with row *ipiv*(*i*).

r, *c* — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*.
If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.
If *equed* = 'R' or 'B', each element of *r* must be positive.
If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.
If *equed* = 'C' or 'B', each element of *c* must be positive.
Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb
INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

x
REAL for sgerfsx
DOUBLE PRECISION for dgerfsx
COMPLEX for cgerfsx
DOUBLE COMPLEX for zgerfsx.
Array, DIMENSION (*ldx*,*).
The solution matrix *X* as computed by ?getrs

ldx
INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds
INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams
INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support DOUBLE PRECISION.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x REAL for sgerfsx
DOUBLE PRECISION for dgerfsx
COMPLEX for cgerfsx
DOUBLE COMPLEX for zgerfsx.
The improved solution matrix *X*.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.
The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

params REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Output parameter only if the input contains erroneous values, namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.

info INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) =

0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?gbrfs

Refines the solution of a system of linear equations with a general band matrix and estimates its error.

Syntax

FORTRAN 77:

```
call sgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zgbrfs( trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gbrfs( ab, afb, ipiv, b, x [,kl] [,trans] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a band matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?gbtrf`
- call the solver routine `?gbtrs`.

Input Parameters

trans — CHARACTER*1. Must be 'N' or 'T' or 'C'.
Indicates the form of the equations:

	If *trans* = 'N', the system has the form $A*X = B$. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
kl	INTEGER. The number of sub-diagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of super-diagonals within the band of *A*; $ku \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab,*afb*,*b*,*x*,*work*	REAL for sgbrfs DOUBLE PRECISION for dgbrfs COMPLEX for cgbrfs DOUBLE COMPLEX for zgbrfs. Arrays: *ab*(*ldab*,*) contains the original band matrix *A*, as supplied to ?gbtrf, but stored in rows from 1 to *kl* + *ku* + 1. *afb*(*ldafb*,*) contains the factored band matrix *A*, as returned by ?gbtrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *ab* and *afb* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldab	INTEGER. The first dimension of *ab*.
ldafb	INTEGER. The first dimension of *afb* .
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?gbtrf.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cgbrfs DOUBLE PRECISION for zgbrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* =0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gbrfs` interface are as follows:

ab	Holds the array *A* of size (*kl*+*ku*+1,*n*).
afb	Holds the array *AF* of size (2**kl***ku*+1,*n*).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n(kl + ku)$ floating-point operations (for real flavors) or $16n(kl + ku)$ operations (for complex flavors). In addition, each step of iterative refinement involves $2n(4kl + 3ku)$ operations (for real flavors) or $8n(4kl + 3ku)$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?gbrfsx

Uses extra precise iterative refinement to improve the solution to the system of linear equations with a banded matrix A and provides error bounds and backward error estimates.

Syntax

FORTRAN 77:

```
call sgbrfsx( trans, equed, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, r, c, b, ldb,
x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work,
iwork, info )
```

```
call dgbrfsx( trans, equed, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, r, c, b, ldb,
x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work,
iwork, info )
```

```
call cgbrfsx( trans, equed, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, r, c, b, ldb,
x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work,
rwork, info )
```

```
call zgbrfsx( trans, equed, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, r, c, b, ldb,
x, ldx, rcond, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work,
rwork, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed*, *r*, and *c* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

trans
: CHARACTER*1. Must be 'N', 'T', or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).
If *trans* = 'T', the system has the form *A**T*X* = *B* (Transpose).
If *trans* = 'C', the system has the form *A**H*X* = *B* (Conjugate transpose = Transpose).

equed
: CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.
Specifies the form of equilibration that was done to *A* before calling this routine.
If *equed* = 'N', no equilibration was done.
If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).
If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).
If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A***diag*(*c*). The right-hand side *B* has been changed accordingly.

n
: INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

kl
: INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku
: INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.

nrhs
: INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

ab, *afb*, *b*, *work*
: REAL for sgbrfsx
DOUBLE PRECISION for dgbrfsx

COMPLEX for cgbrfsx
DOUBLE COMPLEX for zgbrfsx.
Arrays: *ab*(*ldab*,*), *afb*(*ldafb*,*), *b*(*ldb*,*), *work*(*).
The array *ab* contains the original matrix *A* in band storage, in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = *A*(*i*,*j*) for max(1,*j*-*ku*) ≤ *i* ≤ min(*n*,*j*+*kl*).

The array *afb* contains details of the LU factorization of the banded matrix *A* as computed by ?gbtrf. *U* is stored as an upper triangular banded matrix with *kl* + *ku* superdiagonals in rows 1 to *kl* + *ku* + 1. The multipliers used during the factorization are stored in rows *kl* + *ku* + 2 to 2**kl* + *ku* + 1.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

ldab — INTEGER. The first dimension of the array *ab*; *ldab* ≥ *kl*+*ku*+1..

ldafb — INTEGER. The first dimension of the array *afb*; *ldafb* ≥ 2**kl*+*ku*+1..

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains the pivot indices as computed by ?gbtrf; for row 1 ≤ *i* ≤ *n*, row *i* of the matrix was interchanged with row *ipiv*(*i*).

r, *c*
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*.
If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.
If *equed* = 'R' or 'B', each element of *r* must be positive.
If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.
If *equed* = 'C' or 'B', each element of *c* must be positive.
Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

x
REAL for sgbrfsx
DOUBLE PRECISION for dgbrfsx
COMPLEX for cgbrfsx

DOUBLE COMPLEX for zgbrfsx.
Array, DIMENSION (*ldx*,*).
The solution matrix *X* as computed by sgbtrs/dgbtrs for real flavors or cgbtrs/zgbtrs for complex flavors.

ldx
INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds
INTEGER. Number of error bounds to return for each right-hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams
INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support DOUBLE PRECISION.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork
INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork
REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 3*n); used in complex flavors only.

Output Parameters

x

REAL for sgbrfsx
DOUBLE PRECISION for dgbrfsx
COMPLEX for cgbrfsx
DOUBLE COMPLEX for zgbrfsx.
The improved solution matrix *X*.

rcond

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned. The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.
Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

	err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
	err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.
params	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Output parameter only if the input contains erroneous values, namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.	
info	INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value. If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.	

?gtrfs

Refines the solution of a system of linear equations with a tridiagonal matrix and estimates its error.

Syntax

FORTRAN 77:

```
call sgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zgtrfs( trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gtrfs( dl, d, du, dlf, df, duf, du2, ipiv, b, x [,trans] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a tridiagonal matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}|/|a_{ij}| \le \beta|a_{ij}|$, $|\delta b_i|/|b_i| \le \beta|b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty/||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?gttrf`
- call the solver routine `?gttrs`.

Input Parameters

trans	`CHARACTER*1`. Must be `'N'` or `'T'` or `'C'`. Indicates the form of the equations: If *trans* = `'N'`, the system has the form $A*X = B$. If *trans* = `'T'`, the system has the form $A^T*X = B$. If *trans* = `'C'`, the system has the form $A^H*X = B$.
n	`INTEGER`. The order of the matrix A; $n \ge 0$.

nrhs	INTEGER. The number of right-hand sides, that is, the number of columns of the matrix *B*; *nrhs* ≥ 0.
dl,*d*,*du*,*dlf*, *df*,*duf*,*du2*, *b*,*x*,*work*	REAL for sgtrfs DOUBLE PRECISION for dgtrfs COMPLEX for cgtrfs DOUBLE COMPLEX for zgtrfs. Arrays: *dl*, dimension (*n* -1), contains the subdiagonal elements of *A*. *d*, dimension (*n*), contains the diagonal elements of *A*. *du*, dimension (*n* -1), contains the superdiagonal elements of *A*. *dlf*, dimension (*n* -1), contains the (*n* - 1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by ?gttrf. *df*, dimension (*n*), contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*. *duf*, dimension (*n* -1), contains the (*n* - 1) elements of the first superdiagonal of *U*. *du2*, dimension (*n* -2), contains the (*n* - 2) elements of the second superdiagonal of *U*. *b*(*ldb*,*nrhs*) contains the right-hand side matrix *B*. *x*(*ldx*,*nrhs*) contains the solution matrix *X*, as computed by ?gttrs. *work*(*) is a workspace array; the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?gttrf.
iwork	INTEGER. Workspace array, DIMENSION (*n*). Used for real flavors only.
rwork	REAL for cgtrfs DOUBLE PRECISION for zgtrfs. Workspace array, DIMENSION (*n*). Used for complex flavors only.

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1,*nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gtrfs` interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
du	Holds the vector of length (*n*-1).
dlf	Holds the vector of length (*n*-1).
df	Holds the vector of length *n*.
duf	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
trans	Must be `'N'`, `'C'`, or `'T'`. The default value is `'N'`.

?porfs

Refines the solution of a system of linear equations with a symmetric (Hermitian) positive-definite matrix and estimates its error.

Syntax

FORTRAN 77:

```
call sporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zporfs( uplo, n, nrhs, a, lda, af, ldaf, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call porfs( a, af, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric (Hermitian) positive definite matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?potrf`
- call the solver routine `?potrs`.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
a,*af*,*b*,*x*,*work*	REAL for sporfs DOUBLE PRECISION for dporfs COMPLEX for cporfs DOUBLE COMPLEX for zporfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?potrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?potrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cporfs DOUBLE PRECISION for zporfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine porfs interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
af	Holds the matrix *AF* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?porfsx

Uses extra precise iterative refinement to improve the solution to the system of linear equations with a symmetric/Hermitian positive-definite matrix A and provides error bounds and backward error estimates.

Syntax

FORTRAN 77:

```
call sporfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, s, b, ldb, x, ldx, rcond, berr,
n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )
```

```
call dporfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, s, b, ldb, x, ldx, rcond, berr,
n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )
call cporfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, s, b, ldb, x, ldx, rcond, berr,
n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )
call zporfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, s, b, ldb, x, ldx, rcond, berr,
n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine improves the computed solution to a system of linear equations and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

uplo
: CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

equed
: CHARACTER*1. Must be 'N' or 'Y'.
Specifies the form of equilibration that was done to *A* before calling this routine.
If *equed* = 'N', no equilibration was done.
If *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*). The right-hand side *B* has been changed accordingly.

n
: INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs
: INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*
: REAL for sporfsx
DOUBLE PRECISION for dporfsx
COMPLEX for cporfsx
DOUBLE COMPLEX for zporfsx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the symmetric/Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n*

lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*).
The array *af* contains the triangular factor *L* or *U* from the Cholesky factorization *A = U**T*U* or *A = L*L**T* as computed by spotrf for real flavors or dpotrf for complex flavors.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*.
If *equed* = 'N', *s* is not accessed.
If *equed* = 'Y', each element of *s* must be positive.
Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

x — REAL for sporfsx
DOUBLE PRECISION for dporfsx
COMPLEX for cporfsx
DOUBLE COMPLEX for zporfsx.
Array, DIMENSION (*ldx*,*).
The solution matrix *X* as computed by ?potrs

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds — INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams — INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed;

defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support DOUBLE PRECISION.

(Other values are reserved for fututе use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x REAL for sporfsx
DOUBLE PRECISION for dporfsx
COMPLEX for cporfsx
DOUBLE COMPLEX for zporfsx.
The improved solution matrix *X*.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the

matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned. The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.

Let *z=s*a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1
"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2
"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3
Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.

Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

params — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Output parameter only if the input contains erroneous values. namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.

info — INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?pprfs

Refines the solution of a system of linear equations with a packed symmetric (Hermitian) positive-definite matrix and estimates its error.

Syntax

FORTRAN 77:

```
call spprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dpprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cpprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zpprfs( uplo, n, nrhs, ap, afp, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call pprfs( ap, afp, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a packed symmetric (Hermitian)positive definite matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|, \ |\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?pptrf`
- call the solver routine `?pptrs`.

Input Parameters

uplo	CHARACTER*1. Must be `'U'` or `'L'`. Indicates how the input matrix *A* has been factored: If *uplo* = `'U'`, the upper triangle of *A* is stored. If *uplo* = `'L'`, the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
ap,*afp*,*b*,*x*,*work*	REAL for `spprfs` DOUBLE PRECISION for `dpprfs` COMPLEX for `cpprfs` DOUBLE COMPLEX for `zpprfs`. Arrays: *ap*(*) contains the original packed matrix *A*, as supplied to `?pptrf`. *afp*(*) contains the factored packed matrix *A*, as returned by `?pptrf`. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The dimension of arrays *ap* and *afp* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for `cpprfs` DOUBLE PRECISION for `zpprfs`. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pprfs interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
afp	Holds the array *AF* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?pbrfs

Refines the solution of a system of linear equations with a band symmetric (Hermitian) positive-definite matrix and estimates its error.

Syntax

FORTRAN 77:

```
call spbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr, berr, work, iwork, info )
```

```
call dpbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call cpbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zpbrfs( uplo, n, kd, nrhs, ab, ldab, afb, ldafb, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call pbrfs( ab, afb, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric (Hermitian) positive definite band matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?pbtrf`
- call the solver routine `?pbtrs`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates how the input matrix *A* has been factored: If *uplo* = `'U'`, the upper triangle of *A* is stored. If *uplo* = `'L'`, the lower triangle of *A* is stored.
n	`INTEGER`. The order of the matrix *A*; $n \ge 0$.
kd	`INTEGER`. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \ge 0$.
nrhs	`INTEGER`. The number of right-hand sides; $nrhs \ge 0$.

ab,*afb*,*b*,*x*,*work*	`REAL` for `spbrfs`
	`DOUBLE PRECISION` for `dpbrfs`
	`COMPLEX` for `cpbrfs`
	`DOUBLE COMPLEX` for `zpbrfs`.
	Arrays:
	ab(*ldab*,*) contains the original band matrix *A*, as supplied to `?pbtrf`.
	afb(*ldafb*,*) contains the factored band matrix *A*, as returned by `?pbtrf`.
	b(*ldb*,*) contains the right-hand side matrix *B*.
	x(*ldx*,*) contains the solution matrix *X*.

	work(*) is a workspace array. The second dimension of *ab* and *afb* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
ldab	INTEGER. The first dimension of *ab*; *ldab* ≥ *kd* + 1.
ldafb	INTEGER. The first dimension of *afb*; *ldafb* ≥ *kd* + 1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cpbrfs DOUBLE PRECISION for zpbrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbrfs interface are as follows:

ab	Holds the array *A* of size (*kd*+1, *n*).
afb	Holds the array *AF* of size (*kd*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).
x	Holds the matrix *X* of size (*n*, *nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of 8*n***kd* floating-point operations (for real flavors) or 32*n***kd* operations (for complex flavors). In addition, each step of iterative refinement involves 12*n***kd* operations (for real flavors) or 48*n***kd* operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately *4n*kd* floating-point operations for real flavors or *16n*kd* for complex flavors.

?ptrfs

Refines the solution of a system of linear equations with a symmetric (Hermitian) positive-definite tridiagonal matrix and estimates its error.

Syntax

FORTRAN 77:

```
call sptrfs( n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work, info )
call dptrfs( n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work, info )
call cptrfs( uplo, n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zptrfs( uplo, n, nrhs, d, e, df, ef, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call ptrfs( d, df, e, ef, b, x [,ferr] [,berr] [,info] )
call ptrfs( d, df, e, ef, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric (Hermitian) positive definite tridiagonal matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?pttrf`
- call the solver routine `?pttrs`.

Input Parameters

uplo — CHARACTER*1. Used for complex flavors only. Must be `'U'` or `'L'`.
Specifies whether the superdiagonal or the subdiagonal of the tridiagonal matrix *A* is stored and how *A* is factored:

If *uplo* = 'U', the array *e* stores the superdiagonal of *A*, and *A* is factored as U^H*D*U.
If *uplo* = 'L', the array *e* stores the subdiagonal of *A*, and *A* is factored as $L*D*L^H$.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides; $nrhs \geq 0$.

d, *df*, *rwork* — REAL for single precision flavors DOUBLE PRECISION for double precision flavors
Arrays: *d*(*n*), *df*(*n*), *rwork*(*n*).
The array *d* contains the *n* diagonal elements of the tridiagonal matrix *A*.
The array *df* contains the *n* diagonal elements of the diagonal matrix *D* from the factorization of *A* as computed by ?pttrf.
The array *rwork* is a workspace array used for complex flavors only.

e,*ef*,*b*,*x*,*work* — REAL for sptrfs
DOUBLE PRECISION for dptrfs
COMPLEX for cptrfs
DOUBLE COMPLEX for zptrfs.
Arrays: *e*(*n* -1), *ef*(*n* -1), *b*(*ldb*,*nrhs*), *x*(*ldx*,*nrhs*), *work*(*).
The array *e* contains the (*n* - 1) off-diagonal elements of the tridiagonal matrix *A* (see *uplo*).
The array *ef* contains the (*n* - 1) off-diagonal elements of the unit bidiagonal factor *U* or *L* from the factorization computed by ?pttrf (see *uplo*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
The array *x* contains the solution matrix *X* as computed by ?pttrs.
The array *work* is a workspace array. The dimension of *work* must be at least 2**n* for real flavors, and at least *n* for complex flavors.

ldb — INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).

ldx — INTEGER. The leading dimension of *x*; *ldx* ≥ max(1, *n*).

Output Parameters

x — The refined solution matrix *X*.

ferr, *berr* — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ptrfs interface are as follows:

d — Holds the vector of length *n*.

df	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
ef	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Used in complex flavors only. Must be 'U' or 'L'. The default value is 'U'.

?syrfs

Refines the solution of a system of linear equations with a symmetric matrix and estimates its error.

Syntax

FORTRAN 77:

```
call ssyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dsyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call csyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call zsyrfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call syrfs( a, af, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a symmetric full-storage matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?sytrf`

- call the solver routine ?sytrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
a,*af*,*b*,*x*,*work*	REAL for ssyrfs DOUBLE PRECISION for dsyrfs COMPLEX for csyrfs DOUBLE COMPLEX for zsyrfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?sytrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?sytrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sytrf.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for csyrfs DOUBLE PRECISION for zsyrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `syrfs` interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
af	Holds the matrix *AF* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5. Estimating the forward error involves solving a number of systems of linear equations *A*x = b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?syrfsx

Uses extra precise iterative refinement to improve the solution to the system of linear equations with a symmetric indefinite matrix A and provides error bounds and backward error estimates.

Syntax

FORTRAN 77:

```
call ssyrfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, ipiv, s, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )

call dsyrfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, ipiv, s, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork, info )

call csyrfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, ipiv, s, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )

call zsyrfsx( uplo, equed, n, nrhs, a, lda, af, ldaf, ipiv, s, b, ldb, x, ldx, rcond,
berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, rwork, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine improves the computed solution to a system of linear equations when the coefficient matrix is symmetric indefinite, and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

uplo
: CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

equed
: CHARACTER*1. Must be 'N' or 'Y'.
Specifies the form of equilibration that was done to *A* before calling this routine.
If *equed* = 'N', no equilibration was done.
If *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*). The right-hand side *B* has been changed accordingly.

n
: INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs
: INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*
: REAL for ssyrfsx
DOUBLE PRECISION for dsyrfsx
COMPLEX for csyrfsx
DOUBLE COMPLEX for zsyrfsx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the symmetric/Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced.
The second dimension of *a* must be at least max(1,*n*).
The array *af* contains the triangular factor *L* or *U* from the Cholesky factorization *A* = *U****T***U* or *A* = *L***L****T* as computed by ssytrf for real flavors or dsytrf for complex flavors.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

	work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D* as determined by ssytrf for real flavors or dsytrf for complex flavors.
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. If *equed* = 'N', *s* is not accessed. If *equed* = 'Y', each element of *s* must be positive. Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.
ldb	INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).
x	REAL for ssyrfsx DOUBLE PRECISION for dsyrfsx COMPLEX for csyrfsx DOUBLE COMPLEX for zsyrfsx. Array, DIMENSION (*ldx*,*). The solution matrix *X* as computed by ?sytrs
ldx	INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).
n_err_bnds	INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.
nparams	INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.
params	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.

params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support DOUBLE PRECISION.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x REAL for ssyrfsx
DOUBLE PRECISION for dsyrfsx
COMPLEX for csyrfsx
DOUBLE COMPLEX for zsyrfsx.
The improved solution matrix *X*.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.

Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned. The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.
Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

params REAL for single precision flavors

	DOUBLE PRECISION for double precision flavors. Output parameter only if the input contains erroneous values, namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.
info	INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value. If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?herfs

Refines the solution of a system of linear equations with a complex Hermitian matrix and estimates its error.

Syntax

FORTRAN 77:

```
call cherfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

```
call zherfs( uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call herfs( a, af, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X* = *B* with a complex Hermitian full-storage matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?hetrf
- call the solver routine ?hetrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
a,*af*,*b*,*x*,*work*	COMPLEX for cherfs DOUBLE COMPLEX for zherfs. Arrays: *a*(*lda*,*) contains the original matrix *A*, as supplied to ?hetrf. *af*(*ldaf*,*) contains the factored matrix *A*, as returned by ?hetrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* and *af* must be at least max(1, *n*); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 2**n*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?hetrf.
rwork	REAL for cherfs DOUBLE PRECISION for zherfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for cherfs DOUBLE PRECISION for zherfs. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine herfs interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
af	Holds the matrix *AF* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ operations. In addition, each step of iterative refinement involves $24n^2$ operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

The real counterpart of this routine is ?ssyrfs/?dsyrfs

?herfsx

Uses extra precise iterative refinement to improve the solution to the system of linear equations with a symmetric indefinite matrix A and provides error bounds and backward error estimates.

Syntax

FORTRAN 77:

call cherfsx(*uplo*, *equed*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *s*, *b*, *ldb*, *x*, *ldx*, *rcond*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *rwork*, *info*)

call zherfsx(*uplo*, *equed*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *s*, *b*, *ldb*, *x*, *ldx*, *rcond*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *rwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine improves the computed solution to a system of linear equations when the coefficient matrix is Hermitian indefinite, and provides error bounds and backward error estimates for the solution. In addition to a normwise error bound, the code provides a maximum componentwise error bound, if possible. See comments for *err_bnds_norm* and *err_bnds_comp* for details of the error bounds.

The original system of linear equations may have been equilibrated before calling this routine, as described by the parameters *equed* and *s* below. In this case, the solution and error bounds returned are for the original unequilibrated system.

Input Parameters

uplo
CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

equed
CHARACTER*1. Must be 'N' or 'Y'.
Specifies the form of equilibration that was done to *A* before calling this routine.
If *equed* = 'N', no equilibration was done.
If *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*). The right-hand side *B* has been changed accordingly.

n
INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs
INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a, *af*, *b*, *work*
COMPLEX for cherfsx
DOUBLE COMPLEX for zherfsx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the Hermitian matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*).
The factored form of the matrix *A*. The array *af* contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization *A* = *U*D*U**T* or *A* = *L*D*L**T* as computed by ssytrf for cherfsx or dsytrf for zherfsx.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,2**n*).

lda
INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf — INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D* as determined by ssytrf for real flavors or dsytrf for complex flavors.

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*.
If *equed* = 'N', *s* is not accessed.
If *equed* = 'Y', each element of *s* must be positive.
Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

x — COMPLEX for cherfsx
DOUBLE COMPLEX for zherfsx.
Array, DIMENSION (*ldx*,*).
The solution matrix *X* as computed by ?hetrs

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds — INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams — INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with the default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for cherfsx), 1.0D+0 (for zherfsx).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support DOUBLE PRECISION.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

rwork
REAL for cherfsx
DOUBLE PRECISION for zherfsx.
Workspace array, DIMENSION at least max(1, 3*n).

Output Parameters

x
COMPLEX for cherfsx
DOUBLE COMPLEX for zherfsx.
The improved solution matrix *X*.

rcond
REAL for cherfsx
DOUBLE PRECISION for zherfsx.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

berr
REAL for cherfsx
DOUBLE PRECISION for zherfsx.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm
REAL for cherfsx
DOUBLE PRECISION for zherfsx.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned. The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for cherfsx and *sqrt*(*n*)**dlamch*(ε) for zherfsx.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for cherfsx and *sqrt*(*n*)**dlamch*(ε) for zherfsx. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for cherfsx and *sqrt*(*n*)**dlamch*(ε) for zherfsx to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for cherfsx
DOUBLE PRECISION for zherfsx.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.

The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for cherfsx and *sqrt*(*n*)**dlamch*(ε) for zherfsx.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for cherfsx and *sqrt*(*n*)**dlamch*(ε) for zherfsx. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for cherfsx and *sqrt*(*n*)**dlamch*(ε) for zherfsx to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.
Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

params REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Output parameter only if the input contains erroneous values, namely, in *params(1)*, *params(2)*, *params(3)*. In such a case, the corresponding elements of *params* are filled with default values on output.

info INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j*

such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?sprfs

Refines the solution of a system of linear equations with a packed symmetric matrix and estimates the solution error.

Syntax

FORTRAN 77:

```
call ssprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info
)
call dsprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, iwork, info
)
call csprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info
)
call zsprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info
)
```

Fortran 95:

```
call sprfs( ap, afp, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a packed symmetric matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine `?sptrf`
- call the solver routine `?sptrs`.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The order of the matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides; $nrhs \geq 0$.

ap,*afp*,*b*,*x*,*work* — REAL for ssprfs
DOUBLE PRECISION for dsprfs
COMPLEX for csprfs
DOUBLE COMPLEX for zsprfs.
Arrays:
ap(*) contains the original packed matrix *A*, as supplied to ?sptrf.
afp(*) contains the factored packed matrix *A*, as returned by ?sptrf.
b(*ldb*,*) contains the right-hand side matrix *B*.
x(*ldx*,*) contains the solution matrix *X*.
work(*) is a workspace array.
The dimension of arrays *ap* and *afp* must be at least max(1, *n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1, *nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ldx — INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*).

rwork — REAL for csprfs
DOUBLE PRECISION for zsprfs.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x — The refined solution matrix *X*.

ferr, *berr* — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sprfs interface are as follows:

ap — Holds the array *A* of size (*n**(*n*+1)/2).

afp — Holds the array *AF* of size (*n**(*n*+1)/2).

ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $4n^2$ floating-point operations (for real flavors) or $16n^2$ operations (for complex flavors). In addition, each step of iterative refinement involves $6n^2$ operations (for real flavors) or $24n^2$ operations (for complex flavors); the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A*x = b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately $2n^2$ floating-point operations for real flavors or $8n^2$ for complex flavors.

?hprfs

Refines the solution of a system of linear equations with a packed complex Hermitian matrix and estimates the solution error.

Syntax

FORTRAN 77:

```
call chprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info
)
call zhprfs( uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, ferr, berr, work, rwork, info
)
```

Fortran 95:

```
call hprfs( ap, afp, ipiv, b, x [,uplo] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine performs an iterative refinement of the solution to a system of linear equations *A*X = B* with a packed complex Hermitian matrix *A*, with multiple right-hand sides. For each computed solution vector *x*, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of *A* and *b* such that *x* is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

Finally, the routine estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine:

- call the factorization routine ?hptrf
- call the solver routine ?hptrs.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ap,*afp*,*b*,*x*,*work*	COMPLEX for chprfs DOUBLE COMPLEX for zhprfs. Arrays: *ap*(*) contains the original packed matrix *A*, as supplied to ?hptrf. *afp*(*) contains the factored packed matrix *A*, as returned by ?hptrf. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The dimension of arrays *ap* and *afp* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1, 2*n).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?hptrf.
rwork	REAL for chprfs DOUBLE PRECISION for zhprfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x	The refined solution matrix *X*.
ferr, *berr*	REAL for chprfs. DOUBLE PRECISION for zhprfs. Arrays, DIMENSION at least max(1,*nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `hprfs` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
afp	Holds the array *AF* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length *n*.
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

For each right-hand side, computation of the backward error involves a minimum of $16n^2$ operations. In addition, each step of iterative refinement involves $24n^2$ operations; the number of iterations may range from 1 to 5.

Estimating the forward error involves solving a number of systems of linear equations *A***x* = *b*; the number is usually 4 or 5 and never more than 11. Each solution requires approximately $8n^2$ floating-point operations.

The real counterpart of this routine is `?ssprfs`/`?dsprfs`.

?trrfs

Estimates the error in the solution of a system of linear equations with a triangular matrix.

Syntax

FORTRAN 77:

```
call strrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dtrrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call ctrrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call ztrrfs( uplo, trans, diag, n, nrhs, a, lda, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call trrfs( a, b, x [,uplo] [,trans] [,diag] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a triangular matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine `?trtrs`.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', then A is upper triangular. If *uplo* = 'L', then A is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form $A*X = B$. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then A is not a unit triangular matrix. If *diag* = 'U', then A is unit triangular: diagonal elements of A are assumed to be 1 and not referenced in the array *a*.
n	INTEGER. The order of the matrix A; $n \ge 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \ge 0$.
a, *b*, *x*, *work*	REAL for `strrfs` DOUBLE PRECISION for `dtrrfs` COMPLEX for `ctrrfs` DOUBLE COMPLEX for `ztrrfs`. Arrays: *a*(*lda*,*) contains the upper or lower triangular matrix A, as specified by *uplo*. *b*(*ldb*,*) contains the right-hand side matrix B. *x*(*ldx*,*) contains the solution matrix X. *work*(*) is a workspace array. The second dimension of *a* must be at least max(1,*n*); the second dimension of *b* and *x* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,3*n) for real flavors and max(1,2*n) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* $\ge$ max(1, *n*).

ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctrrfs DOUBLE PRECISION for ztrrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trrfs interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations *A*x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

?tprfs

Estimates the error in the solution of a system of linear equations with a packed triangular matrix.

Syntax

FORTRAN 77:

```
call stprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dtprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call ctprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call ztprfs( uplo, trans, diag, n, nrhs, ap, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call tprfs( ap, b, x [,uplo] [,trans] [,diag] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a packed triangular matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine `?tptrs`.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether A is upper or lower triangular: If *uplo* = 'U', then A is upper triangular. If *uplo* = 'L', then A is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form $A*X = B$. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.

diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', *A* is not a unit triangular matrix. If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *ap*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ap, *b*, *x*, *work*	REAL for stprfs DOUBLE PRECISION for dtprfs COMPLEX for ctprfs DOUBLE COMPLEX for ztprfs. Arrays: *ap*(*) contains the upper or lower triangular matrix *A*, as specified by *uplo*. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* and *x* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,3*n) for real flavors and max(1,2*n) for complex flavors.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctprfs DOUBLE PRECISION for ztprfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

ferr, *berr*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tprfs interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).

berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations $A*x = b$; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately n^2 floating-point operations for real flavors or $4n^2$ for complex flavors.

?tbrfs

Estimates the error in the solution of a system of linear equations with a triangular band matrix.

Syntax

FORTRAN 77:

```
call stbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call dtbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, iwork, info )
call ctbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, rwork, info )
call ztbrfs( uplo, trans, diag, n, kd, nrhs, ab, ldab, b, ldb, x, ldx, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call tbrfs( ab, b, x [,uplo] [,trans] [,diag] [,ferr] [,berr] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates the errors in the solution to a system of linear equations $A*X = B$ or $A^T*X = B$ or $A^H*X = B$ with a triangular band matrix A, with multiple right-hand sides. For each computed solution vector x, the routine computes the *component-wise backward error* β. This error is the smallest relative perturbation in elements of A and b such that x is the exact solution of the perturbed system:

$|\delta a_{ij}| \le \beta |a_{ij}|$, $|\delta b_i| \le \beta |b_i|$ such that $(A + \delta A)x = (b + \delta b)$.

The routine also estimates the *component-wise forward error* in the computed solution $||x - x_e||_\infty / ||x||_\infty$ (here x_e is the exact solution).

Before calling this routine, call the solver routine `?tbtrs`.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether *A* is upper or lower triangular: If *uplo* = 'U', then *A* is upper triangular. If *uplo* = 'L', then *A* is lower triangular.
trans	CHARACTER*1. Must be 'N' or 'T' or 'C'. Indicates the form of the equations: If *trans* = 'N', the system has the form $A*X = B$. If *trans* = 'T', the system has the form $A^T*X = B$. If *trans* = 'C', the system has the form $A^H*X = B$.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', *A* is not a unit triangular matrix. If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *ab*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
kd	INTEGER. The number of super-diagonals or sub-diagonals in the matrix *A*; $kd \geq 0$.
nrhs	INTEGER. The number of right-hand sides; $nrhs \geq 0$.
ab, *b*, *x*, *work*	REAL for stbrfs DOUBLE PRECISION for dtbrfs COMPLEX for ctbrfs DOUBLE COMPLEX for ztbrfs. Arrays: *ab*(*ldab*,*) contains the upper or lower triangular matrix *A*, as specified by *uplo*, in band storage format. *b*(*ldb*,*) contains the right-hand side matrix *B*. *x*(*ldx*,*) contains the solution matrix *X*. *work*(*) is a workspace array. The second dimension of *a* must be at least max(1,*n*); the second dimension of *b* and *x* must be at least max(1,*nrhs*). The dimension of *work* must be at least max(1,3*n) for real flavors and max(1,2*n) for complex flavors.
ldab	INTEGER. The first dimension of the array *ab*; $ldab \geq kd + 1$.
ldb	INTEGER. The first dimension of *b*; $ldb \geq \max(1, n)$.
ldx	INTEGER. The first dimension of *x*; $ldx \geq \max(1, n)$.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for ctbrfs DOUBLE PRECISION for ztbrfs. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

ferr, *berr*	REAL for single precision flavors. DOUBLE PRECISION for double precision flavors.

	Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and backward errors, respectively, for each solution vector.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tbrfs interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The bounds returned in *ferr* are not rigorous, but in practice they almost always overestimate the actual error.

A call to this routine involves, for each right-hand side, solving a number of systems of linear equations *A*x* = *b*; the number of systems is usually 4 or 5 and never more than 11. Each solution requires approximately 2*n*kd* floating-point operations for real flavors or 8*n*kd* operations for complex flavors.

Routines for Matrix Inversion

It is seldom necessary to compute an explicit inverse of a matrix. In particular, do not attempt to solve a system of equations $Ax = b$ by first computing A^{-1} and then forming the matrix-vector product $x = A^{-1}b$. Call a solver routine instead (see Routines for Solving Systems of Linear Equations); this is more efficient and more accurate.

However, matrix inversion routines are provided for the rare occasions when an explicit inverse matrix is needed.

?getri

Computes the inverse of an LU-factored general matrix.

Syntax

FORTRAN 77:

```
call sgetri( n, a, lda, ipiv, work, lwork, info )
call dgetri( n, a, lda, ipiv, work, lwork, info )
call cgetri( n, a, lda, ipiv, work, lwork, info )
```

```
call zgetri( n, a, lda, ipiv, work, lwork, info )
```

Fortran 95:

```
call getri( a, ipiv [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the inverse `inv(A)` of a general matrix *A*. Before calling this routine, call `?getrf` to factorize *A*.

Input Parameters

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	REAL for sgetri DOUBLE PRECISION for dgetri COMPLEX for cgetri DOUBLE COMPLEX for zgetri. Arrays: *a*(*lda*,***), *work*(***). *a*(*lda*,***) contains the factorization of the matrix *A*, as returned by `?getrf`: *A = P*L*U*. The second dimension of *a* must be at least max(1,*n*). *work*(***) is a workspace array of dimension at least max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; $lda \geq \max(1, n)$.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by `?getrf`.
lwork	INTEGER. The size of the *work* array; $lwork \geq n$. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* below for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of the factor *U* is zero, *U* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `getri` interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed inverse *X* satisfies the following error bound:

$|XA - I| \leq c(n)\varepsilon|X|P|L||U|,$

where $c(n)$ is a modest linear function of n; ε is the machine precision; I denotes the identity matrix; P, L, and U are the factors of the matrix factorization $A = P*L*U$.

The total number of floating-point operations is approximately $(4/3)n^3$ for real flavors and $(16/3)n^3$ for complex flavors.

?potri

Computes the inverse of a symmetric (Hermitian) positive-definite matrix.

Syntax

FORTRAN 77:

```
call spotri( uplo, n, a, lda, info )
call dpotri( uplo, n, a, lda, info )
call cpotri( uplo, n, a, lda, info )
call zpotri( uplo, n, a, lda, info )
```

Fortran 95:

```
call potri( a [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the inverse `inv(A)` of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix *A*. Before calling this routine, call `?potrf` to factorize *A*.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates whether *A* is upper or lower triangular: If *uplo* = `'U'`, then *A* is upper triangular. If *uplo* = `'L'`, then *A* is lower triangular.
n	`INTEGER`. The order of the matrix *A*; *n* ≥ 0.

a	`REAL` for `spotri`
	`DOUBLE PRECISION` for `dpotri`
	`COMPLEX` for `cpotri`
	`DOUBLE COMPLEX` for `zpotri`.
	Array *a*(*lda*,*). Contains the factorization of the matrix *A*, as returned by `?potrf`.
	The second dimension of *a* must be at least `max(1, n)`.

lda	`INTEGER`. The first dimension of *a*; *lda* ≥ `max(1, n)`.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix `inv(A)`.
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `potri` interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$||XA - I||_2 \le c(n)\varepsilon\kappa_2(A)$, $||AX - I||_2 \le c(n)\varepsilon\kappa_2(A)$,

where $c(n)$ is a modest linear function of n, and ε is the machine precision; I denotes the identity matrix.

The 2-norm $||A||_2$ of a matrix A is defined by $||A||_2 = max_{x \cdot x=1}(Ax \cdot Ax)^{1/2}$, and the condition number $\kappa_2(A)$ is defined by $\kappa_2(A) = ||A||_2 \ ||A^{-1}||_2$.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?pftri

Computes the inverse of a symmetric (Hermitian) positive-definite matrix in RFP format using the Cholesky factorization.

Syntax

FORTRAN 77:

```
call spftri( transr, uplo, n, a, info )
call dpftri( transr, uplo, n, a, info )
call cpftri( transr, uplo, n, a, info )
call zpftri( transr, uplo, n, a, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes the inverse `inv(A)` of a symmetric positive definite or, for complex data, Hermitian positive-definite matrix A using the Cholesky factorization:

$A = U^T*U$ for real data, $A = U^H*U$ for complex data — if *uplo*='U'

$A = L*L^T$ for real data, $A = L*L^H$ for complex data — if *uplo*='L'

Before calling this routine, call `?pftrf` to factorize A.

The matrix A is in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

Input Parameters

transr — CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data).
If *transr* = 'N', the Normal *transr* of RFP A is stored.
If *transr* = 'T', the Transpose *transr* of RFP A is stored.
If *transr* = 'C', the Conjugate-Transpose *transr* of RFP A is stored.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of the RFP matrix A is stored:
If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix A.
If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix A.

n — INTEGER. The order of the matrix A; $n \geq 0$.

a	REAL for spftri DOUBLE PRECISION for dpftri COMPLEX for cpftri DOUBLE COMPLEX for zpftri. Array, DIMENSION (*n**(*n*+1)/2). The array *a* contains the matrix *A* in the RFP format.

Output Parameters

a	The symmetric/Hermitian inverse of the original matrix in the same storage format.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the (*i*,*i*) element of the factor U or L is zero, and the inverse could not be computed.

?pptri

Computes the inverse of a packed symmetric (Hermitian) positive-definite matrix

Syntax

FORTRAN 77:

```
call spptri( uplo, n, ap, info )
call dpptri( uplo, n, ap, info )
call cpptri( uplo, n, ap, info )
call zpptri( uplo, n, ap, info )
```

Fortran 95:

```
call pptri( ap [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes the inverse inv(*A*) of a symmetric positive definite or, for complex flavors, Hermitian positive-definite matrix *A* in *packed* form. Before calling this routine, call ?pptrf to factorize *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular factor is stored in *ap*: If *uplo* = 'U', then the upper triangular factor is stored. If *uplo* = 'L', then the lower triangular factor is stored.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
ap	REAL for spptri DOUBLE PRECISION for dpptri

COMPLEX for cpptri
DOUBLE COMPLEX for zpptri.
Array, DIMENSION at least max(1, $n(n+1)/2$).
Contains the factorization of the packed matrix *A*, as returned by ?pptrf.
The dimension *ap* must be at least max(1,$n(n+1)/2$).

Output Parameters

ap — Overwritten by the packed n-by-n matrix inv(*A*).

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the *i*-th diagonal element of the Cholesky factor (and therefore the factor itself) is zero, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pptri interface are as follows:

ap — Holds the array *A* of size (*n**(*n*+1)/2).

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$||XA - I||_2 \le c(n)\varepsilon\kappa_2(A)$, $||AX - I||_2 \le c(n)\varepsilon\kappa_2(A)$,

where $c(n)$ is a modest linear function of n, and ε is the machine precision; I denotes the identity matrix.

The 2-norm $||A||_2$ of a matrix A is defined by $||A||_2 = max_{x \cdot x=1}(Ax \cdot Ax)^{1/2}$, and the condition number $\kappa_2(A)$ is defined by $\kappa_2(A) = ||A||_2 \, ||A^{-1}||_2$.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?sytri

Computes the inverse of a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssytri( uplo, n, a, lda, ipiv, work, info )
call dsytri( uplo, n, a, lda, ipiv, work, info )
call csytri( uplo, n, a, lda, ipiv, work, info )
```

```
call zsytri( uplo, n, a, lda, ipiv, work, info )
```

Fortran 95:

```
call sytri( a, ipiv [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the inverse `inv(A)` of a symmetric matrix *A*. Before calling this routine, call `?sytrf` to factorize *A*.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates how the input matrix *A* has been factored: If *uplo* = `'U'`, the array *a* stores the Bunch-Kaufman factorization $A = P*U*D*U^T*P^T$. If *uplo* = `'L'`, the array *a* stores the Bunch-Kaufman factorization $A = P*L*D*L^T*P^T$.
n	`INTEGER`. The order of the matrix *A*; $n \geq 0$.

a, *work*	`REAL` for `ssytri`
	`DOUBLE PRECISION` for `dsytri`
	`COMPLEX` for `csytri`
	`DOUBLE COMPLEX` for `zsytri`.
	Arrays:
	a(*lda*,*) contains the factorization of the matrix *A*, as returned by `?sytrf`.
	The second dimension of *a* must be at least `max(1,n)`.
	work(*) is a workspace array.
	The dimension of *work* must be at least `max(1,2*n)`.

lda	`INTEGER`. The first dimension of *a*; *lda* $\geq$ `max(1, n)`.
ipiv	`INTEGER`. Array, `DIMENSION` at least `max(1, n)`. The *ipiv* array, as returned by `?sytrf`.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix `inv(A)`.
info	`INTEGER`. If *info* = `0`, the execution is successful. If *info* = `-i`, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sytri` interface are as follows:

a	Holds the matrix A of size (n,n).
ipiv	Holds the vector of length n.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse X satisfies the following error bounds:

$|D*U^T*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$

for *uplo* = `'U'`, and

$|D*L^T*P^T*X*P*L - I| \le c(n)\varepsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$

for *uplo* = `'L'`. Here $c(n)$ is a modest linear function of n, and ε is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?hetri

Computes the inverse of a complex Hermitian matrix.

Syntax

FORTRAN 77:

```
call chetri( uplo, n, a, lda, ipiv, work, info )
call zhetri( uplo, n, a, lda, ipiv, work, info )
```

Fortran 95:

```
call hetri( a, ipiv [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the inverse `inv(`A`)` of a complex Hermitian matrix A. Before calling this routine, call `?hetrf` to factorize A.

Input Parameters

uplo	CHARACTER*1. Must be `'U'` or `'L'`. Indicates how the input matrix A has been factored:

	If *uplo* = 'U', the array *a* stores the Bunch-Kaufman factorization $A = P*U*D*U^H*P^T$. If *uplo* = 'L', the array *a* stores the Bunch-Kaufman factorization $A = P*L*D*L^H*P^T$.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	COMPLEX for chetri DOUBLE COMPLEX for zhetri. Arrays: *a*(*lda*,*) contains the factorization of the matrix *A*, as returned by ?hetrf. The second dimension of *a* must be at least max(1,*n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1,*n*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?hetrf.

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hetri interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$$|D*U^H*P^T*X*P*U - I| \leq c(n)\varepsilon(|D||U^H|P^T|X|P|U| + |D||D^{-1}|)$$

for *uplo* = 'U', and

$$|D*L^H*P^T*X*P*L - I| \leq c(n)\varepsilon(|D||L^H|P^T|X|P|L| + |D||D^{-1}|)$$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

The real counterpart of this routine is ?sytri.

?sptri

Computes the inverse of a symmetric matrix using packed storage.

Syntax

FORTRAN 77:

```
call ssptri( uplo, n, ap, ipiv, work, info )
call dsptri( uplo, n, ap, ipiv, work, info )
call csptri( uplo, n, ap, ipiv, work, info )
call zsptri( uplo, n, ap, ipiv, work, info )
```

Fortran 95:

```
call sptri( ap, ipiv [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes the inverse inv(*A*) of a packed symmetric matrix *A*. Before calling this routine, call ?sptrf to factorize *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates how the input matrix *A* has been factored: If *uplo* = 'U', the array *ap* stores the Bunch-Kaufman factorization $A = P*U*D*U^T*P^T$. If *uplo* = 'L', the array *ap* stores the Bunch-Kaufman factorization $A = P*L*D*L^T*P^T$.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
ap, *work*	REAL for ssptri DOUBLE PRECISION for dsptri COMPLEX for csptri DOUBLE COMPLEX for zsptri. Arrays: *ap*(*) contains the factorization of the matrix *A*, as returned by ?sptrf. The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). *work*(*) is a workspace array. The dimension of *work* must be at least max(1,*n*).
ipiv	INTEGER.

Array, DIMENSION at least max(1, *n*). The *ipiv* array, as returned by ?sptrf.

Output Parameters

ap	Overwritten by the *n*-by-*n* matrix inv(*A*) in packed form.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sptri interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$|D*U^T*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^T|P^T|X|P|U| + |D||D^{-1}|)$

for *uplo* = 'U', and

$|D*L^T*P^T*X*P*L - I| \le c(n)\varepsilon(|D||L^T|P^T|X|P|L| + |D||D^{-1}|)$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of *n*, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

?hptri

Computes the inverse of a complex Hermitian matrix using packed storage.

Syntax

FORTRAN 77:

```
call chptri( uplo, n, ap, ipiv, work, info )
call zhptri( uplo, n, ap, ipiv, work, info )
```

Fortran 95:

```
call hptri( ap, ipiv [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the inverse `inv(A)` of a complex Hermitian matrix *A* using packed storage. Before calling this routine, call `?hptrf` to factorize *A*.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Indicates how the input matrix *A* has been factored: If *uplo* = `'U'`, the array *ap* stores the packed Bunch-Kaufman factorization $A = P*U*D*U^H*P^T$. If *uplo* = `'L'`, the array *ap* stores the packed Bunch-Kaufman factorization $A = P*L*D*L^H*P^T$.
n	`INTEGER`. The order of the matrix *A*; $n \geq 0$.
ap, *work*	`COMPLEX` for `chptri` `DOUBLE COMPLEX` for `zhptri`. Arrays: *ap*`(*)` contains the factorization of the matrix *A*, as returned by `?hptrf`. The dimension of *ap* must be at least `max(1,`*n*`(`*n*`+1)/2)`. *work*`(*)` is a workspace array. The dimension of *work* must be at least `max(1,`*n*`)`.
ipiv	`INTEGER`. Array, `DIMENSION` at least `max(1,` *n*`)`. The *ipiv* array, as returned by `?hptrf`.

Output Parameters

ap	Overwritten by the *n*-by-*n* matrix `inv(`*A*`)`.
info	`INTEGER`. If *info* = `0`, the execution is successful. If *info* = `-`*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *D* is zero, *D* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `hptri` interface are as follows:

ap	Holds the array *A* of size (*n*`*(`*n*`+1)/2)`.
ipiv	Holds the vector of length *n*.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$|D*U^H*P^T*X*P*U - I| \le c(n)\varepsilon(|D||U^H|P^T|X|P|U| + |D||D^{-1}|)$

for *uplo* = 'U', and

$|D*L^H*P^T*X*PL - I| \le c(n)\varepsilon(|D||L^H|P^T|X|P|L| + |D||D^{-1}|)$

for *uplo* = 'L'. Here $c(n)$ is a modest linear function of n, and ε is the machine precision; *I* denotes the identity matrix.

The total number of floating-point operations is approximately $(2/3)n^3$ for real flavors and $(8/3)n^3$ for complex flavors.

The real counterpart of this routine is ?sptri.

?trtri

Computes the inverse of a triangular matrix.

Syntax

FORTRAN 77:

```
call strtri( uplo, diag, n, a, lda, info )
call dtrtri( uplo, diag, n, a, lda, info )
call ctrtri( uplo, diag, n, a, lda, info )
call ztrtri( uplo, diag, n, a, lda, info )
```

Fortran 95:

```
call trtri( a [,uplo] [,diag] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes the inverse inv(*A*) of a triangular matrix *A*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether *A* is upper or lower triangular: If *uplo* = 'U', then *A* is upper triangular. If *uplo* = 'L', then *A* is lower triangular.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then *A* is not a unit triangular matrix. If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *a*.

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a	REAL for strtri DOUBLE PRECISION for dtrtri COMPLEX for ctrtri DOUBLE COMPLEX for ztrtri. Array: DIMENSION (,*). Contains the matrix *A*. The second dimension of *a* must be at least max(1,*n*).
lda	INTEGER. The first dimension of *a*; *lda* $\geq$ max(1, *n*).

Output Parameters

a	Overwritten by the *n*-by-*n* matrix inv(*A*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is zero, *A* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trtri interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$|XA - I| \leq c(n)\varepsilon\ |X||A|$

$|XA - I| \leq c(n)\varepsilon\ |A^{-1}||A||X|,$

where $c(n)$ is a modest linear function of n; ε is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

?tftri

Computes the inverse of a triangular matrix stored in the Rectangular Full Packed (RFP) format.

Syntax

FORTRAN 77:

```
call stftri( transr, uplo, diag, n, a, info )
call dtftri( transr, uplo, diag, n, a, info )
call ctftri( transr, uplo, diag, n, a, info )
call ztftri( transr, uplo, diag, n, a, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

Computes the inverse of a triangular matrix *A* stored in the Rectangular Full Packed (RFP) format. For the description of the RFP format, see Matrix Storage Schemes.

This is the block version of the algorithm, calling Level 3 BLAS.

Input Parameters

transr	CHARACTER*1. Must be 'N', 'T' (for real data) or 'C' (for complex data). If *transr* = 'N', the Normal *transr* of RFP *A* is stored. If *transr* = 'T', the Transpose *transr* of RFP *A* is stored. If *transr* = 'C', the Conjugate-Transpose *transr* of RFP *A* is stored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of RFP *A* is stored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.
diag	CHARACTER*1. Must be 'N' or 'U'. If *diag* = 'N', then *A* is not a unit triangular matrix. If *diag* = 'U', *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *a*.
n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a	REAL for stftri DOUBLE PRECISION for dtftri COMPLEX for ctftri DOUBLE COMPLEX for ztftri. Array, DIMENSION (*n**(*n*+1)/2). The array *a* contains the matrix *A* in the RFP format.

Output Parameters

a	The (triangular) inverse of the original matrix in the same storage format.
info	INTEGER. If *info*=0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, *A*(*i*,*i*) is exactly zero. The triangular matrix is singular and its inverse cannot be computed.

?tptri

Computes the inverse of a triangular matrix using packed storage.

Syntax

FORTRAN 77:

```
call stptri( uplo, diag, n, ap, info )
call dtptri( uplo, diag, n, ap, info )
call ctptri( uplo, diag, n, ap, info )
call ztptri( uplo, diag, n, ap, info )
```

Fortran 95:

```
call tptri( ap [,uplo] [,diag] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the inverse `inv(A)` of a packed triangular matrix *A*.

Input Parameters

uplo — `CHARACTER*1`. Must be `'U'` or `'L'`.
Indicates whether *A* is upper or lower triangular:
If *uplo* = `'U'`, then *A* is upper triangular.
If *uplo* = `'L'`, then *A* is lower triangular.

diag — `CHARACTER*1`. Must be `'N'` or `'U'`.
If *diag* = `'N'`, then *A* is not a unit triangular matrix.
If *diag* = `'U'`, *A* is unit triangular: diagonal elements of *A* are assumed to be 1 and not referenced in the array *ap*.

n — `INTEGER`. The order of the matrix *A*; $n \geq 0$.

ap — `REAL` for `stptri`
`DOUBLE PRECISION` for `dtptri`
`COMPLEX` for `ctptri`
`DOUBLE COMPLEX` for `ztptri`.
Array, `DIMENSION` at least `max(1,n(n+1)/2)`.
Contains the packed triangular matrix A.

Output Parameters

ap — Overwritten by the packed *n*-by-*n* matrix `inv(A)` .

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is zero, *A* is singular, and the inversion could not be completed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `tptri` interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
uplo	Must be 'U' or 'L'. The default value is 'U'.
diag	Must be 'N' or 'U'. The default value is 'N'.

Application Notes

The computed inverse *X* satisfies the following error bounds:

$|XA - I| \le c(n)\varepsilon\ |X||A|$

$|X - A^{-1}| \le c(n)\varepsilon\ |A^{-1}||A||X|,$

where $c(n)$ is a modest linear function of n; ε is the machine precision; I denotes the identity matrix.

The total number of floating-point operations is approximately $(1/3)n^3$ for real flavors and $(4/3)n^3$ for complex flavors.

Routines for Matrix Equilibration

Routines described in this section are used to compute scaling factors needed to equilibrate a matrix. Note that these routines do not actually scale the matrices.

?geequ

Computes row and column scaling factors intended to equilibrate a general matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call sgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call dgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call cgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call zgeequ( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
```

Fortran 95:

```
call geequ( a, r, c [,rowcnd] [,colcnd] [,amax] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements b_{ij}=*r*(i)**a*$_{ij}$**c*(j) have absolute value 1.

See `?laqge` auxiliary function that uses scaling factors computed by ?geequ.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*; *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*; *n* ≥ 0.
a	REAL for sgeequ DOUBLE PRECISION for dgeequ COMPLEX for cgeequ DOUBLE COMPLEX for zgeequ. Array: DIMENSION (*lda*,*). Contains the *m*-by-*n* matrix *A* whose equilibration factors are to be computed. The second dimension of *a* must be at least max(1,*n*).
lda	INTEGER. The leading dimension of *a*; *lda* ≥ max(1, *m*).

Output Parameters

r, *c*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *r*(*m*), *c*(*n*). If *info* = 0, or *info* > *m*, the array *r* contains the row scale factors of the matrix *A*. If *info* = 0 , the array *c* contains the column scale factors of the matrix *A*.
rowcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0 or *info* > *m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i).
colcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*.
info	INTEGER.

If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i* and
i ≤ *m*, the *i*-th row of *A* is exactly zero;
i > *m*, the (*i*-*m*)th column of *A* is exactly zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine geequ interface are as follows:

a	Holds the matrix *A* of size (*m*, *n*).
r	Holds the vector of length (*m*).
c	Holds the vector of length *n*.

Application Notes

All the components of *r* and *c* are restricted to be between SMLNUM = smallest safe number and BIGNUM= largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *A* but works well in practice.

If *rowcnd* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r*.

If *colcnd* ≥ 0.1, it is not worth scaling by *c*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?geequb

Computes row and column scaling factors restricted to a power of radix to equilibrate a general matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call sgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call dgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call cgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
call zgeequb( m, n, a, lda, r, c, rowcnd, colcnd, amax, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* general matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* - the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements *b*(*ij*)=*r*(i)**a*(*ij*)**c*(j) have an absolute value of at most the radix.

r(i) and *c*(j) are restricted to be a power of the radix between SMLNUM = smallest safe number and BIGNUM = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *a* but works well in practice.

This routine differs from ?geequ by restricting the scaling factors to a power of the radix. Except for over- and underflow, scaling by these factors introduces no additional rounding errors. However, the scaled entries' magnitudes are no longer equal to approximately 1 but lie between sqrt(radix) and 1/sqrt(radix).

Input Parameters

m	INTEGER. The number of rows of the matrix *A*; *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*; *n* ≥ 0.
a	REAL for sgeequb DOUBLE PRECISION for dgeequb COMPLEX for cgeequb DOUBLE COMPLEX for zgeequb. Array: DIMENSION (*lda*,*). Contains the *m*-by-*n* matrix *A* whose equilibration factors are to be computed. The second dimension of *a* must be at least max(1,*n*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *m*).

Output Parameters

r, *c*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *r*(*m*), *c*(*n*). If *info* = 0, or *info* > *m*, the array *r* contains the row scale factors for the matrix *A*. If *info* = 0 , the array *c* contains the column scale factors for the matrix *A*.
rowcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0 or *info* > *m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i). If *rowcnd* ≥ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *r*.
colcnd	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i). If *colcnd* ≥ 0.1, it is not worth scaling by *c*.
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*. If *amax* is very close to overflow or very close to underflow, the matrix should be scaled.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i* and *i* ≤ *m*, the *i*-th row of *A* is exactly zero; *i* > *m*, the (*i*-*m*)-th column of *A* is exactly zero.

?gbequ

Computes row and column scaling factors intended to equilibrate a banded matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call sgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call dgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call cgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call zgbequ( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
```

Fortran 95:

```
call gbequ( ab, r, c [,kl] [,rowcnd] [,colcnd] [,amax] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* band matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements b_{ij}=*r*(i)**a*$_{ij}$**c*(j) have absolute value 1.

See `?laqgb` auxiliary function that uses scaling factors computed by ?gbequ.

Input Parameters

m	INTEGER. The number of rows of the matrix *A*; *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*; *n* ≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl* ≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku* ≥ 0.
ab	REAL for sgbequ DOUBLE PRECISION for dgbequ COMPLEX for cgbequ DOUBLE COMPLEX for zgbequ.

Array, DIMENSION (*ldab*,*).
Contains the original band matrix *A* stored in rows from 1 to *kl* + *ku* + 1.
The second dimension of *ab* must be at least max(1,*n*).

ldab INTEGER. The leading dimension of *ab*; *ldab* ≥ *kl*+*ku*+1.

Output Parameters

r, *c* REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*m*), *c*(*n*).
If *info* = 0, or *info* > *m*, the array *r* contains the row scale factors of the matrix *A*.
If *info* = 0 , the array *c* contains the column scale factors of the matrix *A*.

rowcnd REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0 or *info* > *m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i).

colcnd REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i).

amax REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Absolute value of the largest element of the matrix *A*.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i* and

i ≤ *m*, the *i*-th row of *A* is exactly zero;
i > *m*, the (*i*-*m*)th column of *A* is exactly zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gbequ interface are as follows:

ab Holds the array *A* of size (*kl*+*ku*+1,*n*).

r Holds the vector of length (*m*).

c Holds the vector of length *n*.

kl If omitted, assumed *kl* = *ku*.

ku Restored as *ku* = *lda*-*kl*-1.

Application Notes

All the components of *r* and *c* are restricted to be between SMLNUM = smallest safe number and BIGNUM= largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *A* but works well in practice.

If *rowcnd* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *r*.

If *colcnd* ≥ 0.1, it is not worth scaling by *c*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?gbequb

Computes row and column scaling factors restricted to a power of radix to equilibrate a banded matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call sgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call dgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call cgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
call zgbequb( m, n, kl, ku, ab, ldab, r, c, rowcnd, colcnd, amax, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate an *m*-by-*n* banded matrix *A* and reduce its condition number. The output array *r* returns the row scale factors and the array *c* - the column scale factors. These factors are chosen to try to make the largest element in each row and column of the matrix *B* with elements *b*(*ij*)=*r*(i)**a*(*ij*)**c*(j) have an absolute value of at most the radix.

r(i) and *c*(j) are restricted to be a power of the radix between SMLNUM = smallest safe number and BIGNUM = largest safe number. Use of these scaling factors is not guaranteed to reduce the condition number of *a* but works well in practice.

This routine differs from ?gbequ by restricting the scaling factors to a power of the radix. Except for over- and underflow, scaling by these factors introduces no additional rounding errors. However, the scaled entries' magnitudes are no longer equal to approximately 1 but lie between sqrt(radix) and 1/sqrt(radix).

Input Parameters

m	INTEGER. The number of rows of the matrix *A*; *m* ≥ 0.
n	INTEGER. The number of columns of the matrix *A*; *n* ≥ 0.
kl	INTEGER. The number of subdiagonals within the band of *A*; *kl* ≥ 0.
ku	INTEGER. The number of superdiagonals within the band of *A*; *ku* ≥ 0.

ab
REAL for sgbequb
DOUBLE PRECISION for dgbequb
COMPLEX for cgbequb
DOUBLE COMPLEX for zgbequb.
Array: DIMENSION (*ldab*,*).
Contains the original banded matrix *A* stored in rows from 1 to $kl + ku + 1$. The j-th column of *A* is stored in the j-th column of the array *ab* as follows:
$ab(ku+1+i-j,j) = a(i,j)$ for $\max(1,j-ku) \le i \le \min(n,j+kl)$.
The second dimension of *ab* must be at least max(1,*n*).

ldab
INTEGER. The first dimension of *a*; $ldab \ge \max(1, m)$.

Output Parameters

r, *c*
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*m*), *c*(*n*).
If *info* = 0, or *info* > *m*, the array *r* contains the row scale factors for the matrix *A*.
If *info* = 0 , the array *c* contains the column scale factors for the matrix *A*.

rowcnd
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0 or *info* > *m*, *rowcnd* contains the ratio of the smallest *r*(i) to the largest *r*(i). If *rowcnd* ≥ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *r*.

colcnd
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0, *colcnd* contains the ratio of the smallest *c*(i) to the largest *c*(i). If *colcnd* ≥ 0.1, it is not worth scaling by *c*.

amax
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Absolute value of the largest element of the matrix *A*. If *amax* is very close to overflow or underflow, the matrix should be scaled.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.
$i \le m$, the *i*-th row of *A* is exactly zero;
$i > m$, the (*i*-*m*)-th column of *A* is exactly zero.

?poequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call spoequ( n, a, lda, s, scond, amax, info )
call dpoequ( n, a, lda, s, scond, amax, info )
call cpoequ( n, a, lda, s, scond, amax, info )
call zpoequ( n, a, lda, s, scond, amax, info )
```

Fortran 95:

```
call poequ( a, s [,scond] [,amax] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive-definite matrix *A* and reduce its condition number (with respect to the two-norm). The output array *s* returns scale factors computed as

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix *B* with elements b_{ij}=s(i)*a_{ij}*s(j) has diagonal elements equal to 1.

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

See ?laqsy auxiliary function that uses scaling factors computed by ?poequ.

Input Parameters

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a	REAL for spoequ DOUBLE PRECISION for dpoequ COMPLEX for cpoequ DOUBLE COMPLEX for zpoequ. Array: DIMENSION (*lda*,*).

Contains the *n*-by-*n* symmetric or Hermitian positive definite matrix *A* whose scaling factors are to be computed. Only the diagonal elements of *A* are referenced. The second dimension of *a* must be at least max(1,*n*).

lda — INTEGER. The leading dimension of *a*; *lda* ≥ max(1,*n*).

Output Parameters

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*).
If *info* = 0, the array *s* contains the scale factors for *A*.

scond — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i).

amax — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Absolute value of the largest element of the matrix *A*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine poequ interface are as follows:

a — Holds the matrix *A* of size (*n*,*n*).

s — Holds the vector of length *n*.

Application Notes

If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?poequb

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call spoequb( n, a, lda, s, scond, amax, info )
```

```
call dpoequb( n, a, lda, s, scond, amax, info )
call cpoequb( n, a, lda, s, scond, amax, info )
call zpoequb( n, a, lda, s, scond, amax, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive-definite matrix *A* and reduce its condition number (with respect to the two-norm).

These factors are chosen so that the scaled matrix *B* with elements *b*(*i*,*j*)=*s*(i)**a*(*i*,*j*)**s*(j) has diagonal elements equal to 1. *s*(*i*) is a power of two nearest to, but not exceeding 1/sqrt(A(i,i)).

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

Input Parameters

n	INTEGER. The order of the matrix *A*; *n* ≥ 0.
a	REAL for spoequb DOUBLE PRECISION for dpoequb COMPLEX for cpoequb DOUBLE COMPLEX for zpoequb. Array: DIMENSION (*lda*,*). Contains the *n*-by-*n* symmetric or Hermitian positive definite matrix *A* whose scaling factors are to be computed. Only the diagonal elements of *A* are referenced. The second dimension of *a* must be at least max(1,*n*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *m*).

Output Parameters

s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION (*n*). If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i). If *scond* ≥ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *s*.
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*. If *amax* is very close to overflow or underflow, the matrix should be scaled.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

?ppequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive definite matrix in packed storage and reduce its condition number.

Syntax

FORTRAN 77:

```
call sppequ( uplo, n, ap, s, scond, amax, info )
call dppequ( uplo, n, ap, s, scond, amax, info )
call cppequ( uplo, n, ap, s, scond, amax, info )
call zppequ( uplo, n, ap, s, scond, amax, info )
```

Fortran 95:

```
call ppequ( ap, s [,scond] [,amax] [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive definite matrix *A* in packed storage and reduce its condition number (with respect to the two-norm). The output array *s* returns scale factors computed as

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix *B* with elements b_{ij}=s(i)*a_{ij}*s(j) has diagonal elements equal to 1.

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

See `?laqsp` auxiliary function that uses scaling factors computed by ?ppequ.

Input Parameters

uplo — `CHARACTER*1`. Must be `'U'` or `'L'`.
Indicates whether the upper or lower triangular part of *A* is packed in the array *ap*:
If *uplo* = `'U'`, the array *ap* stores the upper triangular part of the matrix *A*.
If *uplo* = `'L'`, the array *ap* stores the lower triangular part of the matrix *A*.

n — `INTEGER`. The order of matrix *A*; *n* ≥ 0.

ap	REAL for sppequ DOUBLE PRECISION for dppequ COMPLEX for cppequ DOUBLE COMPLEX for zppequ. Array, DIMENSION at least max(1,*n*(*n*+1)/2). The array *ap* contains the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *packed storage* (see Matrix Storage Schemes).

Output Parameters

s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION (*n*). If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ppequ interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
s	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?pbequ

Computes row and column scaling factors intended to equilibrate a symmetric (Hermitian) positive-definite band matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call spbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
call dpbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
call cpbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
call zpbequ( uplo, n, kd, ab, ldab, s, scond, amax, info )
```

Fortran 95:

```
call pbequ( ab, s [,scond] [,amax] [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate a symmetric (Hermitian) positive definite matrix *A* in packed storage and reduce its condition number (with respect to the two-norm). The output array *s* returns scale factors computed as

$$s(i) = \frac{1}{\sqrt{a_{i,i}}}$$

These factors are chosen so that the scaled matrix *B* with elements b_{ij}=s(i)*a_{ij}*s(j) has diagonal elements equal to 1. This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

See `?laqsb` auxiliary function that uses scaling factors computed by ?pbequ.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is packed in the array *ab*: If *uplo* = 'U', the array *ab* stores the upper triangular part of the matrix *A*. If *uplo* = 'L', the array *ab* stores the lower triangular part of the matrix *A*.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; $kd \geq 0$.

ab	REAL for spbequ DOUBLE PRECISION for dpbequ COMPLEX for cpbequ DOUBLE COMPLEX for zpbequ. Array, DIMENSION (*ldab*,*). The array *ap* contains either the upper or the lower triangular part of the matrix *A* (as specified by *uplo*) in *band storage* (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*).
ldab	INTEGER. The leading dimension of the array *ab*; *ldab* ≥ *kd* +1.

Output Parameters

s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION (*n*). If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i).
amax	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Absolute value of the largest element of the matrix *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbequ interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
s	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

If *scond* ≥ 0.1 and *amax* is neither too large nor too small, it is not worth scaling by *s*.

If *amax* is very close to overflow or very close to underflow, the matrix *A* should be scaled.

?syequb

Computes row and column scaling factors intended to equilibrate a symmetric indefinite matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call ssyequb( uplo, n, a, lda, s, scond, amax, work, info )
call dsyequb( uplo, n, a, lda, s, scond, amax, work, info )
call csyequb( uplo, n, a, lda, s, scond, amax, work, info )
call zsyequb( uplo, n, a, lda, s, scond, amax, work, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine computes row and column scalings intended to equilibrate a symmetric indefinite matrix *A* and reduce its condition number (with respect to the two-norm).

The array *s* contains the scale factors, *s*(*i*) = 1/sqrt(A(i,i)). These factors are chosen so that the scaled matrix *B* with elements *b*(*i*,*j*)=*s*(i)**a*(*i*,*j*)**s*(j) has ones on the diagonal.

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.
n	INTEGER. The order of the matrix *A*; *n* ≥ 0.
a, *work*	REAL for ssyequb DOUBLE PRECISION for dsyequb COMPLEX for csyequb DOUBLE COMPLEX for zsyequb. Array *a*: DIMENSION (*lda*,*). Contains the *n*-by-*n* symmetric indefinite matrix *A* whose scaling factors are to be computed. Only the diagonal elements of *A* are referenced. The second dimension of *a* must be at least max(1,*n*). *work(*)* is a workspace array. The dimension of *work* is at least max(1,3**n*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *m*).

Output Parameters

s	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*).
If *info* = 0, the array *s* contains the scale factors for *A*.

scond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i). If *scond* ≥ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *s*.

amax REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Absolute value of the largest element of the matrix *A*. If *amax* is very close to overflow or underflow, the matrix should be scaled.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

?heequb

Computes row and column scaling factors intended to equilibrate a Hermitian indefinite matrix and reduce its condition number.

Syntax

FORTRAN 77:

```
call cheequb( uplo, n, a, lda, s, scond, amax, work, info )
call zheequb( uplo, n, a, lda, s, scond, amax, work, info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine computes row and column scalings intended to equilibrate a Hermitian indefinite matrix *A* and reduce its condition number (with respect to the two-norm).

The array *s* contains the scale factors, *s*(*i*) = 1/sqrt(A(i,i)). These factors are chosen so that the scaled matrix *B* with elements *b*(*i*,*j*)=*s*(i)**a*(*i*,*j*)**s*(j) has ones on the diagonal.

This choice of *s* puts the condition number of *B* within a factor *n* of the smallest possible condition number over all possible diagonal scalings.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix *A*.
If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix *A*.

n	INTEGER. The order of the matrix *A*; $n \geq 0$.
a, *work*	COMPLEX for cheequb DOUBLE COMPLEX for zheequb. Array *a*: DIMENSION (*lda*,*). Contains the *n*-by-*n* symmetric indefinite matrix *A* whose scaling factors are to be computed. Only the diagonal elements of *A* are referenced. The second dimension of *a* must be at least max(1,*n*). *work(*)* is a workspace array. The dimension of *work* is at least max(1,3**n*).
lda	INTEGER. The first dimension of *a*; *lda* $\geq$ max(1, *m*).

Output Parameters

s	REAL for cheequb DOUBLE PRECISION for zheequb. Array, DIMENSION (*n*). If *info* = 0, the array *s* contains the scale factors for *A*.
scond	REAL for cheequb DOUBLE PRECISION for zheequb. If *info* = 0, *scond* contains the ratio of the smallest *s*(i) to the largest *s*(i). If *scond* $\geq$ 0.1, and *amax* is neither too large nor too small, it is not worth scaling by *s*.
amax	REAL for cheequb DOUBLE PRECISION for zheequb. Absolute value of the largest element of the matrix *A*. If *amax* is very close to overflow or underflow, the matrix should be scaled.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of *A* is nonpositive.

Driver Routines

Table 3-3 lists the LAPACK driver routines for solving systems of linear equations with real or complex matrices.

Table 3-3 Driver Routines for Solving Systems of Linear Equations

Matrix type, storage scheme	Simple Driver	Expert Driver	Expert Driver using Extra-Precise Interative Refinement
general	?gesv	?gesvx	?gesvxx
general band	?gbsv	?gbsvx	?gbsvxx
general tridiagonal	?gtsv	?gtsvx	

Matrix type, storage scheme	Simple Driver	Expert Driver	Expert Driver using Extra-Precise Interative Refinement
diagonally dominant tridiagonal	?dtsvb		
symmetric/Hermitian positive-definite	?posv	?posvx	?posvxx
symmetric/Hermitian positive-definite, storage	?ppsv	?ppsvx	
symmetric/Hermitian positive-definite, band	?pbsv	?pbsvx	
symmetric/Hermitian positive-definite, tridiagonal	?ptsv	?ptsvx	
symmetric/Hermitian indefinite	?sysv/?hesv	?sysvx/?hesvx	?sysvxx/?hesvxx
symmetric/Hermitian indefinite, packed storage	?spsv/?hpsv	?spsvx/?hpsvx	
complex symmetric	?sysv	?sysvx	
complex symmetric, packed storage	?spsv	?spsvx	

In this table ? stands for s (single precision real), d (double precision real), c (single precision complex), or z (double precision complex). In the description of ?gesv and ?posv routines, the ? sign stands for combined character codes ds and zc for the mixed precision subroutines.

?gesv

Computes the solution to the system of linear equations with a square matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call dgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call cgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call zgesv( n, nrhs, a, lda, ipiv, b, ldb, info )
call dsgesv( n, nrhs, a, lda, ipiv, b, ldb, x, ldx, work, swork, iter, info )
call zcgesv( n, nrhs, a, lda, ipiv, b, ldb, x, ldx, work, swork, rwork, iter, info )
```

Fortran 95:

```
call gesv( a, b [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for *X* the system of linear equations *A*X = B*, where *A* is an *n*-by-*n* matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The *LU* decomposition with partial pivoting and row interchanges is used to factor *A* as *A = P*L*U*, where *P* is a permutation matrix, *L* is unit lower triangular, and *U* is upper triangular. The factored form of *A* is then used to solve the system of equations *A*X = B*.

The `dsgesv` and `zcgesv` are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (`dsgesv`) or single complex precision (`zcgesv`) and use this factorization within an iterative refinement procedure to produce a solution with double precision (`dsgesv`) / double complex precision (`zcgesv`) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision performance over double precision performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to `ilaenv` in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if

```
iter > itermax
```

or for all the right-hand sides:

```
rnmr < sqrt(n)*xnrm*anrm*eps*bwdmax
```

where

- `iter` is the number of the current iteration in the iterativerefinement process
- `rnmr` is the infinity-norm of the residual
- `xnrm` is the infinity-norm of the solution
- `anrm` is the infinity-operator-norm of the matrix *A*
- `eps` is the machine epsilon returned by `dlamch` ('Epsilon').

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

Input Parameters

n	`INTEGER`. The number of linear equations, that is, the order of the matrix *A*; $n \geq 0$.
nrhs	`INTEGER`. The number of right-hand sides, that is, the number of columns of the matrix *B*; $nrhs \geq 0$.

a, *b*	`REAL` for `sgesv`
	`DOUBLE PRECISION` for `dgesv` and `dsgesv`
	`COMPLEX` for `cgesv`

	DOUBLE COMPLEX for zgesv and zcgesv. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the *n*-by-*n* coefficient matrix *A*. The array *b* contains the *n*-by-*nrhs* matrix of right hand side matrix *B*. The second dimension of *a* must be at least max(1, *n*), the second dimension of *b* at least max(1,*nrhs*).
lda	INTEGER. The leading dimension of the array *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The leading dimension of the array *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The leading dimension of the array *x*; *ldx* ≥ max(1, *n*).
work	DOUBLE PRECISION for dsgesv DOUBLE COMPLEX for zcgesv. Workspace array, DIMENSION at least max(1,*n***nrhs*). This array is used to hold the residual vectors.
swork	REAL for dsgesv COMPLEX for zcgesv. Workspace array, DIMENSION at least max(1,*n**(*n*+*nrhs*)). This array is used to use the single precision matrix and the right-hand sides or solutions in single precision.
rwork	DOUBLE PRECISION. Workspace array, DIMENSION at least max(1,*n*).

Output Parameters

a	Overwritten by the factors *L* and *U* from the factorization of *A* = *P*L*U*; the unit diagonal elements of *L* are not stored. If iterative refinement has been successfully used (*info*= 0 and *iter*≥ 0), then *A* is unchanged. If double precision factorization has been used (*info*= 0 and *iter* < 0), then the array *A* contains the factors *L* and *U* from the factorization *A* = *P*L*U*; the unit diagonal elements of *L* are not stored.
b	Overwritten by the solution matrix *X* for dgesv, sgesv,zgesv,zgesv. Unchanged for dsgesv and zcgesv.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The pivot indices that define the permutation matrix *P*; row *i* of the matrix was interchanged with row *ipiv*(i). Corresponds to the single precision factorization (if *info*= 0 and *iter* ≥ 0) or the double precision factorization (if *info*= 0 and *iter* < 0).
x	DOUBLE PRECISION for dsgesv DOUBLE COMPLEX for zcgesv. Array, DIMENSION (*ldx*, *nrhs*). If *info* = 0, contains the *n*-by-*nrhs* solution matrix *X*.
iter	INTEGER. If *iter* < 0: iterative refinement has failed, double precision factorization has been performed

- If *iter* = -1: the routine fell back to full precision for implementation- or machine-specific reason
- If *iter* = -2: narrowing the precision induced an overflow, the routine fell back to full precision
- If *iter* = -3: failure of sgetrf for dsgesv, or cgetrf for zcgesv
- If *iter* = -31: stop the iterative refinement after the 30th iteration.

If *iter* > 0: iterative refinement has been successfully used. Returns the number of iterations.

info INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, *U*(*i*, *i*) (computed in double precision for mixed precision subroutines) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gesv interface are as follows:

a Holds the matrix *A* of size (*n*,*n*).

b Holds the matrix *B* of size (*n*,*nrhs*).

ipiv Holds the vector of length *n*.

NOTE. Fortran 95 Interface is so far not available for the mixed precision subroutines ds-gesv/zcgesv.

?gesvx

Computes the solution to the system of linear equations with a square matrix A and multiple right-hand sides, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call sgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
```

```
call dgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b, ldb, x, ldx,
rcond, ferr, berr, work, iwork, info )
```

```
call cgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b, ldb, x, ldx,
rcond, ferr, berr, work, rwork, info )
```

```
call zgesvx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b, ldb, x, ldx,
rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gesvx( a, b, x [,af] [,ipiv] [,fact] [,trans] [,equed] [,r] [,c] [,ferr] [,berr]
[,rcond] [,rpvgrw] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gesvx performs the following steps:

1. If *fact* = 'E', real scaling factors *r* and *c* are computed to equilibrate the system:

   trans = 'N': *diag*(*r*)**A***diag*(*c*)*inv(*diag*(*c*))**X* = *diag*(*r*)**B*

   trans = 'T': $(diag(r)*A*diag(c))^{T}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

   trans = 'C': $(diag(r)*A*diag(c))^{H}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*r*)**A***diag*(*c*) and *B* by *diag*(*r*)**B* (if *trans*='N') or *diag*(*c*)**B* (if *trans* = 'T' or 'C').
2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *P***L***U*, where *P* is a permutation matrix, *L* is a unit lower triangular matrix, and *U* is upper triangular.
3. If some $U_{i,i}$= 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*c*) (if *trans* = 'N') or *diag*(*r*) (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact CHARACTER*1. Must be 'F', 'N', or 'E'.

Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F': on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*. *a*, *af*, and *ipiv* are not modified.
If *fact* = 'N', the matrix *A* will be copied to *af* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *af* and factored.

trans

CHARACTER*1. Must be 'N', 'T', or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).
If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose).
If *trans* = 'C', the system has the form $A^H*X = B$ (Transpose for real flavors, conjugate transpose for complex flavors).

n

INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

a,*af*,*b*,*work*

REAL for sgesvx
DOUBLE PRECISION for dgesvx
COMPLEX for cgesvx
DOUBLE COMPLEX for zgesvx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the matrix *A*. If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least max(1,*n*).
The array *af* is an input argument if *fact* = 'F'. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P*L*U* as computed by ?getrf. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*. The second dimension of *af* must be at least max(1,*n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda

INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf

INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb

INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv

INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *P*L*U* as computed by ?getrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed

CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').

If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).
If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).
If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A***diag*(*c*).

r, *c*

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.
If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.
If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.
If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.
If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.

ldx

INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork

INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 2**n*); used in complex flavors only.

Output Parameters

x

REAL for sgesvx
DOUBLE PRECISION for dgesvx
COMPLEX for cgesvx
DOUBLE COMPLEX for zgesvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is:
diag(*C*)$^{-1}$**X*, if *trans* = 'N' and *equed* = 'C' or 'B'; *diag*(*R*)$^{-1}$**X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least max(1,*nrhs*).

a

Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'. If *equed* ≠ 'N', *A* is scaled on exit as follows:
equed = 'R': *A* = *diag*(*R*)**A*
equed = 'C': *A* = *A***diag*(*c*)
equed = 'B': *A* = *diag*(*R*)**A***diag*(*c*).

af If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *PLU* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b Overwritten by *diag*(*r*)**B* if *trans* = 'N' and *equed* = 'R'or 'B'; overwritten by *diag*(*c*)**B* if *trans* = 'T' or 'C' and *equed* = 'C' or 'B'; not changed if *equed* = 'N'.

r, *c* These arrays are output arguments if *fact* ≠ 'F'. See the description of *r*, *c* in *Input Arguments* section.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x* (*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

ipiv If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

equed If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

work, *rwork* On exit, *work*(1) for real flavors, or *rwork*(1) for complex flavors, contains the reciprocal pivot growth factor norm(*A*)/norm(*U*). The "max absolute element" norm is used. If *work*(1) for real flavors, or *rwork*(1) for complex flavors is much less than 1, then the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *x*, condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with 0 < *info* ≤ *n*, then *work*(1) for real flavors, or *rwork*(1) for complex flavors contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i* ≤ *n*, then *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *i*, and *i* = *n*+1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gesvx interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Holds the matrix *AF* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
r	Holds the vector of length *n*. Default value for each element is *r*(*i*) = 1.0_WP.
c	Holds the vector of length *n*. Default value for each element is *c*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
equed	Must be 'N', 'B', 'C', or 'R'. The default value is 'N'.
rpvgrw	Real value that contains the reciprocal pivot growth factor norm(*A*)/norm(*U*).

?gesvxx

Uses extra precise iterative refinement to compute the solution to the system of linear equations with a square matrix A and multiple right-hand sides

Syntax

FORTRAN 77:

```
call sgesvxx( fact, trans, n, nrhs, a, lda, af, ldaf, ipiv, equed, r, c, b, ldb, x, ldx,
rcond, rpvgrw, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work,
iwork, info )
```

call dgesvxx(*fact*, *trans*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *equed*, *r*, *c*, *b*, *ldb*, *x*, *ldx*, *rcond*, *rpvgrw*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *iwork*, *info*)

call cgesvxx(*fact*, *trans*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *equed*, *r*, *c*, *b*, *ldb*, *x*, *ldx*, *rcond*, *rpvgrw*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *rwork*, *info*)

call zgesvxx(*fact*, *trans*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *equed*, *r*, *c*, *b*, *ldb*, *x*, *ldx*, *rcond*, *rpvgrw*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *rwork*, *info*)

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* matrix, the columns of the matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (`O(eps)`, where `eps` is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with `O(eps)` errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?gesvxx performs the following steps:

1. If *fact* = 'E', scaling factors *r* and *c* are computed to equilibrate the system:

   trans = 'N': *diag*(*r*)**A***diag*(*c*)*inv(*diag*(*c*))**X* = *diag*(*r*)**B*

   trans = 'T': $(diag(r)*A*diag(c))^{T}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

   trans = 'C': $(diag(r)*A*diag(c))^{H}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*r*)**A***diag*(*c*) and *B* by *diag*(*r*)**B* (if *trans*='N') or *diag*(*c*)**B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *P***L***U*, where *P* is a permutation matrix, *L* is a unit lower triangular matrix, and *U* is upper triangular.

3. If some $U_{i,i}$= 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.

4. The system of equations is solved for *X* using the factored form of *A*.

5. By default, unless `params(la_linrx_itref_i)` is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.

6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*c*) (if *trans* = 'N') or *diag*(*r*) (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact	CHARACTER*1. Must be 'F', 'N', or 'E'. Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored. If *fact* = 'F', on entry, *af* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*. Parameters *a*, *af*, and *ipiv* are not modified. If *fact* = 'N', the matrix *A* will be copied to *af* and factored. If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.
trans	CHARACTER*1. Must be 'N', 'T', or 'C'. Specifies the form of the system of equations: If *trans* = 'N', the system has the form *A*X* = *B* (No transpose). If *trans* = 'T', the system has the form *A**T*X* = *B* (Transpose). If *trans* = 'C', the system has the form *A**H*X* = *B* (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).
n	INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.
a, *af*, *b*, *work*	REAL for sgesvxx DOUBLE PRECISION for dgesvxx COMPLEX for cgesvxx DOUBLE COMPLEX for zgesvxx. Arrays: *a*(*lda*,***), *af*(*ldaf*,***), *b*(*ldb*,***), *work*(***). The array *a* contains the matrix *A*. If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least max(1,*n*). The array *af* is an input argument if *fact* = 'F'. It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P*L*U* as computed by ?getrf. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *A*. The second dimension of *af* must be at least max(1,*n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*). *work(*)* is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *P*L*U* as computed by ?getrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').
If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).
If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).
If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)*A*diag*(*c*).

r, *c* REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.
If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.
If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.
If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.
If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.
Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

ldx INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the double-precision refinement algorithm, possibly with doubled-single computations if the compilation environment does not support DOUBLE PRECISION.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the guarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork

INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 3*n); used in complex flavors only.

Output Parameters

x

REAL for sgesvxx
DOUBLE PRECISION for dgesvxx
COMPLEX for cgesvxx
DOUBLE COMPLEX for zgesvxx.
Array, DIMENSION (*ldx*,*).
If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is:

	inv(*diag*(*c*))***X*, if *trans* = 'N' and *equed* = 'C' or 'B'; or inv(*diag*(*r*))***X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'. The second dimension of *x* must be at least max(1,*nrhs*).
a	Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'. If *equed* ≠ 'N', *A* is scaled on exit as follows: *equed* = 'R': *A* = *diag*(*r*)***A* *equed* = 'C': *A* = *A***diag*(*c*) *equed* = 'B': *A* = *diag*(*r*)***A***diag*(*c*).
af	If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *PLU* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.
b	Overwritten by *diag*(*r*)***B* if *trans* = 'N' and *equed* = 'R' or 'B'; overwritten by *trans* = 'T' or 'C' and *equed* = 'C' or 'B'; not changed if *equed* = 'N'.
r, *c*	These arrays are output arguments if *fact* ≠ 'F'. Each element of these arrays is a power of the radix. See the description of *r*, *c* in *Input Arguments* section.
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.
rpvgrw	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Contains the reciprocal pivot growth factor *norm*(*A*)/*norm*(*U*). The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with 0 < *info* ≤ *n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*. In ?gesvx, this quantity is returned in *work(1)*.
berr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.
err_bnds_norm	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.
The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

ipiv — If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

equed — If *fact* ≠ 'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info — INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?gbsv

Computes the solution to the system of linear equations with a band matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call dgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call cgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
call zgbsv( n, kl, ku, nrhs, ab, ldab, ipiv, b, ldb, info )
```

Fortran 95:

```
call gbsv( ab, b [,kl] [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for *X* the real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* band matrix with *kl* subdiagonals and *ku* superdiagonals, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The *LU* decomposition with partial pivoting and row interchanges is used to factor *A* as *A* = *L***U*, where *L* is a product of permutation and unit lower triangular matrices with *kl* subdiagonals, and *U* is upper triangular with *kl*+*ku* superdiagonals. The factored form of *A* is then used to solve the system of equations *A***X* = *B*.

Input Parameters

n	INTEGER. The order of *A*. The number of rows in *B*; $n \geq 0$.
kl	INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.
ku	INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.
nrhs	INTEGER. The number of right-hand sides. The number of columns in *B*; $nrhs \geq 0$.
ab, *b*	REAL for sgbsv DOUBLE PRECISION for dgbsv COMPLEX for cgbsv DOUBLE COMPLEX for zgbsv. Arrays: *ab*(*ldab*,*), *b*(*ldb*,*). The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldab	INTEGER. The first dimension of the array *ab*. ($ldab \geq 2kl + ku + 1$)
ldb	INTEGER. The first dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

ab	Overwritten by *L* and *U*. The diagonal and $kl + ku$ superdiagonals of *U* are stored in the first $1 + kl + ku$ rows of *ab*. The multipliers used to form *L* are stored in the next *kl* rows.
b	Overwritten by the solution matrix *X*.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The pivot indices: row *i* was interchanged with row *ipiv*(*i*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gbsv interface are as follows:

ab	Holds the array *A* of size (2**kl*+*ku*+1, *n*).
b	Holds the matrix *B* of size (*n*, *nrhs*).

ipiv	Holds the vector of length *n*.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-2**kl*-1.

?gbsvx

Computes the solution to the real or complex system of linear equations with a band matrix A and multiple right-hand sides, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call sgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call dgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call cgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
call zgbsvx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gbsvx( ab, b, x [,kl] [,afb] [,ipiv] [,fact] [,trans] [,equed] [,r] [,c] [,ferr]
[,berr] [,rcond] [,rpvgrw] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations $A*X = B$, $A^T*X = B$, or $A^H*X = B$, where *A* is a band matrix of order *n* with *kl* subdiagonals and *ku* superdiagonals, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?gbsvx performs the following steps:

1. If *fact* = 'E', real scaling factors *r* and *c* are computed to equilibrate the system:

trans = 'N': *diag*(*r*)**A***diag*(*c*) *inv(*diag*(*c*))**X* = *diag*(*r*)**B*

trans = 'T': $(diag(r)*A*diag(c))^T$ *inv(*diag*(*r*))**X* = *diag*(*c*)**B*

trans = 'C': $(diag(r)*A*diag(c))^H$ *inv(*diag*(*r*))**X* = *diag*(*c*)**B*

Whether the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*r*)**A***diag*(*c*) and *B* by *diag*(*r*)**B* (if *trans*='N') or *diag*(*c*)**B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *L***U*, where *L* is a product of permutation and unit lower triangular matrices with *kl* subdiagonals, and *U* is upper triangular with *kl*+*ku* superdiagonals.
3. If some $U_{i,i} = 0$, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*c*) (if *trans* = 'N') or *diag*(*r*) (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact
CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F': on entry, *afb* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* is equilibrated with scaling factors given by *r* and *c*.
ab, *afb*, and *ipiv* are not modified.
If *fact* = 'N', the matrix *A* will be copied to *afb* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *afb* and factored.

trans
CHARACTER*1. Must be 'N', 'T', or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form *A***X* = *B* (No transpose).
If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose).
If *trans* = 'C', the system has the form $A^H*X = B$ (Transpose for real flavors, conjugate transpose for complex flavors).

n
INTEGER. The number of linear equations, the order of the matrix *A*; $n \geq 0$.

kl
INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku
INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.

nrhs
INTEGER. The number of right hand sides, the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

ab, *afb*, *b*, *work*
REAL for sgesvx
DOUBLE PRECISION for dgesvx
COMPLEX for cgesvx
DOUBLE COMPLEX for zgesvx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *ab* contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*). If *fact* = 'F' and *equed* is not 'N', then *A* must have been equilibrated by the scaling factors in *r* and/or *c*.

	The array *afb* is an input argument if *fact* = 'F'. The second dimension of *afb* must be at least max(1,*n*). It contains the factored form of the matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *L*U* as computed by ?gbtrf. *U* is stored as an upper triangular band matrix with *kl* + *ku* superdiagonals in the first 1 + *kl* + *ku* rows of *afb*. The multipliers used during the factorization are stored in the next *kl* rows. If *equed* is not 'N', then *afb* is the factored form of the equilibrated matrix *A*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*). *work(*)* is a workspace array. The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
ldab	INTEGER. The first dimension of *ab*; *ldab* ≥ *kl*+*ku*+1.
ldafb	INTEGER. The first dimension of *afb*; *ldafb* ≥ 2**kl*+*ku*+1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *L*U* as computed by ?gbtrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).
equed	CHARACTER*1. Must be 'N', 'R', 'C', or 'B'. *equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done: If *equed* = 'N', no equilibration was done (always true if *fact* = 'N'). If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*). If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*). if *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A***diag*(*c*).
r, *c*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments. If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed. If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive. If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed. If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.
ldx	INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.
rwork	REAL for single precision flavors

DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x

REAL for sgbsvx
DOUBLE PRECISION for dgbsvx
COMPLEX for cgbsvx
DOUBLE COMPLEX for zgbsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is: inv(*diag*(*c*))*X, if *trans* = 'N' and *equed* = 'C' or 'B'; inv(*diag*(*r*))*X, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'.
The second dimension of *x* must be at least max(1,*nrhs*).

ab

Array *ab* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *equed* ≠ 'N', *A* is scaled on exit as follows:
equed = 'R': *A* = *diag*(*r*)*A
equed = 'C': *A* = *A***diag*(*c*)
equed = 'B': *A* = *diag*(*r*)*A***diag*(*c*).

afb

If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns details of the *LU* factorization of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ab* for the form of the equilibrated matrix.

b

Overwritten by *diag*(*r*)*b if *trans* = 'N' and *equed* = 'R' or 'B';
overwritten by *diag*(*c*)*b if *trans* = 'T' or 'C' and *equed* = 'C' or 'B';
not changed if *equed* = 'N'.

r, *c*

These arrays are output arguments if *fact* ≠ 'F'. See the description of *r*, *c* in *Input Arguments* section.

rcond

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done).
If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.

ferr

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.
ipiv	If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).
work, *rwork*	On exit, *work*(1) for real flavors, or *rwork*(1) for complex flavors, contains the reciprocal pivot growth factor norm(*A*)/norm(*U*). The "max absolute element" norm is used. If *work*(1) for real flavors, or *rwork*(1) for complex flavors is much less than 1, then the stability of the *LU* factorization of the (equilibrated) matrix *A* could be poor. This also means that the solution *x*, condition estimator *rcond*, and forward error bound *ferr* could be unreliable. If factorization fails with 0 < *info* ≤ *n*, then *work*(1) for real flavors, or *rwork*(1) for complex flavors contains the reciprocal pivot growth factor for the leading *info* columns of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, then *U*(*i*, *i*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n*+1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gbsvx interface are as follows:

ab	Holds the array *A* of size (*kl*+*ku*+1,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
afb	Holds the array *AF* of size (2**kl*+*ku*+1,*n*).
ipiv	Holds the vector of length *n*.
r	Holds the vector of length *n*. Default value for each element is *r*(*i*) = 1.0_WP.
c	Holds the vector of length *n*. Default value for each element is *c*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).

trans	Must be 'N', 'C', or 'T'. The default value is 'N'.
equed	Must be 'N', 'B', 'C', or 'R'. The default value is 'N'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.
rpvgrw	Real value that contains the reciprocal pivot growth factor norm(*A*)/norm(*U*).
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.

?gbsvxx

Uses extra precise iterative refinement to compute the solution to the system of linear equations with a banded matrix A and multiple right-hand sides

Syntax

FORTRAN 77:

```
call sgbsvxx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, rpvgrw, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams,
params, work, iwork, info )
```

```
call dgbsvxx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,
ldb, x, ldx, rcond, rpvgrw, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams,
params, work, iwork, info )
```

```
call cgbsvxx( fact, trans, n, kl, ku, nrhs, ab, ldab, afb, ldafb, ipiv, equed, r, c, b,

params, work, rwork, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* banded matrix, the columns of the matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (`O(eps)`, where `eps` is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with `O(eps)` errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?gbsvxx performs the following steps:

1. If *fact* = 'E', scaling factors *r* and *c* are computed to equilibrate the system:

   trans = 'N': *diag*(*r*)**A*diag*(*c*)*inv(*diag*(*c*))**X* = *diag*(*r*)**B*

   trans = 'T': $(diag(r)*A*diag(c))^{T}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

   trans = 'C': $(diag(r)*A*diag(c))^{H}$*inv(*diag*(*r*))**X* = *diag*(*c*)**B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*r*)**A*diag*(*c*) and *B* by *diag*(*r*)**B* (if *trans*='N') or *diag*(*c*)**B* (if *trans* = 'T' or 'C').

2. If *fact* = 'N' or 'E', the *LU* decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as *A* = *P*L*U*, where *P* is a permutation matrix, *L* is a unit lower triangular matrix, and *U* is upper triangular.

3. If some $U_{i,i}$ = 0, so that *U* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.

4. The system of equations is solved for *X* using the factored form of *A*.

5. By default, unless params(la_linrx_itref_i) is set to zero, the routine applies iterative refinement to improve the computed solution matrix and calculate error bounds. Refinement calculates the residual to at least twice the working precision.

6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*c*) (if *trans* = 'N') or *diag*(*r*) (if *trans* = 'T' or 'C') so that it solves the original system before equilibration.

Input Parameters

fact — CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F', on entry, *afb* and *ipiv* contain the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *r* and *c*. Parameters *ab*, *afb*, and *ipiv* are not modified.
If *fact* = 'N', the matrix *A* will be copied to *afb* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *afb* and factored.

trans — CHARACTER*1. Must be 'N', 'T', or 'C'.
Specifies the form of the system of equations:
If *trans* = 'N', the system has the form *A*X* = *B* (No transpose).
If *trans* = 'T', the system has the form *A**T*X* = *B* (Transpose).
If *trans* = 'C', the system has the form *A**H*X* = *B* (Conjugate Transpose = Transpose for real flavors, Conjugate Transpose for complex flavors).

n — INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

kl INTEGER. The number of subdiagonals within the band of *A*; $kl \geq 0$.

ku INTEGER. The number of superdiagonals within the band of *A*; $ku \geq 0$.

nrhs INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.

ab, *afb*, *b*, *work* REAL for sgbsvxx
DOUBLE PRECISION for dgbsvxx
COMPLEX for cgbsvxx
DOUBLE COMPLEX for zgbsvxx.
Arrays: *ab*(*ldab*,*), *afb*(*ldafb*,*), *b*(*ldb*,*), *work*(*).
The array *ab* contains the matrix *A* in band storage, in rows 1 to *kl*+*ku*+1. The *j*-th column of *A* is stored in the *j*-th column of the array *ab* as follows:

ab(*ku*+1+*i*-*j*,*j*) = *A*(*i*,*j*) for max(1,*j*-*ku*) ≤ *i* ≤ min(*n*,*j*+*kl*).
If *fact* = 'F' and *equed* is not 'N', then *AB* must have been equilibrated by the scaling factors in *r* and/or *c*. The second dimension of *a* must be at least max(1,*n*).
The array *afb* is an input argument if *fact* = 'F'. It contains the factored form of the banded matrix *A*, that is, the factors *L* and *U* from the factorization *A* = *P*L*U* as computed by ?gbtrf. *U* is stored as an upper triangular banded matrix with *kl* + *ku* superdiagonals in rows 1 to *kl* + *ku* + 1. The multipliers used during the factorization are stored in rows *kl* + *ku* + 2 to 2**kl* + *ku* + 1. If *equed* is not 'N', then *afb* is the factored form of the equilibrated matrix *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

ldab INTEGER. The first dimension of the array *ab*; *ldab* ≥ *kl*+*ku*+1..

ldafb INTEGER. The first dimension of the array *afb*; *ldafb* ≥ 2**kl*+*ku*+1..

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains the pivot indices from the factorization *A* = *P*L*U* as computed by ?gbtrf; row *i* of the matrix was interchanged with row *ipiv*(*i*).

equed CHARACTER*1. Must be 'N', 'R', 'C', or 'B'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').
If *equed* = 'R', row equilibration was done, that is, *A* has been premultiplied by *diag*(*r*).

If *equed* = 'C', column equilibration was done, that is, *A* has been postmultiplied by *diag*(*c*).
If *equed* = 'B', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*r*)**A***diag*(*c*).

r, *c*

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays: *r*(*n*), *c*(*n*). The array *r* contains the row scale factors for *A*, and the array *c* contains the column scale factors for *A*. These arrays are input arguments if *fact* = 'F' only; otherwise they are output arguments.
If *equed* = 'R' or 'B', *A* is multiplied on the left by *diag*(*r*); if *equed* = 'N' or 'C', *r* is not accessed.
If *fact* = 'F' and *equed* = 'R' or 'B', each element of *r* must be positive.
If *equed* = 'C' or 'B', *A* is multiplied on the right by *diag*(*c*); if *equed* = 'N' or 'R', *c* is not accessed.
If *fact* = 'F' and *equed* = 'C' or 'B', each element of *c* must be positive.
Each element of *r* or *c* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb

INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1,*n*).

ldx

INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1,*n*).

n_err_bnds

INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in *Output Arguments* section below.

nparams

INTEGER. Specifies the number of parameters set in *params*. If ≤ 0, the *params* array is never referenced and default values are used.

params

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors), 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for fefinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x REAL for sgbsvxx
DOUBLE PRECISION for dgbsvxx
COMPLEX for cgbsvxx
DOUBLE COMPLEX for zgbsvxx.
Array, DIMENSION (*ldx*,*).
If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the *original* system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the *equilibrated* system is:
inv(*diag*(*c*))**X*, if *trans* = 'N' and *equed* = 'C' or 'B'; or
inv(*diag*(*r*))**X*, if *trans* = 'T' or 'C' and *equed* = 'R' or 'B'.
The second dimension of *x* must be at least max(1,*nrhs*).

ab Array *ab* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.
If *equed* ≠ 'N', *A* is scaled on exit as follows:
equed = 'R': *A* = *diag*(*r*)**A*
equed = 'C': *A* = *A***diag*(*c*)
equed = 'B': *A* = *diag*(*r*)**A***diag*(*c*).

afb If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns the factors *L* and *U* from the factorization *A* = *PLU* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

b Overwritten by *diag*(*r*)**B* if *trans* = 'N' and *equed* = 'R' or 'B'; overwritten by *trans* = 'T' or 'C' and *equed* = 'C' or 'B';

not changed if *equed* = 'N'.

r, *c*

These arrays are output arguments if *fact* ≠ 'F'. Each element of these arrays is a power of the radix. See the description of *r*, *c* in *Input Arguments* section.

rcond

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Contains the reciprocal pivot growth factor *norm*(*A*)/*norm*(*U*). The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with 0 < *info* ≤ *n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*. In ?gbsvx, this quantity is returned in *work(1)*.

berr

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.
The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

	err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.
	err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.
	err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.
ipiv		If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P*L*U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').
equed		If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).
info		INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value. If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) =

0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?gtsv

Computes the solution to the system of linear equations with a tridiagonal matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sgtsv( n, nrhs, dl, d, du, b, ldb, info )
call dgtsv( n, nrhs, dl, d, du, b, ldb, info )
call cgtsv( n, nrhs, dl, d, du, b, ldb, info )
call zgtsv( n, nrhs, dl, d, du, b, ldb, info )
```

Fortran 95:

```
call gtsv( dl, d, du, b [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for *X* the system of linear equations *A*X = B*, where *A* is an *n*-by-*n* tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions. The routine uses Gaussian elimination with partial pivoting.

Note that the equation $A^T*X = B$ may be solved by interchanging the order of the arguments *du* and *dl*.

Input Parameters

n	INTEGER. The order of *A*, the number of rows in *B*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
dl, *d*, *du*, *b*	REAL for sgtsv DOUBLE PRECISION for dgtsv COMPLEX for cgtsv DOUBLE COMPLEX for zgtsv. Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1), *b*(*ldb*,*). The array *dl* contains the (*n* - 1) subdiagonal elements of *A*. The array *d* contains the diagonal elements of *A*. The array *du* contains the (*n* - 1) superdiagonal elements of *A*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

dl	Overwritten by the (*n*-2) elements of the second superdiagonal of the upper triangular matrix *U* from the *LU* factorization of A. These elements are stored in *dl*(1), ... , *dl*(*n*-2).
d	Overwritten by the *n* diagonal elements of *U*.
du	Overwritten by the (*n*-1) elements of the first superdiagonal of *U*.
b	Overwritten by the solution matrix *X*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, *U*(*i*, *i*) is exactly zero, and the solution has not been computed. The factorization has not been completed unless *i* = *n*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gtsv interface are as follows:

dl	Holds the vector of length (*n*-1).
d	Holds the vector of length *n*.
dl	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).

?gtsvx

Computes the solution to the real or complex system of linear equations with a tridiagonal matrix A and multiple right-hand sides, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call sgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, iwork, info )
```

```
call dgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, iwork, info )
```

```
call cgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, rwork, info )
```

```
call zgtsvx( fact, trans, n, nrhs, dl, d, du, dlf, df, duf, du2, ipiv, b, ldb, x, ldx,
rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call gtsvx( dl, d, du, b, x [,dlf] [,df] [,duf] [,du2] [,ipiv] [,fact] [,trans] [,ferr]
[,berr] [,rcond] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the *LU* factorization to compute the solution to a real or complex system of linear equations $A*X = B$, $A^T*X = B$, or $A^H*X = B$, where A is a tridiagonal matrix of order n, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?gtsvx` performs the following steps:

1. If *fact* = 'N', the *LU* decomposition is used to factor the matrix A as $A = L*U$, where L is a product of permutation and unit lower bidiagonal matrices and U is an upper triangular matrix with nonzeroes in only the main diagonal and first two superdiagonals.
2. If some $U_{i,i} = 0$, so that U is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact	CHARACTER*1. Must be 'F' or 'N'. Specifies whether or not the factored form of the matrix A has been supplied on entry. If *fact* = 'F': on entry, *dlf*, *df*, *duf*, *du2*, and *ipiv* contain the factored form of A; arrays *dl*, *d*, *du*, *dlf*, *df*, *duf*, *du2*, and *ipiv* will not be modified. If *fact* = 'N', the matrix A will be copied to *dlf*, *df*, and *duf* and factored.
trans	CHARACTER*1. Must be 'N', 'T', or 'C'. Specifies the form of the system of equations: If *trans* = 'N', the system has the form $A*X = B$ (No transpose). If *trans* = 'T', the system has the form $A^T*X = B$ (Transpose). If *trans* = 'C', the system has the form $A^H*X = B$ (Conjugate transpose).
n	INTEGER. The number of linear equations, the order of the matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right hand sides, the number of columns of the matrices B and X; $nrhs \geq 0$.
dl,*d*,*du*,*dlf*,*df*, *duf*,*du2*,*b*, *x*,*work*	REAL for sgtsvx DOUBLE PRECISION for dgtsvx COMPLEX for cgtsvx DOUBLE COMPLEX for zgtsvx.

Arrays:
dl, dimension (*n* -1), contains the subdiagonal elements of *A*.
d, dimension (*n*), contains the diagonal elements of *A*.
du, dimension (*n* -1), contains the superdiagonal elements of *A*.
dlf, dimension (*n* -1). If *fact* = 'F', then *dlf* is an input argument and on entry contains the (*n* -1) multipliers that define the matrix *L* from the *LU* factorization of *A* as computed by ?gttrf.
df, dimension (*n*). If *fact* = 'F', then *df* is an input argument and on entry contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.
duf, dimension (*n* -1). If *fact* = 'F', then *duf* is an input argument and on entry contains the (*n* -1) elements of the first superdiagonal of *U*.
du2, dimension (*n* -2). If *fact* = 'F', then *du2* is an input argument and on entry contains the (*n*-2) elements of the second superdiagonal of *U*.
b(*ldb**) contains the right-hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*).
x(*ldx**) contains the solution matrix *X*. The second dimension of *x* must be at least max(1, *nrhs*).
work(*) is a workspace array;
the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ldx — INTEGER. The first dimension of *x*; *ldx* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). If *fact* = 'F', then *ipiv* is an input argument and on entry contains the pivot indices, as returned by ?gttrf.

iwork — INTEGER. Workspace array, DIMENSION (*n*). Used for real flavors only.

rwork — REAL for cgtsvx
DOUBLE PRECISION for zgtsvx.
Workspace array, DIMENSION (*n*). Used for complex flavors only.

Output Parameters

x — REAL for sgtsvx
DOUBLE PRECISION for dgtsvx
COMPLEX for cgtsvx
DOUBLE COMPLEX for zgtsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X*. The second dimension of *x* must be at least max(1, *nrhs*).

dlf — If *fact* = 'N', then *dlf* is an output argument and on exit contains the (*n*-1) multipliers that define the matrix *L* from the *LU* factorization of A.

df — If *fact* = 'N', then *df* is an output argument and on exit contains the *n* diagonal elements of the upper triangular matrix *U* from the *LU* factorization of *A*.

duf If *fact* = 'N', then *duf* is an output argument and on exit contains the (*n*-1) elements of the first superdiagonal of *U*.

du2 If *fact* = 'N', then *du2* is an output argument and on exit contains the (*n*-2) elements of the second superdiagonal of *U*.

ipiv The array *ipiv* is an output argument if *fact* = 'N' and, on exit, contains the pivot indices from the factorization *A* = *L***U*; row *i* of the matrix was interchanged with row *ipiv*(*i*). The value of *ipiv*(*i*) will always be *i* or *i*+1; *ipiv*(*i*)=*i* indicates a row interchange was not required.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.

ferr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i* ≤ *n*, then *U*(*i*, *i*) is exactly zero. The factorization has not been completed unless *i* = *n*, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gtsvx interface are as follows:

dl Holds the vector of length (*n*-1).

d Holds the vector of length *n*.

du Holds the vector of length (*n*-1).

b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
dlf	Holds the vector of length (*n*-1).
df	Holds the vector of length *n*.
duf	Holds the vector of length (*n*-1).
du2	Holds the vector of length (*n*-2).
ipiv	Holds the vector of length *n*.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then the arguments *dlf*, *df*, *duf*, *du2*, and *ipiv* must be present; otherwise, an error is returned.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

?dtsvb

Computes the solution to the system of linear equations with a diagonally dominant tridiagonal matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call ddtsvb( n, nrhs, dl, d, du, b, ldb, info )
call cdtsvb( n, nrhs, dl, d, du, b, ldb, info )
call zdtsvb( n, nrhs, dl, d, du, b, ldb, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The `?dtsvb` routine solves a system of linear equations *A***X* = *B* for *X*, where *A* is an *n*-by-*n* diagonally dominant tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions. The routine uses the BABE (Burning At Both Ends) algorithm.

Note that the equation $A^T*X = B$ may be solved by interchanging the order of the arguments *du* and *dl*.

Input Parameters

n	INTEGER. The order of *A*, the number of rows in *B*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
dl, *d*, *du*, *b*	REAL for sdtsvb DOUBLE PRECISION for ddtsvb COMPLEX for cdtsvb DOUBLE COMPLEX for zdtsvb.

Arrays: *dl*(*n* - 1), *d*(*n*), *du*(*n* - 1), *b*(*ldb*,*).
The array *dl* contains the (*n* - 1) subdiagonal elements of *A*.
The array *d* contains the diagonal elements of *A*.
The array *du* contains the (*n* - 1) superdiagonal elements of *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

dl Overwritten by the (*n*-1) elements of the subdiagonal of the lower triangular matrices L_1, L_2 from the factorization of *A*.

d Overwritten by the *n* diagonal element reciprocals of *U*.

b Overwritten by the solution matrix *X*.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, u_{ii} is exactly zero, and the solution has not been computed. The factorization has not been completed unless *i* = *n*.

Application Notes

A diagonally dominant tridiagonal system is defined such that $|d_i| > |dl_{i-1}| + |du_i|$ for any *i*:

$1 < i < n$, and $|d_1| > |du_1|$, $|d_n| > |dl_{n-1}|$

The underlying BABE algorithm is designed for diagonally dominant systems. Such systems have no numerical stability issue unlike the canonical systems that use elimination with partial pivoting (see ?gtsv). The diagonally dominant systems are much faster than the canonical systems.

NOTE.

- The current implementation of BABE has a potential accuracy issue on very small or large data close to the underflow or overflow threshold respectively. Scale the matrix before applying the solver in the case of such input data.
- Applying the ?dtsvb factorization to non-diagonally dominant systems may lead to an accuracy loss, or false singularity detected due to no pivoting.

?posv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive-definite matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sposv( uplo, n, nrhs, a, lda, b, ldb, info )
```

```
call dposv( uplo, n, nrhs, a, lda, b, ldb, info )
call cposv( uplo, n, nrhs, a, lda, b, ldb, info )
call zposv( uplo, n, nrhs, a, lda, b, ldb, info )
call dsposv( uplo, n, nrhs, a, lda, b, ldb, x, ldx, work, swork, iter, info )
call zcposv( uplo, n, nrhs, a, lda, b, ldb, x, ldx, work, swork, rwork, iter, info )
```

Fortran 95:

```
call posv( a, b [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for *X* the real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* symmetric/Hermitian positive-definite matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The Cholesky decomposition is used to factor *A* as

$A = U^T*U$ (real flavors) and $A = U^H*U$ (complex flavors), if *uplo* = 'U'

or $A = L*L^T$ (real flavors) and $A = L*L^H$ (complex flavors), if *uplo* = 'L',

where *U* is an upper triangular matrix and *L* is a lower triangular matrix. The factored form of *A* is then used to solve the system of equations *A*X = B*.

The dsposv and zcposv are mixed precision iterative refinement subroutines for exploiting fast single precision hardware. They first attempt to factorize the matrix in single precision (dsposv) or single complex precision (zcposv) and use this factorization within an iterative refinement procedure to produce a solution with double precision (dsposv) / double complex precision (zcposv) normwise backward error quality (see below). If the approach fails, the method switches to a double precision or double complex precision factorization respectively and computes the solution.

The iterative refinement is not going to be a winning strategy if the ratio single precision/COMPLEX performance over double precision/DOUBLE COMPLEX performance is too small. A reasonable strategy should take the number of right-hand sides and the size of the matrix into account. This might be done with a call to ilaenv in the future. At present, iterative refinement is implemented.

The iterative refinement process is stopped if
`iter > itermax`
or for all the right-hand sides:
`rnmr < sqrt(n)*xnrm*anrm*eps*bwdmax`,
where

- `iter` is the number of the current iteration in the iterative refinement process
- `rnmr` is the infinity-norm of the residual
- `xnrm` is the infinity-norm of the solution
- `anrm` is the infinity-operator-norm of the matrix *A*
- `eps` is the machine epsilon returned by `dlamch` ('Epsilon').

The values `itermax` and `bwdmax` are fixed to 30 and 1.0d+00 respectively.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
a, *b*	REAL for sposv DOUBLE PRECISION for dposv and dsposv. COMPLEX for cposv DOUBLE COMPLEX for zposv and zcposv. Arrays: *a*(*lda*,*), *b*(*ldb*,*). The array *a* contains the upper or the lower triangular part of the matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*). Note that in the case of zcposv the imaginary parts of the diagonal elements need not be set and are assumed to be zero. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The leading dimension of the array *x*; *ldx* ≥ max(1, *n*).
work	DOUBLE PRECISION for dsposv DOUBLE COMPLEX for zcposv. Workspace array, DIMENSION (*n***nrhs*). This array is used to hold the residual vectors.
swork	REAL for dsgesv COMPLEX for zcgesv. Workspace array, DIMENSION (*n**(*n*+*nrhs*)). This array is used to use the single precision matrix and the right-hand sides or solutions in single precision.
rwork	DOUBLE PRECISION. Workspace array, DIMENSION (*n*).

Output Parameters

a	If *info* = 0, the upper or lower triangular part of *a* is overwritten by the Cholesky factor *U* or *L*, as specified by *uplo*. If iterative refinement has been successfully used (*info*= 0 and *iter*≥ 0), then *A* is unchanged. If double precision factorization has been used (*info*= 0 and *iter* < 0), then the array *A* contains the factors *L* and *U* from the Cholesky factorization; the unit diagonal elements of *L* are not stored.
b	Overwritten by the solution matrix *X*.
ipiv	INTEGER.

Array, DIMENSION at least max(1, *n*). The pivot indices that define the permutation matrix *P*; row *i* of the matrix was interchanged with row *ipiv*(i). Corresponds to the single precision factorization (if *info*= 0 and *iter* ≥ 0) or the double precision factorization (if *info*= 0 and *iter* < 0).

x — DOUBLE PRECISION for dsposv
DOUBLE COMPLEX for zcposv.
Array, DIMENSION (*ldx*, *nrhs*). If *info* = 0, contains the *n*-by-*nrhs* solution matrix *X*.

iter — INTEGER.
If *iter* < 0: iterative refinement has failed, double precision factorization has been performed

- If *iter* = -1: the routine fell back to full precision for implementation- or machine-specific reason
- If *iter* = -2: narrowing the precision induced an overflow, the routine fell back to full precision
- If *iter* = -3: failure of spotrf for dsposv, or cpotrf for zcposv
- If *iter* = -31: stop the iterative refinement after the 30th iteration.

If *iter* > 0: iterative refinement has been successfully used. Returns the number of iterations.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive definite, so the factorization could not be completed, and the solution has not been computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine posv interface are as follows:

a — Holds the matrix *A* of size (*n*,*n*).

b — Holds the matrix *B* of size (*n*,*nrhs*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

?posvx

Uses the Cholesky factorization to compute the solution to the system of linear equations with a symmetric or Hermitian positive-definite matrix A, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call sposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, iwork, info )
call dposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, iwork, info )
call cposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, rwork, info )
call zposvx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond,
ferr, berr, work, rwork, info )
```

Fortran 95:

```
call posvx( a, b, x [,uplo] [,af] [,fact] [,equed] [,s] [,ferr] [,berr] [,rcond] [,info]
)
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the *Cholesky* factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n real symmetric/Hermitian positive definite matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?posvx performs the following steps:

1. If *fact* = 'E', real scaling factors s are computed to equilibrate the system:

   diag(*s*)**A*diag*(*s*)*inv(*diag*(*s*))**X = diag*(*s*)**B*.

   Whether or not the system will be equilibrated depends on the scaling of the matrix A, but if equilibration is used, A is overwritten by *diag*(*s*)**A*diag*(*s*) and B by *diag*(*s*)**B*.

2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix A (after equilibration if *fact* = 'E') as

   $A = U^T*U$ (real), $A = U^H*U$ (complex), if *uplo* = 'U',

   or $A = L*L^T$ (real), $A = L*L^H$ (complex) , if *uplo* = 'L',

   where U is an upper triangular matrix and L is a lower triangular matrix.

3. If the leading *i*-by-*i* principal minor is not positive-definite, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n* + 1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*s*) so that it solves the original system before equilibration.

Input Parameters

fact	CHARACTER*1. Must be 'F', 'N', or 'E'. Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored. If *fact* = 'F': on entry, *af* contains the factored form of *A*. If *equed* = 'Y', the matrix *A* has been equilibrated with scaling factors given by *s*. *a* and *af* will not be modified. If *fact* = 'N', the matrix *A* will be copied to *af* and factored. If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *af* and factored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs* ≥ 0.
a, *af*, *b*, *work*	REAL for sposvx DOUBLE PRECISION for dposvx COMPLEX for cposvx DOUBLE COMPLEX for zposvx. Arrays: *a*(*lda*,***), *af*(*ldaf*,***), *b*(*ldb*,***), *work*(***). The array *a* contains the matrix *A* as specified by *uplo*. If *fact* = 'F' and *equed* = 'Y', then *A* must have been equilibrated by the scaling factors in *s*, and *a* must contain the equilibrated matrix *diag*(*s*)**A*diag*(*s*). The second dimension of *a* must be at least max(1,*n*). The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *diag*(*s*)**A*diag*(*s*). The second dimension of *af* must be at least max(1,*n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*). *work(*)* is a workspace array. The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

equed CHARACTER*1. Must be 'N' or 'Y'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
if *equed* = 'N', no equilibration was done (always true if *fact* = 'N');
if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).

s REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for cposvx
DOUBLE PRECISION for zposvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x REAL for sposvx
DOUBLE PRECISION for dposvx
COMPLEX for cposvx
DOUBLE COMPLEX for zposvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag*(*s*))**X*. The second dimension of *x* must be at least max(1,*nrhs*).

a Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.
If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag*(*s*)**A***diag*(*s*).

af If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization *A=U**T*U* or *A=L*L**T* (real routines), *A=U**H*U* or *A=L*L**H* (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b Overwritten by *diag*(*s*)**B* , if *equed* = 'Y'; not changed if *equed* = 'N'.

s	This array is an output argument if *fact* ≠ 'F'. See the description of *s* in *Input Arguments* section.
rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* =0), the matrix is singular to working precision. This condition is indicated by a return code of *info*>0.
ferr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.
berr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine posvx interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Holds the matrix *AF* of size (*n*,*n*).

s	Holds the vector of length *n*. Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

?posvxx

Uses extra precise iterative refinement to compute the solution to the system of linear equations with a symmetric or Hermitian positive-definite matrix A applying the Cholesky factorization.

Syntax

FORTRAN 77:

```
call sposvxx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond,
rpvgrw, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work, iwork,
info )
```

```
call dposvxx( fact, uplo, n, nrhs, a, lda, af, ldaf, equed, s, b, ldb, x, ldx, rcond,

info )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine uses the *Cholesky* factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is an n-by-n real symmetric/Hermitian positive definite matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (O(eps), where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with O(eps) errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?posvxx performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

   diag(*s*)***A***diag*(*s*) *inv(*diag*(*s*))***X* = *diag*(*s*)***B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*s*)***A***diag*(*s*) and *B* by *diag*(*s*)***B*.

2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   A = U^T***U* (real), *A* = U^H***U* (complex), if *uplo* = 'U',

   or *A* = *L***L^T (real), *A* = *L***L^H (complex) , if *uplo* = 'L',

   where *U* is an upper triangular matrix and *L* is a lower triangular matrix.

3. If the leading *i*-by-*i* principal minor is not positive-definite, the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.

4. The system of equations is solved for *X* using the factored form of *A*.

5. By default, unless params(la_linrx_itref_i) is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.

6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*s*) so that it solves the original system before equilibration.

Input Parameters

fact — CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F', on entry, *af* contains the factored form of *A*. If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *s*. Parameters *a* and *af* are not modified.
If *fact* = 'N', the matrix *A* will be copied to *af* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n — INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; *nrhs* ≥ 0.

a, *af*, *b*, *work* REAL for sposvxx
DOUBLE PRECISION for dposvxx
COMPLEX for cposvxx
DOUBLE COMPLEX for zposvxx.
Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the matrix *A* as specified by *uplo* . If *fact* = 'F' and *equed* = 'Y', then *A* must have been equilibrated by the scaling factors in *s*, and *a* must contain the equilibrated matrix *diag*(*s*)**A***diag*(*s*). The second dimension of *a* must be at least max(1,*n*).
The array *af* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *af* is the factored form of the equilibrated matrix *diag*(*s*)**A***diag*(*s*). The second dimension of *af* must be at least max(1,*n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.
work(*) is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.

lda INTEGER. The first dimension of the array *a*; *lda* ≥ max(1,*n*).

ldaf INTEGER. The first dimension of the array *af*; *ldaf* ≥ max(1,*n*).

equed CHARACTER*1. Must be 'N' or 'Y'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').
if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).

s REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive. Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows.

Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds — INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.

nparams — INTEGER. Specifies the number of parameters set in *params*. If ≤ 0 , the *params* array is never referenced and default values are used.

params — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors) , 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for fututе use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for fefinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.

Workspace array, DIMENSION at least max(1, 3*n); used in complex flavors only.

Output Parameters

x

REAL for sposvxx
DOUBLE PRECISION for dposvxx
COMPLEX for cposvxx
DOUBLE COMPLEX for zposvxx.
Array, DIMENSION (*ldx*,*).
If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is: inv(*diag*(*s*))*X.

a

Array *a* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.
If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag*(*s*)*A*diag*(*s*).

af

If *fact* = 'N' or 'E', then *af* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization *A=U**T*U* or *A=L*L**T* (real routines), *A=U**H*U* or *A=L*L**H* (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *a* for the form of the equilibrated matrix.

b

If *equed* = 'N', *B* is not modified.
If *equed* = 'Y', *B* is overwritten by *diag*(*s*)*B.

s

This array is an output argument if *fact* ≠ 'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Contains the reciprocal pivot growth factor *norm*(*A*)/*norm*(*U*). The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers,

and error bounds could be unreliable. If factorization fails with `0 <` *info* $\le$ *n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

berr — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.
The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1 — "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 — "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 — Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is

"guaranteed". These reciprocal condition numbers are `1/(norm(1/z,inf)*norm(z,inf))` for some appropriately scaled matrix *z*.
Let *z=s*a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

`REAL` for single precision flavors
`DOUBLE PRECISION` for double precision flavors.
Array, `DIMENSION (`*nrhs*`,`*n_err_bnds*`)`. For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error

estimate is "guaranteed". These reciprocal condition numbers are `1/(norm(1/z,inf)*norm(z,inf))` for some appropriately scaled matrix *Z*.
Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

ipiv — If *fact* = 'N' or 'E', then *ipiv* is an output argument and on exit contains the pivot indices from the factorization *A* = *P***L***U* of the original matrix *A* (if *fact* = 'N') or of the equilibrated matrix *A* (if *fact* = 'E').

equed — If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info — INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?ppsv

Computes the solution to the system of linear equations with a symmetric (Hermitian) positive definite packed matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sppsv( uplo, n, nrhs, ap, b, ldb, info )
call dppsv( uplo, n, nrhs, ap, b, ldb, info )
call cppsv( uplo, n, nrhs, ap, b, ldb, info )
call zppsv( uplo, n, nrhs, ap, b, ldb, info )
```

Fortran 95:

```
call ppsv( ap, b [,uplo] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the real or complex system of linear equations $A*X = B$, where A is an n-by-n real symmetric/Hermitian positive-definite matrix stored in packed format, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The Cholesky decomposition is used to factor A as

$A = U^T*U$ (real flavors) and $A = U^H*U$ (complex flavors), if *uplo* = 'U'

or $A = L*L^T$ (real flavors) and $A = L*L^H$ (complex flavors), if *uplo* = 'L',

where U is an upper triangular matrix and L is a lower triangular matrix. The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; $nrhs \geq 0$.
ap, *b*	REAL for sppsv DOUBLE PRECISION for dppsv COMPLEX for cppsv DOUBLE COMPLEX for zppsv. Arrays: *ap*(*), *b*(*ldb*,*). The array *ap* contains the upper or the lower triangular part of the matrix A (as specified by *uplo*) in *packed storage* (see Matrix Storage Schemes). The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

ap	If *info* = 0, the upper or lower triangular part of A in packed storage is overwritten by the Cholesky factor U or L, as specified by *uplo*.
b	Overwritten by the solution matrix X.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ppsv interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

?ppsvx

Uses the Cholesky factorization to compute the solution to the system of linear equations with a symmetric (Hermitian) positive definite packed matrix A, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call sppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call dppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call cppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
call zppsvx( fact, uplo, n, nrhs, ap, afp, equed, s, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call ppsvx( ap, b, x [,uplo] [,af] [,fact] [,equed] [,s] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where *A* is a *n*-by-*n* symmetric or Hermitian positive-definite matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?ppsvx performs the following steps:

1. If *fact* = 'E', real scaling factors *s* are computed to equilibrate the system:
   diag(*s*)***A***diag*(*s*)***inv(*diag*(*s*))***X* = *diag*(*s*)***B*.

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*s*)***A***diag*(*s*) and *B* by *diag*(*s*)***B*.
2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   A = U^T***U (real), *A* = U^H***U (complex), if *uplo* = 'U',

   or *A* = *L***L^T (real), *A* = *L***L^H (complex) , if *uplo* = 'L',

   where *U* is an upper triangular matrix and *L* is a lower triangular matrix.
3. If the leading *i*-by-*i* principal minor is not positive-definite, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*s*) so that it solves the original system before equilibration.

Input Parameters

fact	CHARACTER*1. Must be 'F', 'N', or 'E'. Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored. If *fact* = 'F': on entry, *afp* contains the factored form of *A*. If *equed* = 'Y', the matrix *A* has been equilibrated with scaling factors given by *s*. *ap* and *afp* will not be modified. If *fact* = 'N', the matrix *A* will be copied to *afp* and factored. If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *afp* and factored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; *n* ≥ 0.
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B*; *nrhs* ≥ 0.
ap,*afp*,*b*,*work*	REAL for sppsvx DOUBLE PRECISION for dppsvx COMPLEX for cppsvx DOUBLE COMPLEX for zppsvx.

Arrays: *ap*(*), *afp*(*), *b*(*ldb*,*), *work*(*).
The array *ap* contains the upper or lower triangle of the original symmetric/Hermitian matrix *A* in *packed storage* (see Matrix Storage Schemes). In case when *fact* = 'F' and *equed* = 'Y', *ap* must contain the equilibrated matrix *diag*(*s*)*A*diag(*s*).
The array *afp* is an input argument if *fact* = 'F' and contains the triangular factor *U* or *L* from the Cholesky factorization of *A* in the same storage format as *A*. If *equed* is not 'N', then *afp* is the factored form of the equilibrated matrix *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
work(*) is a workspace array.
The dimension of arrays *ap* and *afp* must be at least max(1, *n*(*n*+1)/2); the second dimension of *b* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1, 3**n*) for real flavors and max(1, 2**n*) for complex flavors.

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

equed — CHARACTER*1. Must be 'N' or 'Y'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
if *equed* = 'N', no equilibration was done (always true if *fact* = 'N');
if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by *diag*(*s*)*A*diag*(*s*).

s — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *equed* = 'N', *s* is not accessed.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork — REAL for cppsvx;
DOUBLE PRECISION for zppsvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x — REAL for sppsvx
DOUBLE PRECISION for dppsvx
COMPLEX for cppsvx
DOUBLE COMPLEX for zppsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag*(*s*))*X. The second dimension of *x* must be at least max(1,*nrhs*).

ap — Array *ap* is not modified on exit if *fact* = 'F' or 'N', or if *fact* = 'E' and *equed* = 'N'.

If *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag*(*s*)**A***diag*(*s*).

afp If *fact* = 'N' or 'E', then *afp* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ap* for the form of the equilibrated matrix.

b Overwritten by *diag*(*s*)**B*, if *equed* = 'Y'; not changed if *equed* = 'N'.

s This array is an output argument if *fact* ≠ 'F'. See the description of *s* in *Input Arguments* section.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

equed If *fact* ≠ 'F', then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info INTEGER. If *info*=0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ppsvx interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
afp	Holds the matrix *AF* of size (*n**(*n*+1)/2).
s	Holds the vector of length *n*. Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

?pbsv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive-definite band matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call spbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call dpbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call cpbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
call zpbsv( uplo, n, kd, nrhs, ab, ldab, b, ldb, info )
```

Fortran 95:

```
call pbsv( ab, b [,uplo] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for *X* the real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* symmetric/Hermitian positive definite band matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The Cholesky decomposition is used to factor *A* as

$A = U^T*U$ (real flavors) and $A = U^H*U$ (complex flavors), if *uplo* = 'U'

or $A = L*L^T$ (real flavors) and $A = L*L^H$ (complex flavors), if *uplo* = 'L',

where U is an upper triangular band matrix and L is a lower triangular band matrix, with the same number of superdiagonals or subdiagonals as A. The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored: If *uplo* = 'U', the upper triangle of A is stored. If *uplo* = 'L', the lower triangle of A is stored.
n	INTEGER. The order of matrix A; $n \geq 0$.
kd	INTEGER. The number of superdiagonals of the matrix A if *uplo* = 'U', or the number of subdiagonals if *uplo* = 'L'; $kd \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; *nrhs* ≥ 0.
ab, *b*	REAL for spbsv DOUBLE PRECISION for dpbsv COMPLEX for cpbsv DOUBLE COMPLEX for zpbsv. Arrays: *ab*(*ldab*, *), *b*(*ldb*,*). The array *ab* contains the upper or the lower triangular part of the matrix A (as specified by *uplo*) in *band storage* (see Matrix Storage Schemes). The second dimension of *ab* must be at least max(1, *n*). The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldab	INTEGER. The first dimension of the array *ab*; *ldab* ≥ *kd* +1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

ab	The upper or lower triangular part of A (in band storage) is overwritten by the Cholesky factor U or L, as specified by *uplo*, in the same storage format as A.
b	Overwritten by the solution matrix X.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the leading minor of order *i* (and therefore the matrix A itself) is not positive-definite, so the factorization could not be completed, and the solution has not been computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbsv interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

?pbsvx

Uses the Cholesky factorization to compute the solution to the system of linear equations with a symmetric (Hermitian) positive-definite band matrix A, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call spbsvx( fact, uplo, n, kd, nrhs, ab, ldab, afb, ldafb, equed, s, b, ldb, x, ldx,
rcond, ferr, berr, work, iwork, info )

)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine uses the Cholesky factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive definite band matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?pbsvx performs the following steps:

1. If *fact* = 'E', real scaling factors *s* are computed to equilibrate the system:
   diag(*s*)***A***diag*(*s*)***inv(*diag*(*s*))***X* = *diag*(*s*)***B*.

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*s*)***A***diag*(*s*) and *B* by *diag*(*s*)***B*.

2. If *fact* = 'N' or 'E', the Cholesky decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   A = U^T*U (real), *A* = U^H*U (complex), if *uplo* = 'U',

   or *A* = *L**L^T (real), *A* = *L**L^H (complex) , if *uplo* = 'L',

   where *U* is an upper triangular band matrix and *L* is a lower triangular band matrix.
3. If the leading *i*-by-*i* principal minor is not positive definite, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
4. The system of equations is solved for *X* using the factored form of *A*.
5. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.
6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*s*) so that it solves the original system before equilibration.

Input Parameters

fact	CHARACTER*1. Must be 'F', 'N', or 'E'. Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored. If *fact* = 'F': on entry, *afb* contains the factored form of *A*. If *equed* = 'Y', the matrix *A* has been equilibrated with scaling factors given by *s*. *ab* and *afb* will not be modified. If *fact* = 'N', the matrix *A* will be copied to *afb* and factored. If *fact* = 'E', the matrix *A* will be equilibrated if necessary, then copied to *afb* and factored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; *n* ≥ 0.
kd	INTEGER. The number of superdiagonals or subdiagonals in the matrix *A*; *kd* ≥ 0.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs* ≥ 0.
ab, *afb*, *b*, *work*	REAL for spbsvx DOUBLE PRECISION for dpbsvx COMPLEX for cpbsvx DOUBLE COMPLEX for zpbsvx. Arrays: *ab*(*ldab*,*), *afb*(*ldab*,*), *b*(*ldb*,*), *work*(*). The array *ab* contains the upper or lower triangle of the matrix *A* in *band storage* (see Matrix Storage Schemes). If *fact* = 'F' and *equed* = 'Y', then *ab* must contain the equilibrated matrix *diag*(*s*)*A**diag*(*s*). The second dimension of *ab* must be at least max(1, *n*).

	The array *afb* is an input argument if *fact* = 'F'. It contains the triangular factor *U* or *L* from the Cholesky factorization of the band matrix *A* in the same storage format as *A*. If *equed* = 'Y', then *afb* is the factored form of the equilibrated matrix *A*. The second dimension of *afb* must be at least max(1, *n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1,3**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
ldab	INTEGER. The first dimension of *ab*; *ldab* ≥ *kd*+1.
ldafb	INTEGER. The first dimension of *afb*; *ldafb* ≥ *kd*+1.
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
equed	CHARACTER*1. Must be 'N' or 'Y'. *equed* is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done: if *equed* = 'N', no equilibration was done (always true if *fact* = 'N') if *equed* = 'Y', equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. This array is an input argument if *fact* = 'F' only; otherwise it is an output argument. If *equed* = 'N', *s* is not accessed. If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive.
ldx	INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.
rwork	REAL for cpbsvx DOUBLE PRECISION for zpbsvx. Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x	REAL for spbsvx DOUBLE PRECISION for dpbsvx COMPLEX for cpbsvx DOUBLE COMPLEX for zpbsvx. Array, DIMENSION (*ldx*,*). If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the *original* system of equations. Note that if *equed* = 'Y', *A* and *B* are modified on exit, and the solution to the equilibrated system is inv(*diag*(*s*))**X*. The second dimension of *x* must be at least max(1,*nrhs*).
ab	On exit, if *fact* = 'E' and *equed* = 'Y', *A* is overwritten by *diag*(*s*)**A***diag*(*s*).

afb If *fact* = 'N' or 'E', then *afb* is an output argument and on exit returns the triangular factor *U* or *L* from the Cholesky factorization $A=U^T*U$ or $A=L*L^T$ (real routines), $A=U^H*U$ or $A=L*L^H$ (complex routines) of the original matrix *A* (if *fact* = 'N'), or of the equilibrated matrix *A* (if *fact* = 'E'). See the description of *ab* for the form of the equilibrated matrix.

b Overwritten by *diag*(*s*)**B* , if *equed* = 'Y'; not changed if *equed* = 'N'.

s This array is an output argument if *fact* ≠ 'F'. See the description of *s* in *Input Arguments* section.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

equed If *fact* ≠'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbsvx interface are as follows:

ab	Holds the array *A* of size (*kd*+1,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
afb	Holds the array *AF* of size (*kd*+1,*n*).
s	Holds the vector with the number of elements *n*. Default value for each element is *s*(*i*) = 1.0_WP.
ferr	Holds the vector with the number of elements *nrhs*.
berr	Holds the vector with the number of elements *nrhs*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N', 'E', or 'F'. The default value is 'N'. If *fact* = 'F', then *af* must be present; otherwise, an error is returned.
equed	Must be 'N' or 'Y'. The default value is 'N'.

?ptsv

Computes the solution to the system of linear equations with a symmetric or Hermitian positive definite tridiagonal matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sptsv( n, nrhs, d, e, b, ldb, info )
call dptsv( n, nrhs, d, e, b, ldb, info )
call cptsv( n, nrhs, d, e, b, ldb, info )
call zptsv( n, nrhs, d, e, b, ldb, info )
```

Fortran 95:

```
call ptsv( d, e, b [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for *X* the real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* symmetric/Hermitian positive-definite tridiagonal matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

A is factored as *A* = *L***D***L*^{T} (real flavors) or *A* = *L***D***L*^{H} (complex flavors), and the factored form of *A* is then used to solve the system of equations *A***X* = *B*.

Input Parameters

n	INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs* ≥ 0.

d REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, dimension at least max(1, *n*). Contains the diagonal elements of the tridiagonal matrix *A*.

e, *b* REAL for sptsv
DOUBLE PRECISION for dptsv
COMPLEX for cptsv
DOUBLE COMPLEX for zptsv.
Arrays: *e*(*n* - 1) , *b*(*ldb*,*). The array *e* contains the (*n* - 1) subdiagonal elements of *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

d Overwritten by the *n* diagonal elements of the diagonal matrix *D* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*.

e Overwritten by the (*n* - 1) subdiagonal elements of the unit bidiagonal factor *L* from the factorization of *A*.

b Overwritten by the solution matrix *X*.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, and the solution has not been computed. The factorization has not been completed unless *i* = *n*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ptsv interface are as follows:

d Holds the vector of length *n*.

e Holds the vector of length (*n*-1).

b Holds the matrix *B* of size (*n*,*nrhs*).

?ptsvx

Uses factorization to compute the solution to the system of linear equations with a symmetric (Hermitian) positive definite tridiagonal matrix A, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call sptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr, work, info
)
call dptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr, work, info
)
call cptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr, work, rwork,
info )
call zptsvx( fact, n, nrhs, d, e, df, ef, b, ldb, x, ldx, rcond, ferr, berr, work, rwork,
info )
```

Fortran 95:

```
call ptsvx( d, e, b, x [,df] [,ef] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the Cholesky factorization $A = L*D*L^T$ (real)/$A = L*D*L^H$ (complex) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is a n-by-n symmetric or Hermitian positive definite tridiagonal matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine `?ptsvx` performs the following steps:

1. If `fact = 'N'`, the matrix A is factored as $A = L*D*L^T$ (real flavors)/$A = L*D*L^H$ (complex flavors), where L is a unit lower bidiagonal matrix and D is diagonal. The factorization can also be regarded as having the form $A = U^T*D*U$ (real flavors)/$A = U^H*D*U$ (complex flavors).
2. If the leading i-by-i principal minor is not positive-definite, then the routine returns with `info = i`. Otherwise, the factored form of A is used to estimate the condition number of the matrix A. If the reciprocal of the condition number is less than machine precision, `info = n+1` is returned as a warning, but the routine still goes on to solve for X and compute error bounds as described below.
3. The system of equations is solved for X using the factored form of A.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact	CHARACTER*1. Must be 'F' or 'N'. Specifies whether or not the factored form of the matrix *A* is supplied on entry. If *fact* = 'F': on entry, *df* and *ef* contain the factored form of *A*. Arrays *d*, *e*, *df*, and *ef* will not be modified. If *fact* = 'N', the matrix *A* will be copied to *df* and *ef* , and factored.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
d, *df*, *rwork*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays: *d*(*n*), *df*(*n*), *rwork*(*n*). The array *d* contains the *n* diagonal elements of the tridiagonal matrix *A*. The array *df* is an input argument if *fact* = 'F' and on entry contains the *n* diagonal elements of the diagonal matrix *D* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*. The array *rwork* is a workspace array used for complex flavors only.
e,*ef*,*b*,*work*	REAL for sptsvx DOUBLE PRECISION for dptsvx COMPLEX for cptsvx DOUBLE COMPLEX for zptsvx. Arrays: *e*(*n* -1), *ef*(*n* -1), *b*(*ldb**), *work*(*). The array *e* contains the (*n* - 1) subdiagonal elements of the tridiagonal matrix *A*. The array *ef* is an input argument if *fact* = 'F' and on entry contains the (*n* - 1) subdiagonal elements of the unit bidiagonal factor *L* from the $L*D*L^T$ (real)/ $L*D*L^H$ (complex) factorization of *A*. The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The array *work* is a workspace array. The dimension of *work* must be at least 2**n* for real flavors, and at least *n* for complex flavors.
ldb	INTEGER. The leading dimension of *b*; *ldb* ≥ max(1, *n*).
ldx	INTEGER. The leading dimension of *x*; *ldx* ≥ max(1, *n*).

Output Parameters

x	REAL for sptsvx DOUBLE PRECISION for dptsvx COMPLEX for cptsvx DOUBLE COMPLEX for zptsvx. Array, DIMENSION (*ldx*,*). If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).
df, *ef*	These arrays are output arguments if *fact* = 'N'. See the description of *df*, *ef* in *Input Arguments* section.

rcond	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. An estimate of the reciprocal condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.
ferr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.
berr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, the leading minor of order *i* (and therefore the matrix *A* itself) is not positive-definite, so the factorization could not be completed, and the solution and error bounds could not be computed; *rcond* =0 is returned. If *info* = *i*, and *i* = *n* + 1, then *U* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ptsvx interface are as follows:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
df	Holds the vector of length *n*.
ef	Holds the vector of length (*n*-1).
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).

fact Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

?sysv

Computes the solution to the system of linear equations with a real or complex symmetric matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call ssysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call dsysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call csysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zsysv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
```

Fortran 95:

```
call sysv( a, b [,uplo] [,ipiv] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for *X* the real or complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations *A*X = B*.

Input Parameters

uplo CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides; the number of columns in *B*; $nrhs \geq 0$.

a, *b*, *work* REAL for ssysv
DOUBLE PRECISION for dsysv
COMPLEX for csysv
DOUBLE COMPLEX for zsysv.

Arrays: *a*(*lda*,*), *b*(*ldb*,*), *work*(*).
The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1, *n*).
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work is a workspace array, dimension at least max(1,*lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

lwork — INTEGER. The size of the *work* array; *lwork* ≥ 1.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

a — If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?sytrf.

b — If *info* = 0, *b* is overwritten by the solution matrix *X*.

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?sytrf.
If *ipiv*(*i*) = *k* >0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sysv interface are as follows:

a — Holds the matrix *A* of size (*n*,*n*).

b — Holds the matrix *B* of size (*n*,*nrhs*).

ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = *n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sysvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a real or complex symmetric matrix A, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call ssysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, iwork, info )
call dsysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, iwork, info )
call csysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, rwork, info )
call zsysvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, rwork, info )
```

Fortran 95:

```
call sysvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* symmetric matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?sysvx performs the following steps:

1. If *fact = 'N'*, the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is $A = U*D*U^T$ or $A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i}$= 0, so that *D* is exactly singular, then the routine returns with *info = i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info = n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact	CHARACTER*1. Must be 'F' or 'N'. Specifies whether or not the factored form of the matrix *A* has been supplied on entry. If *fact = 'F'*: on entry, *af* and *ipiv* contain the factored form of *A*. Arrays *a*, *af*, and *ipiv* will not be modified. If *fact = 'N'*, the matrix *A* will be copied to *af* and factored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo = 'U'*, the upper triangle of *A* is stored. If *uplo = 'L'*, the lower triangle of *A* is stored.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; *nrhs* $\geq$ 0.
a, *af*, *b*, *work*	REAL for ssysvx DOUBLE PRECISION for dsysvx COMPLEX for csysvx DOUBLE COMPLEX for zsysvx. Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*). The array *a* contains the upper or the lower triangular part of the symmetric matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1,*n*). The array *af* is an input argument if *fact = 'F'*. It contains he block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization *A = U*D*U**T* or*A = L*D*L**T* as computed by ?sytrf. The second dimension of *af* must be at least max(1,*n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*).

work(*) is a workspace array, dimension at least max(1, *lwork*).

lda INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldaf INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).

ldb INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?sytrf.
If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) = *ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) = *ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

lwork INTEGER. The size of the *work* array.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for csysvx;
DOUBLE PRECISION for zsysvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x REAL for ssysvx
DOUBLE PRECISION for dsysvx
COMPLEX for csysvx
DOUBLE COMPLEX for zsysvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

af, *ipiv* These arrays are output arguments if *fact* = 'N'.
See the description of *af*, *ipiv* in *Input Arguments* section.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.
berr	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.
work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, and *i* ≤ *n*, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sysvx interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Holds the matrix *AF* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Application Notes

For real flavors, *lwork* must be at least 3*n, and for complex flavors at least 2*n. For better performance, try using *lwork* = n*blocksize, where *blocksize* is the optimal block size for ?sytrf.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?sysvxx

Uses extra precise iterative refinement to compute the solution to the system of linear equations with a symmetric indefinite matrix A applying the diagonal pivoting factorization.

Syntax

FORTRAN 77:

call ssysvxx(*fact*, *uplo*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *equed*, *s*, *b*, *ldb*, *x*, *ldx*, *rcond*, *rpvgrw*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *iwork*, *info*)

call dsysvxx(*fact*, *uplo*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *equed*, *s*, *b*, *ldb*, *x*, *ldx*, *rcond*, *rpvgrw*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *iwork*, *info*)

call csysvxx(*fact*, *uplo*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *equed*, *s*, *b*, *ldb*, *x*, *ldx*, *rcond*, *rpvgrw*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *rwork*, *info*)

call zsysvxx(*fact*, *uplo*, *n*, *nrhs*, *a*, *lda*, *af*, *ldaf*, *ipiv*, *equed*, *s*, *b*, *ldb*, *x*, *ldx*, *rcond*, *rpvgrw*, *berr*, *n_err_bnds*, *err_bnds_norm*, *err_bnds_comp*, *nparams*, *params*, *work*, *rwork*, *info*)

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface and in mkl_lapack.h for C interface.

The routine uses the *diagonal pivoting* factorization $A=U^T*U$ (real flavors) / $A=U^H*U$ (complex flavors) or $A=L*L^T$ (real flavors) / $A=L*L^H$ (complex flavors) to compute the solution to a real or complex system of linear equations $A*X = B$, where A is an n-by-n real symmetric/Hermitian matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (O(eps), where eps is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with O(eps) errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine ?sysvxx performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

   diag(*s*)***A***diag*(*s*) *inv(*diag*(*s*))***X* = *diag*(*s*)***B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag*(*s*)***A***diag*(*s*) and *B* by *diag*(*s*)***B*.
2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   A = *U***D***U*^{T}, if *uplo* = 'U',

   or *A* = *L***D***L*^{T}, if *uplo* = 'L',

   where *U* or *L* is a product of permutation and unit upper (lower) triangular matrices, and *D* is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
3. If some *D*(*i*,*i*)=0, so that *D* is exactly singular, the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A* (see the *rcond* parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for *X* and compute error bounds.
4. The system of equations is solved for *X* using the factored form of *A*.
5. By default, unless params(la_linrx_itref_i) is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix *X* is premultiplied by *diag*(*r*) so that it solves the original system before equilibration.

Input Parameters

fact — CHARACTER*1. Must be 'F', 'N', or 'E'.
Specifies whether or not the factored form of the matrix *A* is supplied on entry, and if not, whether the matrix *A* should be equilibrated before it is factored.
If *fact* = 'F', on entry, *af* and *ipiv* contain the factored form of *A*.
If *equed* is not 'N', the matrix *A* has been equilibrated with scaling factors given by *s*. Parameters *a*, *af*, and *ipiv* are not modified.
If *fact* = 'N', the matrix *A* will be copied to *af* and factored.
If *fact* = 'E', the matrix *A* will be equilibrated, if necessary, copied to *af* and factored.

uplo — CHARACTER*1. Must be 'U' or 'L'.

	Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.
n	INTEGER. The number of linear equations; the order of the matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; the number of columns of the matrices *B* and *X*; $nrhs \geq 0$.
a, *af*, *b*, *work*	REAL for ssysvxx DOUBLE PRECISION for dsysvxx COMPLEX for csysvxx DOUBLE COMPLEX for zsysvxx. Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*). The array *a* contains the symmetric matrix *A* as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A* and the strictly lower triangular part of *a* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A* and the strictly upper triangular part of *a* is not referenced. The second dimension of *a* must be at least max(1,*n*). The array *af* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* and *L* from the factorization *A = U*D*U**T* or *A = L*D*L**T* as computed by ?sytrf. The second dimension of *af* must be at least max(1,*n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*). *work(*)* is a workspace array. The dimension of *work* must be at least max(1,4**n*) for real flavors, and at least max(1,2**n*) for complex flavors.
lda	INTEGER. The first dimension of the array *a*; *lda* ≥ max(1,*n*).
ldaf	INTEGER. The first dimension of the array *af*; *ldaf* ≥ max(1,*n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D* as determined by ?sytrf. If *ipiv(k)* > 0, rows and columns *k* and *ipiv(k)* were intercanaged and *D(k,k)* is a 1-by-1 diagonal block. If *ipiv* = 'U' and *ipiv(k)* = *ipiv(k-1)* < 0, rows and columns *k-1* and *-ipiv(k)* were interchanged and *D*(*k*-1:*k*, *k*-1:*k*) is a 2-by-2 diagonal block. If *ipiv* = 'L' and *ipiv(k)* = *ipiv(k+1)* < 0, rows and columns *k+1* and *-ipiv(k)* were interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.
equed	CHARACTER*1. Must be 'N' or 'Y'.

equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').
if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).

s

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. If *equed* = 'Y', *A* is multiplied on the left and right by diag(*s*).
This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive. Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb

INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

ldx

INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds

INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.

nparams

INTEGER. Specifies the number of parameters set in *params*. If ≤ 0 , the *params* array is never referenced and default values are used.

params

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors) , 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for refinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

iwork INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 3**n*); used in complex flavors only.

Output Parameters

x REAL for ssysvxx
DOUBLE PRECISION for dsysvxx
COMPLEX for csysvxx
DOUBLE COMPLEX for zsysvxx.
Array, DIMENSION (*ldx*,*nrhs*).
If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is: inv(*diag*(*s*))**X*.

a If *fact* = 'E' and *equed* = 'Y', overwritten by *diag*(*s*)**A***diag*(*s*).

af If *fact* = 'N', *af* is an output argument and on exit returns the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization *A* = *U*D*U**T* or *A* = *L*D*L**T*.

b If *equed* = 'N', *B* is not modified.
If *equed* = 'Y', *B* is overwritten by *diag*(*s*)**B*.

s This array is an output argument if *fact* ≠ 'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Contains the reciprocal pivot growth factor *norm*(*A*)/*norm*(*U*). The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with 0 < *info* ≤ *n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

berr

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm

REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left| Xtrue_{ji} - X_{ji} \right|}{\max_j \left| X_{ji} \right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned.
The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3 Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*.
Let *z*=*s***a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{|Xtrue_{ji} - X_{ji}|}{|X_{ji}|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1 "Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors.

err=2 "Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors. This error bound should only be trusted if the previous boolean is true.

err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for single precision flavors and *sqrt*(*n*)**dlamch*(ε) for double precision flavors to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.
ipiv	If *fact* = 'N', *ipiv* is an output argument and on exit contains details of the interchanges and the block structure *D*, as determined by ssytrf for single precision flavors and dsytrf for double precision flavors.
equed	If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).
info	INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed. If *info* = -*i*, the *i*-th parameter had an illegal value. If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned. If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?hesv

Computes the solution to the system of linear equations with a Hermitian matrix A and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call chesv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
call zhesv( uplo, n, nrhs, a, lda, ipiv, b, ldb, work, lwork, info )
```

Fortran 95:

```
call hesv( a, b [,uplo] [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for X the complex system of linear equations $A*X = B$, where A is an n-by-n symmetric matrix, the columns of matrix B are individual right-hand sides, and the columns of X are the corresponding solutions.

The diagonal pivoting method is used to factor A as $A = U*D*U^H$ or $A = L*D*L^H$, where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of A is then used to solve the system of equations $A*X = B$.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of A is stored and how A is factored: If *uplo* = 'U', the array *a* stores the upper triangular part of the matrix A, and A is factored as $U*D*U^H$. If *uplo* = 'L', the array *a* stores the lower triangular part of the matrix A, and A is factored as $L*D*L^H$.
n	INTEGER. The order of matrix A; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in B; *nrhs* $\geq$ 0.
a, *b*, *work*	COMPLEX for chesv DOUBLE COMPLEX for zhesv. Arrays: *a*(*lda*,*), *b*(*ldb*,*), *work*(*). The array *a* contains the upper or the lower triangular part of the Hermitian matrix A (see *uplo*). The second dimension of *a* must be at least max(1, *n*). The array *b* contains the matrix B whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*). *work* is a workspace array, dimension at least max(1,*lwork*).
lda	INTEGER. The first dimension of *a*; *lda* $\geq$ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* $\geq$ max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* $\geq$ 1). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

Output Parameters

a	If *info* = 0, *a* is overwritten by the block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?hetrf.
b	If *info* = 0, *b* is overwritten by the solution matrix *X*.
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?hetrf. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column. If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hesv interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
ipiv	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hesvx

Uses the diagonal pivoting factorization to compute the solution to the complex system of linear equations with a Hermitian matrix A, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call chesvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, rwork, info )
call zhesvx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, lwork, rwork, info )
```

Fortran 95:

```
call hesvx( a, b, x [,uplo] [,af] [,ipiv] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations *A*X* = *B*, where *A* is an *n*-by-*n* Hermitian matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hesvx performs the following steps:

1. If *fact* = 'N', the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is *A* = *U*D*U*^{H} or A = *L*D*L*^{H}, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i}$ = 0, so that *D* is exactly singular, then the routine returns with *info* = *i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info* = *n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact	CHARACTER*1. Must be 'F' or 'N'. Specifies whether or not the factored form of the matrix *A* has been supplied on entry. If *fact* = 'F': on entry, *af* and *ipiv* contain the factored form of *A*. Arrays *a*, *af*, and *ipiv* are not modified. If *fact* = 'N', the matrix *A* is copied to *af* and factored.
uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored: If *uplo* = 'U', the array *a* stores the upper triangular part of the Hermitian matrix *A*, and *A* is factored as $U*D*U^H$. If *uplo* = 'L', the array *a* stores the lower triangular part of the Hermitian matrix *A*; *A* is factored as $L*D*L^H$.
n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.
a,*af*,*b*,*work*	COMPLEX for chesvx DOUBLE COMPLEX for zhesvx. Arrays: *a*(*lda*,*), *af*(*ldaf*,*), *b*(*ldb*,*), *work*(*). The array *a* contains the upper or the lower triangular part of the Hermitian matrix *A* (see *uplo*). The second dimension of *a* must be at least max(1,*n*). The array *af* is an input argument if *fact* = 'F'. It contains he block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^H$ or $A = L*D*L^H$ as computed by ?hetrf. The second dimension of *af* must be at least max(1,*n*). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1, *nrhs*). *work*(*) is a workspace array of dimension at least max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).
ldaf	INTEGER. The first dimension of *af*; *ldaf* ≥ max(1, *n*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).
ipiv	INTEGER. Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?hetrf. If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column. If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

lwork — INTEGER. The size of the *work* array.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details and for the suggested value of *lwork*.

rwork — REAL for chesvx
DOUBLE PRECISION for zhesvx.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x — COMPLEX for chesvx
DOUBLE COMPLEX for zhesvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

af, *ipiv* — These arrays are output arguments if *fact* = 'N'. See the description of *af*, *ipiv* in *Input Arguments* section.

rcond — REAL for chesvx
DOUBLE PRECISION for zhesvx.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr — REAL for chesvx
DOUBLE PRECISION for zhesvx.
Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcon*, and is almost always a slight overestimate of the true error.

berr — REAL for chesvx
DOUBLE PRECISION for zhesvx.
Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i* ≤ *n*, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hesvx interface are as follows:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
af	Holds the matrix *AF* of size (*n*,*n*).
ipiv	Holds the vector of length *n*.
ferr	Holds the vector of length (*nrhs*).
berr	Holds the vector of length (*nrhs*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

Application Notes

The value of *lwork* must be at least 2**n*. For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is the optimal block size for ?hetrf.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hesvxx

Uses extra precise iterative refinement to compute the solution to the system of linear equations with a Hermitian indefinite matrix A applying the diagonal pivoting factorization.

Syntax

FORTRAN 77:

```
call chesvxx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, equed, s, b, ldb, x, ldx,
rcond, rpvgrw, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work,
rwork, info )
```

```
call zhesvxx( fact, uplo, n, nrhs, a, lda, af, ldaf, ipiv, equed, s, b, ldb, x, ldx,
rcond, rpvgrw, berr, n_err_bnds, err_bnds_norm, err_bnds_comp, nparams, params, work,
rwork, info )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface and in `mkl_lapack.h` for C interface.

The routine uses the *diagonal pivoting* factorization to compute the solution to a complex/double complex system of linear equations *A*X = B*, where *A* is an *n*-by-*n* Hermitian matrix, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Both normwise and maximum componentwise error bounds are also provided on request. The routine returns a solution with a small guaranteed error (`O(eps)`, where `eps` is the working machine precision) unless the matrix is very ill-conditioned, in which case a warning is returned. Relevant condition numbers are also calculated and returned.

The routine accepts user-provided factorizations and equilibration factors; see definitions of the *fact* and *equed* options. Solving with refinement and using a factorization from a previous call of the routine also produces a solution with `O(eps)` errors or warnings but that may not be true for general user-provided factorizations and equilibration factors if they differ from what the routine would itself produce.

The routine `?hesvxx` performs the following steps:

1. If *fact* = 'E', scaling factors are computed to equilibrate the system:

   *diag(s)*A*diag(s)* *inv(*diag(s)*)*X* = *diag(s)*B*

   Whether or not the system will be equilibrated depends on the scaling of the matrix *A*, but if equilibration is used, *A* is overwritten by *diag(s)*A*diag(s)* and *B* by *diag(s)*B*.

2. If *fact* = 'N' or 'E', the LU decomposition is used to factor the matrix *A* (after equilibration if *fact* = 'E') as

   A = *U*D*U*^{T}, if *uplo* = 'U',

   or *A* = *L*D*L*^{T}, if *uplo* = 'L',

   where *U* or *L* is a product of permutation and unit upper (lower) triangular matrices, and *D* is a symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

3. If some $D(i,i)=0$, so that D is exactly singular, the routine returns with $info = i$. Otherwise, the factored form of A is used to estimate the condition number of the matrix A (see the $rcond$ parameter). If the reciprocal of the condition number is less than machine precision, the routine still goes on to solve for X and compute error bounds.
4. The system of equations is solved for X using the factored form of A.
5. By default, unless `params(la_linrx_itref_i)` is set to zero, the routine applies iterative refinement to get a small error and error bounds. Refinement calculates the residual to at least twice the working precision.
6. If equilibration was used, the matrix X is premultiplied by $diag(r)$ so that it solves the original system before equilibration.

Input Parameters

$fact$	CHARACTER*1. Must be `'F'`, `'N'`, or `'E'`. Specifies whether or not the factored form of the matrix A is supplied on entry, and if not, whether the matrix A should be equilibrated before it is factored. If $fact$ = `'F'`, on entry, af and $ipiv$ contain the factored form of A. If $equed$ is not `'N'`, the matrix A has been equilibrated with scaling factors given by s. Parameters a, af, and $ipiv$ are not modified. If $fact$ = `'N'`, the matrix A will be copied to af and factored. If $fact$ = `'E'`, the matrix A will be equilibrated, if necessary, copied to af and factored.
$uplo$	CHARACTER*1. Must be `'U'` or `'L'`. Indicates whether the upper or lower triangular part of A is stored: If $uplo$ = `'U'`, the upper triangle of A is stored. If $uplo$ = `'L'`, the lower triangle of A is stored.
n	INTEGER. The number of linear equations; the order of the matrix A; $n \geq 0$.
$nrhs$	INTEGER. The number of right-hand sides; the number of columns of the matrices B and X; $nrhs \geq 0$.
a, af, b, $work$	COMPLEX for chesvxx DOUBLE COMPLEX for zhesvxx. Arrays: $a(lda,*)$, $af(ldaf,*)$, $b(ldb,*)$, $work(*)$. The array a contains the Hermitian matrix A as specified by $uplo$. If $uplo$ = `'U'`, the leading n-by-n upper triangular part of a contains the upper triangular part of the matrix A and the strictly lower triangular part of a is not referenced. If $uplo$ = `'L'`, the leading n-by-n lower triangular part of a contains the lower triangular part of the matrix A and the strictly upper triangular part of a is not referenced. The second dimension of a must be at least `max(1,n)`. The array af is an input argument if $fact$ = `'F'`. It contains the block diagonal matrix D and the multipliers used to obtain the factor U and L from the factorization $A = U*D*U**T$ or $A = L*D*L**T$ as computed by ?hetrf. The second dimension of af must be at least `max(1,n)`.

The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
work(*) is a workspace array. The dimension of *work* must be at least max(1,2**n*).

lda — INTEGER. The first dimension of the array *a*; *lda* ≥ max(1,*n*).

ldaf — INTEGER. The first dimension of the array *af*; *ldaf* ≥ max(1,*n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D* as determined by ?sytrf. If *ipiv(k)* > 0, rows and columns *k* and *ipiv(k)* were intercanaged and *D(k,k)* is a 1-by-1 diagonal block.
If *ipiv* = 'U' and *ipiv(k)* = *ipiv(k-1)* < 0, rows and columns *k-1* and *-ipiv(k)* were interchanged and *D*(*k*-1:*k*, *k*-1:*k*) is a 2-by-2 diagonal block.
If *ipiv* = 'L' and *ipiv(k)* = *ipiv(k+1)* < 0, rows and columns *k+1* and *-ipiv(k)* were interchanged and *D*(*k*:*k*+1, *k*:*k*+1) is a 2-by-2 diagonal block.

equed — CHARACTER*1. Must be 'N' or 'Y'.
equed is an input argument if *fact* = 'F'. It specifies the form of equilibration that was done:
If *equed* = 'N', no equilibration was done (always true if *fact* = 'N').
if *equed* = 'Y', both row and column equilibration was done, that is, *A* has been replaced by *diag*(*s*)**A***diag*(*s*).

s — REAL for chesvxx
DOUBLE PRECISION for zhesvxx.
Array, DIMENSION (*n*). The array *s* contains the scale factors for *A*. If *equed* = 'Y', *A* is multiplied on the left and right by diag(*s*).
This array is an input argument if *fact* = 'F' only; otherwise it is an output argument.
If *fact* = 'F' and *equed* = 'Y', each element of *s* must be positive. Each element of *s* should be a power of the radix to ensure a reliable solution and error estimates. Scaling by powers of the radix does not cause rounding errors unless the result underflows or overflows. Rounding errors during scaling lead to refining with a matrix that is not equivalent to the input matrix, producing error estimates that may not be reliable.

ldb — INTEGER. The first dimension of the array *b*; *ldb* ≥ max(1, *n*).

ldx — INTEGER. The first dimension of the output array *x*; *ldx* ≥ max(1, *n*).

n_err_bnds INTEGER. Number of error bounds to return for each right hand side and each type (normwise or componentwise). See *err_bnds_norm* and *err_bnds_comp* descriptions in the *Output Arguments* section below.

nparams INTEGER. Specifies the number of parameters set in *params*. If ≤ 0 , the *params* array is never referenced and default values are used.

params REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION *nparams*. Specifies algorithm parameters. If an entry is less than 0.0, that entry will be filled with default value used for that parameter. Only positions up to *nparams* are accessed; defaults are used for higher-numbered parameters. If defaults are acceptable, you can pass *nparams* = 0, which prevents the source code from accessing the *params* argument.
params(la_linrx_itref_i = 1) : Whether to perform iterative refinement or not. Default: 1.0 (for single precision flavors) , 1.0D+0 (for double precision flavors).

=0.0	No refinement is performed and no error bounds are computed.
=1.0	Use the extra-precise refinement algorithm.

(Other values are reserved for futute use.)
params(la_linrx_ithresh_i = 2) : Maximum number of resudual computations allowed for fefinement.

Default	10
Aggressive	Set to 100 to permit convergence using approximate factorizations or factorizations other than *LU*. If the factorization uses a technique other than Gaussian elimination, the quarantees in *err_bnds_norm* and *err_bnds_comp* may no longer be trustworthy.

params(la_linrx_cwise_i = 3) : Flag determining if the code will attempt to find a solution with a small componentwise relative error in the double-precision algorithm. Positive is true, 0.0 is false. Default: 1.0 (attempt componentwise convergence).

rwork REAL for chesvxx
DOUBLE PRECISION for zhesvxx.
Workspace array, DIMENSION at least max(1, 3*n); used in complex flavors only.

Output Parameters

x COMPLEX for chesvxx
DOUBLE COMPLEX for zhesvxx.
Array, DIMENSION (*ldx*,*nrhs*).

If *info* = 0, the array *x* contains the solution *n*-by-*nrhs* matrix *X* to the original system of equations. Note that *A* and *B* are modified on exit if *equed* ≠ 'N', and the solution to the equilibrated system is: inv(*diag*(*s*))***X*.

a — If *fact* = 'E' and *equed* = 'Y', overwritten by *diag*(*s*)***A***diag*(*s*).

af — If *fact* = 'N', *af* is an output argument and on exit returns the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization *A* = *U***D***U****T* or *A* = *L***D***L****T*.

b — If *equed* = 'N', *B* is not modified.
If *equed* = 'Y', *B* is overwritten by *diag*(*s*)***B*.

s — This array is an output argument if *fact* ≠ 'F'. Each element of this array is a power of the radix. See the description of *s* in *Input Arguments* section.

rcond — REAL for chesvxx
DOUBLE PRECISION for zhesvxx.
Reciprocal scaled condition number. An estimate of the reciprocal Skeel condition number of the matrix *A* after equilibration (if done). If *rcond* is less than the machine precision, in particular, if *rcond* = 0, the matrix is singular to working precision. Note that the error may still be small even if this number is very small and the matrix appears ill-conditioned.

rpvgrw — REAL for chesvxx
DOUBLE PRECISION for zhesvxx.
Contains the reciprocal pivot growth factor *norm*(*A*)/*norm*(*U*). The *max absolute element* norm is used. If this is much less than 1, the stability of the *LU* factorization of the (equlibrated) matrix *A* could be poor. This also means that the solution *X*, estimated condition numbers, and error bounds could be unreliable. If factorization fails with 0 < *info* ≤ *n*, this parameter contains the reciprocal pivot growth factor for the leading *info* columns of *A*.

berr — REAL for chesvxx
DOUBLE PRECISION for zhesvxx.
Array, DIMENSION at least max(1, *nrhs*). Contains the componentwise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

err_bnds_norm — REAL for chesvxx
DOUBLE PRECISION for zhesvxx.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the normwise relative error, which is defined as follows:
Normwise relative error in the *i*-th solution vector

$$\frac{\max_j \left|Xtrue_{ji} - X_{ji}\right|}{\max_j \left|X_{ji}\right|}$$

The array is indexed by the type of error information as described below. There are currently up to three pieces of information returned. The first index in *err_bnds_norm(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_norm(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated normwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε)for zhesvxx to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z=s*a*, where *s* scales each row by a power of the radix so all absolute row sums of *z* are approximately 1.

err_bnds_comp

REAL for chesvxx
DOUBLE PRECISION for zhesvxx.
Array, DIMENSION (*nrhs*,*n_err_bnds*). For each right-hand side, contains information about various error bounds and condition numbers corresponding to the componentwise relative error, which is defined as follows:
Componentwise relative error in the *i*-th solution vector:

$$\max_j \frac{\left|Xtrue_{ji} - X_{ji}\right|}{\left|X_{ji}\right|}$$

The array is indexed by the right-hand side *i*, on which the componentwise relative error depends, and by the type of error information as described below. There are currently up to three pieces

of information returned for each right-hand side. If componentwise accuracy is nit requested (*params(3)* = 0.0), then *err_bnds_comp* is not accessed. If *n_err_bnds* < 3, then at most the first *(:,n_err_bnds)* entries are returned.
The first index in *err_bnds_comp(i,:)* corresponds to the *i*-th right-hand side.
The second index in *err_bnds_comp(:,err)* contains the follwoing three fields:

err=1	"Trust/don't trust" boolean. Trust the answer if the reciprocal condition number is less than the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx.
err=2	"Guaranteed" error bpound. The estimated forward error, almost certainly within a factor of 10 of the true error so long as the next entry is greater than the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx. This error bound should only be trusted if the previous boolean is true.
err=3	Reciprocal condition number. Estimated componentwise reciprocal condition number. Compared with the threshold *sqrt*(*n*)**slamch*(ε) for chesvxx and *sqrt*(*n*)**dlamch*(ε) for zhesvxx to determine if the error estimate is "guaranteed". These reciprocal condition numbers are 1/(norm(1/z,inf)*norm(z,inf)) for some appropriately scaled matrix *Z*. Let *z*=*s**(*a**diag(*x*)), where *x* is the solution for the current right-hand side and *s* scales each row of *a**diag(*x*) by a power of the radix so all absolute row sums of *z* are approximately 1.

ipiv — If *fact* = 'N', *ipiv* is an output argument and on exit contains details of the interchanges and the block structure *D*, as determined by ssytrf for single precision flavors and dsytrf for double precision flavors.

equed — If *fact* ≠ 'F' , then *equed* is an output argument. It specifies the form of equilibration that was done (see the description of *equed* in *Input Arguments* section).

info — INTEGER. If *info* = 0, the execution is successful. The solution to every right-hand side is guaranteed.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If 0 < *info* ≤ *n*: *U*(*info*,*info*) is exactly zero. The factorization has been completed, but the factor *U* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.

If *info* = *n*+*j*: The solution corresponding to the *j*-th right-hand side is not guaranteed. The solutions corresponding to other right-hand sides *k* with *k* > *j* may not be guaranteed as well, but only the first such right-hand side is reported. If a small componentwise error is not requested *params(3)* = 0.0, then the *j*-th right-hand side is the first with a normwise error bound that is not guaranteed (the smallest *j* such that *err_bnds_norm*(*j*,1) = 0.0 or *err_bnds_comp*(*j*,1) = 0.0. See the definition of *err_bnds_norm(;,1)* and *err_bnds_comp(;,1)*. To get information about all of the right-hand sides, check *err_bnds_norm* or *err_bnds_comp*.

?spsv

Computes the solution to the system of linear equations with a real or complex symmetric matrix A stored in packed format, and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call sspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call dspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call cspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zspsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call spsv( ap, b [,uplo] [,ipiv] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves for *X* the real or complex system of linear equations *A***X* = *B*, where *A* is an *n*-by-*n* symmetric matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as *A* = *U***D***U*^{T} or *A* = *L***D***L*^{T}, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations *A***X* = *B*.

Input Parameters

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored:
If *uplo* = 'U', the upper triangle of *A* is stored.
If *uplo* = 'L', the lower triangle of *A* is stored.

n INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

ap, *b* REAL for sspsv
DOUBLE PRECISION for dspsv
COMPLEX for cspsv
DOUBLE COMPLEX for zspsv.
Arrays: *ap*(*), *b*(*ldb*,*).
The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).

ldb INTEGER. The first dimension of *b*; $ldb \geq \max(1, n)$.

Output Parameters

ap The block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?sptrf, stored as a packed triangular matrix in the same storage format as *A*.

b If *info* = 0, *b* is overwritten by the solution matrix *X*.

ipiv INTEGER.
Array, DIMENSION at least max(1, *n*). Contains details of the interchanges and the block structure of *D*, as determined by ?sptrf.
If $ipiv(i) = k > 0$, then d_{ii} is a 1-by-1 block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and $ipiv(i) = ipiv(i-1) = -m < 0$, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and $ipiv(i) = ipiv(i+1) = -m < 0$, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

info INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, d_{ii} is 0. The factorization has been completed, but *D* is exactly singular, so the solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spsv interface are as follows:

ap Holds the array *A* of size (*n**(*n*+1)/2).

b Holds the matrix *B* of size (*n*,*nrhs*).

ipiv Holds the vector with the number of elements *n*.

uplo Must be 'U' or 'L'. The default value is 'U'.

?spsvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a real or complex symmetric matrix A stored in packed format, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call sspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call dspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, iwork, info )
call cspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
call zspsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call spsvx( ap, b, x [,uplo] [,afp] [,ipiv] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the diagonal pivoting factorization to compute the solution to a real or complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* symmetric matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?spsvx performs the following steps:

1. If *fact = 'N'*, the diagonal pivoting method is used to factor the matrix A. The form of the factorization is $A = U*D*U^T$ or$A = L*D*L^T$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is symmetric and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that *D* is exactly singular, then the routine returns with *info = i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info = n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.
Specifies whether or not the factored form of the matrix *A* has been supplied on entry.
If *fact* = 'F': on entry, *afp* and *ipiv* contain the factored form of *A*. Arrays *ap*, *afp*, and *ipiv* are not modified.
If *fact* = 'N', the matrix *A* is copied to *afp* and factored.

uplo

CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:
If *uplo* = 'U', the array *ap* stores the upper triangular part of the symmetric matrix *A*, and *A* is factored as $U*D*U^T$.
If *uplo* = 'L', the array *ap* stores the lower triangular part of the symmetric matrix *A*; *A* is factored as $L*D*L^T$.

n

INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs

INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

ap,*afp*,*b*,*work*

REAL for sspsvx
DOUBLE PRECISION for dspsvx
COMPLEX for cspsvx
DOUBLE COMPLEX for zspsvx.
Arrays: *ap*(*), *afp*(*), *b*(*ldb*,*), *work*(*).
The array *ap* contains the upper or lower triangle of the symmetric matrix *A* in *packed storage* (see Matrix Storage Schemes).
The array *afp* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^T$ or $A = L*D*L^T$ as computed by ?sptrf, in the same storage format as *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
work(*) is a workspace array.
The dimension of arrays *ap* and *afp* must be at least max(1, *n*(*n*+1)/2); the second dimension of *b* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,3**n*) for real flavors and max(1,2**n*) for complex flavors.

ldb

INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv

INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?sptrf.
If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.

If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, *n*); used in real flavors only.

rwork — REAL for cspsvx
DOUBLE PRECISION for zspsvx.
Workspace array, DIMENSION at least max(1, *n*); used in complex flavors only.

Output Parameters

x — REAL for sspsvx
DOUBLE PRECISION for dspsvx
COMPLEX for cspsvx
DOUBLE COMPLEX for zspsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

afp, *ipiv* — These arrays are output arguments if *fact* = 'N'. See the description of *afp*, *ipiv* in *Input Arguments* section.

rcond — REAL for single precision flavors.
DOUBLE PRECISION for double precision flavors.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr, *berr* — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *nrhs*). Contain the component-wise forward and relative backward errors, respectively, for each solution vector.

info — INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and *i* ≤ *n*, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *i*, and *i* = *n* + 1, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spsvx interface are as follows:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
b	Holds the matrix *B* of size (*n*,*nrhs*).
x	Holds the matrix *X* of size (*n*,*nrhs*).
afp	Holds the array *AF* of size (*n**(*n*+1)/2).
ipiv	Holds the vector with the number of elements *n*.
ferr	Holds the vector with the number of elements *nrhs*.
berr	Holds the vector with the number of elements *nrhs*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

?hpsv

Computes the solution to the system of linear equations with a Hermitian matrix A stored in packed format, and multiple right-hand sides.

Syntax

FORTRAN 77:

```
call chpsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
call zhpsv( uplo, n, nrhs, ap, ipiv, b, ldb, info )
```

Fortran 95:

```
call hpsv( ap, b [,uplo] [,ipiv] [,info] )
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine solves for *X* the system of linear equations *A*X* = *B*, where *A* is an *n*-by-*n* Hermitian matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

The diagonal pivoting method is used to factor *A* as $A = U*D*U^H$ or $A = L*D*L^H$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.

The factored form of *A* is then used to solve the system of equations *A*X* = *B*.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Indicates whether the upper or lower triangular part of *A* is stored: If *uplo* = 'U', the upper triangle of *A* is stored. If *uplo* = 'L', the lower triangle of *A* is stored.

n	INTEGER. The order of matrix *A*; $n \geq 0$.
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B*; $nrhs \geq 0$.
ap, *b*	COMPLEX for chpsv DOUBLE COMPLEX for zhpsv. Arrays: *ap*(*), *b*(*ldb*,*). The dimension of *ap* must be at least max(1,*n*(*n*+1)/2). The array *ap* contains the factor *U* or *L*, as specified by *uplo*, in *packed storage* (see Matrix Storage Schemes). The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations. The second dimension of *b* must be at least max(1,*nrhs*).
ldb	INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

Output Parameters

ap	The block-diagonal matrix *D* and the multipliers used to obtain the factor *U* (or *L*) from the factorization of *A* as computed by ?hptrf, stored as a packed triangular matrix in the same storage format as *A*.
b	If *info* = 0, *b* is overwritten by the solution matrix *X*.

?hpsvx

Uses the diagonal pivoting factorization to compute the solution to the system of linear equations with a Hermitian matrix A stored in packed format, and provides error bounds on the solution.

Syntax

FORTRAN 77:

```
call chpsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
call zhpsvx( fact, uplo, n, nrhs, ap, afp, ipiv, b, ldb, x, ldx, rcond, ferr, berr, work, rwork, info )
```

Fortran 95:

```
call hpsvx( ap, b, x [,uplo] [,afp] [,ipiv] [,fact] [,ferr] [,berr] [,rcond] [,info] )
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine uses the diagonal pivoting factorization to compute the solution to a complex system of linear equations *A*X = B*, where *A* is a *n*-by-*n* Hermitian matrix stored in packed format, the columns of matrix *B* are individual right-hand sides, and the columns of *X* are the corresponding solutions.

Error bounds on the solution and a condition estimate are also provided.

The routine ?hpsvx performs the following steps:

1. If *fact = 'N'*, the diagonal pivoting method is used to factor the matrix *A*. The form of the factorization is $A = U*D*U^H$ or $A = L*D*L^H$, where *U* (or *L*) is a product of permutation and unit upper (lower) triangular matrices, and *D* is a Hermitian and block diagonal with 1-by-1 and 2-by-2 diagonal blocks.
2. If some $d_{i,i} = 0$, so that *D* is exactly singular, then the routine returns with *info = i*. Otherwise, the factored form of *A* is used to estimate the condition number of the matrix *A*. If the reciprocal of the condition number is less than machine precision, *info = n*+1 is returned as a warning, but the routine still goes on to solve for *X* and compute error bounds as described below.
3. The system of equations is solved for *X* using the factored form of *A*.
4. Iterative refinement is applied to improve the computed solution matrix and calculate error bounds and backward error estimates for it.

Input Parameters

fact

CHARACTER*1. Must be 'F' or 'N'.
Specifies whether or not the factored form of the matrix *A* has been supplied on entry.
If *fact = 'F'*: on entry, *afp* and *ipiv* contain the factored form of *A*. Arrays *ap*, *afp*, and *ipiv* are not modified.

If *fact* = 'N', the matrix *A* is copied to *afp* and factored.

uplo — CHARACTER*1. Must be 'U' or 'L'.
Indicates whether the upper or lower triangular part of *A* is stored and how *A* is factored:
If *uplo* = 'U', the array *ap* stores the upper triangular part of the Hermitian matrix *A*, and *A* is factored as $U*D*U^H$.
If *uplo* = 'L', the array *ap* stores the lower triangular part of the Hermitian matrix *A*, and *A* is factored as $L*D*L^H$.

n — INTEGER. The order of matrix *A*; $n \geq 0$.

nrhs — INTEGER. The number of right-hand sides, the number of columns in *B*; $nrhs \geq 0$.

ap,*afp*,*b*,*work* — COMPLEX for chpsvx
DOUBLE COMPLEX for zhpsvx.
Arrays: *ap*(*), *afp*(*), *b*(*ldb*,*), *work*(*).
The array *ap* contains the upper or lower triangle of the Hermitian matrix *A* in *packed storage* (see Matrix Storage Schemes).
The array *afp* is an input argument if *fact* = 'F'. It contains the block diagonal matrix *D* and the multipliers used to obtain the factor *U* or *L* from the factorization $A = U*D*U^H$ or $A = L*D*L^H$ as computed by ?hptrf, in the same storage format as *A*.
The array *b* contains the matrix *B* whose columns are the right-hand sides for the systems of equations.
work(*) is a workspace array.
The dimension of arrays *ap* and *afp* must be at least max(1,*n*(*n*+1)/2); the second dimension of *b* must be at least max(1,*nrhs*); the dimension of *work* must be at least max(1,2*n).

ldb — INTEGER. The first dimension of *b*; *ldb* ≥ max(1, *n*).

ipiv — INTEGER.
Array, DIMENSION at least max(1, *n*). The array *ipiv* is an input argument if *fact* = 'F'. It contains details of the interchanges and the block structure of *D*, as determined by ?hptrf.
If *ipiv*(*i*) = *k* > 0, then d_{ii} is a 1-by-1 diagonal block, and the *i*-th row and column of *A* was interchanged with the *k*-th row and column.
If *uplo* = 'U' and *ipiv*(*i*) =*ipiv*(*i*-1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*-1, and (*i*-1)-th row and column of *A* was interchanged with the *m*-th row and column.
If *uplo* = 'L' and *ipiv*(*i*) =*ipiv*(*i*+1) = -*m* < 0, then *D* has a 2-by-2 block in rows/columns *i* and *i*+1, and (*i*+1)-th row and column of *A* was interchanged with the *m*-th row and column.

ldx — INTEGER. The leading dimension of the output array *x*; *ldx* ≥ max(1, *n*).

rwork — REAL for chpsvx
DOUBLE PRECISION for zhpsvx.
Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

x
COMPLEX for chpsvx
DOUBLE COMPLEX for zhpsvx.
Array, DIMENSION (*ldx*,*).
If *info* = 0 or *info* = *n*+1, the array *x* contains the solution matrix *X* to the system of equations. The second dimension of *x* must be at least max(1,*nrhs*).

afp, *ipiv*
These arrays are output arguments if *fact* = 'N'. See the description of *afp*, *ipiv* in *Input Arguments* section.

rcond
REAL for chpsvx
DOUBLE PRECISION for zhpsvx.
An estimate of the reciprocal condition number of the matrix *A*. If *rcond* is less than the machine precision (in particular, if *rcond* = 0), the matrix is singular to working precision. This condition is indicated by a return code of *info* > 0.

ferr
REAL for chpsvx
DOUBLE PRECISION for zhpsvx.
Array, DIMENSION at least max(1, *nrhs*). Contains the estimated forward error bound for each solution vector *x*(*j*) (the *j*-th column of the solution matrix *X*). If *xtrue* is the true solution corresponding to *x*(*j*), *ferr*(*j*) is an estimated upper bound for the magnitude of the largest element in (*x*(*j*) - *xtrue*) divided by the magnitude of the largest element in *x*(*j*). The estimate is as reliable as the estimate for *rcond*, and is almost always a slight overestimate of the true error.

berr
REAL for chpsvx
DOUBLE PRECISION for zhpsvx.
Array, DIMENSION at least max(1, *nrhs*). Contains the component-wise relative backward error for each solution vector *x*(*j*), that is, the smallest relative change in any element of *A* or *B* that makes *x*(*j*) an exact solution.

info
INTEGER. If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, and $i \leq n$, then d_{ii} is exactly zero. The factorization has been completed, but the block diagonal matrix *D* is exactly singular, so the solution and error bounds could not be computed; *rcond* = 0 is returned.
If *info* = *i*, and $i = n + 1$, then *D* is nonsingular, but *rcond* is less than machine precision, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of *rcond* would suggest.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or reconstructible arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpsvx interface are as follows:

ap
Holds the array *A* of size (*n**(*n*+1)/2).

b
Holds the matrix *B* of size (*n*,*nrhs*).

x	Holds the matrix *X* of size (*n*,*nrhs*).
afp	Holds the array *AF* of size (*n**(*n*+1)/2).
ipiv	Holds the vector with the number of elements *n*.
ferr	Holds the vector with the number of elements *nrhs*.
berr	Holds the vector with the number of elements *nrhs*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
fact	Must be 'N' or 'F'. The default value is 'N'. If *fact* = 'F', then both arguments *af* and *ipiv* must be present; otherwise, an error is returned.

LAPACK Routines: Least Squares and Eigenvalue Problems

4

This chapter describes the Intel® Math Kernel Library implementation of routines from the LAPACK package that are used for solving linear least squares problems, eigenvalue and singular value problems, as well as performing a number of related computational tasks.

Sections in this chapter include descriptions of LAPACK computational routines and driver routines. For full reference on LAPACK routines and related information see [LUG].

Least Squares Problems. A typical *least squares problem* is as follows: given a matrix A and a vector b, find the vector x that minimizes the sum of squares $\Sigma_i((Ax)_i - b_i)^2$ or, equivalently, find the vector x that minimizes the 2-norm $||Ax - b||_2$.

In the most usual case, A is an m-by-n matrix with $m \geq n$ and $\mathrm{rank}(A) = n$. This problem is also referred to as finding the *least squares solution* to an *overdetermined* system of linear equations (here we have more equations than unknowns). To solve this problem, you can use the QR factorization of the matrix A (see QR Factorization).

If $m < n$ and $\mathrm{rank}(A) = m$, there exist an infinite number of solutions x which exactly satisfy $Ax = b$, and thus minimize the norm $||Ax - b||_2$. In this case it is often useful to find the unique solution that minimizes $||x||_2$. This problem is referred to as finding the *minimum-norm solution* to an *underdetermined* system of linear equations (here we have more unknowns than equations). To solve this problem, you can use the LQ factorization of the matrix A (see LQ Factorization).

In the general case you may have a *rank-deficient least squares problem*, with $\mathrm{rank}(A) < \min(m, n)$: find the *minimum-norm least squares solution* that minimizes both $||x||_2$ and $||Ax - b||^2$. In this case (or when the rank of A is in doubt) you can use the QR factorization with pivoting or *singular value decomposition* (see Singular Value Decomposition).

Eigenvalue Problems. The eigenvalue problems (from German *eigen* "own") are stated as follows: given a matrix A, find the *eigenvalues* λ and the corresponding *eigenvectors* z that satisfy the equation

$Az = \lambda z$ (right eigenvectors z)

or the equation

$z^H A = \lambda z^H$ (left eigenvectors z).

If A is a real symmetric or complex Hermitian matrix, the above two equations are equivalent, and the problem is called a *symmetric* eigenvalue problem. Routines for solving this type of problems are described in the section Symmetric Eigenvalue Problems .

Routines for solving eigenvalue problems with nonsymmetric or non-Hermitian matrices are described in the section Nonsymmetric Eigenvalue Problems .

The library also includes routines that handle *generalized symmetric-definite eigenvalue problems*: find the eigenvalues λ and the corresponding eigenvectors x that satisfy one of the following equations:

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$,

where A is symmetric or Hermitian, and B is symmetric positive-definite or Hermitian positive-definite. Routines for reducing these problems to standard symmetric eigenvalue problems are described in the section Generalized Symmetric-Definite Eigenvalue Problems .

To solve a particular problem, you usually call several computational routines. Sometimes you need to combine the routines of this chapter with other LAPACK routines described in Chapter 3 as well as with BLAS routines described in Chapter 2 .

For example, to solve a set of least squares problems minimizing $||Ax - b||^2$ for all columns b of a given matrix B (where A and B are real matrices), you can call `?geqrf` to form the factorization $A = QR$, then call `?ormqr` to compute $C = Q^H B$ and finally call the BLAS routine `?trsm` to solve for X the system of equations $RX = C$.

Another way is to call an appropriate driver routine that performs several tasks in one call. For example, to solve the least squares problem the driver routine `?gels` can be used.

WARNING. LAPACK routines require that input matrices do not contain `INF` or `NaN` values. When input data is inappropriate for LAPACK, problems may arise, including possible hangs.

Starting from release 8.0, Intel MKL along with FORTRAN 77 interface to LAPACK computational and driver routines supports also Fortran 95 interface which uses simplified routine calls with shorter argument lists. The calling sequence for Fortran 95 interface is given in the syntax section of the routine description immediately after FORTRAN 77 calls.

Routine Naming Conventions

For each routine in this chapter, when calling it from the FORTRAN 77 program you can use the LAPACK name.

LAPACK names have the structure `xyyzzz`, which is described below.

The initial letter `x` indicates the data type:

`s`	real, single precision
`c`	complex, single precision
`d`	real, double precision
`z`	complex, double precision

The second and third letters `yy` indicate the matrix type and storage scheme:

`bd`	bidiagonal matrix
`ge`	general matrix
`gb`	general band matrix
`hs`	upper Hessenberg matrix
`or`	(real) orthogonal matrix
`op`	(real) orthogonal matrix (packed storage)
`un`	(complex) unitary matrix
`up`	(complex) unitary matrix (packed storage)
`pt`	symmetric or Hermitian positive-definite tridiagonal matrix
`sy`	symmetric matrix

sp	symmetric matrix (packed storage)
sb	(real) symmetric band matrix
st	(real) symmetric tridiagonal matrix
he	Hermitian matrix
hp	Hermitian matrix (packed storage)
hb	(complex) Hermitian band matrix
tr	triangular or quasi-triangular matrix.

The last three letters zzz indicate the computation performed, for example:

qrf	form the *QR* factorization
lqf	form the *LQ* factorization.

Thus, the routine sgeqrf forms the *QR* factorization of general real matrices in single precision; the corresponding routine for complex matrices is cgeqrf.

Names of the LAPACK computational and driver routines for Fortran 95 interface in Intel MKL are the same as FORTRAN 77 names but without the first letter that indicates the data type. For example, the name of the routine that forms the *QR* factorization of general real matrices in Fortran 95 interface is geqrf. Handling of different data types is done through defining a specific internal parameter referring to a module block with named constants for single and double precision.

For details on the design of Fortran 95 interface for LAPACK computational and driver routines in Intel MKL and for the general information on how the optional arguments are reconstructed, see Fortran 95 Interface Conventions in chapter 3 .

Matrix Storage Schemes

LAPACK routines use the following matrix storage schemes:

- *Full storage*: a matrix *A* is stored in a two-dimensional array *a*, with the matrix element a_{ij} stored in the array element *a*(*i*,*j*).
- *Packed storage* scheme allows you to store symmetric, Hermitian, or triangular matrices more compactly: the upper or lower triangle of the matrix is packed by columns in a one-dimensional array.
- *Band storage*: an *m*-by-*n* band matrix with *kl* sub-diagonals and *ku* super-diagonals is stored compactly in a two-dimensional array *ab* with *kl*+*ku*+1 rows and *n* columns. Columns of the matrix are stored in the corresponding columns of the array, and *diagonals* of the matrix are stored in rows of the array.

In Chapters 3 and 4 , arrays that hold matrices in packed storage have names ending in *p*; arrays with matrices in band storage have names ending in *b*. For more information on matrix storage schemes, see "Matrix Arguments" in Appendix B .

Mathematical Notation

In addition to the mathematical notation used in previous chapters, descriptions of routines in this chapter use the following notation:

λ_i	*Eigenvalues* of the matrix *A* (for the definition of eigenvalues, see Eigenvalue Problems).

σ_i	*Singular values* of the matrix A. They are equal to square roots of the eigenvalues of $A^H A$. (For more information, see Singular Value Decomposition).
$\|\|x\|\|_2$	The *2-norm* of the vector x: $\|\|x\|\|_2 = (\Sigma_i \|x_i\|^2)^{1/2} = \|\|x\|\|_E$.
$\|\|A\|\|_2$	The *2-norm* (or *spectral norm*) of the matrix A. $\|\|A\|\|_2 = \max_i \sigma_i$, $\|\|A\|\|_2^2 = \max_{\|x\|=1}(Ax \cdot Ax)$.
$\|\|A\|\|_E$	The *Euclidean norm* of the matrix A: $\|\|A\|\|_E^2 = \Sigma_i \Sigma_j \|a_{ij}\|^2$ (for vectors, the Euclidean norm and the 2-norm are equal: $\|\|x\|\|_E = \|\|x\|\|_2$).
$q(x, y)$	The *acute angle between vectors* x and y: $\cos q(x, y) = \|x \cdot y\| / (\|\|x\|\|_2 \|\|y\|\|_2)$.

Computational Routines

In the sections that follow, the descriptions of LAPACK computational routines are given. These routines perform distinct computational tasks that can be used for:

Orthogonal Factorizations

Singular Value Decomposition

Symmetric Eigenvalue Problems

Generalized Symmetric-Definite Eigenvalue Problems

Nonsymmetric Eigenvalue Problems

Generalized Nonsymmetric Eigenvalue Problems

Generalized Singular Value Decomposition

See also the respective driver routines.

Orthogonal Factorizations

This section describes the LAPACK routines for the *QR (RQ)* and *LQ (QL)* factorization of matrices. Routines for the *RZ* factorization as well as for generalized *QR* and *RQ* factorizations are also included.

QR Factorization. Assume that A is an m-by-n matrix to be factored.

If $m \geq n$, the *QR* factorization is given by

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix} = (Q_1, Q_2) \begin{pmatrix} R \\ 0 \end{pmatrix}$$

where R is an n-by-n upper triangular matrix with real diagonal elements, and Q is an m-by-m orthogonal (or unitary) matrix.

You can use the *QR* factorization for solving the following least squares problem: minimize $\|\|Ax - b\|\|^2$ where A is a full-rank m-by-n matrix ($m \geq n$). After factoring the matrix, compute the solution x by solving $Rx = (Q_1)^T b$.

If $m < n$, the *QR* factorization is given by

$A = QR = Q(R_1 R_2)$

where R is trapezoidal, R_1 is upper triangular and R_2 is rectangular.

The LAPACK routines do not form the matrix Q explicitly. Instead, Q is represented as a product of min(m, n) *elementary reflectors*. Routines are provided to work with Q in this representation.

LQ Factorization LQ factorization of an m-by-n matrix A is as follows. If $m \le n$,

$$A = (L, 0)\,Q = (L, 0)\begin{pmatrix} Q_1 \\ Q_2 \end{pmatrix} = (LQ_1)$$

where L is an m-by-m lower triangular matrix with real diagonal elements, and Q is an n-by-n orthogonal (or unitary) matrix.

If $m > n$, the LQ factorization is

$$A = \begin{pmatrix} L_1 \\ L_2 \end{pmatrix} Q$$

where L_1 is an n-by-n lower triangular matrix, L_2 is rectangular, and Q is an n-by-n orthogonal (or unitary) matrix.

You can use the LQ factorization to find the minimum-norm solution of an underdetermined system of linear equations $Ax = b$ where A is an m-by-n matrix of rank m ($m < n$). After factoring the matrix, compute the solution vector x as follows: solve $Ly = b$ for y, and then compute $x = (Q_1)^H y$.

Table 4-1 lists LAPACK routines (FORTRAN 77 interface) that perform orthogonal factorization of matrices. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

?geqrf

Computes the QR factorization of a general m-by-n matrix.

Syntax

FORTRAN 77:

```
call sgeqrf(m, n, a, lda, tau, work, lwork, info)
call dgeqrf(m, n, a, lda, tau, work, lwork, info)
call cgeqrf(m, n, a, lda, tau, work, lwork, info)
call zgeqrf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call geqrf(a [, tau] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeqrf DOUBLE PRECISION for dgeqrf COMPLEX for cgeqrf DOUBLE COMPLEX for zgeqrf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).

lda INTEGER. The first dimension of *a*; at least max(1, *m*).

lwork INTEGER. The size of the *work* array (*lwork* ≥ *n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

a Overwritten by the factorization data as follows:
If *m* ≥ *n*, the elements below the diagonal are overwritten by the details of the unitary matrix *Q*, and the upper triangle is overwritten by the corresponding elements of the upper triangular matrix *R*.
If *m* < *n*, the strictly lower triangular part is overwritten by the details of the unitary matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* upper trapezoidal matrix *R*.

tau REAL for sgeqrf
DOUBLE PRECISION for dgeqrf
COMPLEX for cgeqrf
DOUBLE COMPLEX for zgeqrf.
Array, DIMENSION at least max (1, min(*m*, *n*)). Contains additional information on the matrix *Q*.

work(1) If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine *geqrf* interface are the following:

a Holds the matrix *A* of size (*m*, *n*).

tau Holds the vector of length min(*m*, *n*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $||A*x - b||_2$ for all columns b of a given matrix B, you can call the following:

?geqrf (this routine)	to factorize $A = QR$;
?ormqr	to compute $C = Q^T*B$ (for real matrices);
?unmqr	to compute $C = Q^H*B$ (for complex matrices);
?trsm (a BLAS routine)	to solve $R*X = C$.

(The columns of the computed X are the least squares solution vectors x.)

To compute the elements of Q explicitly, call

?orgqr	(for real matrices)
?ungqr	(for complex matrices).

- mkl_progress

?geqrfp

Computes the QR factorization of a general m-by-n matrix with non-negative diagonal elements.

Syntax

FORTRAN 77:

```
call sgeqrfp(m, n, a, lda, tau, work, lwork, info)
call dgeqrfp(m, n, a, lda, tau, work, lwork, info)
```

```
call cgeqrfp(m, n, a, lda, tau, work, lwork, info)
call zgeqrfp(m, n, a, lda, tau, work, lwork, info)
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for s DOUBLE PRECISION for dgeqrfp COMPLEX for cgeqrfp DOUBLE COMPLEX for zgeqrfp. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See Application Notes for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the factorization data as follows: If *m* ≥ *n*, the elements below the diagonal are overwritten by the details of the unitary matrix *Q*, and the upper triangle is overwritten by the corresponding elements of the upper triangular matrix *R*. If *m* < *n*, the strictly lower triangular part is overwritten by the details of the unitary matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* upper trapezoidal matrix *R*. The diagonal elements of the matrix *R* are non-negative.

tau	REAL for sgeqrfp DOUBLE PRECISION for dgeqrfp COMPLEX for cgeqrfp DOUBLE COMPLEX for zgeqrfp. Array, DIMENSION at least max (1, min(*m*, *n*)). Contains additional information on the matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine *geqrfp* interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length min(*m*, *n*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $||A*x - b||_2$ for all columns b of a given matrix B, you can call the following:

?geqrfp (this routine)	to factorize $A = QR$;
?ormqr	to compute $C = Q^T*B$ (for real matrices);
?unmqr	to compute $C = Q^H*B$ (for complex matrices);
?trsm (a BLAS routine)	to solve $R*X = C$.

(The columns of the computed X are the least squares solution vectors x.)

To compute the elements of Q explicitly, call

?orgqr	(for real matrices)
?ungqr	(for complex matrices).

- mkl_progress

?geqpf

Computes the QR factorization of a general m-by-n matrix with pivoting.

Syntax

FORTRAN 77:

```
call sgeqpf(m, n, a, lda, jpvt, tau, work, info)
call dgeqpf(m, n, a, lda, jpvt, tau, work, info)
call cgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
call zgeqpf(m, n, a, lda, jpvt, tau, work, rwork, info)
```

Fortran 95:

```
call geqpf(a, jpvt [,tau] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine is deprecated and has been replaced by routine ?geqp3.

The routine ?geqpf forms the QR factorization of a general m-by-n matrix A with column pivoting: $A*P = Q*R$ (see Orthogonal Factorizations). Here P denotes an n-by-n permutation matrix.

The routine does not form the matrix Q explicitly. Instead, Q is represented as a product of min(m, n) *elementary reflectors*. Routines are provided to work with Q in this representation.

Input Parameters

m INTEGER. The number of rows in the matrix A ($m \geq 0$).

n	INTEGER. The number of columns in *A* ($n \geq 0$).
a, *work*	REAL for sgeqpf DOUBLE PRECISION for dgeqpf COMPLEX for cgeqpf DOUBLE COMPLEX for zgeqpf. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* (*lwork*) is a workspace array. The size of the *work* array must be at least max(1, 3**n*) for real flavors and at least max(1, *n*) for complex flavors.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
jpvt	INTEGER. Array, DIMENSION at least max(1, *n*). On entry, if *jpvt*(*i*) > 0, the *i*-th column of *A* is moved to the beginning of *A***P* before the computation, and fixed in place during the computation. If *jpvt*(*i*) = 0, the *i*th column of *A* is a free column (that is, it may be interchanged during the computation with any other free column).
rwork	REAL for cgeqpf DOUBLE PRECISION for zgeqpf. A workspace array, DIMENSION at least max(1, 2**n*).

Output Parameters

a	Overwritten by the factorization data as follows: If $m \geq n$, the elements below the diagonal are overwritten by the details of the unitary (orthogonal) matrix *Q*, and the upper triangle is overwritten by the corresponding elements of the upper triangular matrix *R*. If $m < n$, the strictly lower triangular part is overwritten by the details of the matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* upper trapezoidal matrix *R*.
tau	REAL for sgeqpf DOUBLE PRECISION for dgeqpf COMPLEX for cgeqpf DOUBLE COMPLEX for zgeqpf. Array, DIMENSION at least max (1, min(*m*, *n*)). Contains additional information on the matrix *Q*.
jpvt	Overwritten by details of the permutation matrix *P* in the factorization *A***P* = *Q***R*. More precisely, the columns of *A***P* are the columns of *A* in the following order: *jpvt*(1), *jpvt*(2), ..., *jpvt*(*n*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `geqpf` interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
jpvt	Holds the vector of length *n*.
tau	Holds the vector of length min(*m*, *n*)

Application Notes

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon)||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To solve a set of least squares problems minimizing $||A*x - b||_2$ for all columns b of a given matrix B, you can call the following:

?geqpf (this routine)	to factorize $A*P = Q*R$;
?ormqr	to compute $C = Q^T*B$ (for real matrices);
?unmqr	to compute $C = Q^H*B$ (for complex matrices);
?trsm (a BLAS routine)	to solve $R*X = C$.

(The columns of the computed X are the permuted least squares solution vectors x; the output array *jpvt* specifies the permutation order.)

To compute the elements of Q explicitly, call

?orgqr	(for real matrices)
?ungqr	(for complex matrices).

?geqp3

Computes the QR factorization of a general m-by-n matrix with column pivoting using level 3 BLAS.

Syntax

FORTRAN 77:

```
call sgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
call dgeqp3(m, n, a, lda, jpvt, tau, work, lwork, info)
```

```
call cgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
call zgeqp3(m, n, a, lda, jpvt, tau, work, lwork, rwork, info)
```

Fortran 95:

```
call geqp3(a, jpvt [,tau] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine forms the *QR* factorization of a general *m*-by-*n* matrix *A* with column pivoting: *A*P = Q*R* (see Orthogonal Factorizations) using Level 3 BLAS. Here *P* denotes an *n*-by-*n* permutation matrix. Use this routine instead of `?geqpf` for better performance.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeqp3 DOUBLE PRECISION for dgeqp3 COMPLEX for cgeqp3 DOUBLE COMPLEX for zgeqp3. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; must be at least max(1, 3**n*+1) for real flavors, and at least max(1, *n*+1) for complex flavors. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details.
jpvt	INTEGER. Array, DIMENSION at least max(1, *n*). On entry, if *jpvt*(*i*) ≠ 0, the *i*-th column of *A* is moved to the beginning of *AP* before the computation, and fixed in place during the computation. If *jpvt*(*i*) = 0, the *i*-th column of *A* is a free column (that is, it may be interchanged during the computation with any other free column).
rwork	REAL for cgeqp3 DOUBLE PRECISION for zgeqp3.

A workspace array, DIMENSION at least max(1, 2*n). Used in complex flavors only.

Output Parameters

a	Overwritten by the factorization data as follows: If *m* ≥ *n*, the elements below the diagonal are overwritten by the details of the unitary (orthogonal) matrix *Q*, and the upper triangle is overwritten by the corresponding elements of the upper triangular matrix *R*. If *m* < *n*, the strictly lower triangular part is overwritten by the details of the matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* upper trapezoidal matrix *R*.
tau	REAL for sgeqp3 DOUBLE PRECISION for dgeqp3 COMPLEX for cgeqp3 DOUBLE COMPLEX for zgeqp3. Array, DIMENSION at least max (1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors for the matrix *Q*.
jpvt	Overwritten by details of the permutation matrix *P* in the factorization *A*P = Q*R*. More precisely, the columns of *AP* are the columns of *A* in the following order: *jpvt*(1), *jpvt*(2), ..., *jpvt*(*n*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine geqp3 interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
jpvt	Holds the vector of length *n*.
tau	Holds the vector of length min(*m*, *n*)

Application Notes

To solve a set of least squares problems minimizing $||A*X - B||_2$ for all columns *b* of a given matrix *B*, you can call the following:

?geqp3 (this routine)	to factorize *A*P = Q*R*;
?ormqr	to compute $C = Q^T*B$ (for real matrices);
?unmqr	to compute $C = Q^H*B$ (for complex matrices);
?trsm (a BLAS routine)	to solve *R*X = C*.

(The columns of the computed *X* are the permuted least squares solution vectors *x*; the output array *jpvt* specifies the permutation order.)

To compute the elements of *Q* explicitly, call

?orgqr	(for real matrices)
?ungqr	(for complex matrices).

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?orgqr

Generates the real orthogonal matrix Q of the QR factorization formed by ?geqrf.

Syntax

FORTRAN 77:

```
call sorgqr(m, n, k, a, lda, tau, work, lwork, info)
call dorgqr(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgqr(a, tau [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates the whole or part of *m*-by-*m* orthogonal matrix *Q* of the *QR* factorization formed by the routines sgeqrf/dgeqrf or sgeqpf/dgeqpf. Use this routine after a call to sgeqrf/dgeqrf or sgeqpf/dgeqpf.

Usually *Q* is determined from the *QR* factorization of an *m* by *p* matrix *A* with $m \geq p$. To compute the whole matrix *Q*, use:

```
call ?orgqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* columns of *Q* (which form an orthonormal basis in the space spanned by the columns of *A*):

```
call ?orgqr(m, p, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the QR factorization of leading k columns of the matrix A:

```
call ?orgqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading k columns of Q^k (which form an orthonormal basis in the space spanned by leading k columns of the matrix A:):

```
call ?orgqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The order of the orthogonal matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of Q to be computed ($0 \leq n \leq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($0 \leq k \leq n$).
a, *tau*, *work*	REAL for sorgqr DOUBLE PRECISION for dorgqr Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgeqrf / dgeqrf or sgeqpf / dgeqpf. The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork* $\geq n$). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *n* leading columns of the *m*-by-*m* orthogonal matrix Q.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine orgqr interface are the following:

a	Holds the matrix A of size (m, n).

tau	Holds the vector of length (*k*)

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly orthogonal matrix by a matrix *E* such that

$||E||_2 = O(\varepsilon)*|A||_2$ where ε is the machine precision.

The total number of floating-point operations is approximately $4*m*n*k - 2*(m + n)*k^2 + (4/3)*k^3$.

If $n = k$, the number is approximately $(2/3)*n^2*(3m - n)$.

The complex counterpart of this routine is ?ungqr.

?ormqr

Multiplies a real matrix by the orthogonal matrix Q of the QR factorization formed by ?geqrf *or* ?geqpf.

Syntax

FORTRAN 77:

```
call sormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormqr(a, tau, c [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a real matrix *C* by *Q* or Q^T, where *Q* is the orthogonal matrix *Q* of the *QR* factorization formed by the routines sgeqrf/dgeqrf or sgeqpf/dgeqpf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* ='L', Q or Q^T is applied to C from the left. If *side* ='R', Q or Q^T is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* ='N', the routine multiplies C by Q. If *trans* ='T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* ='L'; $0 \leq k \leq n$ if *side* ='R'.
a, *tau*, *c*, *work*	REAL for sgeqrf DOUBLE PRECISION for dgeqrf. Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgeqrf / dgeqrf or sgeqpf / dgeqpf. The second dimension of *a* must be at least max(1, *k*). The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the matrix C. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*. Constraints: *lda* ≥ max(1, *m*) if *side* = 'L'; *lda* ≥ max(1, *n*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*. Constraint: *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ormqr interface are the following:

a	Holds the matrix *A* of size (*r*, *k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*, *n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmqr.

?ungqr

Generates the complex unitary matrix Q of the QR factorization formed by ?geqrf.

Syntax

FORTRAN 77:

```
call cungqr(m, n, k, a, lda, tau, work, lwork, info)
call zungqr(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungqr(a, tau [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine generates the whole or part of m-by-m unitary matrix Q of the QR factorization formed by the routines cgeqrf/zgeqrf or cgeqpf/zgeqpf. Use this routine after a call to cgeqrf/zgeqrf or cgeqpf/zgeqpf.

Usually Q is determined from the QR factorization of an m by p matrix A with $m \geq p$. To compute the whole matrix Q, use:

```
call ?ungqr(m, m, p, a, lda, tau, work, lwork, info)
```

To compute the leading p columns of Q (which form an orthonormal basis in the space spanned by the columns of A):

```
call ?ungqr(m, p, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the QR factorization of the leading k columns of the matrix A:

```
call ?ungqr(m, m, k, a, lda, tau, work, lwork, info)
```

To compute the leading k columns of Q^k (which form an orthonormal basis in the space spanned by the leading k columns of the matrix A):

```
call ?ungqr(m, k, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The order of the unitary matrix Q ($m \geq 0$).
n	INTEGER. The number of columns of Q to be computed ($0 \leq n \leq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q ($0 \leq k \leq n$).
a, *tau*, *work*	COMPLEX for cungqr DOUBLE COMPLEX for zungqr Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by cgeqrf/zgeqrf or cgeqpf/zgeqpf.

	The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *n* leading columns of the *m*-by-*m* unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ungqr interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately `16*m*n*k - 8*(m + n)*k2 + (16/3)*k`^{3}.

If `n = k`, the number is approximately `(8/3)*n`^{2}`*(3m - n)`.

The real counterpart of this routine is `?orgqr`.

?unmqr

Multiplies a complex matrix by the unitary matrix Q of the QR factorization formed by `?geqrf`.

Syntax

FORTRAN 77:

```
call cunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmqr(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmqr(a, tau, c [,side] [,trans] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine multiplies a rectangular complex matrix C by Q or Q_H, where Q is the unitary matrix Q of the QR factorization formed by the routines `cgeqrf`/`zgeqrf` or `cgeqpf`/`zgeqpf`.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

side	CHARACTER*1. Must be either `'L'` or `'R'`. If *side* = `'L'`, Q or Q_H is applied to C from the left. If *side* = `'R'`, Q or Q_H is applied to C from the right.
trans	CHARACTER*1. Must be either `'N'` or `'C'`. If *trans* = `'N'`, the routine multiplies C by Q. If *trans* = `'C'`, the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* = `'L'`; $0 \leq k \leq n$ if *side* = `'R'`.
a, *c*, *tau*, *work*	COMPLEX for `cgeqrf` DOUBLE COMPLEX for `zgeqrf`. Arrays:

	a(*lda*,*) and *tau*(*) are the arrays returned by cgeqrf / zgeqrf or cgeqpf / zgeqpf. The second dimension of *a* must be at least max(1, *k*). The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*. Constraints: *lda* ≥ max(1, *m*) if *side* = 'L'; *lda* ≥ max(1, *n*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*. Constraint: *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^H*C, *C*Q*, or $C*Q^H$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmqr interface are the following:

a	Holds the matrix *A* of size (*r*,*k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormqr.

?gelqf

Computes the LQ factorization of a general m-by-n matrix.

Syntax

FORTRAN 77:

```
call sgelqf(m, n, a, lda, tau, work, lwork, info)
call dgelqf(m, n, a, lda, tau, work, lwork, info)
call cgelqf(m, n, a, lda, tau, work, lwork, info)
call zgelqf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call gelqf(a [, tau] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine forms the *LQ* factorization of a general *m*-by-*n* matrix *A* (see Orthogonal Factorizations). No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgelqf DOUBLE PRECISION for dgelqf COMPLEX for cgelqf DOUBLE COMPLEX for zgelqf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the factorization data as follows: If *m* ≤ *n*, the elements above the diagonal are overwritten by the details of the unitary (orthogonal) matrix *Q*, and the lower triangle is overwritten by the corresponding elements of the lower triangular matrix *L*. If *m* > *n*, the strictly upper triangular part is overwritten by the details of the matrix *Q*, and the remaining elements are overwritten by the corresponding elements of the *m*-by-*n* lower trapezoidal matrix *L*.
tau	REAL for sgelqf DOUBLE PRECISION for dgelqf COMPLEX for cgelqf DOUBLE COMPLEX for zgelqf. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains additional information on the matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gelqf` interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length min(*m*, *n*).

Application Notes

For better performance, try using *lwork* = *m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed factorization is the exact factorization of a matrix $A + E$, where

$||E||_2 = O(\varepsilon) \ ||A||_2$.

The approximate number of floating-point operations for real flavors is

$(4/3)n^3$	if $m = n$,
$(2/3)n^2(3m-n)$	if $m > n$,
$(2/3)m^2(3n-m)$	if $m < n$.

The number of operations for complex flavors is 4 times greater.

To find the minimum-norm solution of an underdetermined least squares problem minimizing $||A*x - b||_2$ for all columns *b* of a given matrix *B*, you can call the following:

`?gelqf` (this routine)	to factorize $A = L*Q$;
`?trsm` (a BLAS routine)	to solve $L*Y = B$ for Y;
`?ormlq`	to compute $X = (Q_1)^T*Y$ (for real matrices);
`?unmlq`	to compute $X = (Q_1)^H*Y$ (for complex matrices).

(The columns of the computed *X* are the minimum-norm solution vectors *x*. Here *A* is an *m*-by-*n* matrix with $m < n$; Q_1 denotes the first *m* columns of *Q*).

To compute the elements of *Q* explicitly, call

`?orglq`	(for real matrices)
`?unglq`	(for complex matrices).

- `mkl_progress`

?orglq

Generates the real orthogonal matrix Q of the LQ factorization formed by ?gelqf.

Syntax

FORTRAN 77:

```
call sorglq(m, n, k, a, lda, tau, work, lwork, info)
call dorglq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orglq(a, tau [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates the whole or part of *n*-by-*n* orthogonal matrix *Q* of the *LQ* factorization formed by the routines sgelqf/gelqf. Use this routine after a call to sgelqf/dgelqf.

Usually *Q* is determined from the *LQ* factorization of an *p*-by-*n* matrix *A* with $n \geq p$. To compute the whole matrix *Q*, use:

```
call ?orglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* rows of *Q*, which form an orthonormal basis in the space spanned by the rows of *A*, use:

```
call ?orglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the *LQ* factorization of *A*'s leading *k* rows, use:

```
call ?orglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading *k* rows of Q^k, which form an orthonormal basis in the space spanned by *A*'s leading *k* rows, use:

```
call ?orgqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The number of rows of *Q* to be computed ($0 \leq m \leq n$).
n	INTEGER. The order of the orthogonal matrix *Q* ($n \geq m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* ($0 \leq k \leq m$).
a, *tau*, *work*	REAL for sorglq DOUBLE PRECISION for dorglq Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgelqf/dgelqf. The second dimension of *a* must be at least max(1, *n*).

	The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *m* leading rows of the *n*-by-*n* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine orglq interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $4*m*n*k - 2*(m + n)*k^2 + (4/3)*k^3$.

If $m = k$, the number is approximately $(2/3)*m^2*(3n - m)$.

The complex counterpart of this routine is ?unglq.

?ormlq

Multiplies a real matrix by the orthogonal matrix Q of the LQ factorization formed by ?gelqf.

Syntax

FORTRAN 77:

```
call sormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormlq(a, tau, c [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a real m-by-n matrix C by Q or Q^T, where Q is the orthogonal matrix Q of the LQ factorization formed by the routine sgelqf/dgelqf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^T is applied to C from the left. If *side* = 'R', Q or Q^T is applied to C from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix Q. Constraints: $0 \leq k \leq m$ if *side* = 'L'; $0 \leq k \leq n$ if *side* = 'R'.
a, *c*, *tau*, *work*	REAL for sormlq DOUBLE PRECISION for dormlq. Arrays: *a*(*lda*,*) and *tau*(*) are arrays returned by ?gelqf.

The second dimension of *a* must be:
at least max(1, *m*) if *side* = 'L';
at least max(1, *n*) if *side* = 'R'.
The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).

ldc — INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ormlq interface are the following:

a — Holds the matrix *A* of size (*k*,*m*).

tau — Holds the vector of length (*k*).

c — Holds the matrix *C* of size (*m*,*n*).

side — Must be 'L' or 'R'. The default value is 'L'.

trans — Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork*= -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmlq.

?unglq

Generates the complex unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

FORTRAN 77:

```
call cunglq(m, n, k, a, lda, tau, work, lwork, info)
call zunglq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call unglq(a, tau [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates the whole or part of *n*-by-*n* unitary matrix *Q* of the *LQ* factorization formed by the routines cgelqf/zgelqf. Use this routine after a call to cgelqf/zgelqf.

Usually *Q* is determined from the *LQ* factorization of an *p*-by-*n* matrix *A* with $n < p$. To compute the whole matrix *Q*, use:

```
call ?unglq(n, n, p, a, lda, tau, work, lwork, info)
```

To compute the leading *p* rows of *Q*, which form an orthonormal basis in the space spanned by the rows of *A*, use:

```
call ?unglq(p, n, p, a, lda, tau, work, lwork, info)
```

To compute the matrix Q^k of the *LQ* factorization of the leading *k* rows of the matrix *A*, use:

```
call ?unglq(n, n, k, a, lda, tau, work, lwork, info)
```

To compute the leading *k* rows of Q^k, which form an orthonormal basis in the space spanned by the leading *k* rows of the matrix *A*, use:

```
call ?ungqr(k, n, k, a, lda, tau, work, lwork, info)
```

Input Parameters

m	INTEGER. The number of rows of *Q* to be computed ($0 \le m \le n$).
n	INTEGER. The order of the unitary matrix *Q* ($n \ge m$).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* ($0 \le k \le m$).
a, *tau*, *work*	COMPLEX for cunglq DOUBLE COMPLEX for zunglq Arrays: *a*(*lda*,*) and *tau*(*) are the arrays returned by sgelqf/dgelqf. The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by *m* leading rows of the *n*-by-*n* unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unglq interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* = *m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $16*m*n*k - 8*(m + n)*k^2 + (16/3)*k^3$.

If $m = k$, the number is approximately $(8/3)*m^2*(3n - m)$.

The real counterpart of this routine is ?orglq.

?unmlq

Multiplies a complex matrix by the unitary matrix Q of the LQ factorization formed by ?gelqf.

Syntax

FORTRAN 77:

```
call cunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmlq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmlq(a, tau, c [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix *Q* of the *LQ* factorization formed by the routine cgelqf/zgelqf.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q*C*, Q^H*C, *C*Q*, or $C*Q^H$ (overwriting the result on *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^H is applied to *C* from the left. If *side* = 'R', *Q* or Q^H is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'C', the routine multiplies *C* by Q_H.

m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: 0 ≤ *k* ≤ *m* if *side* = 'L'; 0 ≤ *k* ≤ *n* if *side* = 'R'.
a, *c*, *tau*, *work*	COMPLEX for cunmlq DOUBLE COMPLEX for zunmlq. Arrays: *a*(*lda*,*) and *tau*(*) are arrays returned by ?gelqf. The second dimension of *a* must be: at least max(1, *m*) if *side* = 'L'; at least max(1, *n*) if *side* = 'R'. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmlq interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormlq.

?geqlf

Computes the QL factorization of a general m-by-n matrix.

Syntax

FORTRAN 77:

```
call sgeqlf(m, n, a, lda, tau, work, lwork, info)
call dgeqlf(m, n, a, lda, tau, work, lwork, info)
call cgeqlf(m, n, a, lda, tau, work, lwork, info)
call zgeqlf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call geqlf(a [, tau] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine forms the *QL* factorization of a general *m*-by-*n* matrix *A*. No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgeqlf DOUBLE PRECISION for dgeqlf COMPLEX for cgeqlf DOUBLE COMPLEX for zgeqlf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten on exit by the factorization data as follows: if *m* ≥ *n*, the lower triangle of the subarray *a*(*m*-*n*+1:*m*, 1:*n*) contains the *n*-by-*n* lower triangular matrix *L*; if *m* ≤ *n*, the elements on and below the (*n*-*m*)-th superdiagonal contain the *m*-by-*n* lower trapezoidal matrix *L*; in both cases, the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors.
tau	REAL for sgeqlf DOUBLE PRECISION for dgeqlf COMPLEX for cgeqlf DOUBLE COMPLEX for zgeqlf. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains scalar factors of the elementary reflectors for the matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `geqlf` interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length min(*m*, *n*).

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

?ormql	to apply matrix Q (for real matrices);
?unmql	to apply matrix Q (for complex matrices).

See Also

- mkl_progress

?orgql

Generates the real matrix Q of the QL factorization formed by ?geqlf.

Syntax

FORTRAN 77:

```
call sorgql(m, n, k, a, lda, tau, work, lwork, info)
call dorgql(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgql(a, tau [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine generates an *m*-by-*n* real matrix *Q* with orthonormal columns, which is defined as the last *n* columns of a product of *k* elementary reflectors *H*(*i*) of order *m*: *Q* = *H*(*k*) *...* *H*(2)*H*(1) as returned by the routines `sgeqlf`/`dgeqlf`. Use this routine after a call to `sgeqlf/dgeqlf`.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q* (*m*≥ 0).
n	INTEGER. The number of columns of the matrix *Q* (*m*≥ *n*≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥ *k*≥ 0).
a, *tau*, *work*	REAL for `sorgql` DOUBLE PRECISION for `dorgql` Arrays: *a*(*lda*,*), *tau*(*). On entry, the (*n* - *k* + *i*)th column of *a* must *contain the vector which* defines the elementary reflector *H*(*i*), for *i* = 1,2,...,*k*, as returned by `sgeqlf/dgeqlf` in the last *k* columns of its array argument *a*; *tau*(*i*) *must contain the scalar factor of the elementary* reflector *H*(*i*), as returned by `sgeqlf/dgeqlf`; The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension `max(1, lwork)`.
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine orgql interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?ungql.

?ungql

Generates the complex matrix Q of the QL factorization formed by ?geqlf.

Syntax

FORTRAN 77:

```
call cungql(m, n, k, a, lda, tau, work, lwork, info)
call zungql(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungql(a, tau [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates an *m*-by-*n* complex matrix *Q* with orthonormal columns, which is defined as the last *n* columns of a product of *k* elementary reflectors *H*(*i*) of order *m*: *Q* = *H*(*k*) *...* *H*(2)**H*(1) as returned by the routines cgeqlf/zgeqlf . Use this routine after a call to cgeqlf/zgeqlf.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q* (*m*≥0).

n	INTEGER. The number of columns of the matrix *Q* (*m*≥*n*≥0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*n*≥*k*≥0).
a, *tau*, *work*	COMPLEX for cungql DOUBLE COMPLEX for zungql Arrays: *a*(*lda*,*), *tau*(*), *work*(*lwork*). On entry, the (*n* - *k* + *i*)th column of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgeqlf/zgeqlf in the last *k* columns of its array argument *a*; *tau*(i) must contain the scalar factor of the elementaryreflector *H*(*i*), as returned by cgeqlf/zgeqlf; The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ungql interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*n*blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?orgql.

?ormql

Multiplies a real matrix by the orthogonal matrix Q of the QL factorization formed by ?geqlf.

Syntax

FORTRAN 77:

```
call sormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormql(a, tau, c [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the orthogonal matrix *Q* of the *QL* factorization formed by the routine sgeqlf/dgeqlf .

Depending on the parameters *side* and *trans*, the routine ?ormql can form one of the matrix products *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T (overwriting the result over *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left. If *side* = 'R', *Q* or Q^T is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'T', the routine multiplies *C* by Q^T.
m	INTEGER. The number of rows in the matrix *C* (*m*≥ 0).
n	INTEGER. The number of columns in *C* (*n*≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

	$0 \le k \le m$ if *side* = 'L'; $0 \le k \le n$ if *side* = 'R'.
a, *tau*, *c*, *work*	REAL for sormql DOUBLE PRECISION for dormql. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*). On entry, the *i*th column of *a* must contain the vector which defines the elementary reflector H_i, for i = 1,2,...,*k*, as returned by sgeqlf/dgeqlf in the last *k* columns of its array argument *a*. The second dimension of *a* must be at least max(1, *k*). *tau*(i) must contain the scalar factor of the elementary reflector H_i, as returned by sgeqlf/dgeqlf. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; if *side* = 'L', *lda* ≥ max(1, *m*); if *side* = 'R', *lda* ≥ max(1, *n*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ormql interface are the following:

a	Holds the matrix *A* of size (*r*, *k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*, *n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmql.

?unmql

Multiplies a complex matrix by the unitary matrix Q of the QL factorization formed by ?geqlf.

Syntax

FORTRAN 77:

```
call cunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmql(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmql(a, tau, c [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix *Q* of the *QL* factorization formed by the routine cgeqlf/zgeqlf .

Depending on the parameters *side* and *trans*, the routine ?unmql can form one of the matrix products *Q*C*, Q^H**C*, *C*Q*, or *C**Q^H (overwriting the result over *C*).

Input Parameters

side — CHARACTER*1. Must be either 'L' or 'R'.
If *side* = 'L', *Q* or Q^H is applied to *C* from the left.
If *side* = 'R', *Q* or Q^H is applied to *C* from the right.

trans — CHARACTER*1. Must be either 'N' or 'C'.
If *trans* = 'N', the routine multiplies *C* by *Q*.
If *trans* = 'C', the routine multiplies *C* by Q^H.

m — INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).

n — INTEGER. The number of columns in *C* (*n* ≥ 0).

k — INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints:

0 ≤ *k* ≤ *m* if *side* = 'L';

0 ≤ *k* ≤ *n* if *side* = 'R'.

a, *tau*, *c*, *work* — COMPLEX for cunmql
DOUBLE COMPLEX for zunmql.
Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*).
On entry, the *i*-th column of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgeqlf/zgeqlf in the last *k* columns of its array argument *a*.
The second dimension of *a* must be at least max(1, *k*).
tau(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by cgeqlf/zgeqlf.
The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the *m*-by-*n* matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *n*).

ldc — INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:

lwork ≥ max(1, *n*) if *side* = 'L';

lwork ≥ max(1, *m*) if *side* = 'R'.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^H**C*, *C*Q*, or *C**Q^H (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmql interface are the following:

a	Holds the matrix *A* of size (*r*, *k*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*, *n*).
side	Must be 'L' or 'L'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (if *side* = 'L') or *lwork* = *m*blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormql.

?gerqf

Computes the RQ factorization of a general m-by-n matrix.

Syntax

FORTRAN 77:

```
call sgerqf(m, n, a, lda, tau, work, lwork, info)
call dgerqf(m, n, a, lda, tau, work, lwork, info)
call cgerqf(m, n, a, lda, tau, work, lwork, info)
call zgerqf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call gerqf(a [, tau] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine forms the *RQ* factorization of a general *m*-by-*n* matrix *A*. No pivoting is performed.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of min(*m*, *n*) *elementary reflectors*. Routines are provided to work with *Q* in this representation.

NOTE. This routine supports the Progress Routine feature. See Progress Function section for details.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
a, *work*	REAL for sgerqf DOUBLE PRECISION for dgerqf COMPLEX for cgerqf DOUBLE COMPLEX for zgerqf. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ max(1, *m*).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See Application Notes for the suggested value of *lwork*.

Output Parameters

a — Overwritten on exit by the factorization data as follows:
if $m \le n$, the upper triangle of the subarray
a(1:*m*, *n*-*m*+1:*n*) contains the *m*-by-*m* upper triangular matrix *R*;
if $m \ge n$, the elements on and above the (*m*-*n*)th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*;
in both cases, the remaining elements, with the array *tau*, represent the orthogonal/unitary matrix *Q* as a product of min(*m*,*n*) elementary reflectors.

tau — REAL for sgerqf
DOUBLE PRECISION for dgerqf
COMPLEX for cgerqf
DOUBLE COMPLEX for zgerqf.
Array, DIMENSION at least max (1, min(*m*, *n*)).
Contains scalar factors of the elementary reflectors for the matrix *Q*.

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gerqf interface are the following:

a — Holds the matrix *A* of size (*m*, *n*).

tau — Holds the vector of length min(*m*, *n*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

?orgrq	to generate matrix Q (for real matrices);

- mkl_progress

?orgrq

Generates the real matrix Q of the RQ factorization formed by ?gerqf.

Syntax

FORTRAN 77:

```
call sorgrq(m, n, k, a, lda, tau, work, lwork, info)
call dorgrq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgrq(a, tau [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates an *m*-by-*n* real matrix *Q* with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors *H*(*i*) of order *n*: *Q* = *H*(1)* *H*(2)*...**H*(*k*)as returned by the routines sgerqf/dgerqf. Use this routine after a call to sgerqf/dgerqf.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q* (*m*≥ 0).
n	INTEGER. The number of columns of the matrix *Q* (*n*≥ *m*).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥ *k*≥ 0).
a, *tau*, *work*	REAL for sorgrq DOUBLE PRECISION for dorgrq Arrays: *a*(*lda*,*), *tau*(*).

	On entry, the (*m* - *k* + *i*)-th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by sgerqf/dgerqf in the last *k* rows of its array argument *a*; *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by sgerqf/dgerqf; The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine orgrq interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?ungrq.

?ungrq

Generates the complex matrix Q of the RQ factorization formed by ?gerqf.

Syntax

FORTRAN 77:

```
call cungrq(m, n, k, a, lda, tau, work, lwork, info)
call zungrq(m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungrq(a, tau [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates an *m*-by-*n* complex matrix *Q* with orthonormal rows, which is defined as the last *m* rows of a product of *k* elementary reflectors *H*(*i*) of order *n*: *Q* = *H*(1)*H** *H*(2)*H**...**H*(*k*)*H* as returned by the routines sgerqf/dgerqf. Use this routine after a call to sgerqf/dgerqf.

Input Parameters

m	INTEGER. The number of rows of the matrix *Q* (*m*≥0).
n	INTEGER. The number of columns of the matrix *Q* (*n*≥*m*).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q* (*m*≥*k*≥0).
a, *tau*, *work*	REAL for cungrq DOUBLE PRECISION for zungrq Arrays: *a*(*lda*,*), *tau*(*), *work*(*lwork*). On entry, the (*m* - *k* + *i*)th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by sgerqf/dgerqf in the last *k* rows of its array argument *a*; *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by sgerqf/dgerqf; The second dimension of *a* must be at least max(1, *n*). The dimension of *tau* must be at least max(1, *k*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; at least max(1, *m*).

	If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *m*-by-*n* matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ungrq interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length (*k*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?orgrq.

?ormrq

Multiplies a real matrix by the orthogonal matrix Q of the RQ factorization formed by ?gerqf.

Syntax

FORTRAN 77:

```
call sormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormrq(side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormrq(a, tau, c [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the real orthogonal matrix defined as a product of *k* elementary reflectors H_i : *Q* = H_1 H_2 ... H_k as returned by the *RQ* factorization routine sgerqf/dgerqf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T (overwriting the result over *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left. If *side* = 'R', *Q* or Q^T is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'T', the routine multiplies *C* by Q^T.
m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: 0 ≤ *k* ≤ *m*, if *side* = 'L'; 0 ≤ *k* ≤ *n*, if *side* = 'R'.
a, *tau*, *c*, *work*	REAL for sormrq DOUBLE PRECISION for dormrq. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*). On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector H_i, for i = 1,2,...,*k*, as returned by sgerqf/dgerqf in the last *k* rows of its array argument *a*.

	The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'. *tau*(i) must contain the scalar factor of the elementary reflector H_i, as returned by sgerqf/dgerqf. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ormrq interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmrq.

?unmrq

Multiplies a complex matrix by the unitary matrix Q of the RQ factorization formed by ?gerqf.

Syntax

FORTRAN 77:

call cunmrq(*side*, *trans*, *m*, *n*, *k*, *a*, *lda*, *tau*, *c*, *ldc*, *work*, *lwork*, *info*)

call zunmrq(*side*, *trans*, *m*, *n*, *k*, *a*, *lda*, *tau*, *c*, *ldc*, *work*, *lwork*, *info*)

Fortran 95:

call unmrq(*a*, *tau*, *c* [,*side*] [,*trans*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the complex unitary matrix defined as a product of *k* elementary reflectors *H*(*i*) of order *n*: *Q* = *H*(1)*H** *H*(2)*H**...**H*(*k*)*Has returned by the *RQ* factorization routine cgerqf/zgerqf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q***C*, Q^H**C*, *C***Q*, or *C***Q*^{H} (overwriting the result over *C*).

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^H is applied to *C* from the left. If *side* = 'R', *Q* or Q^H is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'C', the routine multiplies *C* by Q^H.
m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).

n	INTEGER. The number of columns in *C* (*n* ≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: 0 ≤ *k* ≤ *m*, if *side* = 'L'; 0 ≤ *k* ≤ *n*, if *side* = 'R'.
a, *tau*, *c*, *work*	COMPLEX for cunmrq DOUBLE COMPLEX for zunmrq. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*). On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by cgerqf/zgerqf in the last *k* rows of its array argument *a*. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'. *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by cgerqf/zgerqf. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*) .
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmrq interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormrq.

?tzrzf

Reduces the upper trapezoidal matrix A to upper triangular form.

Syntax

FORTRAN 77:

```
call stzrzf(m, n, a, lda, tau, work, lwork, info)
call dtzrzf(m, n, a, lda, tau, work, lwork, info)
call ctzrzf(m, n, a, lda, tau, work, lwork, info)
call ztzrzf(m, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call tzrzf(a [, tau] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine reduces the *m*-by-*n* ($m \le n$) real/complex upper trapezoidal matrix *A* to upper triangular form by means of orthogonal/unitary transformations. The upper trapezoidal matrix *A* is factored as

A = (*R* 0)**Z*,

where *Z* is an *n*-by-*n* orthogonal/unitary matrix and R is an *m*-by-*m* upper triangular matrix.

See ?larz that applies an elementary reflector returned by ?tzrzf to a general matrix.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \ge 0$).
n	INTEGER. The number of columns in *A* ($n \ge m$).
a, *work*	REAL for stzrzf DOUBLE PRECISION for dtzrzf COMPLEX for ctzrzf DOUBLE COMPLEX for ztzrzf. Arrays: *a*(*lda*,*), *work*(*lwork*).The leading *m*-by-*n* upper trapezoidal part of the array *a* contains the matrix *A* to be factorized. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten on exit by the factorization data as follows: the leading *m*-by-*m* upper triangular part of *a* contains the upper triangular matrix *R*, and elements *m* +1 to *n* of the first *m* rows of *a*, with the array *tau*, represent the orthogonal matrix *Z* as a product of *m* elementary reflectors.
tau	REAL for stzrzf DOUBLE PRECISION for dtzrzf COMPLEX for ctzrzf DOUBLE COMPLEX for ztzrzf. Array, DIMENSION at least max (1, *m*). Contains scalar factors of the elementary reflectors for the matrix *Z*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `tzrzf` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
tau	Holds the vector of length (*m*).

Application Notes

For better performance, try using *lwork* =*m***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Related routines include:

?ormrz	to apply matrix Q (for real matrices)
?unmrz	to apply matrix Q (for complex matrices).

?ormrz

Multiplies a real matrix by the orthogonal matrix defined from the factorization formed by ?tzrzf.

Syntax

FORTRAN 77:

```
call sormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call dormrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormrz(a, tau, c, l [, side] [,trans] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine multiplies a real *m*-by-*n* matrix *C* by *Q* or Q^T, where *Q* is the real orthogonal matrix defined as a product of *k* elementary reflectors *H*(*i*) of order *n*: *Q* = *H*(1)* *H*(2)*...*H*(*k*) as returned by the factorization routine stzrzf/dtzrzf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q*C*, Q^T*C*, *C*Q*, or *C*Q^T (overwriting the result over *C*).

The matrix *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left. If *side* = 'R', *Q* or Q^T is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'T', the routine multiplies *C* by Q^T.
m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: 0 ≤ *k* ≤ *m*, if *side* = 'L'; 0 ≤ *k* ≤ *n*, if *side* = 'R'.
l	INTEGER. The number of columns of the matrix *A* containing the meaningful part of the Householder reflectors. Constraints: 0 ≤ *l* ≤ *m*, if *side* = 'L'; 0 ≤ *l* ≤ *n*, if *side* = 'R'.
a, *tau*, *c*, *work*	REAL for sormrz DOUBLE PRECISION for dormrz. Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*). On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by stzrzf/dtzrzf in the last *k* rows of its array argument *a*. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'. *tau*(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by stzrzf/dtzrzf. The dimension of *tau* must be at least max(1, *k*). *c*(*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*) .
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).

lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ormrz interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex counterpart of this routine is ?unmrz.

?unmrz

Multiplies a complex matrix by the unitary matrix defined from the factorization formed by ?tzrzf.

Syntax

FORTRAN 77:

```
call cunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
call zunmrz(side, trans, m, n, k, l, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmrz(a, tau, c, l [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a complex *m*-by-*n* matrix *C* by *Q* or Q^H, where *Q* is the unitary matrix defined as a product of *k* elementary reflectors *H*(*i*):

Q = *H*(1)*H** *H*(2)*H**...**H*(*k*)*H* as returned by the factorization routine ctzrzf/ztzrzf .

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products *Q***C*, Q^H**C*, *C***Q*, or *C***Q*^{H} (overwriting the result over *C*).

The matrix *Q* is of order *m* if *side* = 'L' and of order *n* if *side* = 'R'.

Input Parameters

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^H is applied to *C* from the left. If *side* = 'R', *Q* or Q^H is applied to *C* from the right.
trans	CHARACTER*1. Must be either 'N' or 'C'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'C', the routine multiplies *C* by Q^H.
m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
k	INTEGER. The number of elementary reflectors whose product defines the matrix *Q*. Constraints: 0 ≤ *k* ≤ *m*, if *side* = 'L'; 0 ≤ *k* ≤ *n*, if *side* = 'R'.

l — INTEGER.
The number of columns of the matrix *A* containing the meaningful part of the Householder reflectors. Constraints:
0 ≤ *l* ≤ *m*, if *side* = 'L';
0 ≤ *l* ≤ *n*, if *side* = 'R'.

a, *tau*, *c*, *work* — COMPLEX for cunmrz
DOUBLE COMPLEX for zunmrz.
Arrays: *a*(*lda*,*), *tau*(*), *c*(*ldc*,*), *work*(*lwork*).
On entry, the *i*th row of *a* must contain the vector which defines the elementary reflector *H*(*i*), for i = 1,2,...,*k*, as returned by ctzrzf/ztzrzf in the last *k* rows of its array argument *a*.
The second dimension of *a* must be at least max(1, *m*) if *side* = 'L', and at least max(1, *n*) if *side* = 'R'.
tau(i) must contain the scalar factor of the elementary reflector *H*(*i*), as returned by ctzrzf/ztzrzf.
The dimension of *tau* must be at least max(1, *k*).
c(*ldc*,*) contains the *m*-by-*n* matrix *C*.
The second dimension of *c* must be at least max(1, *n*)
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; *lda* ≥ max(1, *k*).

ldc — INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).

lwork — INTEGER. The size of the *work* array. Constraints:
lwork ≥ max(1, *n*) if *side* = 'L';
lwork ≥ max(1, *m*) if *side* = 'R'.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c — Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).

work(1) — If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmrz interface are the following:

a	Holds the matrix *A* of size (*k*,*m*).
tau	Holds the vector of length (*k*).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n***blocksize* (if *side* = 'L') or *lwork* = *m***blocksize* (if *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real counterpart of this routine is ?ormrz.

?ggqrf

Computes the generalized QR factorization of two matrices.

Syntax

FORTRAN 77:

```
call sggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggqrf(n, m, p, a, lda, taua, b, ldb, taub, work, lwork, info)
```

Fortran 95:

```
call ggqrf(a, b [,taua] [,taub] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine forms the generalized *QR* factorization of an *n*-by-*m* matrix *A* and an *n*-by-*p* matrix *B* as *A* = *Q***R*, *B* = *Q***T***Z*, where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

$$R = \begin{array}{c} \\ m \\ n-m \end{array} \begin{array}{c} m \\ \begin{pmatrix} R_{11} \\ 0 \end{pmatrix} \end{array}, \quad \text{if } n \geq m$$

or

$$R = \begin{array}{c} n \quad m-n \\ n \quad \begin{pmatrix} R_{11} & R_{12} \end{pmatrix} \end{array}, \quad \text{if } n < m$$

where R_{11} is upper triangular, and

$$T = \begin{array}{c} p-n \quad n \\ n \quad \begin{pmatrix} 0 & T_{12} \end{pmatrix} \end{array}, \quad \text{if } n \leq p,$$

$$T = \begin{array}{c} \\ n-p \\ p \end{array} \begin{array}{c} p \\ \begin{pmatrix} T_{11} \\ T_{21} \end{pmatrix} \end{array}, \quad \text{if } n > p,$$

where T_{12} or T_{21} is a *p*-by-*p* upper triangular matrix.

In particular, if *B* is square and nonsingular, the *GQR* factorization of *A* and *B* implicitly gives the *QR* factorization of $B^{-1}A$ as:

$B^{-1}*A = Z^{H}*(T^{-1}*R)$

Input Parameters

n	INTEGER. The number of rows of the matrices *A* and *B* (*n* ≥ 0).
m	INTEGER. The number of columns in *A* (*m* ≥ 0).
p	INTEGER. The number of columns in *B* (*p* ≥ 0).
a, *b*, *work*	REAL for sggqrf DOUBLE PRECISION for dggqrf COMPLEX for cggqrf

	DOUBLE COMPLEX for zggqrf. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *p*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; must be at least max(1, *n*, *m*, *p*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a, *b*	Overwritten by the factorization data as follows: on exit, the elements on and above the diagonal of the array *a* contain the min(*n*,*m*)-by-*m* upper trapezoidal matrix *R* (*R* is upper triangular if *n* ≥ *m*);the elements below the diagonal, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of min(*n*,*m*) elementary reflectors ; if *n* ≤ *p*, the upper triangle of the subarray *b*(1:*n*, *p*-*n*+1:*p*) contains the *n*-by-*n* upper triangular matrix *T*; if *n* > *p*, the elements on and above the (*n*-*p*)th subdiagonal contain the *n*-by-*p* upper trapezoidal matrix *T*; the remaining elements, with the array *taub*, represent the orthogonal/unitary matrix *Z* as a product of elementary reflectors.
taua, *taub*	REAL for sggqrf DOUBLE PRECISION for dggqrf COMPLEX for cggqrf DOUBLE COMPLEX for zggqrf. Arrays, DIMENSION at least max (1, min(*n*, *m*)) for *taua* and at least max (1, min(*n*, *p*)) for *taub*. The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*. The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `ggqrf` interface are the following:

a	Holds the matrix *A* of size (*n*,*m*).
b	Holds the matrix *B* of size (*n*,*p*).
taua	Holds the vector of length min(*n*,*m*).
taub	Holds the vector of length min(*n*,*p*).

Application Notes

For better performance, try using *lwork* ≥ max(*n*,*m*, *p*)*max(*nb1*,*nb2*,*nb3*), where *nb1* is the optimal blocksize for the *QR* factorization of an *n*-by-*m* matrix, *nb2* is the optimal blocksize for the *RQ* factorization of an *n*-by-*p* matrix, and *nb3* is the optimal blocksize for a call of ?ormqr/?unmqr.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ggrqf

Computes the generalized RQ factorization of two matrices.

Syntax

FORTRAN 77:

```
call sggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call dggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call cggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
call zggrqf (m, p, n, a, lda, taua, b, ldb, taub, work, lwork, info)
```

Fortran 95:

```
call ggrqf(a, b [,taua] [,taub] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine forms the generalized *RQ* factorization of an *m*-by-*n* matrix *A* and an *p*-by-*n* matrix *B* as *A* = *R***Q*, *B* = *Z***T***Q*, where *Q* is an *n*-by-*n* orthogonal/unitary matrix, *Z* is a *p*-by-*p* orthogonal/unitary matrix, and *R* and *T* assume one of the forms:

$$R = \begin{array}{c} \\ m \end{array} \begin{array}{c} \begin{array}{cc} n-m & m \end{array} \\ \begin{pmatrix} 0 & R_{12} \end{pmatrix} \end{array}, \quad \text{if } m \le n,$$

or

$$R = \begin{array}{c} m-n \\ n \end{array} \begin{array}{c} n \\ \begin{pmatrix} R_{11} \\ R_{21} \end{pmatrix} \end{array}, \quad \text{if } m > n,$$

where R_{11} or R_{21} is upper triangular, and

$$T = \begin{array}{c} \\ p-n \end{array} \begin{array}{c} \begin{array}{c} n \end{array} \\ \begin{pmatrix} T_{11} \\ 0 \end{pmatrix} \end{array}, \quad \text{if } p \ge n,$$

or

$$T = \begin{array}{c} \\ p \end{array} \begin{array}{c} \begin{array}{cc} p & n-p \end{array} \\ \begin{pmatrix} T_{11} & T_{12} \end{pmatrix} \end{array}, \quad \text{if } p < n,$$

where T_{11} is upper triangular.

In particular, if *B* is square and nonsingular, the *GRQ* factorization of *A* and *B* implicitly gives the *RQ* factorization of $A*B^{-1}$ as:

$A*B^{-1} = (R*T^{-1})*Z^H$

Input Parameters

m — `INTEGER`. The number of rows of the matrix *A* (*m* ≥ 0).

p — `INTEGER`. The number of rows in *B* (*p* ≥ 0).

n	INTEGER. The number of columns of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *work*	REAL for sggrqf DOUBLE PRECISION for dggrqf COMPLEX for cggrqf DOUBLE COMPLEX for zggrqf. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *p*).
lwork	INTEGER. The size of the *work* array; must be at least max(1, *n*, *m*, *p*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a, *b*	Overwritten by the factorization data as follows: on exit, if $m \leq n$, the upper triangle of the subarray *a*(1:*m*, *n*-*m*+1:*n*) contains the *m*-by-*m* upper triangular matrix *R*; if $m > n$, the elements on and above the (*m*-*n*)th subdiagonal contain the *m*-by-*n* upper trapezoidal matrix *R*; the remaining elements, with the array *taua*, represent the orthogonal/unitary matrix *Q* as a product of elementary reflectors; the elements on and above the diagonal of the array *b* contain the min(*p*,*n*)-by-*n* upper trapezoidal matrix *T* (*T* is upper triangular if $p \geq n$); the elements below the diagonal, with the array *taub*, represent the orthogonal/unitary matrix *Z* as a product of elementary reflectors.
taua, *taub*	REAL for sggrqf DOUBLE PRECISION for dggrqf COMPLEX for cggrqf DOUBLE COMPLEX for zggrqf. Arrays, DIMENSION at least max (1, min(*m*, *n*)) for *taua* and at least max (1, min(*p*, *n*)) for *taub*. The array *taua* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Q*. The array *taub* contains the scalar factors of the elementary reflectors which represent the orthogonal/unitary matrix *Z*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggrqf interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix *A* of size (*p*,*n*).
taua	Holds the vector of length min(*m*,*n*).
taub	Holds the vector of length min(*p*,*n*).

Application Notes

For better performance, try using

lwork ≥ max(*n*,*m*, *p*)*max(*nb1*,*nb2*,*nb3*),

where *nb1* is the optimal blocksize for the *RQ* factorization of an *m*-by-*n* matrix, *nb2* is the optimal blocksize for the *QR* factorization of an *p*-by-*n* matrix, and *nb3* is the optimal blocksize for a call of ?ormrq/?unmrq.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork*= -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork*= -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Singular Value Decomposition

This section describes LAPACK routines for computing the *singular value decomposition* (SVD) of a general *m*-by-*n* matrix *A*:

$A = U\Sigma V^H$.

In this decomposition, *U* and *V* are unitary (for complex *A*) or orthogonal (for real *A*); Σ is an *m*-by-*n* diagonal matrix with real diagonal elements σ_i:

$\sigma_1 < \sigma_2 < \ldots < \sigma_{\min(m,\ n)} < 0$.

The diagonal elements σ_i are *singular values* of *A*. The first min(*m*, *n*) columns of the matrices *U* and *V* are, respectively, *left* and *right singular vectors* of *A*. The singular values and singular vectors satisfy

$Av_i = \sigma_i u_i$ and $A^H u_i = \sigma_i v_i$

where u_i and v_i are the i-th columns of U and V, respectively.

To find the SVD of a general matrix A, call the LAPACK routine ?gebrd or ?gbbrd for reducing A to a bidiagonal matrix B by a unitary (orthogonal) transformation: $A = QBP^H$. Then call ?bdsqr, which forms the SVD of a bidiagonal matrix: $B = U_1 \Sigma V_1^H$.

Thus, the sought-for SVD of A is given by $A = U\Sigma V^H = (QU_1)\Sigma(V_1^H P^H)$.

Table 4-2 lists LAPACK routines (FORTRAN 77 interface) that perform singular value decomposition of matrices. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-2 Computational Routines for Singular Value Decomposition (SVD)

Operation	Real matrices	Complex matrices
Reduce A to a bidiagonal matrix B: $A = QBP^H$ (full storage)	?gebrd	?gebrd
Reduce A to a bidiagonal matrix B: $A = QBP^H$ (band storage)	?gbbrd	?gbbrd
Generate the orthogonal (unitary) matrix Q or P	?orgbr	?ungbr
Apply the orthogonal (unitary) matrix Q or P	?ormbr	?unmbr
Form singular value decomposition of the bidiagonal matrix B: $B = U\Sigma V^H$	?bdsqr ?bdsdc	?bdsqr

Figure 4-1 Decision Tree: Singular Value Decomposition

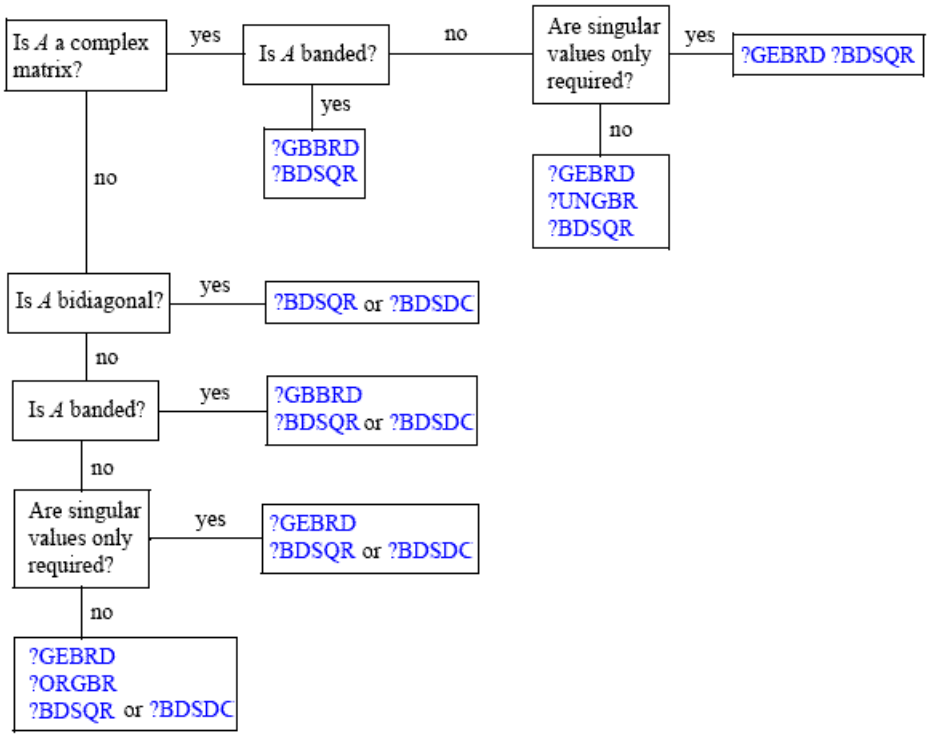

Figure 4-1 "Decision Tree: Singular Value Decomposition" presents a decision tree that helps you choose the right sequence of routines for SVD, depending on whether you need singular values only or singular vectors as well, whether *A* is real or complex, and so on.

You can use the SVD to find a minimum-norm solution to a (possibly) rank-deficient least squares problem of minimizing $||Ax - b||^2$. The effective rank *k* of the matrix *A* can be determined as the number of singular values which exceed a suitable threshold. The minimum-norm solution is

$x = V_k(\Sigma_k)^{-1}c$

where Σ_k is the leading *k*-by-*k* submatrix of Σ, the matrix V_k consists of the first *k* columns of $V = PV_1$, and the vector *c* consists of the first *k* elements of $U^Hb = U_1^HQ^Hb$.

?gebrd

Reduces a general matrix to bidiagonal form.

Syntax

FORTRAN 77:

```
call sgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call dgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
```

```
call cgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
call zgebrd(m, n, a, lda, d, e, tauq, taup, work, lwork, info)
```

Fortran 95:

```
call gebrd(a [, d] [,e] [,tauq] [,taup] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a general *m*-by-*n* matrix *A* to a bidiagonal matrix *B* by an orthogonal (unitary) transformation.

If $m \geq n$, the reduction is given by

$$A = QBP^H = Q\begin{pmatrix} B_1 \\ 0 \end{pmatrix} P^H = Q_1 B_1 P^H,$$

where B_1 is an *n*-by-*n* upper diagonal matrix, *Q* and *P* are orthogonal or, for a complex *A*, unitary matrices; Q_1 consists of the first *n* columns of *Q*.

If $m < n$, the reduction is given by

$A = Q*B*P^H = Q*(B_1 0)*P^H = Q_1*B_1*P_1{}^H$,

where B_1 is an *m*-by-*m* lower diagonal matrix, *Q* and *P* are orthogonal or, for a complex *A*, unitary matrices; P_1 consists of the first *m* rows of *P*.

The routine does not form the matrices *Q* and *P* explicitly, but represents them as products of elementary reflectors. Routines are provided to work with the matrices *Q* and *P* in this representation:

If the matrix *A* is real,

- to compute *Q* and *P* explicitly, call `?orgbr`.
- to multiply a general matrix by *Q* or *P*, call `?ormbr`.

If the matrix *A* is complex,

- to compute *Q* and *P* explicitly, call `?ungbr`.
- to multiply a general matrix by *Q* or *P*, call `?unmbr`.

Input Parameters

m	INTEGER. The number of rows in the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns in *A* ($n \geq 0$).
a, *work*	REAL for sgebrd DOUBLE PRECISION for dgebrd COMPLEX for cgebrd DOUBLE COMPLEX for zgebrd. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).

	work is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
lwork	INTEGER. The dimension of *work*; at least max(1, *m*, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	If $m \geq n$, the diagonal and first super-diagonal of *a* are overwritten by the upper bidiagonal matrix *B*. Elements below the diagonal are overwritten by details of *Q*, and the remaining elements are overwritten by details of *P*. If $m < n$, the diagonal and first sub-diagonal of *a* are overwritten by the lower bidiagonal matrix *B*. Elements above the diagonal are overwritten by details of *P*, and the remaining elements are overwritten by details of *Q*.
d	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains the diagonal elements of *B*.
e	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*) - 1). Contains the off-diagonal elements of *B*.
tauq, *taup*	REAL for sgebrd DOUBLE PRECISION for dgebrd COMPLEX for cgebrd DOUBLE COMPLEX for zgebrd. Arrays, DIMENSION at least max (1, min(*m*, *n*)). Contain further details of the matrices *Q* and *P*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gebrd interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).

d	Holds the vector of length min(*m*, *n*).
e	Holds the vector of length min(*m*, *n*)-1.
tauq	Holds the vector of length min(*m*, *n*).
taup	Holds the vector of length min(*m*, *n*).

Application Notes

For better performance, try using *lwork* = (*m* + *n*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrices *Q*, *B*, and *P* satisfy $QBP^H = A + E$, where $||E||_2 = c(n)\varepsilon ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is

$(4/3)*n^2*(3*m - n)$ for $m \geq n$,

$(4/3)*m^2*(3*n - m)$ for $m < n$.

The number of operations for complex flavors is four times greater.

If *n* is much less than *m*, it can be more efficient to first form the *QR* factorization of *A* by calling ?geqrf and then reduce the factor *R* to bidiagonal form. This requires approximately $2*n^2*(m + n)$ floating-point operations.

If *m* is much less than *n*, it can be more efficient to first form the *LQ* factorization of *A* by calling ?gelqf and then reduce the factor *L* to bidiagonal form. This requires approximately $2*m^2*(m + n)$ floating-point operations.

?gbbrd

Reduces a general band matrix to bidiagonal form.

Syntax

FORTRAN 77:

call sgbbrd(*vect*, *m*, *n*, *ncc*, *kl*, *ku*, *ab*, *ldab*, *d*, *e*, *q*, *ldq*, *pt*, *ldpt*, *c*, *ldc*, *work*, *info*)

call dgbbrd(*vect*, *m*, *n*, *ncc*, *kl*, *ku*, *ab*, *ldab*, *d*, *e*, *q*, *ldq*, *pt*, *ldpt*, *c*, *ldc*, *work*, *info*)

`call cgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work, rwork, info)`

`call zgbbrd(vect, m, n, ncc, kl, ku, ab, ldab, d, e, q, ldq, pt, ldpt, c, ldc, work, rwork, info)`

Fortran 95:

`call gbbrd(ab [, c] [,d] [,e] [,q] [,pt] [,kl] [,m] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces an *m*-by-*n* band matrix *A* to upper bidiagonal matrix *B*: $A = Q*B*P^H$. Here the matrices *Q* and *P* are orthogonal (for real *A*) or unitary (for complex *A*). They are determined as products of Givens rotation matrices, and may be formed explicitly by the routine if required. The routine can also update a matrix *C* as follows: $C = Q^H*C$.

Input Parameters

vect	CHARACTER*1. Must be 'N' or 'Q' or 'P' or 'B'. If *vect* = 'N', neither *Q* nor P^H is generated. If *vect* = 'Q', the routine generates the matrix *Q*. If *vect* = 'P', the routine generates the matrix P^H. If *vect* = 'B', the routine generates both *Q* and P^H.
m	INTEGER. The number of rows in the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns in *A* (*n* ≥ 0).
ncc	INTEGER. The number of columns in *C* (*ncc* ≥ 0).
kl	INTEGER. The number of sub-diagonals within the band of *A* (*kl* ≥ 0).
ku	INTEGER. The number of super-diagonals within the band of *A* (*ku* ≥ 0).
ab, *c*, *work*	REAL for sgbbrd DOUBLE PRECISION for dgbbrd COMPLEX for cgbbrd DOUBLE COMPLEX for zgbbrd. Arrays: *ab*(*ldab*,*) contains the matrix *A* in band storage (see Matrix Storage Schemes). The second dimension of *a* must be at least max(1, *n*). *c*(*ldc*,*) contains an *m*-by-*ncc* matrix *C*. If *ncc* = 0, the array *c* is not referenced. The second dimension of *c* must be at least max(1, *ncc*). *work*(*) is a workspace array. The dimension of *work* must be at least 2*max(*m*, *n*) for real flavors, or max(*m*, *n*) for complex flavors.
ldab	INTEGER. The first dimension of the array *ab* (*ldab* ≥ *kl* + *ku* + 1).

ldq	INTEGER. The first dimension of the output array *q*. *ldq* ≥ max(1, *m*) if *vect* = 'Q' or 'B', *ldq* ≥ 1 otherwise.
ldpt	INTEGER. The first dimension of the output array *pt*. *ldpt* ≥ max(1, *n*) if *vect* = 'P' or 'B', *ldpt* ≥ 1 otherwise.
ldc	INTEGER. The first dimension of the array *c*. *ldc* ≥ max(1, *m*) if *ncc* > 0; *ldc* ≥ 1 if *ncc* = 0.
rwork	REAL for cgbbrd DOUBLE PRECISION for zgbbrd. A workspace array, DIMENSION at least max(*m*, *n*).

Output Parameters

ab	Overwritten by values generated during the reduction.
d	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*)). Contains the diagonal elements of the matrix *B*.
e	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*) - 1). Contains the off-diagonal elements of *B*.
q, *pt*	REAL for sgebrd DOUBLE PRECISION for dgebrd COMPLEX for cgebrd DOUBLE COMPLEX for zgebrd. Arrays: *q*(*ldq*,*) contains the output *m*-by-*m* matrix *Q*. The second dimension of *q* must be at least max(1, *m*). *p*(*ldpt*,*) contains the output *n*-by-*n* matrix P^T. The second dimension of *pt* must be at least max(1, *n*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gbbrd interface are the following:

ab	Holds the array *A* of size (*kl*+*ku*+1, *n*).
c	Holds the matrix *C* of size (*m*, *ncc*).
d	Holds the vector with the number of elements min(*m*, *n*).
e	Holds the vector with the number fo elements min(*m*, *n*)-1.
q	Holds the matrix *Q* of size (*m*, *m*).
pt	Holds the matrix *PT* of size (*n*, *n*).

m	If omitted, assumed *m* = *n*.
kl	If omitted, assumed *kl* = *ku*.
ku	Restored as *ku* = *lda*-*kl*-1.
vect	Restored based on the presence of arguments *q* and pt as follows: *vect* = 'B', if both *q* and *pt* are present, *vect* = 'Q', if *q* is present and *pt* omitted, *vect* = 'P', if *q* is omitted and *pt* present, *vect* = 'N', if both *q* and *pt* are omitted.

Application Notes

The computed matrices *Q*, *B*, and *P* satisfy $Q*B*P^H = A + E$, where $||E||_2 = c(n)\varepsilon\ ||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

If *m* = *n*, the total number of floating-point operations for real flavors is approximately the sum of:

$6*n^2*(kl + ku)$ if *vect* = 'N' and *ncc* = 0,

$3*n^2*ncc*(kl + ku - 1)/(kl + ku)$ if *C* is updated, and

$3*n^3*(kl + ku - 1)/(kl + ku)$ if either *Q* or P^H is generated (double this if both).

To estimate the number of operations for complex flavors, use the same formulas with the coefficients 20 and 10 (instead of 6 and 3).

?orgbr

Generates the real orthogonal matrix Q or P^T determined by ?gebrd.

Syntax

FORTRAN 77:

```
call sorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call dorgbr(vect, m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgbr(a, tau [,vect] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates the whole or part of the orthogonal matrices *Q* and P_T formed by the routines sgebrd/dgebrd. Use this routine after a call to sgebrd/dgebrd. All valid combinations of arguments are described in *Input parameters*. In most cases you need the following:

To compute the whole *m*-by-*m* matrix *Q*:

```
call ?orgbr('Q', m, m, n, a ... )
```

(note that the array *a* must have at least *m* columns).

To form the *n* leading columns of *Q* if *m* > *n*:

```
call ?orgbr('Q', m, n, n, a ... )
```

To compute the whole *n*-by-*n* matrix P^T:

```
call ?orgbr('P', n, n, m, a ... )
```

(note that the array *a* must have at least *n* rows).

To form the *m* leading rows of P_T if *m* < *n*:

```
call ?orgbr('P', m, n, m, a ... )
```

Input Parameters

vect	CHARACTER*1. Must be 'Q' or 'P'. If *vect* = 'Q', the routine generates the matrix *Q*. If *vect* = 'P', the routine generates the matrix P^T.
m	INTEGER. The number of required rows of *Q* or P^T.
n	INTEGER. The number of required columns of *Q* or P^T.
k	INTEGER. One of the dimensions of *A* in ?gebrd: If *vect* = 'Q', the number of columns in *A*; If *vect* = 'P', the number of rows in *A*. Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$. For *vect* = 'Q': $k \leq n \leq m$ if $m > k$, or $m = n$ if $m \leq k$. For *vect* = 'P': $k \leq m \leq n$ if $n > k$, or $m = n$ if $n \leq k$.
a, *work*	REAL for sorgbr DOUBLE PRECISION for dorgbr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?gebrd. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
tau	REAL for sorgbr DOUBLE PRECISION for dorgbr. For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd. The dimension of *tau* must be at least max(1, min(*m*, *k*)) for *vect* = 'Q', or max(1, min(*m*, *k*)) for *vect* = 'P'.
lwork	INTEGER. The size of the *work* array. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the orthogonal matrix *Q* or P^T (or the leading rows or columns thereof) as specified by *vect*, *m*, and *n*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine orgbr interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
tau	Holds the vector of length min(*m*, *k*) where *k* = *m*, if *vect* = 'P', *k* = *n*, if *vect* = 'Q'.
vect	Must be 'Q' or 'P'. The default value is 'Q'.

Application Notes

For better performance, try using *lwork* = min(*m*, *n*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The approximate numbers of floating-point operations for the cases listed in *Description* are as follows:

To form the whole of *Q*:

(4/3)**n**(3*m*^{2} - 3*m***n* + *n*^{2}) if *m* > *n*;

(4/3)**m*^{3} if *m* ≤ *n*.

To form the *n* leading columns of *Q* when *m* > *n*:

(2/3)**n*^{2}*(3*m* - *n*^{2}) if *m* > *n*.

To form the whole of P^T:

`(4/3)*`n^3 if $m \geq n$;

`(4/3)*`m`*(3`n^2 `- 3`m`*`n `+` m^2`)` if $m < n$.

To form the m leading columns of P^T when $m < n$:

`(2/3)*`n^2`*(3`m `-` n^2`)` if $m > n$.

The complex counterpart of this routine is ?ungbr.

?ormbr

Multiplies an arbitrary real matrix by the real orthogonal matrix Q or P^T determined by ?gebrd.

Syntax

FORTRAN 77:

```
call sormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call dormbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormbr(a, tau, c [,vect] [,side] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

Given an arbitrary real matrix C, this routine forms one of the matrix products $Q*C$, Q^T*C, $C*Q$, $C*Q$, ^{T}, $P*C$, P^T*C, $C*P$, $C*P^T$, where Q and P are orthogonal matrices computed by a call to sgebrd/dgebrd. The routine overwrites the product on C.

Input Parameters

In the descriptions below, r denotes the order of Q or P^T:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

vect	CHARACTER*1. Must be 'Q' or 'P'. If *vect* = 'Q', then Q or Q^T is applied to C. If *vect* = 'P', then P or P_T is applied to C.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', multipliers are applied to C from the left. If *side* = 'R', they are applied to C from the right.
trans	CHARACTER*1. Must be 'N' or 'T'. If *trans* = 'N', then Q or P is applied to C. If *trans* = 'T', then Q^T or P^T is applied to C.
m	INTEGER. The number of rows in C.

n	INTEGER. The number of columns in *C*.
k	INTEGER. One of the dimensions of *A* in ?gebrd: If *vect* = 'Q', the number of columns in *A*; If *vect* = 'P', the number of rows in *A*. Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.
a, *c*, *work*	REAL for sormbr DOUBLE PRECISION for dormbr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?gebrd. Its second dimension must be at least max(1, min(*r*,*k*)) for *vect* = 'Q', or max(1, *r*)) for *vect* = 'P'. *c*(*ldc*,*) holds the matrix *C*. Its second dimension must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*. Constraints: *lda* ≥ max(1, *r*) if *vect* = 'Q'; *lda* ≥ max(1, min(*r*,*k*)) if *vect* = 'P'.
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *m*).
tau	REAL for sormbr DOUBLE PRECISION for dormbr. Array, DIMENSION at least max (1, min(*r*, *k*)). For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^T**C*, *C***Q*, *C***Q*, ^{T}, *P***C*, P^T**C*, *C***P*, or *C***P*^{T}, as specified by *vect*, *side*, and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `ormbr` interface are the following:

a	Holds the matrix *A* of size (*r*,min(*nq*, *k*)) where *r* = *nq*, if *vect* = 'Q', *r* = min(*nq*, *k*), if *vect* = 'P', *nq* = *m*, if *side* = 'L', *nq* = *n*, if *side* = 'R', *k* = *m*, if *vect* = 'P', *k* = *n*, if *vect* = 'Q'.
tau	Holds the vector of length min(*nq*, *k*).
c	Holds the matrix *C* of size (*m*, *n*).
vect	Must be 'Q' or 'P'. The default value is 'Q'.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using

lwork = *n***blocksize* for *side* = 'L', or

lwork = *m***blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$.

The total number of floating-point operations is approximately

2**n***k*(2**m* - *k*) if *side* = 'L' and *m* ≥ *k*;

2**m***k*(2**n* - *k*) if *side* = 'R' and *n* ≥ *k*;

$2*m^2*n$ if *side* = 'L' and *m* < *k*;

$2*n^2*m$ if *side* = 'R' and $n < k$.

The complex counterpart of this routine is ?unmbr.

?ungbr

Generates the complex unitary matrix Q or P^H determined by ?gebrd.

Syntax

FORTRAN 77:

```
call cungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
call zungbr(vect, m, n, k, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungbr(a, tau [,vect] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine generates the whole or part of the unitary matrices *Q* and P_H formed by the routines cgebrd/zgebrd. Use this routine after a call to cgebrd/zgebrd. All valid combinations of arguments are described in *Input Parameters*;in most cases you need the following:

To compute the whole *m*-by-*m* matrix *Q*, use:

```
call ?ungbr('Q', m, m, n, a ... )
```

(note that the array *a* must have at least *m* columns).

To form the *n* leading columns of *Q* if $m > n$, use:

```
call ?ungbr('Q', m, n, n, a ... )
```

To compute the whole *n*-by-*n* matrix P^H, use:

```
call ?ungbr('P', n, n, m, a ... )
```

(note that the array *a* must have at least *n* rows).

To form the *m* leading rows of P_H if $m < n$, use:

```
call ?ungbr('P', m, n, m, a ... )
```

Input Parameters

vect	CHARACTER*1. Must be 'Q' or 'P'. If *vect* = 'Q', the routine generates the matrix *Q*. If *vect* = 'P', the routine generates the matrix P^H.
m	INTEGER. The number of required rows of *Q* or P^H.
n	INTEGER. The number of required columns of *Q* or P^H.
k	INTEGER. One of the dimensions of *A* in ?gebrd:

If *vect* = 'Q', the number of columns in *A*;
If *vect* = 'P', the number of rows in *A*.

Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.

For *vect* = 'Q': $k \leq n \leq m$ if $m > k$, or $m = n$ if $m \leq k$.

For *vect* = 'P': $k \leq m \leq n$ if $n > k$, or $m = n$ if $n \leq k$.

a, *work*
COMPLEX for cungbr
DOUBLE COMPLEX for zungbr.
Arrays:
a(*lda*,*) is the array *a* as returned by ?gebrd.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The first dimension of *a*; at least max(1, *m*).

tau
COMPLEX for cungbr
DOUBLE COMPLEX for zungbr.
For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.
The dimension of *tau* must be at least max(1, min(*m*, *k*)) for *vect* = 'Q', or max(1, min(*m*, *k*)) for *vect* = 'P'.

lwork
INTEGER. The size of the *work* array.
Constraint: *lwork* < max(1, min(*m*, *n*)).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a
Overwritten by the orthogonal matrix Q or P^T (or the leading rows or columns thereof) as specified by *vect*, *m*, and *n*.

work(1)
If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ungbr interface are the following:

a
Holds the matrix *A* of size (*m*, *n*).

tau
Holds the vector of length min(*m*, *k*) where
k = *m*, if *vect* = 'P',
k = *n*, if *vect* = 'Q'.

vect	Must be 'Q' or 'P'. The default value is 'Q'.

Application Notes

For better performance, try using *lwork* = min(*m*,*n*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The approximate numbers of possible floating-point operations are listed below:

To compute the whole matrix *Q*:

$(16/3)n(3m^2 - 3m*n + n^2)$ if $m > n$;

$(16/3)m^3$ if $m \le n$.

To form the *n* leading columns of *Q* when $m > n$:

$(8/3)n^2(3m - n^2)$.

To compute the whole matrix P^H:

$(16/3)n^3$ if $m \ge n$;

$(16/3)m(3n^2 - 3m*n + m^2)$ if $m < n$.

To form the *m* leading columns of P^H when $m < n$:

$(8/3)n^2(3m - n^2)$ if $m > n$.

The real counterpart of this routine is ?orgbr.

?unmbr

Multiplies an arbitrary complex matrix by the unitary matrix Q or P determined by ?gebrd.

Syntax

FORTRAN 77:

```
call cunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
call zunmbr(vect, side, trans, m, n, k, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

`call unmbr(a, tau, c [,vect] [,side] [,trans] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

Given an arbitrary complex matrix C, this routine forms one of the matrix products $Q*C$, Q^H*C, $C*Q$, $C*Q^H$, $P*C$, P^H*C, $C*P$, or $C*P^H$, where Q and P are unitary matrices computed by a call to `cgebrd`/`zgebrd`. The routine overwrites the product on C.

Input Parameters

In the descriptions below, r denotes the order of Q or P^H:

If $side$ = 'L', $r = m$; if $side$ = 'R', $r = n$.

vect	CHARACTER*1. Must be 'Q' or 'P'. If *vect* = 'Q', then Q or Q^H is applied to C. If *vect* = 'P', then P or P^H is applied to C.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', multipliers are applied to C from the left. If *side* = 'R', they are applied to C from the right.
trans	CHARACTER*1. Must be 'N' or 'C'. If *trans* = 'N', then Q or P is applied to C. If *trans* = 'C', then Q^H or P^H is applied to C.
m	INTEGER. The number of rows in C.
n	INTEGER. The number of columns in C.
k	INTEGER. One of the dimensions of A in ?gebrd: If *vect* = 'Q', the number of columns in A; If *vect* = 'P', the number of rows in A. Constraints: $m \geq 0$, $n \geq 0$, $k \geq 0$.
a, *c*, *work*	COMPLEX for cunmbr DOUBLE COMPLEX for zunmbr. Arrays: *a*(*lda*,*) is the array a as returned by ?gebrd. Its second dimension must be at least max(1, min(r,k)) for *vect* = 'Q', or max(1, r)) for *vect* = 'P'. *c*(*ldc*,*) holds the matrix C. Its second dimension must be at least max(1, n). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of a. Constraints: *lda* ≥ max(1, r) if *vect* = 'Q'; *lda* ≥ max(1, min(r,k)) if *vect* = 'P'.
ldc	INTEGER. The first dimension of c; *ldc* ≥ max(1, m).

tau	COMPLEX for cunmbr DOUBLE COMPLEX for zunmbr. Array, DIMENSION at least max (1, min(*r*, *k*)). For *vect* = 'Q', the array *tauq* as returned by ?gebrd. For *vect* = 'P', the array *taup* as returned by ?gebrd.
lwork	INTEGER. The size of the *work* array. *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. *lwork* ≥ 1 if *n*=0 or *m*=0. For optimum performance *lwork* ≥ max(1,*n***nb*) if *side* = 'L', and *lwork* ≥ max(1,*m***nb*) if *side* = 'R', where *nb* is the optimal blocksize. (*nb* = 0 if *m* = 0 or *n* = 0.) If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, *C**Q^H, *P***C*, P^H**C*, *C***P*, or *C**P^H, as specified by *vect*, *side*, and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmbr interface are the following:

a	Holds the matrix *A* of size (*r*,min(*nq*, *k*)) where *r* = *nq*, if *vect* = 'Q', *r* = min(*nq*, *k*), if *vect* = 'P', *nq* = *m*, if *side* = 'L', *nq* = *n*, if *side* = 'R', *k* = *m*, if *vect* = 'P', *k* = *n*, if *vect* = 'Q'.
tau	Holds the vector of length min(*nq*, *k*).
c	Holds the matrix *C* of size (*m*, *n*).
vect	Must be 'Q' or 'P'. The default value is 'Q'.
side	Must be 'L' or 'R'. The default value is 'L'.

trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, use

lwork = *n***blocksize* for *side* = 'L', or

lwork = *m***blocksize* for *side* = 'R',

where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $||E||_2 = O(\varepsilon)*||C||_2$.

The total number of floating-point operations is approximately

8**n***k*(2**m* - *k*) if *side* = 'L' and $m \geq k$;

8**m***k*(2**n* - *k*) if *side* = 'R' and $n \geq k$;

$8*m^2*n$ if *side* = 'L' and $m < k$;

$8*n^2*m$ if *side* = 'R' and $n < k$.

The real counterpart of this routine is ?ormbr.

?bdsqr

Computes the singular value decomposition of a general matrix that has been reduced to bidiagonal form.

Syntax

FORTRAN 77:

```
call sbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call dbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call cbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
call zbdsqr(uplo, n, ncvt, nru, ncc, d, e, vt, ldvt, u, ldu, c, ldc, work, info)
```

Fortran 95:

```
call rbdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
call bdsqr(d, e [,vt] [,u] [,c] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the singular values and, optionally, the right and/or left singular vectors from the Singular Value Decomposition (SVD) of a real *n*-by-*n* (upper or lower) bidiagonal matrix *B* using the implicit zero-shift *QR* algorithm. The SVD of *B* has the form $B = Q*S*P^H$ where *S* is the diagonal matrix of singular values, *Q* is an orthogonal matrix of left singular vectors, and *P* is an orthogonal matrix of right singular vectors. If left singular vectors are requested, this subroutine actually returns *U* **Q* instead of *Q*, and, if right singular vectors are requested, this subroutine returns P_H **VT* instead of P_H, for given real/complex input matrices *U* and *VT*. When *U* and *VT* are the orthogonal/unitary matrices that reduce a general matrix *A* to bidiagonal form: *A* = *U***B***VT*, as computed by `?gebrd`, then

$A = (U*Q)*S*(P^H*VT)$

is the SVD of *A*. Optionally, the subroutine may also compute Q_H **C* for a given real/complex input matrix *C*.

See also `?lasq1`, `?lasq2`, `?lasq3`, `?lasq4`, `?lasq5`, `?lasq6` used by this routine.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = `'U'`, *B* is an upper bidiagonal matrix. If *uplo* = `'L'`, *B* is a lower bidiagonal matrix.
n	`INTEGER`. The order of the matrix *B* (*n* ≥ 0).
ncvt	`INTEGER`. The number of columns of the matrix *VT*, that is, the number of right singular vectors (*ncvt* ≥ 0). Set *ncvt* = 0 if no right singular vectors are required.
nru	`INTEGER`. The number of rows in *U*, that is, the number of left singular vectors (*nru* ≥ 0). Set *nru* = 0 if no left singular vectors are required.
ncc	`INTEGER`. The number of columns in the matrix *C* used for computing the product Q^H*C (*ncc* ≥ 0). Set *ncc* = 0 if no matrix *C* is supplied.
d, *e*, *work*	`REAL` for single-precision flavors `DOUBLE PRECISION` for double-precision flavors. Arrays: *d*(*) contains the diagonal elements of *B*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the (*n*-1) off-diagonal elements of *B*. The dimension of *e* must be at least max(1, *n*). *e*(*n*) is used for workspace. *work*(*) is a workspace array.

	The dimension of *work* must be at least max(1, 4*n).
vt, *u*, *c*	REAL for sbdsqr DOUBLE PRECISION for dbdsqr COMPLEX for cbdsqr DOUBLE COMPLEX for zbdsqr. Arrays: *vt*(*ldvt*,*) contains an *n*-by-*ncvt* matrix *VT*. The second dimension of *vt* must be at least max(1, *ncvt*). *vt* is not referenced if *ncvt* = 0. *u*(*ldu*,*) contains an *nru* by *n* unit matrix *U*. The second dimension of *u* must be at least max(1, *n*). *u* is not referenced if *nru* = 0. *c*(*ldc*,*) contains the matrix *C* for computing the product Q^H*C. The second dimension of *c* must be at least max(1, *ncc*). The array is not referenced if *ncc* = 0.
ldvt	INTEGER. The first dimension of *vt*. Constraints: *ldvt* ≥ max(1, *n*) if *ncvt* > 0; *ldvt* ≥ 1 if *ncvt* = 0.
ldu	INTEGER. The first dimension of *u*. Constraint: *ldu* ≥ max(1, *nru*).
ldc	INTEGER. The first dimension of *c*. Constraints: *ldc* ≥ max(1, *n*) if *ncc* > 0; *ldc* ≥ 1 otherwise.

Output Parameters

d	On exit, if *info* = 0, overwritten by the singular values in decreasing order (see *info*).
e	On exit, if *info* = 0, *e* is destroyed. See also *info* below.
c	Overwritten by the product Q^H*C.
vt	On exit, this array is overwritten by P^H*VT.
u	On exit, this array is overwritten by *U* *Q* .
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* > *i*, if *ncvt* = *nru* = *ncc* = 0, • *info* = 1, a split was marked by a positive value in *e* • *info* = 2, the current block of *z* not diagonalized after 30**n* iterations (in the inner while loop) • *info* = 3, termination criterion of the outer while loop is not met (the program created more than *n* unreduced blocks).

In all other cases when *ncvt* = *nru* = *ncc* = 0, the algorithm did not converge; *d* and *e* contain the elements of a bidiagonal matrix that is orthogonally similar to the input matrix *B*; if *info* = *i*, *i* elements of *e* have not converged to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `bdsqr` interface are the following:

d	Holds the vector of length (*n*).
e	Holds the vector of length (*n*).
vt	Holds the matrix *VT* of size (*n*, *ncvt*).
u	Holds the matrix *U* of size (*nru*,*n*).
c	Holds the matrix *C* of size (*n*,*ncc*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.
ncvt	If argument *vt* is present, then *ncvt* is equal to the number of columns in matrix *VT*; otherwise, *ncvt* is set to zero.
nru	If argument *u* is present, then *nru* is equal to the number of rows in matrix *U*; otherwise, *nru* is set to zero.
ncc	If argument *c* is present, then *ncc* is equal to the number of columns in matrix *C*; otherwise, *ncc* is set to zero.

Note that two variants of Fortran 95 interface for `bdsqr` routine are needed because of an ambiguous choice between real and complex cases appear when *vt*, *u*, and *c* are omitted. Thus, the name `rbdsqr` is used in real cases (single or double precision), and the name `bdsqr` is used in complex cases (single or double precision).

Application Notes

Each singular value and singular vector is computed to high relative accuracy. However, the reduction to bidiagonal form (prior to calling the routine) may decrease the relative accuracy in the small singular values of the original matrix if its singular values vary widely in magnitude.

If s_i is an exact singular value of *B*, and s_i is the corresponding computed value, then

$|s_i - \sigma_i| \le p(m,n)*\varepsilon*\sigma_i$

where $p(m, n)$ is a modestly increasing function of *m* and *n*, and ε is the machine precision.

If only singular values are computed, they are computed more accurately than when some singular vectors are also computed (that is, the function $p(m, n)$ is smaller).

If u_i is the corresponding exact left singular vector of *B*, and w_i is the corresponding computed left singular vector, then the angle $\theta(u_i, w_i)$ between them is bounded as follows:

$\theta(u_i, w_i) \le p(m,n)*\varepsilon / \min_{i \ne j}(|\sigma i - \sigma j|/|\sigma_i + \sigma j|)$.

Here $\min_{i \ne j}(|\sigma_i - \sigma_j|/|\sigma_i + \sigma_j|)$ is the *relative gap* between σ_i and the other singular values. A similar error bound holds for the right singular vectors.

The total number of real floating-point operations is roughly proportional to n^2 if only the singular values are computed. About $6n^2*nru$ additional operations ($12n^2*nru$ for complex flavors) are required to compute the left singular vectors and about $6n^2*ncvt$ operations ($12n^2*ncvt$ for complex flavors) to compute the right singular vectors.

?bdsdc

Computes the singular value decomposition of a real bidiagonal matrix using a divide and conquer method.

Syntax

FORTRAN 77:

```
call sbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
call dbdsdc(uplo, compq, n, d, e, u, ldu, vt, ldvt, q, iq, work, iwork, info)
```

Fortran 95:

```
call bdsdc(d, e [,u] [,vt] [,q] [,iq] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the Singular Value Decomposition (SVD) of a real n-by-n (upper or lower) bidiagonal matrix B: $B = U*\Sigma*V^T$, using a divide and conquer method, where Σ is a diagonal matrix with non-negative diagonal elements (the singular values of B), and U and V are orthogonal matrices of left and right singular vectors, respectively. `?bdsdc` can be used to compute all singular values, and optionally, singular vectors or singular vectors in compact form.

This rotuine uses `?lasd0`, `?lasd1`, `?lasd2`, `?lasd3`, `?lasd4`, `?lasd5`, `?lasd6`, `?lasd7`, `?lasd8`, `?lasd9`, `?lasda`, `?lasdq`, `?lasdt`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = `'U'`, B is an upper bidiagonal matrix. If *uplo* = `'L'`, B is a lower bidiagonal matrix.
compq	`CHARACTER*1`. Must be `'N'`, `'P'`, or `'I'`. If *compq* = `'N'`, compute singular values only. If *compq* = `'P'`, compute singular values and compute singular vectors in compact form. If *compq* = `'I'`, compute singular values and singular vectors.
n	`INTEGER`. The order of the matrix B ($n \geq 0$).
d, *e*, *work*	`REAL` for `sbdsdc` `DOUBLE PRECISION` for `dbdsdc`. Arrays: *d(*)* contains the n diagonal elements of the bidiagonal matrix B.

The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of the bidiagonal matrix *B*.
The dimension of *e* must be at least max(1, *n*).
work(*) is a workspace array.
The dimension of *work* must be at least:
max(1, 4**n*), if *compq* = 'N';
max(1, 6**n*), if *compq* = 'P';
max(1, 3**n*^{2}+4**n*), if *compq* = 'I'.

ldu — INTEGER. The first dimension of the output array *u*; *ldu* ≥ 1.
If singular vectors are desired, then *ldu* ≥ max(1, *n*).

ldvt — INTEGER. The first dimension of the output array *vt*; *ldvt* ≥ 1.
If singular vectors are desired, then *ldvt* ≥ max(1, *n*).

iwork — INTEGER. Workspace array, dimension at least max(1, 8**n*).

Output Parameters

d — If *info* = 0, overwritten by the singular values of *B*.

e — On exit, *e* is overwritten.

u, *vt*, *q* — REAL for sbdsdc
DOUBLE PRECISION for dbdsdc.
Arrays: *u*(*ldu*,*), *vt*(*ldvt*,*), *q*(*).
If *compq* = 'I', then on exit *u* contains the left singular vectors of the bidiagonal matrix *B*, unless *info* ≠ 0 (*seeinfo*). For other values of *compq*, *u* is not referenced.
The second dimension of *u* must be at least max(1,*n*).
if *compq* = 'I', then on exit *vt* contains the right singular vectors of the bidiagonal matrix *B*, unless *info* ≠ 0 (*seeinfo*). For other values of *compq*, *vt* is not referenced. The second dimension of *vt* must be at least max(1,*n*).
If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *q* contains all the REAL (for sbdsdc) or DOUBLE PRECISION (for dbdsdc) data for singular vectors. For other values of *compq*, *q* is not referenced. See *Application notes* for details.

iq — INTEGER.
Array: *iq*(*).
If *compq* = 'P', then on exit, if *info* = 0, *q* and *iq* contain the left and right singular vectors in a compact form. Specifically, *iq* contains all the INTEGER data for singular vectors. For other values of *compq*, *iq* is not referenced. See *Application notes* for details.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, the algorithm failed to compute a singular value. The update process of divide and conquer failed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine bdsdc interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
u	Holds the matrix *U* of size (*n*, *n*).
vt	Holds the matrix *VT* of size (*n*, *n*).
q	Holds the vector of length (*ldq*), where *ldq* ≥ *n**(11 + 2**smlsiz* + 8**int*(*log_2*(*n*/(*smlsiz* + 1)))) and *smlsiz* is returned by *ilaenv* and is equal to the maximum size of the subproblems at the bottom of the computation tree (usually about 25).
compq	Restored based on the presence of arguments *u*, *vt*, *q*, and *iq* as follows: *compq* = 'N', if none of *u*, *vt*, *q*, and *iq* are present, *compq* = 'I', if both *u* and *vt* are present. Arguments *u* and *vt* must either be both present or both omitted, *compq* = 'P', if both *q* and *iq* are present. Arguments *q* and *iq* must either be both present or both omitted. Note that there will be an error condition if all of *u*, *vt*, *q*, and *iq* arguments are present simultaneously.

Symmetric Eigenvalue Problems

Symmetric eigenvalue problems are posed as follows: given an *n*-by-*n* real symmetric or complex Hermitian matrix *A*, find the *eigenvalues* λ and the corresponding *eigenvectors* *z* that satisfy the equation

$Az = \lambda z$ (or, equivalently, $z^H A = \lambda z^H$).

In such eigenvalue problems, all *n* eigenvalues are real not only for real symmetric but also for complex Hermitian matrices *A*, and there exists an orthonormal system of *n* eigenvectors. If *A* is a symmetric or Hermitian positive-definite matrix, all eigenvalues are positive.

To solve a symmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to tridiagonal form and then solve the eigenvalue problem with the tridiagonal matrix obtained. LAPACK includes routines for reducing the matrix to a tridiagonal form by an orthogonal (or unitary) similarity transformation $A = QTQ^H$ as well as for solving tridiagonal symmetric eigenvalue problems. These routines (for FORTRAN 77 interface) are listed in Table 4-3 . Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

There are different routines for symmetric eigenvalue problems, depending on whether you need all eigenvectors or only some of them or eigenvalues only, whether the matrix *A* is positive-definite or not, and so on.

These routines are based on three primary algorithms for computing eigenvalues and eigenvectors of symmetric problems: the divide and conquer algorithm, the QR algorithm, and bisection followed by inverse iteration. The divide and conquer algorithm is generally more efficient and is recommended for computing all eigenvalues and eigenvectors. Furthermore, to solve an eigenvalue problem using the divide and conquer algorithm, you need to call only one routine. In general, more than one routine has to be called if the QR algorithm or bisection followed by inverse iteration is used.

Decision tree in Figure 4-2 will help you choose the right routine or sequence of routines for eigenvalue problems with real symmetric matrices. A similar decision tree for complex Hermitian matrices is presented in Figure 4-3 .

?sytrd

Reduces a real symmetric matrix to tridiagonal form.

Syntax

FORTRAN 77:

```
call ssytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call dsytrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
```

Fortran 95:

```
call sytrd(a, tau [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation (see *Application Notes* below).

This routine calls ?latrd to reduce a real symmetric matrix to tridiagonal form by an orthogonal similarity transformation.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
a, *work*	REAL for ssytrd DOUBLE PRECISION for dsytrd. *a*(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* $\geq n$). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	On exit, if *uplo* = 'U', the diagonal and first superdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors; if *uplo* = 'L', the diagonal and first subdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors.
d, *e*, *tau*	REAL for ssytrd DOUBLE PRECISION for dsytrd. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *tau*(*) stores further details of the orthogonal matrix *Q* in the first *n*-1 elements. *tau*(*n*) is used as workspace. The dimension of *tau* must be at least max(1, *n*).

work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sytrd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
tau	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *T* is exactly similar to a matrix *A*+*E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

After calling this routine, you can call the following:

?orgtr	to form the computed matrix *Q* explicitly
?ormtr	to multiply a real matrix by *Q*.

The complex counterpart of this routine is ?hetrd.

?syrdb

Reduces a real symmetric matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

FORTRAN 77:

```
call ssyrdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call dsyrdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$ and optionally multiplies matrix *Z* by *Q*, or simply forms *Q*.

This routine reduces a full symmetric matrix to the banded symmetric form, and then to the tridiagonal symmetric form with a Successive Bandwidth Reduction approach after Prof. C.Bischof's works (see for instance, [Bischof92]). `?syrdb` is functionally close to `?sytrd` routine but the tridiagonal form may differ from those obtained by `?sytrd`. Unlike `?sytrd`, the orthogonal matrix *Q* cannot be restored from the details of matrix *A* on exit.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only *A* is reduced to *T*. If *jobz* = 'V', then *A* is reduced to *T* and *A* contains *Q* on exit. If *jobz* = 'U', then *A* is reduced to *T* and *Z* contains *Z*Q* on exit.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The bandwidth of the banded matrix *B* (*kd* ≥ 1).
a,*z*, *work*	REAL for ssyrdb. DOUBLE PRECISION for dsyrdb. *a*(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *z*(*ldz*,*), the second dimension of *z* must be at least max(1, *n*). If *jobz* = 'U', then the matrix *z* is multiplied by *Q*. If *jobz* = 'N' or 'V', then *z* is not referenced. *work*(*lwork*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldz	INTEGER. The first dimension of *z*; at least max(1, *n*). Not referenced if *jobz* = 'N'

lwork INTEGER. The size of the *work* array (*lwork* ≥ (2*kd*+1)*n*+*kd*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a If *jobz* = 'V', then overwritten by *Q* matrix.
If *jobz* = 'N' or 'U', then overwritten by the banded matrix *B* and details of the orthogonal matrix Q_B to reduce *A* to *B* as specified by *uplo*.

z On exit,
if *jobz* = 'U', then the matrix *z* is overwritten by *Z***Q*.
If *jobz* = 'N' or 'V', then *z* is not referenced.

d, *e*, *tau* DOUBLE PRECISION.
Arrays:
d(*) contains the diagonal elements of the matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of *T*.
The dimension of *e* must be at least max(1, *n*-1).
tau(*) stores further details of the orthogonal matrix *Q*.
The dimension of *tau* must be at least max(1, *n*-*kd*-1).

work(1) If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

For better performance, try using *lwork* = *n**(3**kd*+3).

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using *kd* equal to 40 if n ≤ 2000 and 64 otherwise.

Try using ?syrdb instead of ?sytrd on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. ?syrdb becomes faster beginning approximately with n = 1000, and much faster at larger matrices with a better scalability than ?sytrd.

Avoid applying ?syrdb for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to *Z* is doubled compared to the traditional one-step reduction. In that case it is better to apply ?sytrd and ?ormtr/?orgtr to obtain tridiagonal form along with the orthogonal transformation matrix *Q*.

?herdb

Reduces a complex Hermitian matrix to tridiagonal form with Successive Bandwidth Reduction approach.

Syntax

FORTRAN 77:

```
call cherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
call zherdb(jobz, uplo, n, kd, a, lda, d, e, tau, z, ldz, work, lwork, info)
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine reduces a complex Hermitian matrix *A* to symmetric tridiagonal form *T* by a unitary similarity transformation: $A = Q*T*Q^T$ and optionally multiplies matrix *Z* by *Q*, or simply forms *Q*.

This routine reduces a full Hermitian matrix to the banded Hermitian form, and then to the tridiagonal symmetric form with a Successive Bandwidth Reduction approach after Prof. C.Bischof's works (see for instance, [Bischof92]). ?herdb is functionally close to ?hetrd routine but the tridiagonal form may differ from those obtained by ?hetrd. Unlike ?hetrd, the orthogonal matrix *Q* cannot be restored from the details of matrix *A* on exit.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only *A* is reduced to *T*. If *jobz* = 'V', then *A* is reduced to *T* and *A* contains *Q* on exit. If *jobz* = 'U', then *A* is reduced to *T* and *Z* contains *Z*Q* on exit.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The bandwidth of the banded matrix *B* (*kd* ≥ 1).
a,*z*, *work*	COMPLEX for cherdb. DOUBLE COMPLEX for zherdb. *a*(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*).

	z(*ldz*,*), the second dimension of *z* must be at least max(1, *n*). If *jobz* = 'U', then the matrix *z* is multiplied by *Q*. If *jobz* = 'N' or 'V', then *z* is not referenced. *work*(*lwork*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldz	INTEGER. The first dimension of *z*; at least max(1, *n*). Not referenced if *jobz* = 'N'
lwork	INTEGER. The size of the *work* array (*lwork* ≥ (2*kd*+1)*n*+*kd*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	If *jobz* = 'V', then overwritten by *Q* matrix. If *jobz* = 'N' or 'U', then overwritten by the banded matrix *B* and details of the unitary matrix Q_B to reduce *A* to *B* as specified by *uplo*.
z	On exit, if *jobz* = 'U', then the matrix *z* is overwritten by *Z***Q* . If *jobz* = 'N' or 'V', then *z* is not referenced.
d, *e*	COMPLEX for cherdb. DOUBLE COMPLEX for zherdb. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *tau*(*) stores further details of the orthogonal matrix *Q*. The dimension of *tau* must be at least max(1, *n*-*kd*-1).
tau	COMPLEX for cherdb. DOUBLE COMPLEX for zherdb. Array, DIMENSION at least max(1, *n*-1) Stores further details of the unitary matrix Q_B. The dimension of *tau* must be at least max(1, *n*-*kd*-1).
work(1)	If *info*=0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Application Notes

For better performance, try using *lwork* = *n**(3**kd*+3).

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

For better performance, try using *kd* equal to 40 if n ≤ 2000 and 64 otherwise.

Try using ?herdb instead of ?hetrd on large matrices obtaining only eigenvalues - when no eigenvectors are needed, especially in multi-threaded environment. ?herdb becomes faster beginning approximately with n = 1000, and much faster at larger matrices with a better scalability than ?hetrd.

Avoid applying ?herdb for computing eigenvectors due to the two-step reduction, that is, the number of operations needed to apply orthogonal transformations to *Z* is doubled compared to the traditional one-step reduction. In that case it is better to apply ?hetrd and ?unmtr/?ungtr to obtain tridiagonal form along with the unitary transformation matrix *Q*.

?orgtr

Generates the real orthogonal matrix Q determined by ?sytrd.

Syntax

FORTRAN 77:

```
call sorgtr(uplo, n, a, lda, tau, work, lwork, info)
call dorgtr(uplo, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orgtr(a, tau [,uplo] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine explicitly generates the *n*-by-*n* orthogonal matrix *Q* formed by ?sytrd when reducing a real symmetric matrix *A* to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sytrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sytrd.
n	INTEGER. The order of the matrix *Q* (*n* ≥ 0).

a, *tau*, *work*	REAL for sorgtr DOUBLE PRECISION for dorgtr. Arrays: *a*(*lda*,*) is the array *a* as returned by ?sytrd. The second dimension of *a* must be at least max(1, *n*). *tau*(*) is the array *tau* as returned by ?sytrd. The dimension of *tau* must be at least max(1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine orgtr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
tau	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = (*n*-1)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is ?ungtr.

?ormtr

Multiplies a real matrix by the real orthogonal matrix Q determined by ?sytrd.

Syntax

FORTRAN 77:

call sormtr(*side*, *uplo*, *trans*, *m*, *n*, *a*, *lda*, *tau*, *c*, *ldc*, *work*, *lwork*, *info*)

call dormtr(*side*, *uplo*, *trans*, *m*, *n*, *a*, *lda*, *tau*, *c*, *ldc*, *work*, *lwork*, *info*)

Fortran 95:

call ormtr(*a*, *tau*, *c* [,*side*] [,*uplo*] [,*trans*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a real matrix *C* by *Q* or Q^T, where *Q* is the orthogonal matrix *Q* formed by ?sytrd when reducing a real symmetric matrix *A* to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sytrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on *C*).

Input Parameters

In the descriptions below, *r* denotes the order of *Q*:

If *side* = 'L', *r* = *m*; if *side* = 'R', *r* = *n*.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', *Q* or Q^T is applied to *C* from the left. If *side* = 'R', *Q* or Q^T is applied to *C* from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sytrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies *C* by *Q*. If *trans* = 'T', the routine multiplies *C* by Q^T.

m	INTEGER. The number of rows in the matrix *C* (*m* ≥ 0).
n	INTEGER. The number of columns in *C* (*n* ≥ 0).
a, *c*, *tau*, *work*	REAL for sormtr DOUBLE PRECISION for dormtr *a*(*lda*,*) and *tau* are the arrays returned by ?sytrd. The second dimension of *a* must be at least max(1, *r*). The dimension of *tau* must be at least max(1, *r*-1). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* ≥ max(1, *r*).
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *n*).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* ≥ max(1, *n*) if *side* = 'L'; *lwork* ≥ max(1, *m*) if *side* = 'R'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ormtr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* for *side* = 'L', or *lwork* = *m*blocksize* for *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix E such that $||E||^2 = O(\varepsilon)*||C||^2$.

The total number of floating-point operations is approximately $2*m^2*n$, if *side* = 'L', or $2*n^2*m$, if *side* = 'R'.

The complex counterpart of this routine is ?unmtr.

?hetrd

Reduces a complex Hermitian matrix to tridiagonal form.

Syntax

FORTRAN 77:

```
call chetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
call zhetrd(uplo, n, a, lda, d, e, tau, work, lwork, info)
```

Fortran 95:

```
call hetrd(a, tau [,uplo] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine reduces a complex Hermitian matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix Q is not formed explicitly but is represented as a product of n-1 elementary reflectors. Routines are provided to work with Q in this representation. (They are described later in this section .)

This routine calls ?latrd to reduce a complex Hermitian matrix *A* to Hermitian tridiagonal form by a unitary similarity transformation.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	COMPLEX for chetrd DOUBLE COMPLEX for zhetrd. *a*(*lda*,*) is an array containing either upper or lower triangular part of the matrix *A*, as specified by *uplo*. If *uplo* = 'U', the leading *n*-by-*n* upper triangular part of *a* contains the upper triangular part of the matrix *A*, and the strictly lower triangular part of *A* is not referenced. If *uplo* = 'L', the leading *n*-by-*n* lower triangular part of *a* contains the lower triangular part of the matrix *A*, and the strictly upper triangular part of *A* is not referenced. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array (*lwork* ≥ *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	On exit, if *uplo* = 'U', the diagonal and first superdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements above the first superdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors; if *uplo* = 'L', the diagonal and first subdiagonal of *A* are overwritten by the corresponding elements of the tridiagonal matrix *T*, and the elements below the first subdiagonal, with the array *tau*, represent the orthogonal matrix *Q* as a product of elementary reflectors.
d, *e*	REAL for chetrd DOUBLE PRECISION for zhetrd. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).

tau	COMPLEX for chetrd DOUBLE COMPLEX for zhetrd. Array, DIMENSION at least max(1, *n*-1). Stores further details of the unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hetrd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
tau	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

For better performance, try using *lwork* =*n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *T* is exactly similar to a matrix *A* + *E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

After calling this routine, you can call the following:

?ungtr	to form the computed matrix *Q* explicitly
?unmtr	to multiply a complex matrix by *Q*.

The real counterpart of this routine is ?sytrd.

?ungtr

Generates the complex unitary matrix Q determined by `?hetrd`*.*

Syntax

FORTRAN 77:

```
call cungtr(uplo, n, a, lda, tau, work, lwork, info)
call zungtr(uplo, n, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call ungtr(a, tau [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine explicitly generates the *n*-by-*n* unitary matrix *Q* formed by `?hetrd` when reducing a complex Hermitian matrix *A* to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to `?hetrd`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Use the same *uplo* as supplied to `?hetrd`.
n	`INTEGER`. The order of the matrix *Q* ($n \geq 0$).
a, *tau*, *work*	`COMPLEX` for `cungtr` `DOUBLE COMPLEX` for `zungtr`. Arrays: *a*(*lda*,*) is the array *a* as returned by `?hetrd`. The second dimension of *a* must be at least max(1, *n*). *tau*(*) is the array *tau* as returned by `?hetrd`. The dimension of *tau* must be at least max(1, *n*-1). *work* is a workspace array, its dimension `max(1, lwork)`.
lda	`INTEGER`. The first dimension of *a*; at least max(1, *n*).
lwork	`INTEGER`. The size of the *work* array ($lwork \geq n$). If $lwork = -1$, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the unitary matrix *Q*.

work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ungtr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
tau	Holds the vector of length (*n*-1).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For better performance, try using *lwork* = (*n*-1)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from an exactly unitary matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

The real counterpart of this routine is ?orgtr.

?unmtr

Multiplies a complex matrix by the complex unitary matrix Q determined by ?hetrd.

Syntax

FORTRAN 77:

```
call cunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
call zunmtr(side, uplo, trans, m, n, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

`call unmtr(a, tau, c [,side] [,uplo] [,trans] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine multiplies a complex matrix C by Q or Q^H, where Q is the unitary matrix Q formed by ?hetrd when reducing a complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hetrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^H is applied to C from the left. If *side* = 'R', Q or Q^H is applied to C from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hetrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
a, *c*, *tau*, *work*	COMPLEX for cunmtr DOUBLE COMPLEX for zunmtr. *a*(*lda*,*) and *tau* are the arrays returned by ?hetrd. The second dimension of *a* must be at least max(1, r). The dimension of *tau* must be at least max(1, r-1). *c*(*ldc*,*) contains the matrix C. The second dimension of *c* must be at least max(1, n) *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; *lda* $\geq$ max(1, r).
ldc	INTEGER. The first dimension of *c*; *ldc* $\geq$ max(1, n).
lwork	INTEGER. The size of the *work* array. Constraints: *lwork* $\geq$ max(1, n) if *side* = 'L'; *lwork* $\geq$ max(1, m) if *side* = 'R'.

	If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	Overwritten by the product *Q*C*, Q^H**C*, *C*Q*, or *C**Q^H (as specified by *side* and *trans*).
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmtr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = *n*blocksize* (for *side* = 'L') or *lwork* = *m*blocksize* (for *side* = 'R') where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if *side* = 'L' or $8*n^2*m$ if *side* = 'R'.

The real counterpart of this routine is ?ormtr.

?sptrd

Reduces a real symmetric matrix to tridiagonal form using packed storage.

Syntax

FORTRAN 77:

```
call ssptrd(uplo, n, ap, d, e, tau, info)
call dsptrd(uplo, n, ap, d, e, tau, info)
```

Fortran 95:

```
call sptrd(ap, tau [,uplo] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine reduces a packed real symmetric matrix *A* to symmetric tridiagonal form *T* by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation (see *Application Notes* below).

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangle of *A*. If *uplo* = 'L', *ap* stores the packed lower triangle of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap	REAL for ssptrd DOUBLE PRECISION for dsptrd. Array, DIMENSION at least max(1, *n*(*n*+1)/2). Contains either upper or lower triangle of *A* (as specified by *uplo*) in packed form.

Output Parameters

ap	Overwritten by the tridiagonal matrix *T* and details of the orthogonal matrix *Q*, as specified by *uplo*.
d, *e*, *tau*	REAL for ssptrd DOUBLE PRECISION for dsptrd. Arrays:

	d(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *tau*(*) stores further details of the matrix *Q*. The dimension of *tau* must be at least max(1, *n*-1).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sptrd` interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector with the number of elements *n*-1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A*+*E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision. The approximate number of floating-point operations is $(4/3)n^3$.

After calling this routine, you can call the following:

?opgtr	to form the computed matrix *Q* explicitly
?opmtr	to multiply a real matrix by *Q*.

The complex counterpart of this routine is ?hptrd.

?opgtr

Generates the real orthogonal matrix Q determined by ?sptrd*.*

Syntax

FORTRAN 77:

```
call sopgtr(uplo, n, ap, tau, q, ldq, work, info)
call dopgtr(uplo, n, ap, tau, q, ldq, work, info)
```

Fortran 95:

```
call opgtr(ap, tau, q [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine explicitly generates the *n*-by-*n* orthogonal matrix *Q* formed by `?sptrd` when reducing a packed real symmetric matrix *A* to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to `?sptrd`.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. Use the same *uplo* as supplied to `?sptrd`.
n	`INTEGER`. The order of the matrix *Q* ($n \geq 0$).
ap, *tau*	`REAL` for `sopgtr` `DOUBLE PRECISION` for `dopgtr`. Arrays *ap* and *tau*, as returned by `?sptrd`. The dimension of *ap* must be at least max(1, *n*(*n*+1)/2). The dimension of *tau* must be at least max(1, *n*-1).
ldq	`INTEGER`. The first dimension of the output array *q*; at least max(1, *n*).
work	`REAL` for `sopgtr` `DOUBLE PRECISION` for `dopgtr`. Workspace array, `DIMENSION` at least max(1, *n*-1).

Output Parameters

q	`REAL` for `sopgtr` `DOUBLE PRECISION` for `dopgtr`. Array, `DIMENSION` (*ldq*,*). Contains the computed matrix *Q*. The second dimension of *q* must be at least max(1, *n*).
info	`INTEGER`. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `opgtr` interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector with the number of elements *n* - 1.
q	Holds the matrix *Q* of size (*n*, *n*).
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

The computed matrix Q differs from an exactly orthogonal matrix by a matrix E such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)n^3$.

The complex counterpart of this routine is ?upgtr.

?opmtr

Multiplies a real matrix by the real orthogonal matrix Q determined by ?sptrd.

Syntax

FORTRAN 77:

```
call sopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call dopmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
```

Fortran 95:

```
call opmtr(ap, tau, c [,side] [,uplo] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a real matrix C by Q or Q^T, where Q is the orthogonal matrix Q formed by ?sptrd when reducing a packed real symmetric matrix A to tridiagonal form: $A = Q*T*Q^T$. Use this routine after a call to ?sptrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^T is applied to C from the left. If *side* = 'R', Q or Q^T is applied to C from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?sptrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^T.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).

n	INTEGER. The number of columns in *C* (*n* ≥ 0).
ap, *tau*, *c*, *work*	REAL for sopmtr DOUBLE PRECISION for dopmtr. *ap* and *tau* are the arrays returned by ?sptrd. The dimension of *ap* must be at least max(1, *r*(*r*+1)/2). The dimension of *tau* must be at least max(1, *r*-1). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work*(*) is a workspace array. The dimension of *work* must be at least max(1, *n*) if *side* = 'L'; max(1, *m*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *n*).

Output Parameters

c	Overwritten by the product *Q***C*, Q^T**C*, *C***Q*, or *C**Q^T (as specified by *side* and *trans*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine opmtr interface are the following:

ap	Holds the array *A* of size (*r*(r+1)/2*), where *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector with the number of elements *r* - 1.
c	Holds the matrix *C* of size (*m*,*n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'. The default value is 'U'.
trans	Must be 'N', 'C', or 'T'. The default value is 'N'.

Application Notes

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)\ ||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately 2**m*^{2}**n* if *side* = 'L', or 2**n*^{2}**m* if *side* = 'R'.

The complex counterpart of this routine is ?upmtr.

?hptrd

Reduces a complex Hermitian matrix to tridiagonal form using packed storage.

Syntax

FORTRAN 77:

```
call chptrd(uplo, n, ap, d, e, tau, info)
call zhptrd(uplo, n, ap, d, e, tau, info)
```

Fortran 95:

```
call hptrd(ap, tau [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a packed complex Hermitian matrix *A* to symmetric tridiagonal form *T* by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix *Q* is not formed explicitly but is represented as a product of *n*-1 elementary reflectors. Routines are provided for working with *Q* in this representation (see *Application Notes* below).

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = `'U'`, *ap* stores the packed upper triangle of *A*. If *uplo* = `'L'`, *ap* stores the packed lower triangle of *A*.
n	`INTEGER`. The order of the matrix *A* (*n* ≥ 0).
ap	`COMPLEX` for `chptrd` `DOUBLE COMPLEX` for `zhptrd`. Array, `DIMENSION` at least max(1, *n*(*n*+1)/2). Contains either upper or lower triangle of *A* (as specified by *uplo*) in packed form.

Output Parameters

ap	Overwritten by the tridiagonal matrix *T* and details of the orthogonal matrix *Q*, as specified by *uplo*.
d, *e*	`REAL` for `chptrd` `DOUBLE PRECISION` for `zhptrd`. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).
tau	`COMPLEX` for `chptrd` `DOUBLE COMPLEX` for `zhptrd`.

	Arrays, DIMENSION at least max(1, *n*-1). Contains further details of the orthogonal matrix *Q*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hptrd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector with the number of elements *n* - 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The computed matrix *T* is exactly similar to a matrix $A + E$, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision.

The approximate number of floating-point operations is $(16/3)n^3$.

After calling this routine, you can call the following:

?upgtr	to form the computed matrix *Q* explicitly
?upmtr	to multiply a complex matrix by *Q*.

The real counterpart of this routine is ?sptrd.

?upgtr

Generates the complex unitary matrix Q determined by ?hptrd*.*

Syntax

FORTRAN 77:

```
call cupgtr(uplo, n, ap, tau, q, ldq, work, info)
call zupgtr(uplo, n, ap, tau, q, ldq, work, info)
```

Fortran 95:

```
call upgtr(ap, tau, q [,uplo] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine explicitly generates the *n*-by-*n* unitary matrix *Q* formed by ?hptrd when reducing a packed complex Hermitian matrix *A* to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hptrd.

Input Parameters

uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hptrd.
n	INTEGER. The order of the matrix *Q* ($n \geq 0$).
ap, *tau*	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Arrays *ap* and *tau*, as returned by ?hptrd. The dimension of *ap* must be at least max(1, *n*(*n*+1)/2). The dimension of *tau* must be at least max(1, *n*-1).
ldq	INTEGER. The first dimension of the output array *q*; at least max(1, *n*).
work	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Workspace array, DIMENSION at least max(1, *n*-1).

Output Parameters

q	COMPLEX for cupgtr DOUBLE COMPLEX for zupgtr. Array, DIMENSION (*ldq*,*). Contains the computed matrix *Q*. The second dimension of *q* must be at least max(1, *n*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine upgtr interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
tau	Holds the vector with the number of elements *n* - 1.
q	Holds the matrix *Q* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is (16/3)*n3*.

The real counterpart of this routine is ?opgtr.

?upmtr

Multiplies a complex matrix by the unitary matrix Q determined by ?hptrd.

Syntax

FORTRAN 77:

```
call cupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
call zupmtr(side, uplo, trans, m, n, ap, tau, c, ldc, work, info)
```

Fortran 95:

```
call upmtr(ap, tau, c [,side] [,uplo] [,trans] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine multiplies a complex matrix C by Q or Q^H, where Q is the unitary matrix formed by ?hptrd when reducing a packed complex Hermitian matrix A to tridiagonal form: $A = Q*T*Q^H$. Use this routine after a call to ?hptrd.

Depending on the parameters *side* and *trans*, the routine can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$ (overwriting the result on C).

Input Parameters

In the descriptions below, r denotes the order of Q:

If *side* = 'L', $r = m$; if *side* = 'R', $r = n$.

side	CHARACTER*1. Must be either 'L' or 'R'. If *side* = 'L', Q or Q^H is applied to C from the left. If *side* = 'R', Q or Q^H is applied to C from the right.
uplo	CHARACTER*1. Must be 'U' or 'L'. Use the same *uplo* as supplied to ?hptrd.
trans	CHARACTER*1. Must be either 'N' or 'T'. If *trans* = 'N', the routine multiplies C by Q. If *trans* = 'T', the routine multiplies C by Q^H.
m	INTEGER. The number of rows in the matrix C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
ap, *tau*, *c*,	COMPLEX for cupmtr DOUBLE COMPLEX for zupmtr. *ap* and *tau* are the arrays returned by ?hptrd. The dimension of *ap* must be at least max(1, $r(r+1)/2$). The dimension of *tau* must be at least max(1, $r-1$).

	c(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*) *work*(*) is a workspace array. The dimension of *work* must be at least max(1, *n*) if *side* = 'L'; max(1, *m*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*; *ldc* ≥ max(1, *n*).

Output Parameters

c	Overwritten by the product *Q***C*, Q^H**C*, *C***Q*, or *C**Q^H (as specified by *side* and *trans*).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine upmtr interface are the following:

ap	Holds the array *A* of size (*r**(*r*+1)/2), where *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector with the number of elements *n* - 1.
c	Holds the matrix *C* of size (*m*, *n*).
side	Must be 'L' or 'R'. The default value is 'L'.
uplo	Must be 'U' or 'L'.The default value is 'U'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

The computed product differs from the exact product by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$, where ε is the machine precision.

The total number of floating-point operations is approximately $8*m^2*n$ if *side* = 'L' or $8*n^2*m$ if *side* = 'R'.

The real counterpart of this routine is ?opmtr.

?sbtrd

Reduces a real symmetric band matrix to tridiagonal form.

Syntax

FORTRAN 77:

```
call ssbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call dsbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
```

Fortran 95:

```
call sbtrd(ab[, q] [,vect] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a real symmetric band matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = Q*T*Q^T$. The orthogonal matrix Q is determined as a product of Givens rotations.

If required, the routine can also form the matrix Q explicitly.

Input Parameters

vect	CHARACTER*1. Must be 'V' or 'N'. If *vect* = 'V', the routine returns the explicit matrix *Q*. If *vect* = 'N', the routine does not return *Q*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n*≥0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd*≥0).
ab, *work*	REAL for ssbtrd DOUBLE PRECISION for dsbtrd. *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1, *n*).
ldab	INTEGER. The first dimension of *ab*; at least *kd*+1.
ldq	INTEGER. The first dimension of *q*. Constraints: *ldq* ≥ max(1, *n*) if *vect* = 'V'; *ldq* ≥ 1 if *vect* = 'N'.

Output Parameters

ab	On exit, the diagonal elements of the array *ab* are overwritten by the diagonal elements of the tridiagonal matrix *T*. If *kd* > 0, the elements on the first superdiagonal (if *uplo* = 'U') or the first subdiagonal (if *uplo* = 'L') are ovewritten by the off-diagonal elements of *T*. The rest of *ab* is overwritten by values generated during the reduction.
d, *e*, *q*	REAL for ssbtrd DOUBLE PRECISION for dsbtrd. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *q*(*ldq*,*) is not referenced if *vect* = 'N'. If *vect* = 'V', *q* contains the *n*-by-*n* matrix *Q*. The second dimension of *q* must be: at least max(1, *n*) if *vect* = 'V'; at least 1 if *vect* = 'N'.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbtrd interface are the following:

ab	Holds the array *A* of size (*kd*+1, *n*).
q	Holds the matrix *Q* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vect	If omitted, this argument is restored based on the presence of argument *q* as follows: *vect* = 'V', if *q* is present, *vect* = 'N', if *q* is omitted. If present, *vect* must be equal to 'V' or 'U' and the argument *q* must also be present. Note that there will be an error condition if *vect* is present and *q* omitted.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The computed matrix *T* is exactly similar to a matrix *A*+*E*, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of *n*, and ε is the machine precision. The computed matrix *Q* differs from an exactly orthogonal matrix by a matrix *E* such that $||E||_2 = O(\varepsilon)$.

The total number of floating-point operations is approximately $6n^2*kd$ if *vect* = 'N', with $3n^3*(kd-1)/kd$ additional operations if *vect* = 'V'.

The complex counterpart of this routine is ?hbtrd.

?hbtrd

Reduces a complex Hermitian band matrix to tridiagonal form.

Syntax

FORTRAN 77:

```
call chbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
call zhbtrd(vect, uplo, n, kd, ab, ldab, d, e, q, ldq, work, info)
```

Fortran 95:

```
call hbtrd(ab [, q] [,vect] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a complex Hermitian band matrix A to symmetric tridiagonal form T by a unitary similarity transformation: $A = Q*T*Q^H$. The unitary matrix Q is determined as a product of Givens rotations.

If required, the routine can also form the matrix Q explicitly.

Input Parameters

vect	CHARACTER*1. Must be 'V' or 'N'. If *vect* = 'V', the routine returns the explicit matrix *Q*. If *vect* = 'N', the routine does not return *Q*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	COMPLEX for chbtrd DOUBLE COMPLEX for zhbtrd. *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1, *n*).
ldab	INTEGER. The first dimension of *ab*; at least *kd*+1.
ldq	INTEGER. The first dimension of *q*. Constraints: *ldq* ≥ max(1, *n*) if *vect* = 'V';

ldq ≥ 1 if *vect* = 'N'.

Output Parameters

ab	On exit, the diagonal elements of the array *ab* are overwritten by the diagonal elements of the tridiagonal matrix *T*. If *kd* > 0, the elements on the first superdiagonal (if *uplo* = 'U') or the first subdiagonal (if *uplo* = 'L') are ovewritten by the off-diagonal elements of *T*. The rest of *ab* is overwritten by values generated during the reduction.
d, *e*	REAL for chbtrd DOUBLE PRECISION for zhbtrd. Arrays: *d*(*) contains the diagonal elements of the matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1).
q	COMPLEX for chbtrd DOUBLE COMPLEX for zhbtrd. Array, DIMENSION (*ldq*,*). If *vect* = 'N', *q* is not referenced. If *vect* = 'V', *q* contains the *n*-by-*n* matrix *Q*. The second dimension of *q* must be: at least max(1, *n*) if *vect* = 'V'; at least 1 if *vect* = 'N'.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbtrd interface are the following:

ab	Holds the array *A* of size (*kd*+1, *n*).
q	Holds the matrix *Q* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vect	If omitted, this argument is restored based on the presence of argument *q* as follows: *vect* = 'V', if *q* is present, *vect* = 'N', if *q* is omitted. If present, *vect* must be equal to 'V' or 'U' and the argument *q* must also be present. Note that there will be an error condition if *vect* is present and *q* omitted.

Note that diagonal (*d*) and off-diagonal (*e*) elements of the matrix *T* are omitted because they are kept in the matrix *A* on exit.

Application Notes

The computed matrix T is exactly similar to a matrix $A + E$, where $||E||_2 = c(n)*\varepsilon*||A||_2$, $c(n)$ is a modestly increasing function of n, and ε is the machine precision. The computed matrix Q differs from an exactly unitary matrix by a matrix E such that $||E||_2 = O(\varepsilon)$.

The total number of floating-point operations is approximately $20n^2*kd$ if `vect = 'N'`, with $10n^3*(kd-1)/kd$ additional operations if `vect = 'V'`.

The real counterpart of this routine is `?sbtrd`.

?sterf

Computes all eigenvalues of a real symmetric tridiagonal matrix using QR algorithm.

Syntax

FORTRAN 77:

```
call ssterf(n, d, e, info)
call dsterf(n, d, e, info)
```

Fortran 95:

```
call sterf(d, e [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues of a real symmetric tridiagonal matrix T (which can be obtained by reducing a symmetric or Hermitian matrix to tridiagonal form). The routine uses a square-root-free variant of the QR algorithm.

If you need not only the eigenvalues but also the eigenvectors, call `?steqr`.

Input Parameters

n	`INTEGER`. The order of the matrix T ($n \geq 0$).
d, e	`REAL` for `ssterf` `DOUBLE PRECISION` for `dsterf`. Arrays: d(*) contains the diagonal elements of T. The dimension of d must be at least max(1, n). e(*) contains the off-diagonal elements of T. The dimension of e must be at least max(1, n-1).

Output Parameters

d	The n eigenvalues in ascending order, unless $info > 0$.

	See also *info*.
e	On exit, the array is overwritten; see *info*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, the algorithm failed to find all the eigenvalues after 30*n* iterations: *i* off-diagonal elements have not converged to zero. On exit, *d* and *e* contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to *T*. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `sterf` interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix *T*+*E* such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and m_i is the corresponding computed value, then

$|\mu i - \lambda i| \le c(n)*\varepsilon*||T||_2$

where $c(n)$ is a modestly increasing function of n.

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about $14n^2$.

?steqr

Computes all eigenvalues and eigenvectors of a symmetric or Hermitian matrix reduced to tridiagonal form (QR algorithm).

Syntax

FORTRAN 77:

```
call ssteqr(compz, n, d, e, z, ldz, work, info)
call dsteqr(compz, n, d, e, z, ldz, work, info)
call csteqr(compz, n, d, e, z, ldz, work, info)
call zsteqr(compz, n, d, e, z, ldz, work, info)
```

Fortran 95:

```
call rsteqr(d, e [,z] [,compz] [,info])
call steqr(d, e [,z] [,compz] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric tridiagonal matrix T. In other words, the routine can compute the spectral factorization: $T = Z*\Lambda*Z^T$. Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$T*z_i = \lambda_i*z_i$ for $i = 1, 2, \ldots, n$.

The routine normalizes the eigenvectors so that $||z_i||_2 = 1$.

You can also use the routine for computing the eigenvalues and eigenvectors of an arbitrary real symmetric (or complex Hermitian) matrix A reduced to tridiagonal form T: $A = Q*T*Q^H$. In this case, the spectral factorization is as follows: $A = Q*T*Q^H = (Q*Z)*\Lambda*(Q*Z)^H$. Before calling `?steqr`, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	`?sytrd`, `?orgtr`	`?hetrd`, `?ungtr`
packed storage	`?sptrd`, `?opgtr`	`?hptrd`, `?upgtr`
band storage	`?sbtrd` (*vect*='V')	`?hbtrd` (*vect*='V')

If you need eigenvalues only, it's more efficient to call `?sterf`. If T is positive-definite, `?pteqr` can compute small eigenvalues more accurately than `?steqr`.

To solve the problem by a single call, use one of the divide and conquer routines `?stevd`, `?syevd`, `?spevd`, or `?sbevd` for real symmetric matrices or `?heevd`, `?hpevd`, or `?hbevd` for complex Hermitian matrices.

Input Parameters

compz
: CHARACTER*1. Must be 'N' or 'I' or 'V'.
If *compz* = 'N', the routine computes eigenvalues only.
If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix T.
If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of A (and the array z must contain the matrix Q on entry).

n
: INTEGER. The order of the matrix T ($n \geq 0$).

d, *e*, *work*
: REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Arrays:

	d(*) contains the diagonal elements of *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the off-diagonal elements of *T*. The dimension of *e* must be at least max(1, *n*-1). *work*(*) is a workspace array. The dimension of *work* must be: at least 1 if *compz* = 'N'; at least max(1, 2**n*-2) if *compz* = 'V' or 'I'.
z	REAL for ssteqr DOUBLE PRECISION for dsteqr COMPLEX for csteqr DOUBLE COMPLEX for zsteqr. Array, DIMENSION (*ldz*, *) If *compz* = 'N' or 'I', *z* need not be set. If *vect* = 'V', *z* must contain the *n*-by-*n* matrix *Q*. The second dimension of *z* must be: at least 1 if *compz* = 'N'; at least max(1, *n*) if *compz* = 'V' or 'I'. *work* (*lwork*) is a workspace array.
ldz	INTEGER. The first dimension of *z*. Constraints: *ldz* ≥ 1 if *compz* = 'N'; *ldz* ≥ max(1, *n*) if *compz* = 'V' or 'I'.

Output Parameters

d	The *n* eigenvalues in ascending order, unless *info* > 0. See also *info*.
e	On exit, the array is overwritten; see *info*.
z	If *info* = 0, contains the *n* orthonormal eigenvectors, stored by columns. (The *i*-th column corresponds to the *i*th eigenvalue.)
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, the algorithm failed to find all the eigenvalues after 30*n* iterations: *i* off-diagonal elements have not converged to zero. On exit, *d* and *e* contain, respectively, the diagonal and off-diagonal elements of a tridiagonal matrix orthogonally similar to *T*. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine steqr interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).

z	Holds the matrix *Z* of size (*n*, *n*).
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted. Note that two variants of Fortran 95 interface for steqr routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name rsteqr is used in real cases (single or double precision), and the name steqr is used in complex cases (single or double precision).

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix *T*+*E* such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \le c(n)*\varepsilon*||T||_2$

where $c(n)$ is a modestly increasing function of n.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$\theta(z_i, w_i) \le c(n)*\varepsilon*||T||_2 / \min_{i \ne j}|\lambda_i - \lambda_j|$.

The total number of floating-point operations depends on how rapidly the algorithm converges. Typically, it is about

$24n^2$ if *compz* = 'N';

$7n^3$ (for complex flavors, $14n^3$) if *compz* = 'V' or 'I'.

?stemr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

FORTRAN 77:

call sstemr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *m*, *w*, *z*, *ldz*, *nzc*, *isuppz*, *tryrac*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call dstemr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *m*, *w*, *z*, *ldz*, *nzc*, *isuppz*, *tryrac*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call cstemr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *m*, *w*, *z*, *ldz*, *nzc*, *isuppz*, *tryrac*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call zstemr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *m*, *w*, *z*, *ldz*, *nzc*, *isuppz*, *tryrac*, *work*, *lwork*, *iwork*, *liwork*, *info*)

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*. Any such unreduced matrix has a well defined set of pairwise different real eigenvalues, the corresponding real eigenvectors are pairwise orthogonal.

The spectrum may be computed either completely or partially by specifying either an interval `(vl,vu]` or a range of indices `il:iu` for the desired eigenvalues.

Depending on the number of desired eigenvalues, these are computed either by bisection or the *dqds* algorithm. Numerically orthogonal eigenvectors are computed by the use of various suitable $L*D*L^T$ factorizations near clusters of close eigenvalues (referred to as RRRs, Relatively Robust Representations). An informal sketch of the algorithm follows.

For each unreduced block (submatrix) of *T*,

a. Compute $T - sigma*I = L*D*L^T$, so that *L* and *D* define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of *L* and *D* cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix *T* does not have this property in general.

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see steps c and d.

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.

d. For each eigenvalue with a large enough relative separation compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to step c for any clusters that remain.

For more details, see: [Dhillon04], [Dhillon04-02], [Dhillon97]

The routine works only on machines which follow IEEE-754 floating-point standard in their handling of infinities and NaNs (NaN stands for "not a number"). This permits the use of efficient inner loops avoiding a check for zero divisors.

LAPACK routines can be used to reduce a complex Hermitean matrix to real symmetric tridiagonal form.

(Any complex Hermitean tridiagonal matrix has real values on its diagonal and potentially complex numbers on its off-diagonals. By applying a similarity transform with an appropriate diagonal matrix $\mathtt{diag(1,e^{i\ \backslash phy_1}, \ldots , e^{i\ \backslash phy_\{n-1\}})}$, the complex Hermitean matrix can be transformed into a real symmetric matrix and complex arithmetic can be entirely avoided.) While the eigenvectors of the real symmetric tridiagonal matrix are real, the eigenvectors of original complex Hermitean matrix have complex entries in general. Since LAPACK drivers overwrite the matrix data with the eigenvectors, `zstemr` accepts complex workspace to facilitate interoperability with `zunmtr` or `zupmtr`.

Input Parameters

jobz CHARACTER*1. Must be `'N'` or `'V'`.

If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes all eigenvalues in the half-open interval: (*vl*, *vu*].
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

n — INTEGER. The order of the matrix *T* (*n*≥0).

d — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*).
Contains *n* diagonal elements of the tridiagonal matrix *T*.

e — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*-1).
Contains (*n*-1) off-diagonal elements of the tridiagonal matrix *T* in elements 1 to *n*-1 of *e*. *e*(*n*) need not be set on input, but is used internally as workspace.

vl, *vu* — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*<*vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.

Constraint: 1≤*il*≤*iu*≤*n*, if *n*>0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

ldz — INTEGER. The leading dimension of the output array *z*.

if *jobz* = 'V', then *ldz* ≥ max(1, *n*);

ldz ≥ 1 otherwise.

nzc — INTEGER. The number of eigenvectors to be held in the array *z*.

If *range* = 'A', then *nzc*≥max(1, *n*);

If *range* = 'V', then *nzc* is greater than or equal to the number of eigenvalues in the half-open interval: (*vl*, *vu*].

If *range* = 'I', then *nzc*≥*il*+*iu*+1.
This value is returned as the first entry of the array *z*, and no error message related to *nzc* is issued by the routine xerbla.

tryrac — LOGICAL.
If *tryrac* = .TRUE., it indicates that the code should check whether the tridiagonal matrix defines its eigenvalues to high relative accuracy. If so, the code uses relative-accuracy preserving algorithms that might

be (a bit) slower depending on the matrix. If the matrix does not define its eigenvalues to high relative accuracy, the code can uses possibly faster algorithms.
If *tryrac* = .FALSE., the code is not required to guarantee relatively accurate eigenvalues and can use the fastest possible techniques.

work — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION (*lwork*).

lwork — INTEGER.
The dimension of the array *work*,
lwork≥max(1, 18**n*).
If *lwork*=-1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

iwork — INTEGER.
Workspace array, DIMENSION (*liwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
lwork≥max(1, 10**n*) if the eigenvectors are desired, and
lwork≥max(1, 8**n*) if only the eigenvalues are to be computed.
If *liwork*=-1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla.

Output Parameters

e — On exit, the array *e* is overwritten.

m — INTEGER.
The total number of eigenvalues found, 0≤*m*≤*n*.
If *range* = 'A', then *m*=*n*, and if If *range* = 'I', then *m*=*iu*-*il*+1.

w — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Array, DIMENSION (*n*).
The first *m* elements contain the selected eigenvalues in ascending order.

z — REAL for sstemr
DOUBLE PRECISION for dstemr
COMPLEX for cstemr
DOUBLE COMPLEX for zstemr.
Array *z*(*ldz*, *), the second dimension of *z* must be at least max(1, *m*).

If *jobz* = 'V', and *info* = 0, then the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i).
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and an can be computed with a workspace query by setting *nzc*=-1, see description of the parameter *nzc*.

isuppz — INTEGER.
Array, DIMENSION (2*max(1, *m*)).
The support of the eigenvectors in *z*, that is the indices indicating the nonzero elements in *z*. The i-th computed eigenvector is nonzero only in elements *isuppz*(2*i-1) through *isuppz*(2*i). This is relevant in the case when the matrix is split. *isuppz* is only accessed when *jobz* = 'V' and *n*>0.

tryrac — On exit, TRUE. *tryrac* is set to .FALSE. if the matrix does not define its eigenvalues to high relative accuracy.

work(1) — On exit, if *info* = 0, then *work*(1) returns the optimal (and minimal) size of *lwork*.

iwork(1) — On exit, if *info* = 0, then *iwork*(1) returns the optimal size of *liwork*.

info — INTEGER.
If = 0, the execution is successful.
If *info* = -i, the i-th parameter had an illegal value.
If *info* = 1, internal error in ?larre occurred,
if *info* = 2, internal error in ?larrv occurred.

?stedc

Computes all eigenvalues and eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method.

Syntax

FORTRAN 77:

```
call sstedc(compz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call dstedc(compz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call cstedc(compz, n, d, e, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
call zstedc(compz, n, d, e, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call rstedc(d, e [,z] [,compz] [,info])
call stedc(d, e [,z] [,compz] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a symmetric tridiagonal matrix using the divide and conquer method. The eigenvectors of a full or band real symmetric or complex Hermitian matrix can also be found if `?sytrd`/`?hetrd` or `?sptrd`/`?hptrd` or `?sbtrd`/`?hbtrd` has been used to reduce this matrix to tridiagonal form.

See also `?laed0`, `?laed1`, `?laed2`, `?laed3`, `?laed4`, `?laed5`, `?laed6`, `?laed7`, `?laed8`, `?laed9`, and `?laeda` used by this function.

Input Parameters

compz	CHARACTER*1. Must be 'N' or 'I' or 'V'. If *compz* = 'N', the routine computes eigenvalues only. If *compz* = 'I', the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix. If *compz* = 'V', the routine computes the eigenvalues and eigenvectors of original symmetric/Hermitian matrix. On entry, the array *z* must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form.
n	INTEGER. The order of the symmetric tridiagonal matrix ($n \geq 0$).
d, *e*, *rwork*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d*(*) contains the diagonal elements of the tridiagonal matrix. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the subdiagonal elements of the tridiagonal matrix. The dimension of *e* must be at least max(1, *n*-1). *rwork* is a workspace array, its dimension max(1, *lrwork*).
z, *work*	REAL for sstedc DOUBLE PRECISION for dstedc COMPLEX for cstedc DOUBLE COMPLEX for zstedc. Arrays: *z*(*ldz*, *), *work*(*). If *compz* = 'V', then, on entry, *z* must contain the orthogonal/unitary matrix used to reduce the original matrix to tridiagonal form. The second dimension of *z* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
ldz	INTEGER. The first dimension of *z*. Constraints: *ldz* ≥ 1 if *compz* = 'N'; *ldz* ≥ max(1, *n*) if *compz* = 'V' or 'I'.
lwork	INTEGER. The dimension of the array *work*. If *compz* = 'N'or 'I', or $n \leq 1$, *lwork* must be at least 1.

If *compz* = 'V' and *n* > 1, *lwork* must be at least *n***n*. Note that for *compz* = 'V', and if *n* is less than or equal to the minimum divide size, usually 25, then *lwork* need only be 1.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for the required value of *lwork*.

lrwork INTEGER. The dimension of the array *rwork* (used for complex flavors only).
If *compz* = 'N', or *n* ≤ 1, *lrwork* must be at least 1.
If *compz* = 'V' and *n* > 1, *lrwork* must be at least (1+3**n*+2**n**lg(*n*)+3**n***n*), where lg(*n*)is the smallest integer *k* such that 2***k*≥*n*.
If *compz* = 'I' and *n* > 1, *lrwork* must be at least (1+4**n*+2**n***n*). Note that for *compz* = 'V'or 'I', and if *n* is less than or equal to the minimum divide size, usually 25, then *lrwork* need only be max(1, 2*(*n*-1)).
If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for the required value of *lrwork*.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER. The dimension of the array *iwork*.
If *compz* = 'N', or *n* ≤ 1, *liwork* must be at least 1.
If *compz* = 'V' and *n* > 1, *liwork* must be at least (6+6**n*+5**n**lg(*n*), where lg(*n*)is the smallest integer *k* such that 2***k*≥*n*.
If *compz* = 'I' and *n* > 1, *liwork* must be at least (3+5**n*).
Note that for *compz* = 'V'or 'I', and if *n* is less than or equal to the minimum divide size, usually 25, then *liwork* need only be 1.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for the required value of *liwork*.

Output Parameters

d The *n* eigenvalues in ascending order, unless *info* ≠ 0.
See also *info*.

e On exit, the array is overwritten; see *info*.

z	If *info* = 0, then if *compz* = 'V', *z* contains the orthonormal eigenvectors of the original symmetric/Hermitian matrix, and if *compz* = 'I', *z* contains the orthonormal eigenvectors of the symmetric tridiagonal matrix. If *compz* = 'N', *z* is not referenced.
work(1)	On exit, if *info* = 0, then *work(1)* returns the optimal *lwork*.
rwork(1)	On exit, if *info* = 0, then *rwork(1)* returns the optimal *lrwork* (for complex flavors only).
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the optimal *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *i*/(*n*+1) through mod(*i*, *n*+1).

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stedc interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
z	Holds the matrix *Z* of size (*n*, *n*).
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Note that two variants of Fortran 95 interface for stedc routine are needed because of an ambiguous choice between real and complex cases appear when *z* and *work* are omitted. Thus, the name rstedc is used in real cases (single or double precision), and the name stedc is used in complex cases (single or double precision).

Application Notes

The required size of workspace arrays must be as follows.

For sstedc/dstedc:

If *compz* = 'N' or $n \le 1$ then *lwork* must be at least 1.

If *compz* = 'V' and $n > 1$ then *lwork* must be at least $(1 + 3n + 2n \cdot \lg n + 3n2)$, where lg(*n*) = smallest integer k such that $2^k \ge n$.

If *compz* = 'I' and $n > 1$ then *lwork* must be at least $(1 + 4n + n2)$.

If *compz* = 'N' or $n \le 1$ then *liwork* must be at least 1.

If *compz* = 'V' and $n > 1$ then *liwork* must be at least $(6 + 6n + 5n \cdot \lg n)$.

If *compz* = 'I' and $n > 1$ then *liwork* must be at least $(3 + 5n)$.

For cstedc/zstedc:

If *compz* = 'N' or'I', or $n \leq 1$, *lwork* must be at least 1.

If *compz* = 'V' and $n > 1$, *lwork* must be at least n^2.

If *compz* = 'N' or $n \leq 1$, *lrwork* must be at least 1.

If *compz* = 'V' and $n > 1$, *lrwork* must be at least $(1 + 3n + 2n \cdot \lg n + 3n^2)$, where lg($n$) = smallest integer k such that $2^k \geq n$.

If *compz* = 'I' and $n > 1$, *lrwork* must be at least$(1 + 4n + 2n^2)$.

The required value of *liwork* for complex flavors is the same as for real flavors.

If *lwork* (or *liwork* or *lrwork*, if supplied) is equal to -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*, *lrwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?stegr

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

FORTRAN 77:

```
call sstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call dstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call cstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
call zstegr(jobz, range, n, d, e, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call rstegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
call stegr(d, e, w [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*. Any such unreduced matrix has a well defined set of pairwise different real eigenvalues, the corresponding real eigenvectors are pairwise orthogonal.

The spectrum may be computed either completely or partially by specifying either an interval (*vl*,*vu*] or a range of indices *il*:*iu* for the desired eigenvalues.

?sregr is a compatibility wrapper around the improved ?stemr routine. See its description for further details.

Note that the *abstol* parameter no longer provides any benefit and hence is no longer used.

See also auxiliary ?lasq2 ?lasq5, ?lasq6 , used by this routine.

Input Parameters

jobz
CHARACTER*1. Must be 'N' or 'V'.
If *job* = 'N', then only eigenvalues are computed.
If *job* = 'V', then eigenvalues and eigenvectors are computed.

range
CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
vl< *lambda*(*i*) ≤ *vu*.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

n
INTEGER. The order of the matrix *T* (*n* ≥ 0).

d, *e*, *work*
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays:
d(*) contains the diagonal elements of *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the subdiagonal elements of *T* in elements 1 to *n*-1; *e*(*n*) need not be set on input, but it is used as a workspace.
The dimension of *e* must be at least max(1, *n*).
work(*lwork*) is a workspace array.

vl, *vu*
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Unused. Was the absolute error tolerance for the eigenvalues/eigenvectors in previous versions.

ldz
INTEGER. The leading dimension of the output array *z*. Constraints:

	ldz < 1 if *jobz* = 'N'; *ldz* < max(1, *n*) *jobz* = 'V', an.
lwork	INTEGER. The dimension of the array *work*, *lwork*≥max(1, 18**n*) if *jobz* = 'V', and *lwork*≥max(1, 12**n*) if *jobz* = 'N'. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* below for details.
iwork	INTEGER. Workspace array, DIMENSION (*liwork*).
liwork	INTEGER. The dimension of the array *iwork*, *lwork* ≥ max(1, 10**n*) if the eigenvectors are desired, and *lwork* ≥ max(1, 8**n*) if only the eigenvalues are to be computed.. If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See *Application Notes* below for details.

Output Parameters

d, *e*	On exit, *d* and *e* are overwritten.
m	INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.
w	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, *n*). The selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*).
z	REAL for sstegr DOUBLE PRECISION for dstegr COMPLEX for cstegr DOUBLE COMPLEX for zstegr. Array *z*(*ldz*, *), the second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', and if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced.

	Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used. Supplying *n* columns is always safe.
isuppz	INTEGER. Array, DIMENSION at least (2*max(1, *m*)). The support of the eigenvectors in *z*, that is the indices indicating the nonzero elements in *z*. The *i*-th computed eigenvector is nonzero only in elements *isuppz*(2**i*-1) through *isuppz*(2**i*). This is relevant in the case when the matrix is split. *isuppz* is only accessed when *jobz* = 'V', and *n* > 0.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1*x*, internal error in ?larre occurred, If *info* = 2*x*, internal error in ?larrv occurred. Here the digit *x* = abs(*iinfo*) < 10, where *iinfo* is the non-zero error code returned by ?larre or ?larrv, respectively.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stegr interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*,*m*).
isuppz	Holds the vector of length (*2*m*).
vl	Default value for this argument is *vl* = - HUGE (*vl*) where HUGE(*a*) means the largest machine number of the same precision as argument *a*.
vu	Default value for this argument is *vu* = HUGE (*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this argument is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present,

range = 'I', if one of or both *il* and *iu* are present,
range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,
Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Note that two variants of Fortran 95 interface for stegr routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name rstegr is used in real cases (single or double precision), and the name stegr is used in complex cases (single or double precision).

Application Notes

Currently ?stegr is only set up to find *all* the *n* eigenvalues and eigenvectors of *T* in O(n^2) time, that is, only *range* = 'A' is supported.

?stegr works only on machines which follow IEEE-754 floating-point standard in their handling of infinities and NaNs. Normal execution of ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not conform to the IEEE-754 standard.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?pteqr

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric positive-definite tridiagonal matrix.

Syntax

FORTRAN 77:

```
call spteqr(compz, n, d, e, z, ldz, work, info)
call dpteqr(compz, n, d, e, z, ldz, work, info)
call cpteqr(compz, n, d, e, z, ldz, work, info)
call zpteqr(compz, n, d, e, z, ldz, work, info)
```

Fortran 95:

```
call rpteqr(d, e [,z] [,compz] [,info])
call pteqr(d, e [,z] [,compz] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues and (optionally) all the eigenvectors of a real symmetric positive-definite tridiagonal matrix T. In other words, the routine can compute the spectral factorization: $T = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i; Z is an orthogonal matrix whose columns are eigenvectors. Thus,

$T*z_i = \lambda_i*z_i$ for $i = 1, 2, \ldots, n$.

(The routine normalizes the eigenvectors so that $||z_i||_2 = 1$.)

You can also use the routine for computing the eigenvalues and eigenvectors of real symmetric (or complex Hermitian) positive-definite matrices A reduced to tridiagonal form T: $A = Q*T*Q^H$. In this case, the spectral factorization is as follows: $A = Q*T*Q^H = (QZ)*\Lambda*(QZ)^H$. Before calling `?pteqr`, you must reduce A to tridiagonal form and generate the explicit matrix Q by calling the following routines:

	for real matrices:	for complex matrices:
full storage	`?sytrd`, `?orgtr`	`?hetrd`, `?ungtr`
packed storage	`?sptrd`, `?opgtr`	`?hptrd`, `?upgtr`
band storage	`?sbtrd` (*vect*='V')	`?hbtrd` (*vect*='V')

The routine first factorizes T as $L*D*L^H$ where L is a unit lower bidiagonal matrix, and D is a diagonal matrix. Then it forms the bidiagonal matrix $B = L*D^{1/2}$ and calls `?bdsqr` to compute the singular values of B, which are the same as the eigenvalues of T.

Input Parameters

compz
: `CHARACTER*1`. Must be `'N'` or `'I'` or `'V'`.
If *compz* = `'N'`, the routine computes eigenvalues only.
If *compz* = `'I'`, the routine computes the eigenvalues and eigenvectors of the tridiagonal matrix T.
If *compz* = `'V'`, the routine computes the eigenvalues and eigenvectors of A (and the array z must contain the matrix Q on entry).

n
: `INTEGER`. The order of the matrix T ($n \geq 0$).

d, *e*, *work*
: `REAL` for single-precision flavors
`DOUBLE PRECISION` for double-precision flavors.
Arrays:
d(*) contains the diagonal elements of T.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of T.
The dimension of *e* must be at least max(1, *n*-1).
work(*) is a workspace array.

The dimension of *work* must be:
at least 1 if *compz* = 'N';
at least max(1, 4*n*-4) if *compz* = 'V' or 'I'.

z — REAL for spteqr
DOUBLE PRECISION for dpteqr
COMPLEX for cpteqr
DOUBLE COMPLEX for zpteqr.
Array, DIMENSION (*ldz*,*)
If *compz* = 'N' or 'I', *z* need not be set.
If *vect* = 'V', *z* must contains the *n*-by-*n* matrix *Q*.
The second dimension of *z* must be:
at least 1 if *compz* = 'N';
at least max(1, *n*) if *compz* = 'V' or 'I'.

ldz — INTEGER. The first dimension of *z*. Constraints:
ldz ≥ 1 if *compz* = 'N';
ldz ≥ max(1, *n*) if *compz* = 'V' or 'I'.

Output Parameters

d — The *n* eigenvalues in descending order, unless *info* > 0.
See also *info*.

e — On exit, the array is overwritten.

z — If *info* = 0, contains the *n* orthonormal eigenvectors, stored by columns. (The *i*-th column corresponds to the *i*-th eigenvalue.)

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = *i*, the leading minor of order *i* (and hence *T* itself) is not positive-definite.
If *info* = *n* + *i*, the algorithm for computing singular values failed to converge; *i* off-diagonal elements have not converged to zero.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pteqr interface are the following:

d — Holds the vector of length *n*.

e — Holds the vector of length (*n*-1).

z — Holds the matrix *Z* of size (*n*, *n*).

compz — If omitted, this argument is restored based on the presence of argument *z* as follows:
compz = 'I', if *z* is present,
compz = 'N', if *z* is omitted.
If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Note that two variants of Fortran 95 interface for pteqr routine are needed because of an ambiguous choice between real and complex cases appear when *z* is omitted. Thus, the name rpteqr is used in real cases (single or double precision), and the name pteqr is used in complex cases (single or double precision).

Application Notes

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \le c(n)*\varepsilon*K*\lambda_i$

where $c(n)$ is a modestly increasing function of n, ε is the machine precision, and $K = ||DTD||_2 * ||(DTD)^{-1}||_2$, D is diagonal with $d_{ii} = t_{ii}^{-1/2}$.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$\theta(u_i, w_i) \le c(n)\varepsilon K / \min_{i \ne j}(|\lambda_i - \lambda_j|/|\lambda_i + \lambda_j|)$.

Here $\min_{i \ne j}(|\lambda_i - \lambda_j|/|\lambda_i + \lambda_j|)$ is the *relative gap* between λ_i and the other eigenvalues.

The total number of floating-point operations depends on how rapidly the algorithm converges.

Typically, it is about

$30n^2$ if *compz* = 'N';

$6n^3$ (for complex flavors, $12n^3$) if *compz* = 'V' or 'I'.

?stebz

Computes selected eigenvalues of a real symmetric tridiagonal matrix by bisection.

Syntax

FORTRAN 77:

call sstebz (*range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *abstol*, *d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit*, *work*, *iwork*, *info*)

call dstebz (*range*, *order*, *n*, *vl*, *vu*, *il*, *iu*, *abstol*, *d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit*, *work*, *iwork*, *info*)

Fortran 95:

call stebz(*d*, *e*, *m*, *nsplit*, *w*, *iblock*, *isplit* [, *order*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes some (or all) of the eigenvalues of a real symmetric tridiagonal matrix T by bisection. The routine searches for zero or negligible off-diagonal elements to see if T splits into block-diagonal form $T = \mathrm{diag}(T_1, T_2, \ldots)$. Then it performs bisection on each of the blocks T_i and returns the block index of each computed eigenvalue, so that a subsequent call to ?stein can also take advantage of the block structure.

See also ?laebz.

Input Parameters

range
CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \le vu$.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.

order
CHARACTER*1. Must be 'B' or 'E'.
If *order* = 'B', the eigenvalues are to be ordered from smallest to largest within each split-off block.
If *order* = 'E', the eigenvalues for the entire matrix are to be ordered from smallest to largest.

n
INTEGER. The order of the matrix T ($n \ge 0$).

vl, *vu*
REAL for sstebz
DOUBLE PRECISION for dstebz.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
$vl < lambda(i) \le vu$.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER. Constraint: $1 \le il \le iu \le n$.
If *range* = 'I', the routine computes eigenvalues *lambda*(*i*) such that $il \le i \le iu$ (assuming that the eigenvalues *lambda*(*i*) are in ascending order).
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for sstebz
DOUBLE PRECISION for dstebz.
The absolute tolerance to which each eigenvalue is required. An eigenvalue (or cluster) is considered to have converged if it lies in an interval of width *abstol*.
If $abstol \le 0.0$, then the tolerance is taken as eps*$|T|$, where eps is the machine precision, and $|T|$ is the 1-norm of the matrix T.

d, *e*, *work*
REAL for sstebz
DOUBLE PRECISION for dstebz.
Arrays:
d(*) contains the diagonal elements of T.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the off-diagonal elements of T.

	The dimension of *e* must be at least max(1, *n*-1). *work*(*) is a workspace array. The dimension of *work* must be at least max(1, 4*n*).
iwork	INTEGER. Workspace. Array, DIMENSION at least max(1, 3*n*).

Output Parameters

m	INTEGER. The actual number of eigenvalues found.
nsplit	INTEGER. The number of diagonal blocks detected in *T*.
w	REAL for sstebz DOUBLE PRECISION for dstebz. Array, DIMENSION at least max(1, *n*). The computed eigenvalues, stored in *w*(1) to *w*(*m*).
iblock, *isplit*	INTEGER. Arrays, DIMENSION at least max(1, *n*). A positive value *iblock*(*i*) is the block number of the eigenvalue stored in *w*(*i*) (see also *info*). The leading *nsplit* elements of *isplit* contain points at which *T* splits into blocks T_i as follows: the block T_1 contains rows/columns 1 to *isplit*(1); the block T_2 contains rows/columns *isplit*(1)+1 to *isplit*(2), and so on.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = 1, for *range* = 'A' or 'V', the algorithm failed to compute some of the required eigenvalues to the desired accuracy; *iblock*(*i*)<0 indicates that the eigenvalue stored in *w*(*i*) failed to converge. If *info* = 2, for *range* = 'I', the algorithm failed to compute some of the required eigenvalues. Try calling the routine again with *range* = 'A'. If *info* = 3: for *range* = 'A' or 'V', same as *info* = 1; for *range* = 'I', same as *info* = 2. If *info* = 4, no eigenvalues have been computed. The floating-point arithmetic on the computer is not behaving as expected. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stebz interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length (*n*-1).
w	Holds the vector of length *n*.
iblock	Holds the vector of length *n*.

isplit	Holds the vector of length *n*.
order	Must be 'B' or 'E'. The default value is 'B'.
vl	Default value for this argument is *vl* = - HUGE (*vl*) where HUGE(*a*) means the largest machine number of the same precision as argument *a*.
vu	Default value for this argument is *vu* = HUGE (*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this argument is *abstol* = 0.0_WP.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

The eigenvalues of *T* are computed to high relative accuracy which means that if they vary widely in magnitude, then any small eigenvalues will be computed more accurately than, for example, with the standard *QR* method. However, the reduction to tridiagonal form (prior to calling the routine) may exclude the possibility of obtaining high relative accuracy in the small eigenvalues of the original matrix if its eigenvalues vary widely in magnitude.

?stein

Computes the eigenvectors corresponding to specified eigenvalues of a real symmetric tridiagonal matrix.

Syntax

FORTRAN 77:

```
call sstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call dstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call cstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
call zstein(n, d, e, m, w, iblock, isplit, z, ldz, work, iwork, ifailv, info)
```

Fortran 95:

```
call stein(d, e, w, iblock, isplit, z [,ifailv] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes the eigenvectors of a real symmetric tridiagonal matrix *T* corresponding to specified eigenvalues, by inverse iteration. It is designed to be used in particular after the specified eigenvalues have been computed by ?stebz with *order* = 'B', but may also be used when the eigenvalues have been computed by other routines.

If you use this routine after ?stebz, it can take advantage of the block structure by performing inverse iteration on each block T_i separately, which is more efficient than using the whole matrix T.

If T has been formed by reduction of a full symmetric or Hermitian matrix A to tridiagonal form, you can transform eigenvectors of T to eigenvectors of A by calling ?ormtr or ?opmtr (for real flavors) or by calling ?unmtr or ?upmtr (for complex flavors).

Input Parameters

n	INTEGER. The order of the matrix T ($n \geq 0$).
m	INTEGER. The number of eigenvectors to be returned.
d, *e*, *w*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays: *d*(*) contains the diagonal elements of T. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the sub-diagonal elements of T stored in elements 1 to *n*-1 The dimension of *e* must be at least max(1, *n*-1). *w*(*) contains the eigenvalues of T, stored in *w*(1) to *w*(*m*) (as returned by ?stebz). Eigenvalues of T_1 must be supplied first, in non-decreasing order; then those of T_2, again in non-decreasing order, and so on. Constraint: if *iblock*(*i*) = *iblock*(*i*+1), *w*(*i*) ≤ *w*(*i*+1). The dimension of *w* must be at least max(1, *n*).
iblock, *isplit*	INTEGER. Arrays, DIMENSION at least max(1, *n*). The arrays *iblock* and *isplit*, as returned by ?stebz with *order* = 'B'. If you did not call ?stebz with *order* = 'B', set all elements of *iblock* to 1, and *isplit*(1) to *n*.)
ldz	INTEGER. The first dimension of the output array *z*; *ldz* ≥ max(1, *n*).
work	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Workspace array, DIMENSION at least max(1, 5*n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).

Output Parameters

z	REAL for sstein DOUBLE PRECISION for dstein COMPLEX for cstein DOUBLE COMPLEX for zstein. Array, DIMENSION (*ldz*, *). If *info* = 0, *z* contains the *m* orthonormal eigenvectors, stored by columns. (The *i*th column corresponds to the *i*-th specified eigenvalue.)

ifailv	INTEGER. Array, DIMENSION at least max(1, *m*). If *info* = *i* > 0, the first *i* elements of *ifailv* contain the indices of any eigenvectors that failed to converge.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then *i* eigenvectors (as indicated by the parameter *ifailv*) each failed to converge in 5 iterations. The current iterates are stored in the corresponding columns of the array *z*. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stein interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
w	Holds the vector of length *n*.
iblock	Holds the vector of length *n*.
isplit	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*,*m*).
ifailv	Holds the vector of length (*m*).

Application Notes

Each computed eigenvector z_i is an exact eigenvector of a matrix $T+E_i$, where $||E_i||_2 = O(\varepsilon)*||T||_2$. However, a set of eigenvectors computed by this routine may not be orthogonal to so high a degree of accuracy as those computed by ?steqr.

?disna

Computes the reciprocal condition numbers for the eigenvectors of a symmetric/ Hermitian matrix or for the left or right singular vectors of a general matrix.

Syntax

FORTRAN 77:

```
call sdisna(job, m, n, d, sep, info)
call ddisna(job, m, n, d, sep, info)
```

Fortran 95:

```
call disna(d, sep [,job] [,minmn] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the reciprocal condition numbers for the eigenvectors of a real symmetric or complex Hermitian matrix or for the left or right singular vectors of a general *m*-by-*n* matrix.

The reciprocal condition number is the 'gap' between the corresponding eigenvalue or singular value and the nearest other one.

The bound on the error, measured by angle in radians, in the *i*-th computed vector is given by

`slamch('E')*(`*anorm/sep*`(`*i*`))`

where *anorm* = $||A||_2$ = max(|*d*(j)|). *sep*(*i*) is not allowed to be smaller than `slamch('E')*`*anorm* in order to limit the size of the error bound.

`?disna` may also be used to compute error bounds for eigenvectors of the generalized symmetric definite eigenproblem.

Input Parameters

job	CHARACTER*1. Must be 'E','L', or 'R'. Specifies for which problem the reciprocal condition numbers should be computed: *job* = 'E': for the eigenvectors of a symmetric/Hermitian matrix; *job* = 'L': for the left singular vectors of a general matrix; *job* = 'R': for the right singular vectors of a general matrix.
m	INTEGER. The number of rows of the matrix (*m* ≥ 0).
n	INTEGER. If *job* = 'L', or 'R', the number of columns of the matrix (*n* ≥ 0). Ignored if *job* = 'E'.
d	REAL for sdisna DOUBLE PRECISION for ddisna. Array, dimension at least max(1,*m*) if *job* = 'E', and at least max(1, min(*m*,*n*)) if *job* = 'L' or 'R'. This array must contain the eigenvalues (if *job* = 'E') or singular values (if *job* = 'L' or 'R') of the matrix, in either increasing or decreasing order. If singular values, they must be non-negative.

Output Parameters

sep	REAL for sdisna DOUBLE PRECISION for ddisna. Array, dimension at least max(1,*m*) if *job* = 'E', and at least max(1, min(*m*,*n*)) if *job* = 'L' or 'R'. The reciprocal condition numbers of the vectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `disna` interface are the following:

d	Holds the vector of length min(*m*, *n*).
sep	Holds the vector of length min(*m*, *n*).
job	Must be `'E'`, `'L'`, or `'R'`. The default value is `'E'`.
minmn	Indicates which of the values *m* or *n* is smaller. Must be either `'M'` or `'N'`, the default is `'M'`. If *job* = `'E'`, this argument is superfluous, If *job* = `'L'` or `'R'`, this argument is used by the routine.

Generalized Symmetric-Definite Eigenvalue Problems

Generalized symmetric-definite eigenvalue problems are as follows: find the eigenvalues λ and the corresponding eigenvectors *z* that satisfy one of these equations:

$Az = \lambda Bz$, $ABz = \lambda z$, or $BAz = \lambda z$,

where *A* is an *n*-by-*n* symmetric or Hermitian matrix, and *B* is an *n*-by-*n* symmetric positive-definite or Hermitian positive-definite matrix.

In these problems, there exist *n* real eigenvectors corresponding to real eigenvalues (even for complex Hermitian matrices *A* and *B*).

Routines described in this section allow you to reduce the above generalized problems to standard symmetric eigenvalue problem $Cy = \lambda y$, which you can solve by calling LAPACK routines described earlier in this chapter (see Symmetric Eigenvalue Problems).

Different routines allow the matrices to be stored either conventionally or in packed storage. Prior to reduction, the positive-definite matrix *B* must first be factorized using either `?potrf` or `?pptrf`.

The reduction routine for the banded matrices *A* and *B* uses a split Cholesky factorization for which a specific routine `?pbstf` is provided. This refinement halves the amount of work required to form matrix *C*.

Table 4-4 lists LAPACK routines (FORTRAN 77 interface) that can be used to solve generalized symmetric-definite eigenvalue problems. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-4 Computational Routines for Reducing Generalized Eigenproblems to Standard Problems

Matrix type	Reduce to standard problems (full storage)	Reduce to standard problems (packed storage)	Reduce to standard problems (band matrices)	Factorize band matrix
real symmetric matrices	`?sygst`	`?spgst`	`?sbgst`	`?pbstf`
complex Hermitian matrices	`?hegst`	`?hpgst`	`?hbgst`	`?pbstf`

?sygst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form.

Syntax

FORTRAN 77:

```
call ssygst(itype, uplo, n, a, lda, b, ldb, info)
call dsygst(itype, uplo, n, a, lda, b, ldb, info)
```

Fortran 95:

```
call sygst(a, b [,itype] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces real symmetric-definite generalized eigenproblems

$A*z = \lambda*B*z$, $A*B*z = \lambda*z$, or $B*A*z = \lambda*z$

to the standard form $C*y = \lambda*y$. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, call `?potrf` to compute the Cholesky factorization: $B = U^T*U$ or $B = L*L^T$.

Input Parameters

itype	`INTEGER`. Must be 1 or 2 or 3. If *itype* = 1, the generalized eigenproblem is *A*z = lambda*B*z* for *uplo* = 'U': $C = \text{inv}(U^T)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$; for *uplo* = 'L': $C = \text{inv}(L)*A*\text{inv}(L^T)$, $z = \text{inv}(L^T)*y$. If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z* for *uplo* = 'U': $C = U*A*U^T$, $z = \text{inv}(U)*y$; for *uplo* = 'L': $C = L^T*A*L$, $z = \text{inv}(L^T)*y$. If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z* for *uplo* = 'U': $C = U*A*U^T$, $z = U^T*y$; for *uplo* = 'L': $C = L^T*A*L$, $z = L*y$.
uplo	`CHARACTER*1`. Must be 'U' or 'L'. If *uplo* = 'U', the array *a* stores the upper triangle of A; you must supply B in the factored form $B = U^T*U$. If *uplo* = 'L', the array *a* stores the lower triangle of A; you must supply B in the factored form $B = L*L^T$.
n	`INTEGER`. The order of the matrices A and B ($n \geq 0$).
a, *b*	`REAL` for `ssygst` `DOUBLE PRECISION` for `dsygst`. Arrays: *a*(*lda*,*) contains the upper or lower triangle of A.

	The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the Cholesky-factored matrix *B*: *B* = U^T*U or *B* = *L*L^T (as returned by ?potrf). The second dimension of *b* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).

Output Parameters

a	The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sygst interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by inv(*B*) (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is *n3*.

?hegst

Reduces a complex Hermitian-definite generalized eigenvalue problem to the standard form.

Syntax

FORTRAN 77:

```
call chegst(itype, uplo, n, a, lda, b, ldb, info)
call zhegst(itype, uplo, n, a, lda, b, ldb, info)
```

Fortran 95:

```
call hegst(a, b [,itype] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces complex Hermitian-definite generalized eigenvalue problems

$A*x = \lambda*B*x$, $A*B*x = \lambda*x$, or $B*A*x = \lambda*x$.

to the standard form $Cy = \lambda y$. Here the matrix A is complex Hermitian, and B is complex Hermitian positive-definite. Before calling this routine, you must call `?potrf` to compute the Cholesky factorization: $B = U^H*U$ or $B = L*L^H$.

Input Parameters

itype	INTEGER. Must be 1 or 2 or 3. If *itype* = 1, the generalized eigenproblem is *A*z = lambda*B*z* for *uplo* = 'U': $C = \text{inv}(U^H)*A*\text{inv}(U)$, $z = \text{inv}(U)*y$; for *uplo* = 'L': $C = \text{inv}(L)*A*\text{inv}(L^H)$, $z = \text{inv}(L^H)*y$. If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z* for *uplo* = 'U': $C = U*A*U^H$, $z = \text{inv}(U)*y$; for *uplo* = 'L': $C = L^H*A*L$, $z = \text{inv}(L^H)*y$. If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z* for *uplo* = 'U': $C = U*A*U^H$, $z = U^H*y$; for *uplo* = 'L': $C = L^H*A*L$, $z = L*y$.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', the array *a* stores the upper triangle of A; you must supply B in the factored form $B = U^H*U$. If *uplo* = 'L', the array *a* stores the lower triangle of A; you must supply B in the factored form $B = L*L^H$.
n	INTEGER. The order of the matrices A and B ($n \geq 0$).
a, *b*	COMPLEX for chegstDOUBLE COMPLEX for zhegst. Arrays: *a*(*lda*,*) contains the upper or lower triangle of A. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the Cholesky-factored matrix B: $B = U^H*U$ or $B = L*L^H$ (as returned by ?potrf). The second dimension of *b* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).

Output Parameters

a	The upper or lower triangle of A is overwritten by the upper or lower triangle of C, as specified by the arguments *itype* and *uplo*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `hegst` interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be `'U'` or `'L'`. The default value is `'U'`.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by `inv(`*B*`)` (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?spgst

Reduces a real symmetric-definite generalized eigenvalue problem to the standard form using packed storage.

Syntax

FORTRAN 77:

```
call sspgst(itype, uplo, n, ap, bp, info)
call dspgst(itype, uplo, n, ap, bp, info)
```

Fortran 95:

```
call spgst(ap, bp [,itype] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces real symmetric-definite generalized eigenproblems

*A*x* = λ**B*x*, *A*B*x* = λ**x*, or *B*A*x* = λ**x*

to the standard form *C*y* = λ**y*, using packed matrix storage. Here *A* is a real symmetric matrix, and *B* is a real symmetric positive-definite matrix. Before calling this routine, call `?pptrf` to compute the Cholesky factorization: $B = U^T * U$ or $B = L * L^T$.

Input Parameters

itype	`INTEGER`. Must be 1 or 2 or 3. If *itype* = 1, the generalized eigenproblem is *A*z* = *lambda*B*z*

	for *uplo* = 'U': *C* = inv(U^T)*A*inv(*U*), *z* = inv(*U*)*y;
	for *uplo* = 'L': *C* = inv(*L*)*A*inv(L^T), *z* = inv(L^T)*y.
	If *itype* = 2, the generalized eigenproblem is *A*B*z = lambda*z
	for *uplo* = 'U': *C* = *U*A*U^T, *z* = inv(*U*)*y;
	for *uplo* = 'L': *C* = L^T*A*L, *z* = inv(L^T)*y.
	If *itype* = 3, the generalized eigenproblem is *B*A*z = lambda*z
	for *uplo* = 'U': *C* = *U*A*U^T, *z* = U^T*y;
	for *uplo* = 'L': *C* = L^T*A*L, *z* = L*y.

uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangle of *A*; you must supply *B* in the factored form *B* = U^T*U. If *uplo* = 'L', *ap* stores the packed lower triangle of *A*; you must supply *B* in the factored form *B* = *L*L^T.
n	INTEGER. The order of the matrices *A* and *B* (*n* ≥ 0).
ap, *bp*	REAL for sspgst DOUBLE PRECISION for dspgst. Arrays: *ap(*)* contains the packed upper or lower triangle of *A*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *bp(*)* contains the packed Cholesky factor of *B* (as returned by ?pptrf with the same *uplo* value). The dimension of *bp* must be at least max(1, *n**(*n*+1)/2).

Output Parameters

ap	The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spgst interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix C is a stable procedure. However, it involves implicit multiplication by `inv(`B`)` (if $itype$ `= 1`) or B (if $itype$ `= 2` or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?hpgst

Reduces a complex Hermitian-definite generalized eigenvalue problem to the standard form using packed storage.

Syntax

FORTRAN 77:

`call chpgst(`$itype$`, `$uplo$`, `n`, `ap`, `bp`, `$info$`)`

`call zhpgst(`$itype$`, `$uplo$`, `n`, `ap`, `bp`, `$info$`)`

Fortran 95:

`call hpgst(`ap`, `bp` [,`$itype$`] [,`$uplo$`] [,`$info$`])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces real symmetric-definite generalized eigenproblems

$A*z = \lambda*B*z$, $A*B*z = \lambda*z$, or $B*A*z = \lambda*z$.

to the standard form $C*y = \lambda*y$, using packed matrix storage. Here A is a real symmetric matrix, and B is a real symmetric positive-definite matrix. Before calling this routine, you must call `?pptrf` to compute the Cholesky factorization: $B = U^H*U$ or $B = L*L^H$.

Input Parameters

$itype$	`INTEGER`. Must be 1 or 2 or 3. If $itype$ `= 1`, the generalized eigenproblem is $A*z$ `= lambda*`$B*z$ for $uplo$ `= 'U'`: C `= inv(`U^H`)*`A`*inv(`U`)`, z `= inv(`U`)*`y; for $uplo$ `= 'L'`: C `= inv(`L`)*`A`*inv(`L^H`)`, z `= inv(`L^H`)*`y. If $itype$ `= 2`, the generalized eigenproblem is $A*B*z$ `= lambda*`z for $uplo$ `= 'U'`: $C = U*A*U^H$, z `= inv(`U`)*`y; for $uplo$ `= 'L'`: $C = L^H*A*L$, z `= inv(`L^H`)*`y. If $itype$ `= 3`, the generalized eigenproblem is $B*A*z$ `= lambda*`z for $uplo$ `= 'U'`: $C = U*A*U^H$, $z = U^H*y$; for $uplo$ `= 'L'`: $C = L^H*A*L$, $z = L*y$.
$uplo$	`CHARACTER*1`. Must be `'U'` or `'L'`.

	If *uplo* = 'U', *ap* stores the packed upper triangle of *A*; you must supply *B* in the factored form $B = U^H*U$. If *uplo* = 'L', *ap* stores the packed lower triangle of *A*; you must supply *B* in the factored form $B = L*L^H$.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
ap, *bp*	COMPLEX for chpgstDOUBLE COMPLEX for zhpgst. Arrays: *ap*(*) contains the packed upper or lower triangle of *A*. The dimension of *a* must be at least max(1, *n**(*n*+1)/2). *bp*(*) contains the packed Cholesky factor of *B* (as returned by ?pptrf with the same *uplo* value). The dimension of *b* must be at least max(1, *n**(*n*+1)/2).

Output Parameters

ap	The upper or lower triangle of *A* is overwritten by the upper or lower triangle of *C*, as specified by the arguments *itype* and *uplo*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpgst interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
bp	Holds the array *B* of size (*n*(n+1)/2*).
itype	Must be 1, 2, or 3. The default value is 1.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

Forming the reduced matrix *C* is a stable procedure. However, it involves implicit multiplication by inv(*B*) (if *itype* = 1) or *B* (if *itype* = 2 or 3). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

The approximate number of floating-point operations is n^3.

?sbgst

Reduces a real symmetric-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by ?pbstf.

Syntax

FORTRAN 77:

```
call ssbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
call dsbgst(vect, uplo, n, ka, kb, ab, ldab, bb, ldbb, x, ldx, work, info)
```

Fortran 95:

```
call sbgst(ab, bb [,x] [,uplo] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

To reduce the real symmetric-definite generalized eigenproblem $A*z = \lambda*B*z$ to the standard form $C*y=\lambda*y$, where A, B and C are banded, this routine must be preceded by a call to spbstf/dpbstf, which computes the split Cholesky factorization of the positive-definite matrix B: $B=S^T*S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites A with $C = X^T*A*X$, where $X = \text{inv}(S)*Q$ and Q is an orthogonal matrix chosen (implicitly) to preserve the bandwidth of A. The routine also has an option to allow the accumulation of X, and then, if z is an eigenvector of C, $X*z$ is an eigenvector of the original system.

Input Parameters

vect	CHARACTER*1. Must be 'N' or 'V'. If *vect* = 'N', then matrix X is not returned; If *vect* = 'V', then matrix X is returned.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of A. If *uplo* = 'L', *ab* stores the lower triangular part of A.
n	INTEGER. The order of the matrices A and B ($n \geq 0$).
ka	INTEGER. The number of super- or sub-diagonals in A ($ka \geq 0$).
kb	INTEGER. The number of super- or sub-diagonals in B ($ka \geq kb \geq 0$).
ab, *bb*, *work*	REAL for ssbgst DOUBLE PRECISION for dsbgst *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix A (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*).

	bb (*ldbb*,*) is an array containing the banded split Cholesky factor of *B* as specified by *uplo*, *n* and *kb* and returned by spbstf/dpbstf. The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, dimension at least max(1, 2**n*)
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldx	The first dimension of the output array x. Constraints: if *vect* = 'N', then *ldx* ≥ 1; if *vect* = 'V', then *ldx* ≥ max(1, *n*).

Output Parameters

ab	On exit, this array is overwritten by the upper or lower triangle of *C* as specified by *uplo*.
x	REAL for ssbgst DOUBLE PRECISION for dsbgst Array. If *vect* = 'V', then *x* (*ldx*,*) contains the *n*-by-*n* matrix *X* = inv(*S*)**Q*. If *vect* = 'N', then *x* is not referenced. The second dimension of x must be: at least max(1, *n*), if *vect* = 'V'; at least 1, if *vect* = 'N'.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbgst interface are the following:

ab	Holds the array *A* of size (*ka+1*, *n*).
bb	Holds the array *B* of size (*kb+1*, *n*).
x	Holds the matrix *X* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vect	Restored based on the presence of the argument *x* as follows: *vect* = 'V', if *x* is present, *vect* = 'N', if *x* is omitted.

Application Notes

Forming the reduced matrix *C* involves implicit multiplication by inv(*B*). When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion.

If *ka* and *kb* are much less than *n* then the total number of floating-point operations is approximately $6n^2*kb$, when *vect* = 'N'. Additional $(3/2)n^3*(kb/ka)$ operations are required when *vect* = 'V'.

?hbgst

Reduces a complex Hermitian-definite generalized eigenproblem for banded matrices to the standard form using the factorization performed by ?pbstf.

Syntax

FORTRAN 77:

call chbgst(*vect*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *x*, *ldx*, *work*, *rwork*, *info*)

call zhbgst(*vect*, *uplo*, *n*, *ka*, *kb*, *ab*, *ldab*, *bb*, *ldbb*, *x*, *ldx*, *work*, *rwork*, *info*)

Fortran 95:

call hbgst(*ab*, *bb* [,*x*] [,*uplo*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

To reduce the complex Hermitian-definite generalized eigenproblem $A*z = \lambda*B*z$ to the standard form $C*x = \lambda*y$, where *A*, *B* and *C* are banded, this routine must be preceded by a call to cpbstf/zpbstf, which computes the split Cholesky factorization of the positive-definite matrix *B*: $B = S^H*S$. The split Cholesky factorization, compared with the ordinary Cholesky factorization, allows the work to be approximately halved.

This routine overwrites *A* with $C = X^H*A*X$, where $X = \text{inv}(S)*Q$, and *Q* is a unitary matrix chosen (implicitly) to preserve the bandwidth of *A*. The routine also has an option to allow the accumulation of *X*, and then, if *z* is an eigenvector of *C*, *X*z* is an eigenvector of the original system.

Input Parameters

vect	CHARACTER*1. Must be 'N' or 'V'. If *vect* = 'N', then matrix *X* is not returned; If *vect* = 'V', then matrix *X* is returned.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
ka	INTEGER. The number of super- or sub-diagonals in *A* ($ka \geq 0$).
kb	INTEGER. The number of super- or sub-diagonals in *B* ($ka \geq kb \geq 0$).
ab, *bb*, *work*	COMPLEX for chbgstDOUBLE COMPLEX for zhbgst

	ab (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of the array *ab* must be at least max(1, *n*). *bb* (*ldbb*,*) is an array containing the banded split Cholesky factor of *B* as specified by *uplo*, *n* and *kb* and returned by cpbstf/zpbstf. The second dimension of the array *bb* must be at least max(1, *n*). *work(*)* is a workspace array, dimension at least max(1, *n*)
ldab	INTEGER. The first dimension of the array *ab*; must be at least *ka*+1.
ldbb	INTEGER. The first dimension of the array *bb*; must be at least *kb*+1.
ldx	The first dimension of the output array x. Constraints: if *vect* = 'N', then *ldx* ≥ 1; if *vect* = 'V', then *ldx* ≥ max(1, *n*).
rwork	REAL for chbgst DOUBLE PRECISION for zhbgst Workspace array, dimension at least max(1, *n*)

Output Parameters

ab	On exit, this array is overwritten by the upper or lower triangle of *C* as specified by *uplo*.
x	COMPLEX for chbgst DOUBLE COMPLEX for zhbgst Array. If *vect* = 'V', then *x* (*ldx*,*) contains the *n*-by-*n* matrix *X* = inv(*S*)**Q*. If *vect* = 'N', then *x* is not referenced. The second dimension of x must be: at least max(1, *n*), if *vect* = 'V'; at least 1, if *vect* = 'N'.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbgst interface are the following:

ab	Holds the array *A* of size (*ka+1*, *n*).
bb	Holds the array *B* of size (*kb+1*, *n*).
x	Holds the matrix *X* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
vect	Restored based on the presence of the argument *x* as follows: *vect* = 'V', if *x* is present, *vect* = 'N', if *x* is omitted.

Application Notes

Forming the reduced matrix *C* involves implicit multiplication by `inv(`*B*`)`. When the routine is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if *B* is ill-conditioned with respect to inversion. The total number of floating-point operations is approximately $20n^2*kb$, when *vect* = 'N'. Additional $5n^3*(kb/ka)$ operations are required when *vect* = 'V'. All these estimates assume that both *ka* and *kb* are much less than *n*.

?pbstf

Computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite banded matrix used in `?sbgst/?hbgst` *.*

Syntax

FORTRAN 77:

```
call spbstf(uplo, n, kb, bb, ldbb, info)
call dpbstf(uplo, n, kb, bb, ldbb, info)
call cpbstf(uplo, n, kb, bb, ldbb, info)
call zpbstf(uplo, n, kb, bb, ldbb, info)
```

Fortran 95:

```
call pbstf(bb [, uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes a split Cholesky factorization of a real symmetric or complex Hermitian positive-definite band matrix *B*. It is to be used in conjunction with `?sbgst/?hbgst`.

The factorization has the form $B = S^T*S$ (or $B = S^H*S$ for complex flavors), where *S* is a band matrix of the same bandwidth as *B* and the following structure: S is upper triangular in the first $(n+kb)/2$ rows and lower triangular in the remaining rows.

Input Parameters

uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = 'U', *bb* stores the upper triangular part of *B*. If *uplo* = 'L', *bb* stores the lower triangular part of *B*.
n	`INTEGER`. The order of the matrix *B* ($n \geq 0$).
kb	`INTEGER`. The number of super- or sub-diagonals in *B* ($kb \geq 0$).

bb	`REAL` for `spbstf`
	`DOUBLE PRECISION` for `dpbstf`
	`COMPLEX` for `cpbstf`

	DOUBLE COMPLEX for zpbstf. *bb* (*ldbb*,*) is an array containing either upper or lower triangular part of the matrix *B* (as specified by *uplo*) in band storage format. The second dimension of the array *bb* must be at least max(1, *n*).
ldbb	INTEGER. The first dimension of *bb*; must be at least *kb*+1.

Output Parameters

bb	On exit, this array is overwritten by the elements of the split Cholesky factor *S*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the factorization could not be completed, because the updated element b_{ii} would be the square root of a negative number; hence the matrix *B* is not positive-definite. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine pbstf interface are the following:

bb	Holds the array *B* of size (*kb*+1, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed factor *S* is the exact factor of a perturbed matrix *B* + *E*, where

$$|E| \le c(kb + 1)\varepsilon |S^H||S|, \quad |e_{ij}| \le c(kb + 1)\varepsilon \sqrt{b_{ii} b_{jj}}$$

$c(n)$ is a modest linear function of n, and ε is the machine precision.

The total number of floating-point operations for real flavors is approximately $n(kb+1)^2$. The number of operations for complex flavors is 4 times greater. All these estimates assume that *kb* is much less than *n*.

After calling this routine, you can call ?sbgst/?hbgst to solve the generalized eigenproblem $Az = \lambda Bz$, where *A* and *B* are banded and *B* is positive-definite.

Nonsymmetric Eigenvalue Problems

This section describes LAPACK routines for solving nonsymmetric eigenvalue problems, computing the Schur factorization of general matrices, as well as performing a number of related computational tasks.

A *nonsymmetric eigenvalue problem* is as follows: given a nonsymmetric (or non-Hermitian) matrix *A*, find the *eigenvalues* λ and the corresponding *eigenvectors* *z* that satisfy the equation

$Az = \lambda z$ (right eigenvectors z)

or the equation

$z^H A = \lambda z^H$ (left eigenvectors z).

Nonsymmetric eigenvalue problems have the following properties:

- The number of eigenvectors may be less than the matrix order (but is not less than the number of *distinct eigenvalues* of A).
- Eigenvalues may be complex even for a real matrix A.
- If a real nonsymmetric matrix has a complex eigenvalue $a+bi$ corresponding to an eigenvector z, then $a-bi$ is also an eigenvalue. The eigenvalue $a-bi$ corresponds to the eigenvector whose elements are complex conjugate to the elements of z.

To solve a nonsymmetric eigenvalue problem with LAPACK, you usually need to reduce the matrix to the upper Hessenberg form and then solve the eigenvalue problem with the Hessenberg matrix obtained. Table 4-5 lists LAPACK routines (FORTRAN 77 interface) for reducing the matrix to the upper Hessenberg form by an orthogonal (or unitary) similarity transformation $A = QHQ^H$ as well as routines for solving eigenvalue problems with Hessenberg matrices, forming the Schur factorization of such matrices and computing the corresponding condition numbers. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Decision tree in Figure 4-4 helps you choose the right routine or sequence of routines for an eigenvalue problem with a real nonsymmetric matrix. If you need to solve an eigenvalue problem with a complex non-Hermitian matrix, use the decision tree shown in Figure 4-5 .

Table 4-5 Computational Routines for Solving Nonsymmetric Eigenvalue Problems

Figure 4-4 Decision Tree: Real Nonsymmetric Eigenvalue Problems

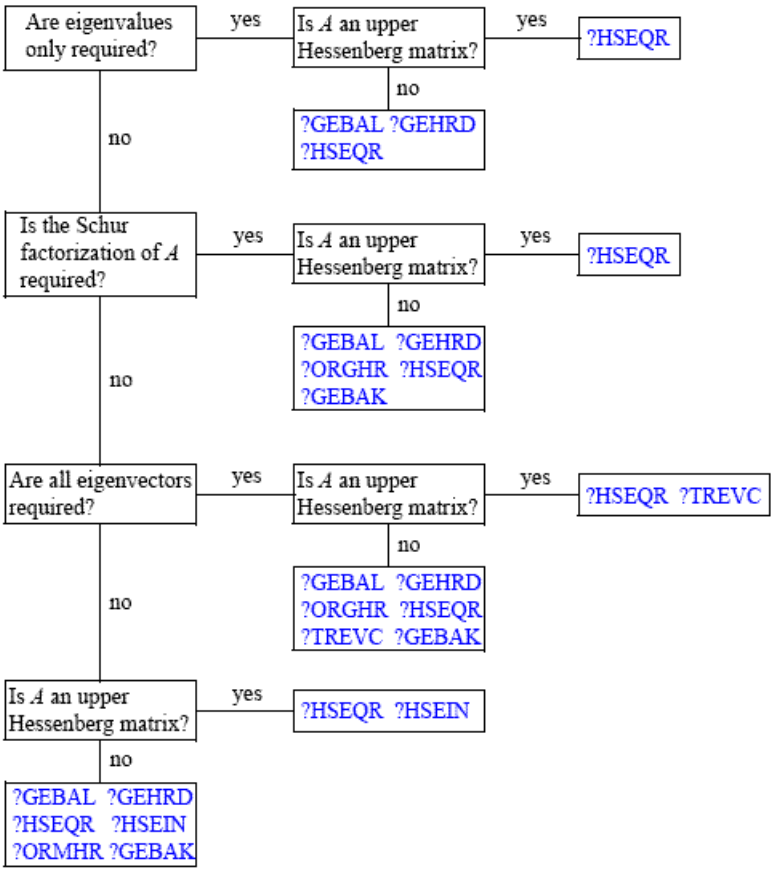

Figure 4-5 Decision Tree: Complex Non-Hermitian Eigenvalue Problems

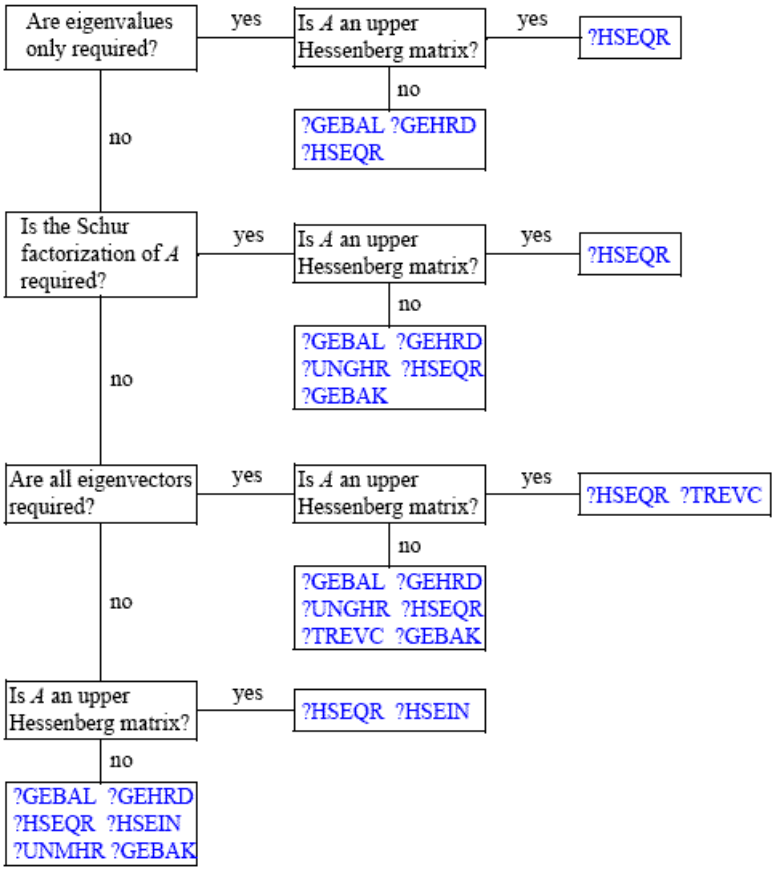

?gehrd

Reduces a general matrix to upper Hessenberg form.

Syntax

FORTRAN 77:

```
call sgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call dgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call cgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
call zgehrd(n, ilo, ihi, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call gehrd(a [, tau] [,ilo] [,ihi] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a general matrix *A* to upper Hessenberg form *H* by an orthogonal or unitary similarity transformation $A = Q*H*Q^H$. Here *H* has real subdiagonal elements.

The routine does not form the matrix *Q* explicitly. Instead, *Q* is represented as a product of *elementary reflectors*. Routines are provided to work with *Q* in this representation.

Input Parameters

n	INTEGER. The order of the matrix *A* ($n \geq 0$).
ilo, *ihi*	INTEGER. If *A* is an output by ?gebal, then *ilo* and *ihi* must contain the values returned by that routine. Otherwise *ilo* = 1 and *ihi* = *n*. (If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, *ilo* = 1 and *ihi* = 0.)
a, *work*	REAL for sgehrd DOUBLE PRECISION for dgehrd COMPLEX for cgehrd DOUBLE COMPLEX for zgehrd. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* (*lwork*) is a workspace array.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; at least max(1, *n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the upper Hessenberg matrix *H* and details of the matrix *Q*. The subdiagonal elements of *H* are real.
tau	REAL for sgehrd DOUBLE PRECISION for dgehrd COMPLEX for cgehrd DOUBLE COMPLEX for zgehrd. Array, DIMENSION at least max (1, *n*-1). Contains additional information on the matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i* , the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gehrd interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
tau	Holds the vector of length (*n*-1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* = *n***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed Hessenberg matrix *H* is exactly similar to a nearby matrix $A + E$, where $||E||_2 < c(n)\varepsilon||A||_2$, $c(n)$ is a modestly increasing function of n, and ε is the machine precision.

The approximate number of floating-point operations for real flavors is $(2/3)*(ihi - ilo)^2(2ihi + 2ilo + 3n)$; for complex flavors it is 4 times greater.

?orghr

Generates the real orthogonal matrix Q determined by ?gehrd*.*

Syntax

FORTRAN 77:

```
call sorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call dorghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call orghr(a, tau [,ilo] [,ihi] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine explicitly generates the orthogonal matrix *Q* that has been determined by a preceding call to `sgehrd/dgehrd`. (The routine `?gehrd` reduces a real general matrix *A* to upper Hessenberg form *H* by an orthogonal similarity transformation, $A = Q*H*Q^T$, and represents the matrix *Q* as a product of *ihi-ilo elementary reflectors*. Here *ilo* and *ihi* are values determined by `sgebal/dgebal` when balancing the matrix; if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.)

The matrix *Q* generated by `?orghr` has the structure:

$$Q = \begin{bmatrix} I & 0 & 0 \\ 0 & Q_{22} & 0 \\ 0 & 0 & I \end{bmatrix}$$

where Q_{22} occupies rows and columns *ilo* to *ihi*.

Input Parameters

n	INTEGER. The order of the matrix *Q* (*n* ≥ 0).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to `?gehrd`. (If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*; if *n* = 0, *ilo* = 1 and *ihi* = 0.)
a, *tau*, *work*	REAL for `sorghr` DOUBLE PRECISION for `dorghr` Arrays: *a*(*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by `?gehrd`. The second dimension of *a* must be at least max(1, *n*). *tau*(*) contains further details of the elementary reflectors, as returned by `?gehrd`. The dimension of *tau* must be at least max (1, *n*-1). *work* is a workspace array, its dimension `max(1, lwork)`.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ `max(1, ihi-ilo)`. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* orthogonal matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine orghr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
tau	Holds the vector of length (*n*-1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* =(*ihi*-*ilo*)***blocksize* where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of floating-point operations is $(4/3)(ihi-ilo)^3$.

The complex counterpart of this routine is ?unghr.

?ormhr

Multiplies an arbitrary real matrix C by the real orthogonal matrix Q determined by ?gehrd.

Syntax

FORTRAN 77:

```
call sormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call dormhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call ormhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine multiplies a matrix C by the orthogonal matrix Q that has been determined by a preceding call to sgehrd/dgehrd. (The routine ?gehrd reduces a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation, $A = Q*H*Q^T$, and represents the matrix Q as a product of $ihi-ilo$ *elementary reflectors*. Here ilo and ihi are values determined by sgebal/dgebal when balancing the matrix;if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.)

With ?ormhr, you can form one of the matrix products $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$, overwriting the result on C (which may be any real rectangular matrix).

A common application of ?ormhr is to transform a matrix V of eigenvectors of H to the matrix QV of eigenvectors of A.

Input Parameters

side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', then the routine forms $Q*C$ or Q^T*C. If *side* = 'R', then the routine forms $C*Q$ or $C*Q^T$.
trans	CHARACTER*1. Must be 'N' or 'T'. If *trans* = 'N' , then Q is applied to C. If *trans* = 'T', then Q^T is applied to C.
m	INTEGER. The number of rows in C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd. If $m > 0$ and *side* = 'L', then $1 \leq ilo \leq ihi \leq m$. If $m = 0$ and *side* = 'L' , then $ilo = 1$ and $ihi = 0$. If $n > 0$ and *side* = 'R', then $1 \leq ilo \leq ihi \leq n$. If $n = 0$ and *side* = 'R' , then $ilo = 1$ and $ihi = 0$.

a, *tau*, *c*, *work*	REAL for sormhr DOUBLE PRECISION for dormhr Arrays: *a*(*lda*,*) contains details of the vectors which define the *elementary reflectors*, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L' and at least max(1, *n*) if *side* = 'R'. *tau*(*) contains further details of the *elementary reflectors*, as returned by ?gehrd . The dimension of *tau* must be at least max (1, *m*-1) if *side* = 'L' and at least max (1, *n*-1) if *side* = 'R'. *c*(*ldc*,*) contains the *m* by *n* matrix *C*. The second dimension of *c* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*) if *side* = 'L' and at least max (1, *n*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array. If *side* = 'L', *lwork* ≥ max(1, *n*). If *side* = 'R', *lwork* ≥ max(1, *m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	*C* is overwritten by product $Q*C$, Q^T*C, $C*Q$, or $C*Q^T$ as specified by *side* and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ormhr interface are the following:

a	Holds the matrix *A* of size (*r*, *r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).

c	Holds the matrix *C* of size (*m*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, *lwork* should be at least *n***blocksize* if *side* = 'L' and at least *m***blocksize* if *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)*|C||_2$, where ε is the machine precision.

The approximate number of floating-point operations is

$2n(ihi-ilo)^2$ if *side* = 'L';

$2m(ihi-ilo)^2$ if *side* = 'R'.

The complex counterpart of this routine is ?unmhr.

?unghr

Generates the complex unitary matrix Q determined by ?gehrd.

Syntax

FORTRAN 77:

```
call cunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
call zunghr(n, ilo, ihi, a, lda, tau, work, lwork, info)
```

Fortran 95:

```
call unghr(a, tau [,ilo] [,ihi] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine is intended to be used following a call to `cgehrd/zgehrd`, which reduces a complex matrix *A* to upper Hessenberg form *H* by a unitary similarity transformation: $A = Q*H*Q^H$. `?gehrd` represents the matrix *Q* as a product of *ihi-ilo elementary reflectors*. Here *ilo* and *ihi* are values determined by `cgebal/zgebal` when balancing the matrix; if the matrix has not been balanced, *ilo* = 1 and *ihi* = *n*.

Use the routine `?unghr` to generate *Q* explicitly as a square matrix. The matrix *Q* has the structure:

$$Q = \begin{bmatrix} I & 0 & 0 \\ 0 & Q_{22} & 0 \\ 0 & 0 & I \end{bmatrix}$$

where Q_{22} occupies rows and columns *ilo* to *ihi*.

Input Parameters

n	INTEGER. The order of the matrix *Q* (*n* ≥ 0).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to `?gehrd` . (If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*. If *n* = 0, then *ilo* = 1 and *ihi* = 0.)
a, *tau*, *work*	COMPLEX for `cunghr` DOUBLE COMPLEX for `zunghr`. Arrays: *a*(*lda*,*) contains details of the vectors which define the *elementary reflectors*, as returned by `?gehrd`. The second dimension of *a* must be at least max(1, *n*). *tau*(*) contains further details of the *elementary reflectors*, as returned by `?gehrd` . The dimension of *tau* must be at least max (1, *n*-1). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
lwork	INTEGER. The size of the *work* array; *lwork* ≥ max(1, *ihi-ilo*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by `xerbla`. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	Overwritten by the *n*-by-*n* unitary matrix *Q*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unghr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
tau	Holds the vector of length (*n*-1).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.

Application Notes

For better performance, try using *lwork* = (*ihi*-*ilo*)***blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)$, where ε is the machine precision.

The approximate number of real floating-point operations is $(16/3)(ihi-ilo)^3$.

The real counterpart of this routine is ?orghr.

?unmhr

Multiplies an arbitrary complex matrix C by the complex unitary matrix Q determined by ?gehrd.

Syntax

FORTRAN 77:

```
call cunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
call zunmhr(side, trans, m, n, ilo, ihi, a, lda, tau, c, ldc, work, lwork, info)
```

Fortran 95:

```
call unmhr(a, tau, c [,ilo] [,ihi] [,side] [,trans] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine multiplies a matrix C by the unitary matrix Q that has been determined by a preceding call to cgehrd/zgehrd. (The routine ?gehrd reduces a real general matrix A to upper Hessenberg form H by an orthogonal similarity transformation, $A = Q*H*Q^H$, and represents the matrix Q as a product of $ihi-ilo$ *elementary reflectors*. Here ilo and ihi are values determined by cgebal/zgebal when balancing the matrix; if the matrix has not been balanced, $ilo = 1$ and $ihi = n$.)

With ?unmhr, you can form one of the matrix products $Q*C$, Q^H*C, $C*Q$, or $C*Q^H$, overwriting the result on C (which may be any complex rectangular matrix). A common application of this routine is to transform a matrix V of eigenvectors of H to the matrix QV of eigenvectors of A.

Input Parameters

side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L', then the routine forms $Q*C$ or Q^H*C. If *side* = 'R', then the routine forms $C*Q$ or $C*Q^H$.
trans	CHARACTER*1. Must be 'N' or 'C'. If *trans* = 'N' , then Q is applied to C. If *trans* = 'T', then Q^H is applied to C.
m	INTEGER. The number of rows in C ($m \geq 0$).
n	INTEGER. The number of columns in C ($n \geq 0$).
ilo, *ihi*	INTEGER. These must be the same parameters *ilo* and *ihi*, respectively, as supplied to ?gehrd . If $m > 0$ and *side* = 'L', then $1 \leq ilo \leq ihi \leq m$. If $m = 0$ and *side* = 'L' , then $ilo = 1$ and $ihi = 0$. If $n > 0$ and *side* = 'R', then $1 \leq ilo \leq ihi \leq n$. If $n = 0$ and *side* = 'R' , then $ilo = 1$ and $ihi = 0$.
a, *tau*, *c*, *work*	COMPLEX for cunmhr DOUBLE COMPLEX for zunmhr.

	Arrays: *a* (*lda*,*) contains details of the vectors which define the elementary reflectors, as returned by ?gehrd. The second dimension of *a* must be at least max(1, *m*) if *side* = 'L' and at least max(1, *n*) if *side* = 'R'. *tau*(*) contains further details of the elementary reflectors, as returned by ?gehrd. The dimension of *tau* must be at least max (1, *m*-1) if *side* = 'L' and at least max (1, *n*-1) if *side* = 'R'. *c* (*ldc*,*) contains the *m*-by-*n* matrix *C*. The second dimension of *c* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*) if *side* = 'L' and at least max (1, *n*) if *side* = 'R'.
ldc	INTEGER. The first dimension of *c*; at least max(1, *m*).
lwork	INTEGER. The size of the *work* array. If *side* = 'L', *lwork*≥ max(1,*n*). If *side* = 'R', *lwork*≥ max(1,*m*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

c	*C* is overwritten by *Q*C*, or Q^H**C*, or *C*Q*^{H}, or *C*Q* as specified by *side* and *trans*.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine unmhr interface are the following:

a	Holds the matrix *A* of size (*r*,*r*). *r* = *m* if *side* = 'L'. *r* = *n* if *side* = 'R'.
tau	Holds the vector of length (*r*-1).
c	Holds the matrix *C* of size (*m*,*n*).
ilo	Default value for this argument is *ilo* = 1.

ihi	Default value for this argument is *ihi* = *n*.
side	Must be 'L' or 'R'. The default value is 'L'.
trans	Must be 'N' or 'C'. The default value is 'N'.

Application Notes

For better performance, *lwork* should be at least *n***blocksize* if *side* = 'L' and at least *m***blocksize* if *side* = 'R', where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The computed matrix *Q* differs from the exact result by a matrix *E* such that $||E||_2 = O(\varepsilon)*||C||_2$, where ε is the machine precision.

The approximate number of floating-point operations is

$8n(ihi-ilo)^2$ if *side* = 'L';

$8m(ihi-ilo)^2$ if *side* = 'R'.

The real counterpart of this routine is ?ormhr.

?gebal

Balances a general matrix to improve the accuracy of computed eigenvalues and eigenvectors.

Syntax

FORTRAN 77:

call sgebal(*job*, *n*, *a*, *lda*, *ilo*, *ihi*, *scale*, *info*)

call dgebal(*job*, *n*, *a*, *lda*, *ilo*, *ihi*, *scale*, *info*)

call cgebal(*job*, *n*, *a*, *lda*, *ilo*, *ihi*, *scale*, *info*)

call zgebal(*job*, *n*, *a*, *lda*, *ilo*, *ihi*, *scale*, *info*)

Fortran 95:

call gebal(*a* [, *scale*] [,*ilo*] [,*ihi*] [,*job*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine *balances* a matrix *A* by performing either or both of the following two similarity transformations:

(1) The routine first attempts to permute *A* to block upper triangular form:

$$PAP^T = A' = \begin{bmatrix} A'_{11} & A'_{12} & A'_{13} \\ 0 & A'_{22} & A'_{23} \\ 0 & 0 & A'_{33} \end{bmatrix}$$

where *P* is a permutation matrix, and A'_{11} and A'_{33} are upper triangular. The diagonal elements of A'_{11} and A'_{33} are eigenvalues of *A*. The rest of the eigenvalues of *A* are the eigenvalues of the central diagonal block A'_{22}, in rows and columns *ilo* to *ihi*. Subsequent operations to compute the eigenvalues of *A* (or its Schur factorization) need only be applied to these rows and columns; this can save a significant amount of work if *ilo* > 1 and *ihi* < *n*.

If no suitable permutation exists (as is often the case), the routine sets *ilo* = 1 and *ihi* = *n*, and A'_{22} is the whole of *A*.

(2) The routine applies a diagonal similarity transformation to *A'*, to make the rows and columns of A'_{22} as close in norm as possible:

$$A'' = DA'D^{-1} = \begin{bmatrix} I & 0 & 0 \\ 0 & D_{22} & 0 \\ 0 & 0 & I \end{bmatrix} \times \begin{bmatrix} A'_{11} & A'_{12} & A'_{13} \\ 0 & A'_{22} & A'_{23} \\ 0 & 0 & A'_{33} \end{bmatrix} \times \begin{bmatrix} I & 0 & 0 \\ 0 & D_{22}^{-1} & 0 \\ 0 & 0 & I \end{bmatrix}$$

This scaling can reduce the norm of the matrix (that is, $||A'_2'_2|| < ||A'_{22}||$), and hence reduce the effect of rounding errors on the accuracy of computed eigenvalues and eigenvectors.

Input Parameters

job
CHARACTER*1. Must be 'N' or 'P' or 'S' or 'B'.
If *job* = 'N', then *A* is neither permuted nor scaled (but *ilo*, *ihi*, and *scale* get their values).
If *job* = 'P', then *A* is permuted but not scaled.
If *job* = 'S', then *A* is scaled but not permuted.
If *job* = 'B', then *A* is both scaled and permuted.

n
INTEGER. The order of the matrix *A* (*n* ≥ 0).

a
REAL for sgebal
DOUBLE PRECISION for dgebal
COMPLEX for cgebal

	DOUBLE COMPLEX for zgebal. Arrays: *a* (*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *a* is not referenced if *job* = 'N'.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).

Output Parameters

a	Overwritten by the balanced matrix (*a* is not referenced if *job* = 'N').
ilo, *ihi*	INTEGER. The values *ilo* and *ihi* such that on exit *a*(*i*,*j*) is zero if *i* > *j* and 1 ≤ *j* < *ilo* or *ihi* < *i* ≤ *n*. If *job* = 'N' or 'S', then *ilo* = 1 and *ihi* = *n*.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors Array, DIMENSION at least max(1, *n*). Contains details of the permutations and scaling factors. More precisely, if p_j is the index of the row and column interchanged with row and column *j*, and d_j is the scaling factor used to balance row and column *j*, then *scale*(*j*) = p_j for *j* = 1, 2,..., *ilo*-1, *ihi*+1,..., *n*; *scale*(*j*) = d_j for *j* = *ilo*, *ilo* + 1,..., *ihi*. The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gebal interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
scale	Holds the vector of length *n*.
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

Application Notes

The errors are negligible, compared with those in subsequent computations.

If the matrix *A* is balanced by this routine, then any eigenvectors computed subsequently are eigenvectors of the matrix *A*'' and hence you must call ?gebak to transform them back to eigenvectors of *A*.

If the Schur vectors of *A* are required, do not call this routine with *job* = 'S' or 'B', because then the balancing transformation is not orthogonal (not unitary for complex flavors).

If you call this routine with *job* = 'P', then any Schur vectors computed subsequently are Schur vectors of the matrix *A''*, and you need to call ?gebak (with *side* = 'R') to transform them back to Schur vectors of *A*.

The total number of floating-point operations is proportional to n^2.

?gebak

Transforms eigenvectors of a balanced matrix to those of the original nonsymmetric matrix.

Syntax

FORTRAN 77:

```
call sgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call dgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call cgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
call zgebak(job, side, n, ilo, ihi, scale, m, v, ldv, info)
```

Fortran 95:

```
call gebak(v, scale [,ilo] [,ihi] [,job] [,side] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine is intended to be used after a matrix *A* has been balanced by a call to ?gebal, and eigenvectors of the balanced matrix A''_{22} have subsequently been computed. For a description of balancing, see ?gebal. The balanced matrix *A''* is obtained as *A''= D*P*A*P*^{T}*inv(*D*), where *P* is a permutation matrix and *D* is a diagonal scaling matrix. This routine transforms the eigenvectors as follows:

if *x* is a right eigenvector of *A''*, then *P*^{T}*inv(*D*)**x* is a right eigenvector of *A*; if *x* is a left eigenvector of *A''*, then *P*^{T}**D*y* is a left eigenvector of *A*.

Input Parameters

job	CHARACTER*1. Must be 'N' or 'P' or 'S' or 'B'. The same parameter *job* as supplied to ?gebal.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L' , then left eigenvectors are transformed. If *side* = 'R', then right eigenvectors are transformed.
n	INTEGER. The number of rows of the matrix of eigenvectors ($n \geq 0$).
ilo, *ihi*	INTEGER. The values *ilo* and *ihi*, as returned by ?gebal. (If *n* > 0, then $1 \leq ilo \leq ihi \leq n$; if *n* = 0, then *ilo* = 1 and *ihi* = 0.)

scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors Array, DIMENSION at least max(1, *n*). Contains details of the permutations and/or the scaling factors used to balance the original general matrix, as returned by ?gebal.
m	INTEGER. The number of columns of the matrix of eigenvectors (*m* ≥ 0).
v	REAL for sgebak DOUBLE PRECISION for dgebak COMPLEX for cgebak DOUBLE COMPLEX for zgebak. Arrays: *v* (*ldv*,*) contains the matrix of left or right eigenvectors to be transformed. The second dimension of *v* must be at least max(1, *m*).
ldv	INTEGER. The first dimension of *v*; at least max(1, *n*).

Output Parameters

v	Overwritten by the transformed eigenvectors.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gebak interface are the following:

v	Holds the matrix *V* of size (*n*,*m*).
scale	Holds the vector of length *n*.
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.
side	Must be 'L' or 'R'. The default value is 'L'.

Application Notes

The errors in this routine are negligible.

The approximate number of floating-point operations is approximately proportional to *m***n*.

?hseqr

Computes all eigenvalues and (optionally) the Schur factorization of a matrix reduced to Hessenberg form.

Syntax

FORTRAN 77:

```
call shseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call dhseqr(job, compz, n, ilo, ihi, h, ldh, wr, wi, z, ldz, work, lwork, info)
call chseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
call zhseqr(job, compz, n, ilo, ihi, h, ldh, w, z, ldz, work, lwork, info)
```

Fortran 95:

```
call hseqr(h, wr, wi [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
call hseqr(h, w [,ilo] [,ihi] [,z] [,job] [,compz] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally the Schur factorization, of an upper Hessenberg matrix H: $H = Z*T*Z^H$, where T is an upper triangular (or, for real flavors, quasi-triangular) matrix (the Schur form of H), and Z is the unitary or orthogonal matrix whose columns are the Schur vectors z_i.

You can also use this routine to compute the Schur factorization of a general matrix A which has been reduced to upper Hessenberg form H:

$A = Q*H*Q^H$, where Q is unitary (orthogonal for real flavors);

$A = (QZ)*H*(QZ)^H$.

In this case, after reducing A to Hessenberg form by `?gehrd`, call `?orghr` to form Q explicitly and then pass Q to `?hseqr` with *compz* = `'V'`.

You can also call `?gebal` to balance the original matrix before reducing it to Hessenberg form by `?hseqr`, so that the Hessenberg matrix H will have the structure:

$$\begin{bmatrix} H_{11} & H_{12} & H_{13} \\ 0 & H_{22} & H_{23} \\ 0 & 0 & H_{33} \end{bmatrix}$$

where H_{11} and H_{33} are upper triangular.

If so, only the central diagonal block H_{22} (in rows and columns *ilo* to *ihi*) needs to be further reduced to Schur form (the blocks H_{12} and H_{23} are also affected). Therefore the values of *ilo* and *ihi* can be supplied to ?hseqr directly. Also, after calling this routine you must call ?gebak to permute the Schur vectors of the balanced matrix to those of the original matrix.

If ?gebal has not been called, however, then *ilo* must be set to 1 and *ihi* to *n*. Note that if the Schur factorization of *A* is required, ?gebal must not be called with *job* = 'S' or 'B', because the balancing transformation is not unitary (for real flavors, it is not orthogonal).

?hseqr uses a multishift form of the upper Hessenberg *QR* algorithm. The Schur vectors are normalized so that $||z_i||_2 = 1$, but are determined only to within a complex factor of absolute value 1 (for the real flavors, to within a factor ±1).

Input Parameters

job	CHARACTER*1. Must be 'E' or 'S'. If *job* = 'E', then eigenvalues only are required. If *job* = 'S', then the Schur form *T* is required.
compz	CHARACTER*1. Must be 'N' or 'I' or 'V'. If *compz* = 'N', then no Schur vectors are computed (and the array *z* is not referenced). If *compz* = 'I', then the Schur vectors of *H* are computed (and the array *z* is initialized by the routine). If *compz* = 'V', then the Schur vectors of *A* are computed (and the array *z* must contain the matrix *Q* on entry).
n	INTEGER. The order of the matrix *H* (*n* ≥ 0).
ilo, *ihi*	INTEGER. If *A* has been balanced by ?gebal, then *ilo* and *ihi* must contain the values returned by ?gebal. Otherwise, *ilo* must be set to 1 and *ihi* to *n*.
h, *z*, *work*	REAL for shseqr DOUBLE PRECISION for dhseqr COMPLEX for chseqr DOUBLE COMPLEX for zhseqr. Arrays: *h*(*ldh*,*) The *n*-by-*n* upper Hessenberg matrix *H*. The second dimension of *h* must be at least max(1, *n*). *z*(*ldz*,*) If *compz* = 'V', then *z* must contain the matrix *Q* from the reduction to Hessenberg form. If *compz* = 'I', then *z* need not be set. If *compz* = 'N', then *z* is not referenced. The second dimension of *z* must be at least max(1, *n*) if *compz* = 'V' or 'I'; at least 1 if *compz* = 'N'. *work*(*lwork*) is a workspace array. The dimension of *work* must be at least max (1, *n*).
ldh	INTEGER. The first dimension of *h*; at least max(1, *n*).

ldz INTEGER. The first dimension of *z*;

If *compz* = 'N', then *ldz* ≥ 1.

If *compz* = 'V' or 'I', then *ldz* ≥ max(1, *n*).

lwork INTEGER. The dimension of the array *work*.

lwork ≥ max(1, *n*) is sufficient and delivers very good and sometimes optimal performance. However, *lwork* as large as 11**n* may be required for optimal performance. A workspace query is recommended to determine the optimal workspace size.
If *lwork* = -1, then a workspace query is assumed; the routine only estimates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w COMPLEX for chseqr
DOUBLE COMPLEX for zhseqr.
Array, DIMENSION at least max (1, *n*). Contains the computed eigenvalues, unless *info*>0. The eigenvalues are stored in the same order as on the diagonal of the Schur form *T* (if computed).

wr, *wi* REAL for shseqr
DOUBLE PRECISION for dhseqr
Arrays, DIMENSION at least max (1, *n*) each.
Contain the real and imaginary parts, respectively, of the computed eigenvalues, unless *info* > 0. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first. The eigenvalues are stored in the same order as on the diagonal of the Schur form *T* (if computed).

h If *info* = 0 and *job* = 'S', *h* contains the upper triangular matrix *T* from the Schur decomposition (the Schur form).
If *info* = 0 and *job* = 'E', the contents of *h* are unspecified on exit. (The output value of *h* when *info* > 0 is given under the description of *info* below.)

z If *compz* = 'V' and *info* = 0, then *z* contains *Q***Z*.
If *compz* = 'I' and *info* = 0, then *z* contains the unitary or orthogonal matrix *Z* of the Schur vectors of *H*.
If *compz* = 'N', then *z* is not referenced.

work(1) On exit, if *info* = 0, then *work(1)* returns the optimal *lwork*.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, elements 1,2, ..., *ilo*-1 and *i*+1, *i*+2, ..., *n* of *wr* and *wi* contain the real and imaginary parts of those eigenvalues that have been succesively found.

If *info* > 0, and *job* = 'E', then on exit, the remaining unconverged eigenvalues are the eigenvalues of the upper Hessenberg matrix rows and columns *ilo* through *info* of the final output value of *H*.
If *info* > 0, and *job* = 'S', then on exit (initial value of *H*)*U = U*(final value of *H*), where U is a unitary matrix. The final value of *H* is upper Hessenberg and triangular in rows and columns *info*+1 through *ihi*.
If *info* > 0, and *compz* = 'V', then on exit (final value of *Z*) = (initial value of *Z*)*U, where U is the unitary matrix (regardless of the value of *job*).
If *info* > 0, and *compz* = 'I', then on exit (final value of *Z*) = U, where U is the unitary matrix (regardless of the value of *job*).
If *info* > 0, and *compz* = 'N', then *Z* is not accessed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hseqr interface are the following:

h	Holds the matrix *H* of size (*n*, *n*).
wr	Holds the vector of length *n*. Used in real flavors only.
wi	Holds the vector of length *n*. Used in real flavors only.
w	Holds the vector of length *n*. Used in complex flavors only.
z	Holds the matrix *Z* of size (*n*, *n*).
job	Must be 'E' or 'S'. The default value is 'E'.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

Application Notes

The computed Schur factorization is the exact factorization of a nearby matrix $H + E$, where $||E||_2 < O(\varepsilon)||H||_2/s_i$, and ε is the machine precision.

If λ_i is an exact eigenvalue, and μ_i is the corresponding computed value, then $|\lambda_i - \mu_i| \le c(n)*\varepsilon*||H||_2/s_i$, where $c(n)$ is a modestly increasing function of n, and s_i is the reciprocal condition number of λ_i. The condition numbers s_i may be computed by calling ?trsna.

The total number of floating-point operations depends on how rapidly the algorithm converges; typical numbers are as follows.

If only eigenvalues are computed:	$7n^3$ for real flavors $25n^3$ for complex flavors.
If the Schur form is computed:	$10n^3$ for real flavors $35n^3$ for complex flavors.

If the full Schur factorization is computed:	$20n^3$ for real flavors $70n^3$ for complex flavors.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?hsein

Computes selected eigenvectors of an upper Hessenberg matrix that correspond to specified eigenvalues.

Syntax

FORTRAN 77:

```
call shsein(job, eigsrc, initv, select, n, h, ldh, wr, wi, vl, ldvl, vr, ldvr, mm, m,
work, ifaill, ifailr, info)
call dhsein(job, eigsrc, initv, select, n, h, ldh, wr, wi, vl, ldvl, vr, ldvr, mm, m,
work, ifaill, ifailr, info)
call chsein(job, eigsrc, initv, select, n, h, ldh, w, vl, ldvl, vr, ldvr, mm, m, work,
rwork, ifaill, ifailr, info)
call zhsein(job, eigsrc, initv, select, n, h, ldh, w, vl, ldvl, vr, ldvr, mm, m, work,
rwork, ifaill, ifailr, info)
```

Fortran 95:

```
call hsein(h, wr, wi, select [, vl] [,vr] [,ifaill] [,ifailr] [,initv] [,eigsrc] [,m]
[,info])
call hsein(h, w, select [,vl] [,vr] [,ifaill] [,ifailr] [,initv] [,eigsrc] [,m] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes left and/or right eigenvectors of an upper Hessenberg matrix *H*, corresponding to selected eigenvalues.

The right eigenvector *x* and the left eigenvector *y*, corresponding to an eigenvalue λ, are defined by: $H*x = \lambda*x$ and $y^H*H = \lambda*y^H$ (or $H^H*y = \lambda^**y$). Here λ^* denotes the conjugate of λ.

The eigenvectors are computed by inverse iteration. They are scaled so that, for a real eigenvector x, $\max|x_i| = 1$, and for a complex eigenvector, $\max(|\mathrm{Re}x_i| + |\mathrm{Im}x_i|) = 1$.

If H has been formed by reduction of a general matrix A to upper Hessenberg form, then eigenvectors of H may be transformed to eigenvectors of A by ?ormhr or ?unmhr.

Input Parameters

job
CHARACTER*1. Must be 'R' or 'L' or 'B'.
If *job* = 'R', then only right eigenvectors are computed.
If *job* = 'L', then only left eigenvectors are computed.
If *job* = 'B', then all eigenvectors are computed.

eigsrc
CHARACTER*1. Must be 'Q' or 'N'.
If *eigsrc* = 'Q', then the eigenvalues of *H* were found using ?hseqr; thus if *H* has any zero sub-diagonal elements (and so is block triangular), then the *j*-th eigenvalue can be assumed to be an eigenvalue of the block containing the *j*-th row/column. This property allows the routine to perform inverse iteration on just one diagonal block. If *eigsrc* = 'N', then no such assumption is made and the routine performs inverse iteration using the whole matrix.

initv
CHARACTER*1. Must be 'N' or 'U'.
If *initv* = 'N', then no initial estimates for the selected eigenvectors are supplied.
If *initv* = 'U', then initial estimates for the selected eigenvectors are supplied in *vl* and/or *vr*.

select
LOGICAL.
Array, DIMENSION at least max (1, *n*). Specifies which eigenvectors are to be computed.
For real flavors:
To obtain the real eigenvector corresponding to the real eigenvalue *wr*(*j*), set *select*(*j*) to .TRUE.
To select the complex eigenvector corresponding to the complex eigenvalue (*wr*(*j*), *wi*(*j*)) with complex conjugate (*wr*(*j*+1), *wi*(*j*+1)), set *select*(*j*) and/or *select*(*j*+1) to .TRUE.; the eigenvector corresponding to the first eigenvalue in the pair is computed.
For complex flavors:
To select the eigenvector corresponding to the eigenvalue *w*(*j*), set *select*(*j*) to .TRUE.

n
INTEGER. The order of the matrix *H* ($n \geq 0$).

h, *vl*, *vr*,
REAL for shsein
DOUBLE PRECISION for dhsein
COMPLEX for chsein
DOUBLE COMPLEX for zhsein.
Arrays:
h(*ldh*,*) The *n*-by-*n* upper Hessenberg matrix *H*.
The second dimension of *h* must be at least max(1, *n*).
(*ldvl*,*)

If *initv* = 'V' and *job* = 'L' or 'B', then *vl* must contain starting vectors for inverse iteration for the left eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector.
If *initv* = 'N', then *vl* need not be set.
The second dimension of *vl* must be at least max(1, *mm*) if *job* = 'L' or 'B' and at least 1 if *job* = 'R'.
The array *vl* is not referenced if *job* = 'R'.

vr(*ldvr*,*)
If *initv* = 'V' and *job* = 'R' or 'B', then *vr* must contain starting vectors for inverse iteration for the right eigenvectors. Each starting vector must be stored in the same column or columns as will be used to store the corresponding eigenvector.
If *initv* = 'N', then *vr* need not be set.
The second dimension of *vr* must be at least max(1, *mm*) if *job* = 'R' or 'B' and at least 1 if *job* = 'L'.
The array *vr* is not referenced if *job* = 'L'.

work(*) is a workspace array.
DIMENSION at least max (1, *n**(*n*+2)) for real flavors and at least max (1, *n***n*) for complex flavors.

ldh — INTEGER. The first dimension of *h*; at least max(1, *n*).

w — COMPLEX for chsein
DOUBLE COMPLEX for zhsein.
Array, DIMENSION at least max (1, *n*).
Contains the eigenvalues of the matrix *H*.
If *eigsrc* = 'Q', the array must be exactly as returned by ?hseqr.

wr, *wi* — REAL for shsein
DOUBLE PRECISION for dhsein
Arrays, DIMENSION at least max (1, *n*) each.
Contain the real and imaginary parts, respectively, of the eigenvalues of the matrix *H*. Complex conjugate pairs of values must be stored in consecutive elements of the arrays. If *eigsrc* = 'Q', the arrays must be exactly as returned by ?hseqr.

ldvl — INTEGER. The first dimension of *vl*.

If *job* = 'L' or 'B', *ldvl* ≥ max(1,*n*).

If *job* = 'R', *ldvl* ≥ 1.

ldvr — INTEGER. The first dimension of *vr*.

If *job* = 'R' or 'B', *ldvr* ≥ max(1,*n*).

If *job* = 'L', *ldvr* ≥1.

mm — INTEGER. The number of columns in *vl* and/or *vr*.
Must be at least *m*, the actual number of columns required (see *Output Parameters* below).
For real flavors, *m* is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector (see *select*).

For complex flavors, *m* is the number of selected eigenvectors (see *select*).
Constraint:

$0 \le mm \le n$.

rwork — REAL for chsein
DOUBLE PRECISION for zhsein.
Array, DIMENSION at least max (1, *n*).

Output Parameters

select — Overwritten for real flavors only.
If a complex eigenvector was selected as specified above, then *select*(*j*) is set to .TRUE. and *select*(*j*+1) to .FALSE.

w — The real parts of some elements of *w* may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.

wr — Some elements of *wr* may be modified, as close eigenvalues are perturbed slightly in searching for independent eigenvectors.

vl, *vr* — If *job* = 'L' or 'B', *vl* contains the computed left eigenvectors (as specified by *select*).
If *job* = 'R' or 'B', *vr* contains the computed right eigenvectors (as specified by *select*).
The eigenvectors are stored consecutively in the columns of the array, in the same order as their eigenvalues.
For real flavors: a real eigenvector corresponding to a selected real eigenvalue occupies one column; a complex eigenvector corresponding to a selected complex eigenvalue occupies two columns: the first column holds the real part and the second column holds the imaginary part.

m — INTEGER. *For real flavors*: the number of columns of *vl* and/or *vr* required to store the selected eigenvectors.
For complex flavors: the number of selected eigenvectors.

ifaill, *ifailr* — INTEGER.
Arrays, DIMENSION at least max(1, *mm*) each.
ifaill(*i*) = 0 if the *i*th column of *vl* converged;
ifaill(*i*) = *j* > 0 if the eigenvector stored in the *i*-th column of *vl* (corresponding to the *j*th eigenvalue) failed to converge.
ifailr(*i*) = 0 if the *i*th column of *vr* converged;
ifailr(*i*) = *j* > 0 if the eigenvector stored in the *i*-th column of *vr* (corresponding to the *j*th eigenvalue) failed to converge.
For real flavors: if the *i*th and (*i*+1)th columns of *vl* contain a selected complex eigenvector, then *ifaill*(*i*) and *ifaill*(*i*+1) are set to the same value. A similar rule holds for *vr* and *ifailr*.
The array *ifaill* is not referenced if *job* = 'R'. The array *ifailr* is not referenced if *job* = 'L'.

info — INTEGER.
If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* > 0, then *i* eigenvectors (as indicated by the parameters *ifaill* and/or *ifailr* above) failed to converge. The corresponding columns of *vl* and/or *vr* contain no useful information.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hsein interface are the following:

h	Holds the matrix *H* of size (*n*, *n*).
wr	Holds the vector of length *n*. Used in real flavors only.
wi	Holds the vector of length *n*. Used in real flavors only.
w	Holds the vector of length *n*. Used in complex flavors only.
select	Holds the vector of length *n*.
vl	Holds the matrix *VL* of size (*n*, *mm*).
vr	Holds the matrix *VR* of size (*n*, *mm*).
ifaill	Holds the vector of length (*mm*). Note that there will be an error condition if *ifaill* is present and *vl* is omitted.
ifailr	Holds the vector of length (*mm*). Note that there will be an error condition if *ifailr* is present and *vr* is omitted.
initv	Must be 'N' or 'U'. The default value is 'N'.
eigsrc	Must be 'N' or 'Q'. The default value is 'N'.
job	Restored based on the presence of arguments *vl* and *vr* as follows: *job* = 'B', if both *vl* and *vr* are present, *job* = 'L', if *vl* is present and *vr* omitted, *job* = 'R', if *vl* is omitted and *vr* present, Note that there will be an error condition if both *vl* and *vr* are omitted.

Application Notes

Each computed right eigenvector *x* i is the exact eigenvector of a nearby matrix $A + E_i$, such that $||E_i|| < O(\varepsilon)||A||$. Hence the residual is small:

$$||Ax_i - \lambda_i x_i|| = O(\varepsilon)||A||.$$

However, eigenvectors corresponding to close or coincident eigenvalues may not accurately span the relevant subspaces.

Similar remarks apply to computed left eigenvectors.

?trevc

Computes selected eigenvectors of an upper (quasi-) triangular matrix computed by ?hseqr.

Syntax

FORTRAN 77:

```
call strevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, info)
call dtrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, info)
call ctrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call ztrevc(side, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
```

Fortran 95:

```
call trevc(t [, howmny] [,select] [,vl] [,vr] [,m] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes some or all of the right and/or left eigenvectors of an upper triangular matrix *T* (or, for real flavors, an upper quasi-triangular matrix *T*). Matrices of this type are produced by the Schur factorization of a general matrix: $A = Q*T*Q^H$, as computed by ?hseqr.

The right eigenvector *x* and the left eigenvector *y* of *T* corresponding to an eigenvalue *w*, are defined by:

$T*x = w*x$, $y^H*T = w*y^H$, where y^H denotes the conjugate transpose of *y*.

The eigenvalues are not input to this routine, but are read directly from the diagonal blocks of *T*.

This routine returns the matrices *X* and/or *Y* of right and left eigenvectors of *T*, or the products *Q**X* and/or *Q**Y*, where *Q* is an input matrix.

If *Q* is the orthogonal/unitary factor that reduces a matrix *A* to Schur form *T*, then *Q**X* and *Q**Y* are the matrices of right and left eigenvectors of *A*.

Input Parameters

side
CHARACTER*1. Must be 'R' or 'L' or 'B'.
If *side* = 'R' , then only right eigenvectors are computed.
If *side* = 'L' , then only left eigenvectors are computed.
If *side* = 'B', then all eigenvectors are computed.

howmny
CHARACTER*1. Must be 'A' or 'B' or 'S'.
If *howmny* = 'A' , then all eigenvectors (as specified by *side*) are computed.
If *howmny* = 'B' , then all eigenvectors (as specified by *side*) are computed and backtransformed by the matrices supplied in *vl* and *vr*.

If *howmny* = 'S' , then selected eigenvectors (as specified by *side* and *select*) are computed.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*).
If *howmny* = 'S', *select* specifies which eigenvectors are to be computed.
If *howmny* = 'A' or 'B', *select* is not referenced.
For real flavors:
If *omega*(*j*) is a real eigenvalue, the corresponding real eigenvector is computed if *select*(*j*) is .TRUE..
If *omega*(*j*) and *omega*(*j*+1) are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either *select*(*j*) or *select*(*j*+1) is .TRUE., and on exit *select*(*j*) is set to .TRUE.and *select*(*j*+1) is set to .FALSE..
For complex flavors:
The eigenvector corresponding to the *j*-th eigenvalue is computed if *select*(*j*) is .TRUE..

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

t, *vl*, *vr* — REAL for strevc
DOUBLE PRECISION for dtrevc
COMPLEX for ctrevc
DOUBLE COMPLEX for ztrevc.
Arrays:
t(*ldt*,*) contains the *n*-by-*n* matrix *T* in Schur canonical form.
The second dimension of *t* must be at least max(1, *n*).
vl(*ldvl*,*)
If *howmny* = 'B' and *side* = 'L' or 'B', then *vl* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by ?hseqr).
If *howmny* = 'A' or 'S', then *vl* need not be set.
The second dimension of *vl* must be at least max(1, *mm*) if *side* = 'L' or 'B' and at least 1 if *side* = 'R'.
The array *vl* is not referenced if *side* = 'R'.
vr (*ldvr*,*)
If *howmny* = 'B' and *side* = 'R' or 'B', then *vr* must contain an *n*-by-*n* matrix *Q* (usually the matrix of Schur vectors returned by ?hseqr). .
If *howmny* = 'A' or 'S', then *vr* need not be set.
The second dimension of *vr* must be at least max(1, *mm*) if *side* = 'R' or 'B' and at least 1 if *side* = 'L'.
The array *vr* is not referenced if *side* = 'L'.
work(*) is a workspace array.
DIMENSION at least max (1, 3**n*) for real flavors and at least max (1, 2**n*) for complex flavors.

ldt — INTEGER. The first dimension of *t*; at least max(1, *n*).

ldvl — INTEGER. The first dimension of *vl*.

	If *side* = 'L' or 'B', *ldvl* ≥ *n*.
	If *side* = 'R', *ldvl* ≥ 1.
ldvr	INTEGER. The first dimension of *vr*.
	If *side* = 'R' or 'B', *ldvr* ≥ *n*.
	If *side* = 'L', *ldvr* ≥ 1.
mm	INTEGER. The number of columns in the arrays *vl* and/or *vr*. Must be at least *m* (the precise number of columns required). If *howmny* = 'A' or 'B', *m* = *n*. If *howmny* = 'S': *for real flavors*, *m* is obtained by counting 1 for each selected real eigenvector and 2 for each selected complex eigenvector; *for complex flavors*, *m* is the number of selected eigenvectors (see *select*).
	Constraint: 0 ≤ *m* ≤ *n*.
rwork	REAL for ctrevc DOUBLE PRECISION for ztrevc. Workspace array, DIMENSION at least max (1, *n*).

Output Parameters

select	If a complex eigenvector of a real matrix was selected as specified above, then *select*(*j*) is set to .TRUE. and *select*(*j*+1) to .FALSE.
t	COMPLEX for ctrevc DOUBLE COMPLEX for ztrevc. ctrevc/ztrevc modify the *t*(*ldt*,*) array on exit.
vl, *vr*	If *side* = 'L' or 'B', *vl* contains the computed left eigenvectors (as specified by *howmny* and *select*). If *side* = 'R' or 'B', *vr* contains the computed right eigenvectors (as specified by *howmny* and *select*). The eigenvectors are stored consecutively in the columns of the array, in the same order as their eigenvalues. *For real flavors*: corresponding to each real eigenvalue is a real eigenvector, occupying one column;corresponding to each complex conjugate pair of eigenvalues is a complex eigenvector, occupying two columns; the first column holds the real part and the second column holds the imaginary part.
m	INTEGER. *For complex flavors*: the number of selected eigenvectors. If *howmny* = 'A' or 'B', *m* is set to *n*. *For real flavors*: the number of columns of *vl* and/or *vr* actually used to store the selected eigenvectors. If *howmny* = 'A' or 'B', *m* is set to *n*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `trevc` interface are the following:

t	Holds the matrix *T* of size (*n*, *n*).
select	Holds the vector of length *n*.
vl	Holds the matrix *VL* of size (*n*, *mm*).
vr	Holds the matrix *VR* of size (*n*, *mm*).
side	If omitted, this argument is restored based on the presence of arguments *vl* and *vr* as follows: *side* = 'B', if both *vl* and *vr* are present, *side* = 'L', if *vr* is omitted, *side* = 'R', if *vl* is omitted. Note that there will be an error condition if both *vl* and *vr* are omitted.
howmny	If omitted, this argument is restored based on the presence of argument *select* as follows: *howmny* = 'V', if *q* is present, *howmny* = 'N', if *q* is omitted. If present, *vect* = 'V' or 'U' and the argument *q* must also be present. Note that there will be an error condition if both *select* and *howmny* are present.

Application Notes

If x i is an exact right eigenvector and y_i is the corresponding computed eigenvector, then the angle $\theta(y_i, x_i)$ between them is bounded as follows: $\theta(y_i, x_i) \leq (c(n)\varepsilon ||T||_2)/\text{sep}_i$ where sep_i is the reciprocal condition number of x_i. The condition number sep_i may be computed by calling `?trsna`.

?trsna

Estimates condition numbers for specified eigenvalues and right eigenvectors of an upper (quasi-) triangular matrix.

Syntax

FORTRAN 77:

```
call strsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, iwork, info)
call dtrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, iwork, info)
call ctrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, rwork, info)
```

`call ztrsna(job, howmny, select, n, t, ldt, vl, ldvl, vr, ldvr, s, sep, mm, m, work, ldwork, rwork, info)`

Fortran 95:

`call trsna(t [, s] [,sep] [,vl] [,vr] [,select] [,m] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine estimates condition numbers for specified eigenvalues and/or right eigenvectors of an upper triangular matrix *T* (or, for real flavors, upper quasi-triangular matrix *T* in canonical Schur form). These are the same as the condition numbers of the eigenvalues and right eigenvectors of an original matrix *A = Z*T*Z*^{H} (with unitary or, for real flavors, orthogonal *Z*), from which *T* may have been derived.

The routine computes the reciprocal of the condition number of an eigenvalue *lambda*(i) as s_i = $|v_H{*}u|/(||u||_E||v||_E)$, where *u* and *v* are the right and left eigenvectors of *T*, respectively, corresponding to *lambda*(i). This reciprocal condition number always lies between zero (ill-conditioned) and one (well-conditioned).

An approximate error estimate for a computed eigenvalue *lambda*(i)is then given by $\varepsilon{*}||T||/s_i$, where ε is the *machine precision*.

To estimate the reciprocal of the condition number of the right eigenvector corresponding to *lambda*(i), the routine first calls `?trexc` to reorder the eigenvalues so that *lambda*(i) is in the leading position:

$$T = Q \begin{bmatrix} \lambda_i & C^H \\ 0 & T_{22} \end{bmatrix} Q^H$$

The reciprocal condition number of the eigenvector is then estimated as sep_i, the smallest singular value of the matrix T_{22} - *lambda*(i)**I*. This number ranges from zero (ill-conditioned) to very large (well-conditioned).

An approximate error estimate for a computed right eigenvector u corresponding to *lambda*(i) is then given by $\varepsilon{*}||T||/\mathrm{sep}_i$.

Input Parameters

job	CHARACTER*1. Must be 'E' or 'V' or 'B'. If *job* = 'E', then condition numbers for eigenvalues only are computed. If *job* = 'V', then condition numbers for eigenvectors only are computed. If *job* = 'B', then condition numbers for both eigenvalues and eigenvectors are computed.
howmny	CHARACTER*1. Must be 'A' or 'S'. If *howmny* = 'A' , then the condition numbers for all eigenpairs are computed.

If *howmny* = 'S' , then condition numbers for selected eigenpairs (as specified by *select*) are computed.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*) if *howmny* = 'S' and at least 1 otherwise.
Specifies the eigenpairs for which condition numbers are to be computed if *howmny*= 'S'.
For real flavors:
To select condition numbers for the eigenpair corresponding to the real eigenvalue *lambda*(*j*), *select*(*j*) must be set .TRUE.;
to select condition numbers for the eigenpair corresponding to a complex conjugate pair of eigenvalues *lambda*(*j*) and *lambda*(*j*+1), *select*(*j*) and/or *select*(*j*+1) must be set .TRUE.
For complex flavors
To select condition numbers for the eigenpair corresponding to the eigenvalue *lambda*(*j*), *select*(*j*) must be set .TRUE. *select* is not referenced if *howmny* = 'A'.

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

t, *vl*, *vr*, *work* — REAL for strsna
DOUBLE PRECISION for dtrsna
COMPLEX for ctrsna
DOUBLE COMPLEX for ztrsna.
Arrays:
t(*ldt*,*) contains the *n*-by-*n* matrix *T*.
The second dimension of *t* must be at least max(1, *n*).
vl(*ldvl*,*)
If *job* = 'E' or 'B', then *vl* must contain the left eigenvectors of *T* (or of any matrix $Q*T*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vl*, as returned by ?trevc or ?hsein.
The second dimension of *vl* must be at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.
The array *vl* is not referenced if *job* = 'V'.
vr(*ldvr*,*)
If *job* = 'E' or 'B', then *vr* must contain the right eigenvectors of *T* (or of any matrix $Q*T*Q^H$ with *Q* unitary or orthogonal) corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vr*, as returned by ?trevc or ?hsein.
The second dimension of *vr* must be at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.
The array *vr* is not referenced if *job* = 'V'.
work is a workspace array, its dimension (*ldwork*,*n*+6).
The array *work* is not referenced if *job* = 'E'.

ldt — INTEGER. The first dimension of *t*; at least max(1, *n*).

ldvl INTEGER. The first dimension of *vl*.

If *job* = 'E' or 'B', *ldvl* ≥ max(1,*n*).

If *job* = 'V', *ldvl* ≥ 1.

ldvr INTEGER. The first dimension of *vr*.

If *job* = 'E' or 'B', *ldvr* ≥ max(1,*n*).

If *job* = 'R', *ldvr* ≥ 1.

mm INTEGER. The number of elements in the arrays *s* and *sep*, and the number of columns in *vl* and *vr* (if used). Must be at least *m* (the precise number required).
If *howmny* = 'A', *m* = *n*;
if *howmny* = 'S', *for real flavors m* is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues.
for complex flavors m is the number of selected eigenpairs (see *select*).
Constraint:

0 ≤ *m* ≤ *n*.

ldwork INTEGER. The first dimension of *work*.

If *job* = 'V' or 'B', *ldwork* ≥ max(1,*n*).

If *job* = 'E', *ldwork* ≥ 1.

rwork REAL for ctrsna, ztrsna.
Array, DIMENSION at least max (1, *n*). The array is not referenced if *job* = 'E'.

iwork INTEGER for strsna, dtrsna.
Array, DIMENSION at least max (1, 2*(*n* - 1)). The array is not referenced if *job* = 'E'.

Output Parameters

s REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.
Array, DIMENSION at least max(1, *mm*) if *job* = 'E' or 'B' and at least 1 if *job* = 'V'.
Contains the reciprocal condition numbers of the selected eigenvalues if *job* = 'E' or 'B', stored in consecutive elements of the array. Thus *s*(*j*), *sep*(*j*) and the *j*-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the *j* th eigenpair unless all eigenpairs have been selected).
For real flavors: for a complex conjugate pair of eigenvalues, two consecutive elements of S are set to the same value. The array *s* is not referenced if *job* = 'V'.

sep REAL for single-precision flavors
DOUBLE PRECISION for double-precision flavors.

	Array, DIMENSION at least max(1, *mm*) if *job* = 'V' or 'B' and at least 1 if *job* = 'E'. Contains the estimated reciprocal condition numbers of the selected right eigenvectors if *job* = 'V' or 'B', stored in consecutive elements of the array. *For real flavors*: for a complex eigenvector, two consecutive elements of *sep* are set to the same value; if the eigenvalues cannot be reordered to compute *sep*(*j*), then *sep*(*j*) is set to zero; this can only occur when the true value would be very small anyway. The array *sep* is not referenced if *job* = 'E'.
m	INTEGER. *For complex flavors*: the number of selected eigenpairs. If *howmny* = 'A', *m* is set to *n*. *For real flavors*: the number of elements of *s* and/or *sep* actually used to store the estimated condition numbers. If *howmny* = 'A', *m* is set to *n*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trsna interface are the following:

t	Holds the matrix *T* of size (*n*,*n*).
s	Holds the vector of length (*mm*).
sep	Holds the vector of length (*mm*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
select	Holds the vector of length *n*.
job	Restored based on the presence of arguments *s* and sep as follows: *job* = 'B', if both *s* and *sep* are present, *job* = 'E', if *s* is present and *sep* omitted, *job* = 'V', if *s* is omitted and *sep* present. Note an error condition if both *s* and *sep* are omitted.
howmny	Restored based on the presence of the argument *select* as follows: *howmny* = 'S', if *select* is present, *howmny* = 'A', if *select* is omitted.

Note that the arguments *s*, *vl*, and *vr* must either be all present or all omitted.

Otherwise, an error condition is observed.

Application Notes

The computed values sep_i may overestimate the true value, but seldom by a factor of more than 3.

?trexc

Reorders the Schur factorization of a general matrix.

Syntax

FORTRAN 77:

```
call strexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call dtrexc(compq, n, t, ldt, q, ldq, ifst, ilst, work, info)
call ctrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
call ztrexc(compq, n, t, ldt, q, ldq, ifst, ilst, info)
```

Fortran 95:

```
call trexc(t, ifst, ilst [,q] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reorders the Schur factorization of a general matrix $A = Q*T*Q^H$, so that the diagonal element or block of T with row index *ifst* is moved to row *ilst*.

The reordered Schur form S is computed by an unitary (or, for real flavors, orthogonal) similarity transformation: $S = Z^H*T*Z$. Optionally the updated matrix P of Schur vectors is computed as $P = Q*Z$, giving $A = P*S*P^H$.

Input Parameters

compq	CHARACTER*1. Must be 'V' or 'N'. If *compq* = 'V', then the Schur vectors (Q) are updated. If *compq* = 'N', then no Schur vectors are updated.
n	INTEGER. The order of the matrix T ($n \geq 0$).
t, *q*	REAL for strexc DOUBLE PRECISION for dtrexc COMPLEX for ctrexc DOUBLE COMPLEX for ztrexc. Arrays: *t*(*ldt*,*) contains the *n*-by-*n* matrix T. The second dimension of *t* must be at least max(1, *n*). *q*(*ldq*,*) If *compq* = 'V', then *q* must contain Q (Schur vectors). If *compq* = 'N', then *q* is not referenced. The second dimension of *q* must be at least max(1, *n*) if *compq* = 'V' and at least 1 if *compq* = 'N'.
ldt	INTEGER. The first dimension of *t*; at least max(1, *n*).
ldq	INTEGER. The first dimension of *q*; If *compq* = 'N', then *ldq*≥ 1.

	If *compq* = 'V', then *ldq*≥ max(1, *n*).
ifst, *ilst*	INTEGER. 1 ≤ *ifst* ≤ *n*; 1 ≤ *ilst* ≤ *n*. Must specify the reordering of the diagonal elements (or blocks, which is possible for real flavors) of the matrix *T*. The element (or block) with row index *ifst* is moved to row *ilst* by a sequence of exchanges between adjacent elements (or blocks).
work	REAL for strexc DOUBLE PRECISION for dtrexc. Array, DIMENSION at least max (1, *n*).

Output Parameters

t	Overwritten by the updated matrix *S*.
q	If *compq* = 'V', *q* contains the updated matrix of Schur vectors.
ifst, *ilst*	Overwritten for real flavors only. If *ifst* pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; *ilst* always points to the first row of the block in its final position (which may differ from its input value by ±1).
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trexc interface are the following:

t	Holds the matrix *T* of size (*n*, *n*).
q	Holds the matrix *Q* of size (*n*, *n*).
compq	Restored based on the presence of the argument *q* as follows: *compq* = 'V', if *q* is present, *compq* = 'N', if *q* is omitted.

Application Notes

The computed matrix *S* is exactly similar to a matrix *T*+*E*, where $||E||_2 = O(\varepsilon)*||T||_2$, and ε is the machine precision.

Note that if a 2 by 2 diagonal block is involved in the re-ordering, its off-diagonal elements are in general changed; the diagonal elements and the eigenvalues of the block are unchanged unless the block is sufficiently ill-conditioned, in which case they may be noticeably altered. It is possible for a 2 by 2 block to break into two 1 by 1 blocks, that is, for a pair of complex eigenvalues to become purely real.

The values of eigenvalues however are never changed by the re-ordering.

The approximate number of floating-point operations is

for real flavors:	6*n*(*ifst-ilst*) if *compq* = 'N'; 12*n*(*ifst-ilst*) if *compq* = 'V';
for complex flavors:	20*n*(*ifst-ilst*) if *compq* = 'N'; 40*n*(*ifst-ilst*) if *compq* = 'V'.

?trsen

Reorders the Schur factorization of a matrix and (optionally) computes the reciprocal condition numbers and invariant subspace for the selected cluster of eigenvalues.

Syntax

FORTRAN 77:

```
call strsen(job, compq, select, n, t, ldt, q, ldq, wr, wi, m, s, sep, work, lwork, iwork, liwork, info)
call dtrsen(job, compq, select, n, t, ldt, q, ldq, wr, wi, m, s, sep, work, lwork, iwork, liwork, info)
call ctrsen(job, compq, select, n, t, ldt, q, ldq, w, m, s, sep, work, lwork, info)
call ztrsen(job, compq, select, n, t, ldt, q, ldq, w, m, s, sep, work, lwork, info)
```

Fortran 95:

```
call trsen(t, select [,wr] [,wi] [,m] [,s] [,sep] [,q] [,info])
call trsen(t, select [,w] [,m] [,s] [,sep] [,q] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reorders the Schur factorization of a general matrix $A = Q*T*Q^H$ so that a selected cluster of eigenvalues appears in the leading diagonal elements (or, for real flavors, diagonal blocks) of the Schur form. The reordered Schur form R is computed by an unitary (orthogonal) similarity transformation: $R = Z^H*T*Z$. Optionally the updated matrix P of Schur vectors is computed as $P = Q*Z$, giving $A = P*R*P^H$.

Let

$$R = \begin{bmatrix} T_{11} & T_{12} \\ 0 & T_{13} \end{bmatrix}$$

where the selected eigenvalues are precisely the eigenvalues of the leading m-by-m submatrix T_{11}. Let P be correspondingly partitioned as $(Q_1\ Q_2)$ where Q_1 consists of the first m columns of Q. Then $A*Q_1 = Q_1*T_{11}$, and so the m columns of Q_1 form an orthonormal basis for the invariant subspace corresponding to the selected cluster of eigenvalues.

Optionally the routine also computes estimates of the reciprocal condition numbers of the average of the cluster of eigenvalues and of the invariant subspace.

Input Parameters

job — CHARACTER*1. Must be 'N' or 'E' or 'V' or 'B'.
If *job* = 'N', then no condition numbers are required.
If *job* = 'E', then only the condition number for the cluster of eigenvalues is computed.
If *job* = 'V', then only the condition number for the invariant subspace is computed.
If *job* = 'B', then condition numbers for both the cluster and the invariant subspace are computed.

compq — CHARACTER*1. Must be 'V' or 'N'.
If *compq* = 'V', then *Q* of the Schur vectors is updated.
If *compq* = 'N', then no Schur vectors are updated.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*).
Specifies the eigenvalues in the selected cluster. To select an eigenvalue *lambda*(*j*), *select*(*j*) must be .TRUE.
For real flavors: to select a complex conjugate pair of eigenvalues *lambda*(*j*) and *lambda*(*j*+1) (corresponding 2 by 2 diagonal block), *select*(*j*) and/or *select*(*j*+1) must be .TRUE.; the complex conjugate *lambda*(*j*)and *lambda*(*j*+1) must be either both included in the cluster or both excluded.

n — INTEGER. The order of the matrix *T* (*n* ≥ 0).

t, *q*, *work* — REAL for strsen
DOUBLE PRECISION for dtrsen
COMPLEX for ctrsen
DOUBLE COMPLEX for ztrsen.
Arrays:
t (*ldt*,*) The *n*-by-*n* *T*.
The second dimension of *t* must be at least max(1, *n*).
q (*ldq*,*)
If *compq* = 'V', then *q* must contain *Q* of Schur vectors.
If *compq* = 'N', then *q* is not referenced.
The second dimension of *q* must be at least max(1, *n*) if *compq* = 'V' and at least 1 if *compq* = 'N'.
work is a workspace array, its dimension max(1, *lwork*).

ldt — INTEGER. The first dimension of *t*; at least max(1, *n*).

ldq — INTEGER. The first dimension of *q*;
If *compq* = 'N', then *ldq* ≥ 1.
If *compq* = 'V', then *ldq* ≥ max(1, *n*).

lwork — INTEGER. The dimension of the array *work*.
If *job* = 'V' or 'B', *lwork* ≥ max(1,2*m*(*n*-*m*)).

If *job* = 'E', then *lwork* ≥ max(1, *m**(*n*-*m*))

If *job* = 'N', then *lwork* ≥ 1 for complex flavors and *lwork* ≥ max(1,*n*) for real flavors.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER.*iwork*(*liwork*) is a workspace array. The array *iwork* is not referenced if *job* = 'N' or 'E'.
The actual amount of workspace required cannot exceed $n^2/2$ if *job* = 'V' or 'B'.

liwork — INTEGER.
The dimension of the array *iwork*.

If *job* = 'V' or 'B', *liwork* ≥ max(1,2*m*(*n*-*m*)).

If *job* = 'E' or 'E', *liwork* ≥ 1.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

t — Overwritten by the updated matrix *R*.

q — If *compq* = 'V', *q* contains the updated matrix of Schur vectors; the first m columns of the *Q* form an orthogonal basis for the specified invariant subspace.

w — COMPLEX for ctrsen
DOUBLE COMPLEX for ztrsen.
Array, DIMENSION at least max(1, *n*). The recorded eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*.

wr, *wi* — REAL for strsen
DOUBLE PRECISION for dtrsen
Arrays, DIMENSION at least max(1, *n*). Contain the real and imaginary parts, respectively, of the reordered eigenvalues of *R*. The eigenvalues are stored in the same order as on the diagonal of *R*. Note that if a complex eigenvalue is sufficiently ill-conditioned, then its value may differ significantly from its value before reordering.

m — INTEGER.
For complex flavors: the number of the specified invariant subspaces, which is the same as the number of selected eigenvalues (see *select*).
For real flavors: the dimension of the specified invariant subspace. The value of *m* is obtained by counting 1 for each selected real eigenvalue and 2 for each selected complex conjugate pair of eigenvalues (see *select*).

Constraint: 0 ≤ *m* ≤ *n*.

s	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. If *job* = 'E' or 'B', *s* is a lower bound on the reciprocal condition number of the average of the selected cluster of eigenvalues. If *m* = 0 or *n*, then *s* = 1. *For real flavors*: if *info* = 1, then *s* is set to zero.*s* is not referenced if *job* = 'N' or 'V'.
sep	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. If *job* = 'V' or 'B', *sep* is the estimated reciprocal condition number of the specified invariant subspace. If *m* = 0 or *n*, then *sep* = |*T*|. *For real flavors*: if *info* = 1, then *sep* is set to zero. *sep* is not referenced if *job* = 'N' or 'E'.
work(1)	On exit, if *info* = 0, then *work*(1) returns the optimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the optimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine trsen interface are the following:

t	Holds the matrix *T* of size (*n*, *n*).
select	Holds the vector of length *n*.
wr	Holds the vector of length *n*. Used in real flavors only.
wi	Holds the vector of length *n*. Used in real flavors only.
w	Holds the vector of length *n*. Used in complex flavors only.
q	Holds the matrix *Q* of size (*n*, *n*).
compq	Restored based on the presence of the argument *q* as follows: *compq* = 'V', if *q* is present, *compq* = 'N', if *q* is omitted.
job	Restored based on the presence of arguments *s* and sep as follows: *job* = 'B', if both *s* and *sep* are present, *job* = 'E', if *s* is present and *sep* omitted, *job* = 'V', if *s* is omitted and *sep* present, *job* = 'N', if both *s* and *sep* are omitted.

Application Notes

The computed matrix *R* is exactly similar to a matrix *T*+*E*, where $||E||_2 = O(\varepsilon)*||T||_2$, and ε is the machine precision. The computed *s* cannot underestimate the true reciprocal condition number by more than a factor of $(\min(m, n-m))_{1/2}$; *sep* may differ from the true value by $(m*n-m^2)_{1/2}$. The angle between the computed invariant subspace and the true subspace is $O(\varepsilon)*||A||_2/sep$. Note that if a 2-by-2 diagonal block is involved in the

re-ordering, its off-diagonal elements are in general changed; the diagonal elements and the eigenvalues of the block are unchanged unless the block is sufficiently ill-conditioned, in which case they may be noticeably altered. It is possible for a 2-by-2 block to break into two 1-by-1 blocks, that is, for a pair of complex eigenvalues to become purely real. The values of eigenvalues however are never changed by the re-ordering.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?trsyl

Solves Sylvester equation for real quasi-triangular or complex triangular matrices.

Syntax

FORTRAN 77:

```
call strsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call dtrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ctrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
call ztrsyl(trana, tranb, isgn, m, n, a, lda, b, ldb, c, ldc, scale, info)
```

Fortran 95:

```
call trsyl(a, b, c, scale [, trana] [,tranb] [,isgn] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves the Sylvester matrix equation op(*A*)**X* ± *X**op(*B*) = α**C*, where op(*A*) = *A* or A^H, and the matrices *A* and *B* are upper triangular (or, for real flavors, upper quasi-triangular in canonical Schur form); $\alpha \leq 1$ is a scale factor determined by the routine to avoid overflow in *X*; *A* is *m*-by-*m*, *B* is *n*-by-*n*, and *C* and *X* are both *m*-by-*n*. The matrix *X* is obtained by a straightforward process of back substitution.

The equation has a unique solution if and only if $\alpha_i \pm \beta_i \neq 0$, where $\{\alpha_i\}$ and $\{\beta_i\}$ are the eigenvalues of *A* and *B*, respectively, and the sign (+ or -) is the same as that used in the equation to be solved.

Input Parameters

trana	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *trana* = 'N' , then op(*A*) = *A*. If *trana* = 'T', then op(*A*) = A^T (real flavors only). If *trana* = 'C' then op(*A*) = A^H.
tranb	CHARACTER*1. Must be 'N' or 'T' or 'C'. If *tranb* = 'N' , then op(*B*) = *B*. If *tranb* = 'T', then op(*B*) = B^T (real flavors only). If *tranb* = 'C', then op(*B*) = B^H.
isgn	INTEGER. Indicates the form of the Sylvester equation. If *isgn* = +1, op(*A*)*X + X*op(*B*) = alpha*C. If *isgn* = -1, op(*A*)*X - X*op(*B*) = alpha*C.
m	INTEGER. The order of *A*, and the number of rows in *X* and *C* ($m \geq 0$).
n	INTEGER. The order of *B*, and the number of columns in *X* and *C* ($n \geq 0$).
a, *b*, *c*	REAL for strsyl DOUBLE PRECISION for dtrsyl COMPLEX for ctrsyl DOUBLE COMPLEX for ztrsyl. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*). *c*(*ldc*,*) contains the matrix *C*. The second dimension of *c* must be at least max(1, *n*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
ldc	INTEGER. The first dimension of *c*; at least max(1, *n*).

Output Parameters

c	Overwritten by the solution matrix *X*.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. The value of the scale factor α.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, *A* and *B* have common or close eigenvalues perturbed values were used to solve the equation.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `trsyl` interface are the following:

a	Holds the matrix *A* of size (*m*, *m*).
b	Holds the matrix *B* of size (*n*, *n*).
c	Holds the matrix *C* of size (*m*, *n*).
trana	Must be 'N', 'C', or 'T'. The default value is 'N'.
tranb	Must be 'N', 'C', or 'T'. The default value is 'N'.
isgn	Must be +1 or -1. The default value is +1.

Application Notes

Let *X* be the exact, *Y* the corresponding computed solution, and *R* the residual matrix: $R = C - (AY \pm YB)$. Then the residual is always small:

$||R||_F = O(\varepsilon)*(||A||_F + ||B||_F)*||Y||_F$.

However, *Y* is not necessarily the exact solution of a slightly perturbed equation; in other words, the solution is not backwards stable.

For the forward error, the following bound holds:

$||Y - X||_F \le ||R||_F/\mathrm{sep}(A,B)$

but this may be a considerable overestimate. See [Golub96] for a definition of sep(*A*, *B*).

The approximate number of floating-point operations for real flavors is $m*n*(m + n)$. For complex flavors it is 4 times greater.

Generalized Nonsymmetric Eigenvalue Problems

This section describes LAPACK routines for solving generalized nonsymmetric eigenvalue problems, reordering the generalized Schur factorization of a pair of matrices, as well as performing a number of related computational tasks.

A *generalized nonsymmetric eigenvalue problem* is as follows: given a pair of nonsymmetric (or non-Hermitian) *n*-by-*n* matrices *A* and *B*, find the *generalized eigenvalues* λ and the corresponding *generalized eigenvectors* *x* and *y* that satisfy the equations

$Ax = \lambda Bx$ (right generalized eigenvectors *x*)

and

$y^H A = \lambda y^H B$ (left generalized eigenvectors *y*).

Table 4-6 lists LAPACK routines (FORTRAN 77 interface) used to solve the generalized nonsymmetric eigenvalue problems and the generalized Sylvester equation. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-6 Computational Routines for Solving Generalized Nonsymmetric Eigenvalue Problems

Routine name	Operation performed
?gghrd	Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.
?ggbal	Balances a pair of general real or complex matrices.
?ggbak	Forms the right or left eigenvectors of a generalized eigenvalue problem.
?hgeqz	Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).
?tgevc	Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices
?tgexc	Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.
?tgsen	Reorders the *generalized* Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B).
?tgsyl	Solves the generalized Sylvester equation.
?tgsna	Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

?gghrd

Reduces a pair of matrices to generalized upper Hessenberg form using orthogonal/unitary transformations.

Syntax

FORTRAN 77:

```
call sgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call dgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call cgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
call zgghrd(compq, compz, n, ilo, ihi, a, lda, b, ldb, q, ldq, z, ldz, info)
```

Fortran 95:

```
call gghrd(a, b [,ilo] [,ihi] [,q] [,z] [,compq] [,compz] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reduces a pair of real/complex matrices (*A*,*B*) to generalized upper Hessenberg form using orthogonal/unitary transformations, where *A* is a general matrix and *B* is upper triangular. The form of the generalized eigenvalue problem is $A*x = \lambda*B*x$, and *B* is typically made upper triangular by computing its *QR* factorization and moving the orthogonal matrix *Q* to the left side of the equation.

This routine simultaneously reduces *A* to a Hessenberg matrix *H*:

$Q^H*A*Z = H$

and transforms *B* to another upper triangular matrix *T*:

$Q^H*B*Z = T$

in order to reduce the problem to its standard form $H*y = \lambda*T*y$, where $y = Z^H*x$.

The orthogonal/unitary matrices *Q* and *Z* are determined as products of Givens rotations. They may either be formed explicitly, or they may be postmultiplied into input matrices Q_1 and Z_1, so that

$Q_1*A*Z_1^H = (Q_1*Q)*H*(Z_1*Z)^H$

$Q_1*B*Z_1^H = (Q_1*Q)*T*(Z_1*Z)^H$

If Q_1 is the orthogonal/unitary matrix from the *QR* factorization of *B* in the original equation $A*x = \lambda*B*x$, then the routine ?gghrd reduces the original problem to generalized Hessenberg form.

Input Parameters

compq	CHARACTER*1. Must be 'N', 'I', or 'V'. If *compq* = 'N', matrix *Q* is not computed. If *compq* = 'I', *Q* is initialized to the unit matrix, and the orthogonal/unitary matrix *Q* is returned; If *compq* = 'V', *Q* must contain an orthogonal/unitary matrix Q_1 on entry, and the product Q_1*Q is returned.
compz	CHARACTER*1. Must be 'N', 'I', or 'V'. If *compz* = 'N', matrix *Z* is not computed. If *compz* = 'I', *Z* is initialized to the unit matrix, and the orthogonal/unitary matrix *Z* is returned; If *compz* = 'V', *Z* must contain an orthogonal/unitary matrix Z_1 on entry, and the product Z_1*Z is returned.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
ilo, *ihi*	INTEGER. *ilo* and *ihi* mark the rows and columns of *A* which are to be reduced. It is assumed that *A* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*. Values of *ilo* and *ihi* are normally set by a previous call to ?ggbal; otherwise they should be set to 1 and *n* respectively. Constraint: If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, then $ilo = 1$ and $ihi = 0$.
a, *b*, *q*, *z*	REAL for sgghrd DOUBLE PRECISION for dgghrd

COMPLEX for cgghrd
DOUBLE COMPLEX for zgghrd.
Arrays:
a(*lda*,*) contains the *n*-by-*n* general matrix *A*. The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the *n*-by-*n* upper triangular matrix *B*.
The second dimension of *b* must be at least max(1, *n*).
q (*ldq*,*)
If *compq* = 'N', then *q* is not referenced.
If *compq* = 'V', then *q* must contain the orthogonal/unitary matrix Q_1, typically from the *QR* factorization of *B*.
The second dimension of *q* must be at least max(1, *n*).
z (*ldz*,*)
If *compq* = 'N', then *z* is not referenced.
If *compq* = 'V', then *z* must contain the orthogonal/unitary matrix Z_1.
The second dimension of *z* must be at least max(1, *n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

ldq — INTEGER. The first dimension of *q*;
If *compq* = 'N', then *ldq* ≥ 1.
If *compq* = 'I'or 'V', then *ldq* ≥ max(1, *n*).

ldz — INTEGER. The first dimension of *z*;
If *compq* = 'N', then *ldz* ≥ 1.
If *compq* = 'I'or 'V', then *ldz* ≥ max(1, *n*).

Output Parameters

a — On exit, the upper triangle and the first subdiagonal of *A* are overwritten with the upper Hessenberg matrix *H*, and the rest is set to zero.

b — On exit, overwritten by the upper triangular matrix $T = Q^H*B*Z$. The elements below the diagonal are set to zero.

q — If *compq* = 'I', then *q* contains the orthogonal/unitary matrix *Q*, ;
If *compq* = 'V', then *q* is overwritten by the product Q_1*Q.

z — If *compq* = 'I', then *z* contains the orthogonal/unitary matrix *Z*;
If *compq* = 'V', then *z* is overwritten by the product Z_1*Z.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gghrd interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
q	Holds the matrix *Q* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
compq	If omitted, this argument is restored based on the presence of argument *q* as follows: *compq* = 'I', if *q* is present, *compq* = 'N', if *q* is omitted. If present, *compq* must be equal to 'I' or 'V' and the argument *q* must also be present. Note that there will be an error condition if *compq* is present and *q* omitted.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note that there will be an error condition if *compz* is present and *z* omitted.

?ggbal

Balances a pair of general real or complex matrices.

Syntax

FORTRAN 77:

```
call sggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call dggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call cggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
call zggbal(job, n, a, lda, b, ldb, ilo, ihi, lscale, rscale, work, info)
```

Fortran 95:

```
call ggbal(a, b [,ilo] [,ihi] [,lscale] [,rscale] [,job] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine balances a pair of general real/complex matrices (*A*,*B*). This involves, first, permuting *A* and *B* by similarity transformations to isolate eigenvalues in the first 1 to *ilo*-1 and last *ihi*+1 to *n* elements on the diagonal;and second, applying a diagonal similarity transformation to rows and columns *ilo* to *ihi* to make the rows and columns as close in norm as possible. Both steps are optional. Balancing may reduce the 1-norm of the matrices, and improve the accuracy of the computed eigenvalues and/or eigenvectors in the generalized eigenvalue problem *A***x* = λ**B***x*.

Input Parameters

job	CHARACTER*1. Specifies the operations to be performed on *A* and *B*. Must be 'N' or 'P' or 'S' or 'B'.

If *job* = 'N', then no operations are done; simply set *ilo* =1, *ihi*=*n*, *lscale*(i) =1.0 and *rscale*(i)=1.0 for i = 1,..., *n*.
If *job* = 'P', then permute only.
If *job* = 'S', then scale only.
If *job* = 'B', then both permute and scale.

n — INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).

a, *b* — REAL for sggbal
DOUBLE PRECISION for dggbal
COMPLEX for cggbal
DOUBLE COMPLEX for zggbal.
Arrays:
a(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

work — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Workspace array, DIMENSION at least max(1, 6*n*) when *job* = 'S'or 'B', or at least 1 when *job* = 'N'or 'P'.

Output Parameters

a, *b* — Overwritten by the balanced matrices *A* and *B*, respectively.
If *job* = 'N', *a* and *b* are not referenced.

ilo, *ihi* — INTEGER. *ilo* and *ihi* are set to integers such that on exit *a*(*i*,*j*)=0 and *b*(*i*,*j*)=0 if *i*>*j* and *j*=1,...,*ilo*-1 or *i*=*ihi*+1,..., *n*.
If *job* = 'N'or 'S', then *ilo* = 1 and *ihi* = *n*.

lscale, *rscale* — REAL for single precision flavors
DOUBLE PRECISION for double precision flavors.
Arrays, DIMENSION at least max(1, *n*).
lscale contains details of the permutations and scaling factors applied to the left side of *A* and *B*.
If P_j is the index of the row interchanged with row *j*, and D_j is the scaling factor applied to row *j*, then
lscale(*j*) = P_j, for *j* = 1,..., *ilo*-1
= D_j, for *j* = *ilo*,...,*ihi*
= P_j, for *j* = *ihi*+1,..., *n*.
rscale contains details of the permutations and scaling factors applied to the right side of *A* and *B*.
If P_j is the index of the column interchanged with column *j*, and D_j is the scaling factor applied to column *j*, then
rscale(*j*) = P_j, for *j* = 1,..., *ilo*-1
= D_j, for *j* = *ilo*,...,*ihi*

	= P_j, for j = ihi+1, ..., n The order in which the interchanges are made is n to ihi+1, then 1 to ilo-1.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggbal interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
lscale	Holds the vector of length (*n*).
rscale	Holds the vector of length (*n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.

?ggbak

Forms the right or left eigenvectors of a generalized eigenvalue problem.

Syntax

FORTRAN 77:

```
call sggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call dggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call cggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
call zggbak(job, side, n, ilo, ihi, lscale, rscale, m, v, ldv, info)
```

Fortran 95:

```
call ggbak(v [, ilo] [,ihi] [,lscale] [,rscale] [,job] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine forms the right or left eigenvectors of a real/complex generalized eigenvalue problem

$A*x = \lambda*B*x$

by backward transformation on the computed eigenvectors of the balanced pair of matrices output by ?ggbal.

Input Parameters

job	CHARACTER*1. Specifies the type of backward transformation required. Must be 'N', 'P', 'S', or 'B'. If *job* = 'N', then no operations are done; return. If *job* = 'P', then do backward transformation for permutation only. If *job* = 'S', then do backward transformation for scaling only. If *job* = 'B', then do backward transformation for both permutation and scaling. This argument must be the same as the argument *job* supplied to ?ggbal.
side	CHARACTER*1. Must be 'L' or 'R'. If *side* = 'L' , then *v* contains left eigenvectors. If *side* = 'R' , then *v* contains right eigenvectors.
n	INTEGER. The number of rows of the matrix *V* ($n \geq 0$).
ilo, *ihi*	INTEGER. The integers *ilo* and *ihi* determined by ?gebal. Constraint: If $n > 0$, then $1 \leq ilo \leq ihi \leq n$; if $n = 0$, then $ilo = 1$ and $ihi = 0$.
lscale, *rscale*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *n*). The array *lscale* contains details of the permutations and/or scaling factors applied to the left side of *A* and *B*, as returned by ?ggbal. The array *rscale* contains details of the permutations and/or scaling factors applied to the right side of *A* and *B*, as returned by ?ggbal.
m	INTEGER. The number of columns of the matrix *V* ($m \geq 0$).
v	REAL for sggbak DOUBLE PRECISION for dggbak COMPLEX for cggbak DOUBLE COMPLEX for zggbak. Array *v*(*ldv*,*). Contains the matrix of right or left eigenvectors to be transformed, as returned by ?tgevc. The second dimension of *v* must be at least max(1, *m*).
ldv	INTEGER. The first dimension of *v*; at least max(1, *n*).

Output Parameters

v	Overwritten by the transformed eigenvectors
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggbak interface are the following:

v	Holds the matrix *V* of size (*n*,*m*).
lscale	Holds the vector of length *n*.
rscale	Holds the vector of length *n*.
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'B', 'S', 'P', or 'N'. The default value is 'B'.
side	If omitted, this argument is restored based on the presence of arguments *lscale* and *rscale* as follows: *side* = 'L', if *lscale* is present and *rscale* omitted, *side* = 'R', if *lscale* is omitted and *rscale* present. Note that there will be an error condition if both *lscale* and *rscale* are present or if they both are omitted.

?hgeqz

Implements the QZ method for finding the generalized eigenvalues of the matrix pair (H,T).

Syntax

FORTRAN 77:

```
call shgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphar, alphai, beta, q, ldq, z, ldz, work, lwork, info)
call dhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alphar, alphai, beta, q, ldq, z, ldz, work, lwork, info)
call chgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q, ldq, z, ldz, work, lwork, rwork, info)
call zhgeqz(job, compq, compz, n, ilo, ihi, h, ldh, t, ldt, alpha, beta, q, ldq, z, ldz, work, lwork, rwork, info)
```

Fortran 95:

```
call hgeqz(h, t [,ilo] [,ihi] [,alphar] [,alphai] [,beta] [,q] [,z] [,job] [,compq] [,compz] [,info])
call hgeqz(h, t [,ilo] [,ihi] [,alpha] [,beta] [,q] [,z] [,job] [,compq] [, compz] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the eigenvalues of a real/complex matrix pair (*H*,*T*), where *H* is an upper Hessenberg matrix and *T* is upper triangular, using the double-shift version (for real flavors) or single-shift version (for complex flavors) of the *QZ* method. Matrix pairs of this type are produced by the reduction to generalized upper Hessenberg form of a real/complex matrix pair (*A*,*B*):

$A = Q_1*H*Z_1^H$, $B = Q_1*T*Z_1^H$,

as computed by ?gghrd.

For real flavors:

If *job* = 'S', then the Hessenberg-triangular pair (*H*,*T*) is also reduced to generalized Schur form,

$H = Q*S*Z^T$, $T = Q*P*Z^T$,

where *Q* and *Z* are orthogonal matrices, *P* is an upper triangular matrix, and *S* is a quasi-triangular matrix with 1-by-1 and 2-by-2 diagonal blocks. The 1-by-1 blocks correspond to real eigenvalues of the matrix pair (*H*,*T*) and the 2-by-2 blocks correspond to complex conjugate pairs of eigenvalues.

Additionally, the 2-by-2 upper triangular diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* are reduced to positive diagonal form, that is, if *S*(j+1,j) is non-zero, then *P*(j+1,j) = *P*(j,j+1) = 0, *P*(j,j) > 0, and *P*(j+1,j+1) > 0.

For complex flavors:

If *job* = 'S', then the Hessenberg-triangular pair (*H*,*T*) is also reduced to generalized Schur form,

$H = Q*\ S*Z^H$, $T = Q*P*Z^H$,

where *Q* and *Z* are unitary matrices, and *S* and *P* are upper triangular.

For all function flavors:

Optionally, the orthogonal/unitary matrix *Q* from the generalized Schur factorization may be postmultiplied into an input matrix Q_1, and the orthogonal/unitary matrix *Z* may be postmultiplied into an input matrix Z_1.

If Q_1 and Z_1 are the orthogonal/unitary matrices from ?gghrd that reduced the matrix pair (*A*,*B*) to generalized upper Hessenberg form, then the output matrices Q_1Q and *Z* 1*Z* are the orthogonal/unitary factors from the generalized Schur factorization of (*A*,*B*):

$A = (Q_1Q)*S\ *(Z_1Z)^H$, $B = (Q_1Q)*P*(Z_1Z)^H$.

To avoid overflow, eigenvalues of the matrix pair (*H*,*T*) (equivalently, of (*A*,*B*)) are computed as a pair of values (*alpha*,*beta*). For chgeqz/zhgeqz, *alpha* and *beta* are complex, and for shgeqz/dhgeqz, *alpha* is complex and *beta* real. If *beta* is nonzero, $\lambda = alpha/beta$ is an eigenvalue of the generalized nonsymmetric eigenvalue problem (GNEP)

$A*x = \lambda*B*x$

and if *alpha* is nonzero, $\mu = beta/alpha$ is an eigenvalue of the alternate form of the GNEP

$\mu*A*y = B*y$.

Real eigenvalues (for real flavors) or the values of *alpha* and *beta* for the i-th eigenvalue (for complex flavors) can be read directly from the generalized Schur form:

alpha = *S*(i,i), *beta* = *P*(i,i).

Input Parameters

job — CHARACTER*1. Specifies the operations to be performed. Must be 'E' or 'S'.
If *job* = 'E', then compute eigenvalues only;

	If *job* = 'S', then compute eigenvalues and the Schur form.
compq	CHARACTER*1. Must be 'N', 'I', or 'V'. If *compq* = 'N', left Schur vectors (*q*) are not computed; If *compq* = 'I', *q* is initialized to the unit matrix and the matrix of left Schur vectors of (*H*,*T*) is returned; If *compq* = 'V', *q* must contain an orthogonal/unitary matrix Q_1 on entry and the product Q_1*Q is returned.
compz	CHARACTER*1. Must be 'N', 'I', or 'V'. If *compz* = 'N', right Schur vectors (*z*) are not computed; If *compz* = 'I', *z* is initialized to the unit matrix and the matrix of right Schur vectors of (*H*,*T*) is returned; If *compz* = 'V', *z* must contain an orthogonal/unitary matrix Z_1 on entry and the product Z_1*Z is returned.
n	INTEGER. The order of the matrices *H*, *T*, *Q*, and *Z* (*n* ≥ 0).
ilo, *ihi*	INTEGER. *ilo* and *ihi* mark the rows and columns of *H* which are in Hessenberg form. It is assumed that *H* is already upper triangular in rows and columns 1:*ilo*-1 and *ihi*+1:*n*. Constraint: If *n* > 0, then 1 ≤ *ilo* ≤ *ihi* ≤ *n*; if *n* = 0, then *ilo* = 1 and *ihi* = 0.
h, *t*, *q*, *z*, *work*	REAL for shgeqz DOUBLE PRECISION for dhgeqz COMPLEX for chgeqz DOUBLE COMPLEX for zhgeqz. Arrays: On entry, *h*(*ldh*,*) contains the *n*-by-*n* upper Hessenberg matrix *H*. The second dimension of *h* must be at least max(1, *n*). On entry, *t*(*ldt*,*) contains the *n*-by-*n* upper triangular matrix *T*. The second dimension of *t* must be at least max(1, *n*). *q* (*ldq*,*): On entry, if *compq* = 'V', this array contains the orthogonal/unitary matrix Q_1 used in the reduction of (*A*,*B*) to generalized Hessenberg form. If *compq* = 'N', then *q* is not referenced. The second dimension of *q* must be at least max(1, *n*). *z* (*ldz*,*): On entry, if *compz* = 'V', this array contains the orthogonal/unitary matrix Z_1 used in the reduction of (*A*,*B*) to generalized Hessenberg form. If *compz* = 'N', then *z* is not referenced. The second dimension of *z* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
ldh	INTEGER. The first dimension of *h*; at least max(1, *n*).
ldt	INTEGER. The first dimension of *t*; at least max(1, *n*).

ldq INTEGER. The first dimension of *q*;
If *compq* = 'N', then *ldq* ≥ 1.
If *compq* = 'I'or 'V', then *ldq* ≥ max(1, *n*).

ldz INTEGER. The first dimension of *z*;
If *compq* = 'N', then *ldz* ≥ 1.
If *compq* = 'I'or 'V', then *ldz* ≥ max(1, *n*).

lwork INTEGER. The dimension of the array *work*.
lwork ≥ max(1, *n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

rwork REAL for chgeqz
DOUBLE PRECISION for zhgeqz.
Workspace array, DIMENSION at least max(1, *n*). Used in complex flavors only.

Output Parameters

h *For real flavors*:
If *job* = 'S', then, on exit, *h* contains the upper quasi-triangular matrix *S* from the generalized Schur factorization; 2-by-2 diagonal blocks (corresponding to complex conjugate pairs of eigenvalues) are returned in standard form, with *h*(i,i) = *h*(i+1, i+1) and *h*(i+1, i) * *h*(i, i+1) < 0.
If *job* = 'E', then on exit the diagonal blocks of *h* match those of *S*, but the rest of *h* is unspecified.
For complex flavors:
If *job* = 'S', then, on exit, *h* contains the upper triangular matrix *S* from the generalized Schur factorization.
If *job* = 'E', then on exit the diagonal of *h* matches that of *S*, but the rest of *h* is unspecified.

t If *job* = 'S', then, on exit, *t* contains the upper triangular matrix *P* from the generalized Schur factorization.
For real flavors:
2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* are reduced to positive diagonal form, that is, if *h*(j+1,j) is non-zero, then *t*(j+1,j)=*t*(j,j+1)=0 and *t*(j,j) and *t*(j+1,j+1) will be positive.
If *job* = 'E', then on exit the diagonal blocks of *t* match those of *P*, but the rest of *t* is unspecified.
For complex flavors:
if *job* = 'E', then on exit the diagonal of *t* matches that of *P*, but the rest of *t* is unspecified.

alphar, *alphai* REAL for shgeqz;
DOUBLE PRECISION for dhgeqz.

	Arrays, DIMENSION at least max(1, *n*). The real and imaginary parts, respectively, of each scalar *alpha* defining an eigenvalue of GNEP. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-th eigenvalues are a complex conjugate pair, with *alphai*(j+1) = -*alphai*(j).
alpha	COMPLEX for chgeqz; DOUBLE COMPLEX for zhgeqz. Array, DIMENSION at least max(1, *n*). The complex scalars *alpha* that define the eigenvalues of GNEP. *alphai*(i) = *S*(i,i) in the generalized Schur factorization.
beta	REAL for shgeqz DOUBLE PRECISION for dhgeqz COMPLEX for chgeqz DOUBLE COMPLEX for zhgeqz. Array, DIMENSION at least max(1, *n*). *For real flavors*: The scalars *beta* that define the eigenvalues of GNEP. Together, the quantities *alpha* = (*alphar*(j), *alphai*(j)) and *beta* = *beta*(j) represent the j-th eigenvalue of the matrix pair (*A*,*B*), in one of the forms *lambda* = *alpha/beta* or *mu* = *beta/alpha*. Since either *lambda* or *mu* may overflow, they should not, in general, be computed. *For complex flavors*: The real non-negative scalars *beta* that define the eigenvalues of GNEP. *beta*(i) = *P*(i,i) in the generalized Schur factorization. Together, the quantities *alpha* = *alpha*(j) and *beta* = *beta*(j) represent the j-th eigenvalue of the matrix pair (*A*,*B*), in one of the forms *lambda* = *alpha/beta* or *mu* = *beta/alpha*. Since either *lambda* or *mu* may overflow, they should not, in general, be computed.
q	On exit, if *compq* = 'I', *q* is overwritten by the orthogonal/unitary matrix of left Schur vectors of the pair (*H*,*T*), and if *compq* = 'V', *q* is overwritten by the orthogonal/unitary matrix of left Schur vectors of (*A*,*B*).
z	On exit, if *compz* = 'I', *z* is overwritten by the orthogonal/unitary matrix of right Schur vectors of the pair (*H*,*T*), and if *compz* = 'V', *z* is overwritten by the orthogonal/unitary matrix of right Schur vectors of (*A*,*B*).
work(1)	If *info* ≥ 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1,..., *n*, the *QZ* iteration did not converge. (*H*,*T*) is not in Schur form, but *alphar*(i), *alphai*(i) (for real flavors), *alpha*(i) (for complex flavors), and *beta*(i), i=*info*+1,..., *n* should be correct.

If *info* = *n*+1, ..., 2*n*, the shift calculation failed.
(*H*,*T*) is not in Schur form, but *alphar*(i), *alphai*(i) (for real flavors), *alpha*(i) (for complex flavors), and *beta*(i), i =*info*-*n*+1, ..., *n* should be correct.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hgeqz interface are the following:

h	Holds the matrix *H* of size (*n*, *n*).
t	Holds the matrix *T* of size (*n*, *n*).
alphar	Holds the vector of length *n*. Used in real flavors only.
alphai	Holds the vector of length *n*. Used in real flavors only.
alpha	Holds the vector of length *n*. Used in complex flavors only.
beta	Holds the vector of length *n*.
q	Holds the matrix *Q* of size (*n*, *n*).
z	Holds the matrix *Z* of size (*n*, *n*).
ilo	Default value for this argument is *ilo* = 1.
ihi	Default value for this argument is *ihi* = *n*.
job	Must be 'E' or 'S'. The default value is 'E'.
compq	If omitted, this argument is restored based on the presence of argument *q* as follows: *compq* = 'I', if *q* is present, *compq* = 'N', if *q* is omitted. If present, *compq* must be equal to 'I' or 'V' and the argument *q* must also be present. Note that there will be an error condition if *compq* is present and *q* omitted.
compz	If omitted, this argument is restored based on the presence of argument *z* as follows: *compz* = 'I', if *z* is present, *compz* = 'N', if *z* is omitted. If present, *compz* must be equal to 'I' or 'V' and the argument *z* must also be present. Note an error condition if *compz* is present and *z* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgevc

Computes some or all of the right and/or left generalized eigenvectors of a pair of upper triangular matrices.

Syntax

FORTRAN 77:

```
call stgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, info)
call dtgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, info)
call ctgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
call ztgevc(side, howmny, select, n, s, lds, p, ldp, vl, ldvl, vr, ldvr, mm, m, work, rwork, info)
```

Fortran 95:

```
call tgevc(s, p [,howmny] [,select] [,vl] [,vr] [,m] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes some or all of the right and/or left eigenvectors of a pair of real/complex matrices (*S*,*P*), where *S* is quasi-triangular (for real flavors) or upper triangular (for complex flavors) and *P* is upper triangular.

Matrix pairs of this type are produced by the generalized Schur factorization of a real/complex matrix pair (*A*,*B*):

$A = Q*S*Z^H, B = Q*P*Z^H$

as computed by `?gghrd` plus `?hgeqz`.

The right eigenvector *x* and the left eigenvector *y* of (*S*,*P*) corresponding to an eigenvalue *w* are defined by:

$S*x = w*P*x, \quad y^H*S = w*y^H*P$

The eigenvalues are not input to this routine, but are computed directly from the diagonal blocks or diagonal elements of *S* and *P*.

This routine returns the matrices *X* and/or *Y* of right and left eigenvectors of (*S*,*P*), or the products *Z***X* and/or *Q***Y*, where *Z* and *Q* are input matrices.

If *Q* and *Z* are the orthogonal/unitary factors from the generalized Schur factorization of a matrix pair (*A*,*B*), then *Z***X* and *Q***Y* are the matrices of right and left eigenvectors of (*A*,*B*).

Input Parameters

side CHARACTER*1. Must be `'R'`, `'L'`, or `'B'`.

If *side* = 'R' , compute right eigenvectors only.
If *side* = 'L' , compute left eigenvectors only.
If *side* = 'B', compute both right and left eigenvectors.

howmny — CHARACTER*1. Must be 'A' , 'B', or 'S'.
If *howmny* = 'A' , compute all right and/or left eigenvectors.
If *howmny* = 'B' , compute all right and/or left eigenvectors, backtransformed by the matrices in *vr* and/or *vl*.
If *howmny* = 'S' , compute selected right and/or left eigenvectors, specified by the logical array *select*.

select — LOGICAL.
Array, DIMENSION at least max (1, *n*).
If *howmny* = 'S', *select* specifies the eigenvectors to be computed.
If *howmny* = 'A'or 'B', *select* is not referenced.
For real flavors:
If *omega*(*j*) is a real eigenvalue, the corresponding real eigenvector is computed if *select*(*j*) is .TRUE..
If *omega*(*j*) and *omega*(*j*+1) are the real and imaginary parts of a complex eigenvalue, the corresponding complex eigenvector is computed if either *select*(*j*) or *select*(*j*+1) is .TRUE., and on exit *select*(*j*) is set to .TRUE.and *select*(*j*+1) is set to .FALSE..
For complex flavors:
The eigenvector corresponding to the *j*-th eigenvalue is computed if *select*(*j*) is .TRUE..

n — INTEGER. The order of the matrices *S* and *P* (*n* ≥ 0).

s, *p*, *vl*, *vr*, *work* — REAL for stgevc
DOUBLE PRECISION for dtgevc
COMPLEX for ctgevc
DOUBLE COMPLEX for ztgevc.
Arrays:
s(*lds*,*) contains the matrix *S* from a generalized Schur factorization as computed by ?hgeqz. This matrix is upper quasi-triangular for real flavors, and upper triangular for complex flavors.
The second dimension of *s* must be at least max(1, *n*).
p(*ldp*,*) contains the upper triangular matrix *P* from a generalized Schur factorization as computed by ?hgeqz.
For real flavors, 2-by-2 diagonal blocks of *P* corresponding to 2-by-2 blocks of *S* must be in positive diagonal form.
For complex flavors, *P* must have real diagonal elements. The second dimension of *p* must be at least max(1, *n*).
If *side* = 'L' or 'B' and *howmny* = 'B', *vl*(*ldvl*,*) must contain an *n*-by-*n* matrix *Q* (usually the orthogonal/unitary matrix *Q* of left Schur vectors returned by ?hgeqz). The second dimension of *vl* must be at least max(1, *mm*).
If *side* = 'R' , *vl* is not referenced.

If *side* = 'R' or 'B' and *howmny* = 'B', *vr*(*ldvr*,*) must contain an *n*-by-*n* matrix *Z* (usually the orthogonal/unitary matrix *Z* of right Schur vectors returned by ?hgeqz). The second dimension of *vr* must be at least max(1, *mm*).
If *side* = 'L', *vr* is not referenced.
work(*) is a workspace array.
DIMENSION at least max (1, 6**n*) for real flavors and at least max (1, 2**n*) for complex flavors.

lds — INTEGER. The first dimension of *s*; at least max(1, *n*).

ldp — INTEGER. The first dimension of *p*; at least max(1, *n*).

ldvl — INTEGER. The first dimension of *vl*;
If *side* = 'L' or 'B', then *ldvl* ≥*n*.
If *side* = 'R', then *ldvl* ≥ 1.

ldvr — INTEGER. The first dimension of *vr*;
If *side* = 'R' or 'B', then *ldvr* ≥*n*.
If *side* = 'L', then *ldvr* ≥ 1.

mm — INTEGER. The number of columns in the arrays *vl* and/or *vr* (*mm* ≥ *m*).

rwork — REAL for ctgevc DOUBLE PRECISION for ztgevc. Workspace array, DIMENSION at least max (1, 2**n*). Used in complex flavors only.

Output Parameters

vl — On exit, if *side* = 'L' or 'B', *vl* contains:
if *howmny* = 'A', the matrix *Y* of left eigenvectors of (*S*,*P*);
if *howmny* = 'B', the matrix *Q***Y*;
if *howmny* = 'S', the left eigenvectors of (*S*,*P*) specified by *select*, stored consecutively in the columns of *vl*, in the same order as their eigenvalues.
For real flavors:
A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.

vr — On exit, if *side* = 'R' or 'B', *vr* contains:
if *howmny* = 'A', the matrix *X* of right eigenvectors of (*S*,*P*);
if *howmny* = 'B', the matrix *Z***X*;
if *howmny* = 'S', the right eigenvectors of (*S*,*P*) specified by *select*, stored consecutively in the columns of *vr*, in the same order as their eigenvalues.
For real flavors:
A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive columns, the first holding the real part, and the second the imaginary part.

m — INTEGER. The number of columns in the arrays *vl* and/or *vr* actually used to store the eigenvectors.
If *howmny* = 'A' or 'B', *m* is set to *n*.

	For real flavors: Each selected real eigenvector occupies one column and each selected complex eigenvector occupies two columns. *For complex flavors*: Each selected eigenvector occupies one column.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. *For real flavors*: if *info* = *i*>0, the 2-by-2 block (*i*:*i*+1) does not have a complex eigenvalue.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tgevc interface are the following:

s	Holds the matrix *S* of size (*n*, *n*).
p	Holds the matrix *P* of size (*n*, *n*).
select	Holds the vector of length *n*.
vl	Holds the matrix *VL* of size (*n*, *mm*).
vr	Holds the matrix *VR* of size (*n*, *mm*).
side	Restored based on the presence of arguments *vl* and *vr* as follows: *side* = 'B', if both *vl* and *vr* are present, *side* = 'L', if *vl* is present and *vr* omitted, *side* = 'R', if *vl* is omitted and *vr* present, Note that there will be an error condition if both *vl* and *vr* are omitted.
howmny	If omitted, this argument is restored based on the presence of argument *select* as follows: *howmny* = 'S', if *select* is present, *howmny* = 'A', if *select* is omitted. If present, *howmny* must be equal to 'A' or 'B' and the argument *select* must be omitted. Note that there will be an error condition if both *howmny* and *select* are present.

?tgexc

Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that one diagonal block of (A,B) moves to another row index.

Syntax

FORTRAN 77:

```
call stgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)
```

```
call dtgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, work, lwork, info)
call ctgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
call ztgexc(wantq, wantz, n, a, lda, b, ldb, q, ldq, z, ldz, ifst, ilst, info)
```

Fortran 95:

```
call tgexc(a, b [,ifst] [,ilst] [,z] [,q] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (*A*,*B*) using an orthogonal/unitary equivalence transformation

$(A,B) = Q*(A,B)*Z^H$,

so that the diagonal block of (*A*, *B*) with row index *ifst* is moved to row *ilst*. Matrix pair (*A*, *B*) must be in a generalized real-Schur/Schur canonical form (as returned by ?gges), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks and *B* is upper triangular. Optionally, the matrices *Q* and *Z* of generalized Schur vectors are updated.

Q(in)**A*(in)**Z*(in)' = *Q*(out)**A*(out)**Z*(out)'

Q(in)**B*(in)**Z*(in)' = *Q*(out)**B*(out)**Z*(out)'.

Input Parameters

wantq, *wantz*	LOGICAL. If *wantq* = .TRUE., update the left transformation matrix *Q*; If *wantq* = .FALSE., do not update *Q*; If *wantz* = .TRUE., update the right transformation matrix *Z*; If *wantz* = .FALSE., do not update *Z*.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *q*,	REAL for stgexc DOUBLE PRECISION for dtgexc COMPLEX for ctgexc DOUBLE COMPLEX for ztgexc. Arrays: *a*(*lda*,*) contains the matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the matrix *B*. The second dimension of *b* must be at least max(1, *n*). *q* (*ldq*,*) If *wantq* = .FALSE., then *q* is not referenced. If *wantq* = .TRUE., then *q* must contain the orthogonal/unitary matrix *Q*. The second dimension of *q* must be at least max(1, *n*). *z* (*ldz*,*)

If *wantz* = .FALSE., then *z* is not referenced.
If *wantz* = .TRUE., then *z* must contain the orthogonal/unitary matrix *Z*.
The second dimension of *z* must be at least max(1, *n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

ldq — INTEGER. The first dimension of *q*;
If *wantq* = .FALSE., then *ldq* ≥ 1.
If *wantq* = .TRUE., then *ldq* ≥ max(1, *n*).

ldz — INTEGER. The first dimension of *z*;
If *wantz* = .FALSE., then *ldz* ≥ 1.
If *wantz* = .TRUE., then *ldz* ≥ max(1, *n*).

ifst, *ilst* — INTEGER. Specify the reordering of the diagonal blocks of (*A*, *B*). The block with row index *ifst* is moved to row *ilst*, by a sequence of swapping between adjacent blocks. Constraint: 1 ≤ *ifst*, *ilst* ≤ *n*.

work — REAL for stgexc;
DOUBLE PRECISION for dtgexc.
Workspace array, DIMENSION (*lwork*). Used in real flavors only.

lwork — INTEGER. The dimension of *work*; must be at least 4*n* +16.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

a, *b* — Overwritten by the updated matrices *A* and *B*.

ifst, *ilst* — Overwritten for real flavors only.
If *ifst* pointed to the second row of a 2 by 2 block on entry, it is changed to point to the first row; *ilst* always points to the first row of the block in its final position (which may differ from its input value by ±1).

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = 1, the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is ill-conditioned. (*A*, *B*) may have been partially reordered, and *ilst* points to the first row of the current position of the block being moved.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tgexc interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
b	Holds the matrix *B* of size (*n*, *n*).
z	Holds the matrix *Z* of size (*n*, *n*).
q	Holds the matrix *Q* of size (*n*, *n*).
wantq	Restored based on the presence of the argument *q* as follows: *wantq* = .TRUE., if *q* is present, *wantq* = .FALSE., if *q* is omitted.
wantz	Restored based on the presence of the argument *z* as follows: *wantz* = .TRUE., if *z* is present, *wantz* = .FALSE., if z is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsen

Reorders the generalized Schur decomposition of a pair of matrices (A,B) so that a selected cluster of eigenvalues appears in the leading diagonal blocks of (A,B).

Syntax

FORTRAN 77:

```
call stgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphar, alphai, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)
```

```
call dtgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alphar, alphai, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)
```

```
call ctgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)
```

```
call ztgsen(ijob, wantq, wantz, select, n, a, lda, b, ldb, alpha, beta, q, ldq, z, ldz, m, pl, pr, dif, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call tgsen(a, b, select [,alphar] [,alphai] [,beta] [,ijob] [,q] [,z] [,pl] [,pr] [,dif] [,m] [,info])
call tgsen(a, b, select [,alpha] [,beta] [,ijob] [,q] [,z] [,pl] [,pr] [, dif] [,m] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine reorders the generalized real-Schur/Schur decomposition of a real/complex matrix pair (*A*, *B*) (in terms of an orthogonal/unitary equivalence transformation *Q**(*A*,*B*)**Z*, so that a selected cluster of eigenvalues appears in the leading diagonal blocks of the pair (*A*, *B*). The leading columns of *Q* and *Z* form orthonormal/unitary bases of the corresponding left and right eigenspaces (deflating subspaces).

(*A*, *B*) must be in generalized real-Schur/Schur canonical form (as returned by `?gges`), that is, *A* and *B* are both upper triangular.

`?tgsen` also computes the generalized eigenvalues

ω_j = (*alphar*(j) + *alphai*(j)*i)/*beta*(j) (for real flavors)

ω_j = *alpha*(j)/*beta*(j) (for complex flavors)

of the reordered matrix pair (*A*, *B*).

Optionally, the routine computes the estimates of reciprocal condition numbers for eigenvalues and eigenspaces. These are `Difu`[(A_{11}, B_{11}), (A_{22}, B_{22})] and `Difl`[(A_{11}, B_{11}), (A_{22}, B_{22})], that is, the separation(s) between the matrix pairs (A_{11}, B_{11}) and (A_{22}, B_{22}) that correspond to the selected cluster and the eigenvalues outside the cluster, respectively, and norms of "projections" onto left and right eigenspaces with respect to the selected cluster in the (1,1)-block.

Input Parameters

ijob — `INTEGER`. Specifies whether condition numbers are required for the cluster of eigenvalues (*pl* and *pr*) or the deflating subspaces `Difu` and `Difl`.
If *ijob* =0, only reorder with respect to *select*;
If *ijob* =1, reciprocal of norms of "projections" onto left and right eigenspaces with respect to the selected cluster (*pl* and *pr*);
If *ijob* =2, compute upper bounds on `Difu` and `Difl`, using F-norm-based estimate (*dif* (1:2));
If *ijob* =3, compute estimate of `Difu` and `Difl`, sing 1-norm-based estimate (*dif* (1:2)). This option is about 5 times as expensive as *ijob* =2;
If *ijob* =4,>compute *pl*, *pr* and *dif* (i.e., options 0, 1 and 2 above). This is an economic version to get it all;
If *ijob* =5, compute *pl*, *pr* and *dif* (i.e., options 0, 1 and 3 above).

wantq, *wantz* — `LOGICAL`.
If *wantq* = `.TRUE.`, update the left transformation matrix *Q*;
If *wantq* = `.FALSE.`, do not update *Q*;

	If *wantz* = .TRUE., update the right transformation matrix *Z*; If *wantz* = .FALSE., do not update *Z*.
select	LOGICAL. Array, DIMENSION at least max (1, *n*). Specifies the eigenvalues in the selected cluster. To select an eigenvalue *omega*(*j*), *select*(*j*) must be .TRUE. *For real flavors*: to select a complex conjugate pair of eigenvalues *omega*(*j*) and *omega*(*j*+1) (corresponding 2 by 2 diagonal block), *select*(*j*) and/or *select*(*j*+1) must be set to .TRUE.; the complex conjugate *omega*(*j*) and *omega*(*j*+1) must be either both included in the cluster or both excluded.
n	INTEGER. The order of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *q*, *z*, *work*	REAL for stgsen DOUBLE PRECISION for dtgsen COMPLEX for ctgsen DOUBLE COMPLEX for ztgsen. Arrays: *a*(*lda*,*) contains the matrix *A*. *For real flavors*: *A* is upper quasi-triangular, with (*A*, *B*) in generalized real Schur canonical form. *For complex flavors*: *A* is upper triangular, in generalized Schur canonical form. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the matrix *B*. *For real flavors*: *B* is upper triangular, with (*A*, *B*) in generalized real Schur canonical form. *For complex flavors*: *B* is upper triangular, in generalized Schur canonical form. The second dimension of *b* must be at least max(1, *n*). *q* (*ldq*,*) If *wantq* = .TRUE., then *q* is an *n*-by-*n* matrix; If *wantq* = .FALSE., then *q* is not referenced. The second dimension of *q* must be at least max(1, *n*). *z* (*ldz*,*) If *wantz* = .TRUE., then *z* is an *n*-by-*n* matrix; If *wantz* = .FALSE., then *z* is not referenced. The second dimension of *z* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
ldq	INTEGER. The first dimension of *q*; $ldq \geq 1$. If *wantq* = .TRUE., then $ldq \geq \max(1, n)$.
ldz	INTEGER. The first dimension of *z*; $ldz \geq 1$. If *wantz* = .TRUE., then $ldz \geq \max(1, n)$.
lwork	INTEGER. The dimension of the array *work*.

For real flavors:

If *ijob* = 1, 2, or 4, *lwork* ≥ max(4*n*+16, 2*m*(*n*-*m*)).

If *ijob* = 3 or 5, *lwork* ≥ max(4*n*+16, 4*m*(*n*-*m*)).

For complex flavors:

If *ijob* = 1, 2, or 4, *lwork* ≥ max(1, 2*m*(*n*-*m*)).

If *ijob* = 3 or 5, *lwork* ≥ max(1, 4*m*(*n*-*m*)).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER. Workspace array, its dimension max(1, *liwork*).
If *ijob* =0, *iwork* is not referenced.

liwork — INTEGER. The dimension of the array *iwork*.

For real flavors:

If *ijob* = 1, 2, or 4, *liwork* ≥ *n*+6.

If *ijob* = 3 or 5, *liwork* ≥ max(*n*+6, 2*m*(*n*-*m*)).

For complex flavors:

If *ijob* = 1, 2, or 4, *liwork* ≥ *n*+2.

If *ijob* = 3 or 5, *liwork* ≥ max(*n*+2, 2*m*(*n*-*m*)).

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

a, *b* — Overwritten by the reordered matrices *A* and *B*, respectively.

alphar, *alphai* — REAL for stgsen;
DOUBLE PRECISION for dtgsen.
Arrays, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in real flavors.
See *beta*.

alpha — COMPLEX for ctgsen;
DOUBLE COMPLEX for ztgsen.
Array, DIMENSION at least max(1, *n*). Contain values that form generalized eigenvalues in complex flavors.
See *beta*.

beta — REAL for stgsen
DOUBLE PRECISION for dtgsen
COMPLEX for ctgsen
DOUBLE COMPLEX for ztgsen.
Array, DIMENSION at least max(1, *n*).

For real flavors:

	On exit, (*alphar*(j) + *alphai*(j)*i)/*beta*(j), j=1,..., *n*, will be the generalized eigenvalues. *alphar*(j) + *alphai*(j)*i and *beta*(j), j=1,..., *n* are the diagonals of the complex Schur form (*S*,*T*) that would result if the 2-by-2 diagonal blocks of the real generalized Schur form of (*A*,*B*) were further reduced to triangular form using complex unitary transformations. If *alphai*(j) is zero, then the j-th eigenvalue is real; if positive, then the j-th and (j+1)-st eigenvalues are a complex conjugate pair, with *alphai*(j+1) negative. *For complex flavors:* The diagonal elements of *A* and *B*, respectively, when the pair (*A*,*B*) has been reduced to generalized Schur form. *alpha*(i)/*beta*(i), i=1,..., *n* are the generalized eigenvalues.
q	If *wantq* =.TRUE., then, on exit, *Q* has been postmultiplied by the left orthogonal transformation matrix which reorder (*A*, *B*). The leading *m* columns of *Q* form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).
z	If *wantz* =.TRUE., then, on exit, *Z* has been postmultiplied by the left orthogonal transformation matrix which reorder (*A*, *B*). The leading *m* columns of *Z* form orthonormal bases for the specified pair of left eigenspaces (deflating subspaces).
m	INTEGER. The dimension of the specified pair of left and right eigen-spaces (deflating subspaces); $0 \le m \le n$.
pl, *pr*	REAL for single precision flavors; DOUBLE PRECISION for double precision flavors. If *ijob* = 1, 4, or 5, *pl* and *pr* are lower bounds on the reciprocal of the norm of "projections" onto left and right eigenspaces with respect to the selected cluster. $0 < pl, pr \le 1$. If $m = 0$ or $m = n$, $pl = pr = 1$. If *ijob* = 0, 2 or 3, *pl* and *pr* are not referenced
dif	REAL for single precision flavors;DOUBLE PRECISION for double precision flavors. Array, DIMENSION (2). If $ijob \ge 2$, *dif*(1:2) store the estimates of Difu and Difl. If *ijob* = 2 or 4, *dif*(1:2) are F-norm-based upper bounds on Difu and Difl. If *ijob* = 3 or 5, *dif*(1:2) are 1-norm-based estimates of Difu and Difl. If $m = 0$ or n, *dif*(1:2) = F-norm([*A*, *B*]). If *ijob* = 0 or 1, *dif* is not referenced.
work(1)	If *ijob* is not 0 and *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.

iwork(1)	If *ijob* is not 0 and *info* = 0, on exit, *iwork*(1) contains the minimum value of *liwork* required for optimum performance. Use this *liwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, Reordering of (*A*, *B*) failed because the transformed matrix pair (*A*, *B*) would be too far from generalized Schur form; the problem is very ill-conditioned. (*A*, *B*) may have been partially reordered. If requested, 0 is returned in *dif*(*), *pl* and *pr*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tgsen interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
select	Holds the vector of length *n*.
alphar	Holds the vector of length *n*. Used in real flavors only.
alphai	Holds the vector of length *n*. Used in real flavors only.
alpha	Holds the vector of length *n*. Used in complex flavors only.
beta	Holds the vector of length *n*.
q	Holds the matrix *Q* of size (*n*,*n*).
z	Holds the matrix *Z* of size (*n*,*n*).
dif	Holds the vector of length (2).
ijob	Must be 0, 1, 2, 3, 4, or 5. The default value is 0.
wantq	Restored based on the presence of the argument *q* as follows: *wantq* = .TRUE, if *q* is present, *wantq* = .FALSE, if *q* is omitted.
wantz	Restored based on the presence of the argument *z* as follows: *wantz* = .TRUE, if *z* is present, *wantz* = .FALSE, if z is omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsyl

Solves the generalized Sylvester equation.

Syntax

FORTRAN 77:

```
call stgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
call dtgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
call ctgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
call ztgsyl(trans, ijob, m, n, a, lda, b, ldb, c, ldc, d, ldd, e, lde, f, ldf, scale,
dif, work, lwork, iwork, info)
```

Fortran 95:

```
call tgsyl(a, b, c, d, e, f [,ijob] [,trans] [,scale] [,dif] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves the generalized Sylvester equation:

*A*R-L*B = scale*C*

*D*R-L*E = scale*F*

where *R* and *L* are unknown *m*-by-*n* matrices, (*A*, *D*), (*B*, *E*) and (*C*, *F*) are given matrix pairs of size *m*-by-*m*, *n*-by-*n* and *m*-by-*n*, respectively, with real/complex entries. (*A*, *D*) and (*B*, *E*) must be in generalized real-Schur/Schur canonical form, that is, *A*, *B* are upper quasi-triangular/triangular and *D*, *E* are upper triangular.

The solution (*R*, *L*) overwrites (*C*, *F*). The factor *scale*, $0 \le scale \le 1$, is an output scaling factor chosen to avoid overflow.

In matrix notation the above equation is equivalent to the following: solve *Z*x = scale*b*, where *Z* is defined as

$$Z = \begin{pmatrix} kron(I_n, A) - kron(B', I_m) \\ kron(I_n, D) - kron(E', I_m) \end{pmatrix}$$

Here I_k is the identity matrix of size *k* and *X*' is the transpose/conjugate-transpose of *X*. *kron*(*X*, *Y*) is the Kronecker product between the matrices *X* and *Y*.

If *trans* = 'T' (for real flavors), or *trans* = 'C' (for complex flavors), the routine ?tgsyl solves the transposed/conjugate-transposed system *Z'*y = scale*b*, which is equivalent to solve for *R* and *L* in

*A'*R+D'*L = scale*C*

*R*B'+L*E' = scale*(-F)*

This case (*trans* = 'T' for stgsyl/dtgsyl or *trans* = 'C' for ctgsyl/ztgsyl) is used to compute an one-norm-based estimate of Dif[(*A*, *D*), (*B*, *E*)], the separation between the matrix pairs (*A*,*D*) and (*B*,*E*), using slacon/clacon.

If *ijob* ≥ 1, ?tgsyl computes a Frobenius norm-based estimate of Dif[(*A*, *D*), (*B*,*E*)]. That is, the reciprocal of a lower bound on the reciprocal of the smallest singular value of *Z*. This is a level 3 BLAS algorithm.

Input Parameters

trans	CHARACTER*1. Must be 'N', 'T', or 'C'. If *trans* = 'N', solve the generalized Sylvester equation. If *trans* = 'T', solve the 'transposed' system (for real flavors only). If *trans* = 'C', solve the ' conjugate transposed' system (for complex flavors only).
ijob	INTEGER. Specifies what kind of functionality to be performed: If *ijob* =0 , solve the generalized Sylvester equation only; If *ijob* =1, perform the functionality of *ijob* =0 and *ijob* =3; If *ijob* =2, perform the functionality of *ijob* =0 and *ijob* =4; If *ijob* =3, only an estimate of Dif[(*A*, *D*), (*B*, *E*)] is computed (look ahead strategy is used); If *ijob* =4, only an estimate of Dif[(*A*, *D*), (*B*,*E*)] is computed (?gecon on sub-systems is used). If *trans* = 'T' or 'C', *ijob* is not referenced.
m	INTEGER. The order of the matrices *A* and *D*, and the row dimension of the matrices *C*, *F*, *R* and *L*.
n	INTEGER. The order of the matrices *B* and *E*, and the column dimension of the matrices *C*, *F*, *R* and *L*.
a, *b*, *c*, *d*, *e*, *f*, *work*	REAL for stgsyl DOUBLE PRECISION for dtgsyl COMPLEX for ctgsyl DOUBLE COMPLEX for ztgsyl. Arrays: *a*(*lda*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *A*. The second dimension of *a* must be at least max(1, *m*). *b*(*ldb*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *B*. The second dimension of *b* must be at least max(1, *n*). *c* (*ldc*,*) contains the right-hand-side of the first matrix equation in the generalized Sylvester equation (as defined by *trans*) The second dimension of *c* must be at least max(1, *n*). *d* (*ldd*,*) contains the upper triangular matrix *D*.

	The second dimension of *d* must be at least max(1, *m*). *e* (*lde*,*) contains the upper triangular matrix *E*. The second dimension of *e* must be at least max(1, *n*). *f* (*ldf*,*) contains the right-hand-side of the second matrix equation in the generalized Sylvester equation (as defined by *trans*) The second dimension of *f* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
ldc	INTEGER. The first dimension of *c*; at least max(1, *m*).
ldd	INTEGER. The first dimension of *d*; at least max(1, *m*).
lde	INTEGER. The first dimension of *e*; at least max(1, *n*).
ldf	INTEGER. The first dimension of *f*; at least max(1, *m*).
lwork	INTEGER. The dimension of the array *work*. *lwork* ≥ 1. If *ijob* = 1 or 2 and *trans* = 'N', *lwork* ≥ max(1, 2**m***n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.
iwork	INTEGER. Workspace array, DIMENSION at least (*m*+*n*+6) for real flavors, and at least (*m*+*n*+2) for complex flavors.

Output Parameters

c	If *ijob*=0, 1, or 2, overwritten by the solution *R*. If *ijob*=3 or 4 and *trans* = 'N', *c* holds *R*, the solution achieved during the computation of the Dif-estimate.
f	If *ijob*=0, 1, or 2, overwritten by the solution *L*. If *ijob*=3 or 4 and *trans* = 'N', *f* holds *L*, the solution achieved during the computation of the Dif-estimate.
dif	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. On exit, *dif* is the reciprocal of a lower bound of the reciprocal of the Dif-function, that is, *dif* is an upper bound of Dif[(*A*, *D*), (*B*, *E*)] = sigma_min(*Z*), where *Z* as in (2). If *ijob* = 0, or *trans* = 'T' (for real flavors), or *trans* = 'C' (for complex flavors), *dif* is not touched.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. On exit, *scale* is the scaling factor in the generalized Sylvester equation.

	If `0 < scale < 1`, *c* and *f* hold the solutions *R* and *L*, respectively, to a slightly perturbed system but the input matrices *A*, *B*, *D* and *E* have not been changed. If `scale = 0`, *c* and *f* hold the solutions *R* and *L*, respectively, to the homogeneous system with *C* = *F* = `0`. Normally, `scale = 1`.
work(1)	If *info* = `0`, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = `0`, the execution is successful. If *info* = `-`*i*, the *i*-th parameter had an illegal value. If *info* > `0`, (*A*, *D*) and (*B*, *E*) have common or close eigenvalues.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `tgsyl` interface are the following:

a	Holds the matrix *A* of size (*m*,*m*).
b	Holds the matrix *B* of size (*n*,*n*).
c	Holds the matrix *C* of size (*m*,*n*).
d	Holds the matrix *D* of size (*m*,*m*).
e	Holds the matrix *E* of size (*n*,*n*).
f	Holds the matrix *F* of size (*m*,*n*).
ijob	Must be 0, 1, 2, 3, or 4. The default value is 0.
trans	Must be `'N'` or `'T'`. The default value is `'N'`.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = `-1`.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = `-1`, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to `-1`, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?tgsna

Estimates reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a pair of matrices in generalized real Schur canonical form.

Syntax

FORTRAN 77:

```
call stgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m, work, lwork, iwork, info)
call dtgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m, work, lwork, iwork, info)
call ctgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m, work, lwork, iwork, info)
call ztgsna(job, howmny, select, n, a, lda, b, ldb, vl, ldvl, vr, ldvr, s, dif, mm, m, work, lwork, iwork, info)
```

Fortran 95:

```
call tgsna(a, b [,s] [,dif] [,vl] [,vr] [,select] [,m] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The real flavors `stgsna/dtgsna` of this routine estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (*A*, *B*) in generalized real Schur canonical form (or of any matrix pair ($Q*A*Z^T$, $Q*B*Z^T$) with orthogonal matrices *Q* and *Z*.

(*A*, *B*) must be in generalized real Schur form (as returned by sgges/dgges), that is, *A* is block upper triangular with 1-by-1 and 2-by-2 diagonal blocks. B is upper triangular.

The complex flavors `ctgsna/ztgsna` estimate reciprocal condition numbers for specified eigenvalues and/or eigenvectors of a matrix pair (*A*, *B*). (*A*, *B*) must be in generalized Schur canonical form , that is, *A* and *B* are both upper triangular.

Input Parameters

job	CHARACTER*1. Specifies whether condition numbers are required for eigenvalues or eigenvectors. Must be 'E' or 'V' or 'B'. If *job* = 'E', for eigenvalues only (compute *s*). If *job* = 'V', for eigenvectors only (compute *dif*). If *job* = 'B', for both eigenvalues and eigenvectors (compute both *s* and *dif*).
howmny	CHARACTER*1. Must be 'A' or 'S'. If *howmny* = 'A' , compute condition numbers for all eigenpairs. If *howmny* = 'S' , compute condition numbers for selected eigenpairs specified by the logical array *select*.

select	LOGICAL. Array, DIMENSION at least max (1, *n*). If *howmny* = 'S', *select* specifies the eigenpairs for which condition numbers are required. If *howmny* = 'A', *select* is not referenced. *For real flavors*: To select condition numbers for the eigenpair corresponding to a real eigenvalue omega(*j*), *select*(*j*) must be set to .TRUE.; to select condition numbers corresponding to a complex conjugate pair of eigenvalues omega(*j*) and omega(*j*+1), either *select*(*j*) or *select*(*j*+1) must be set to .TRUE. *For complex flavors:* To select condition numbers for the corresponding *j*-th eigenvalue and/or eigenvector, *select*(*j*) must be set to .TRUE..
n	INTEGER. The order of the square matrix pair (*A*, *B*) (*n* ≥ 0).
a, *b*, *vl*, *vr*, *work*	REAL for stgsna DOUBLE PRECISION for dtgsna COMPLEX for ctgsna DOUBLE COMPLEX for ztgsna. Arrays: *a*(*lda*,*) contains the upper quasi-triangular (for real flavors) or upper triangular (for complex flavors) matrix *A* in the pair (*A*, *B*). The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the upper triangular matrix *B* in the pair (*A*, *B*). The second dimension of *b* must be at least max(1, *n*). If *job* = 'E' or 'B', *vl*(*ldvl*,*) must contain left eigenvectors of (*A*, *B*), corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vl*, as returned by ?tgevc. If *job* = 'V', *vl* is not referenced. The second dimension of *vl* must be at least max(1, *m*). If *job* = 'E' or 'B', *vr*(*ldvr*,*) must contain right eigenvectors of (*A*, *B*), corresponding to the eigenpairs specified by *howmny* and *select*. The eigenvectors must be stored in consecutive columns of *vr*, as returned by ?tgevc. If *job* = 'V', *vr* is not referenced. The second dimension of *vr* must be at least max(1, *m*). *work* is a workspace array, its dimension max(1, *lwork*). If *job* = 'E', *work* is not referenced.
lda	INTEGER. The first dimension of *a*; at least max(1, *n*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *n*).
ldvl	INTEGER. The first dimension of *vl*; *ldvl* ≥ 1. If *job* = 'E' or 'B', then *ldvl* ≥ max(1, *n*).
ldvr	INTEGER. The first dimension of *vr*; *ldvr* ≥ 1.

If *job* = 'E' or 'B', then *ldvr* ≥ max(1, *n*).

mm INTEGER. The number of elements in the arrays *s* and *dif* (*mm* ≥ *m*).

lwork INTEGER. The dimension of the array *work*.

lwork ≥ max(1, *n*).

If *job* = 'V' or 'B', *lwork* ≥ 2**n**(*n*+2)+16 for real flavors, and

lwork ≥ max(1, 2**n***n*) for complex flavors.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER. Workspace array, DIMENSION at least (*n*+6) for real flavors, and at least (*n*+2) for complex flavors.

If *job* = 'E', *iwork* is not referenced.

Output Parameters

s REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, DIMENSION (*mm*).

If *job* = 'E' or 'B', contains the reciprocal condition numbers of the selected eigenvalues, stored in consecutive elements of the array.

If *job* = 'V', *s* is not referenced.

For real flavors:

For a complex conjugate pair of eigenvalues two consecutive elements of *s* are set to the same value. Thus, *s*(j), *dif*(j), and the j-th columns of *vl* and *vr* all correspond to the same eigenpair (but not in general the j-th eigenpair, unless all eigenpairs are selected).

dif REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.

Array, DIMENSION (*mm*).

If *job* = 'V' or 'B', contains the estimated reciprocal condition numbers of the selected eigenvectors, stored in consecutive elements of the array.

If the eigenvalues cannot be reordered to compute *dif*(j), *dif*(j) is set to 0; this can only occur when the true value would be very small anyway.

If *job* = 'E', *dif* is not referenced.

For real flavors:

For a complex eigenvector, two consecutive elements of *dif* are set to the same value.

For complex flavors:

For each eigenvalue/vector specified by *select*, *dif* stores a Frobenius norm-based estimate of Difl.

m	INTEGER. The number of elements in the arrays *s* and *dif* used to store the specified condition numbers; for each selected eigenvalue one element is used. If *howmny* = 'A', *m* is set to *n*.
work(1)	*work*(1) If *job* is not 'E' and *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine tgsna interface are the following:

a	Holds the matrix *A* of size (*n*,*n*).
b	Holds the matrix *B* of size (*n*,*n*).
s	Holds the vector of length (*mm*).
dif	Holds the vector of length (*mm*).
vl	Holds the matrix *VL* of size (*n*,*mm*).
vr	Holds the matrix *VR* of size (*n*,*mm*).
select	Holds the vector of length *n*.
howmny	Restored based on the presence of the argument *select* as follows: *howmny* = 'S', if *select* is present, *howmny* = 'A', if *select* is omitted.
job	Restored based on the presence of arguments *s* and dif as follows: *job* = 'B', if both *s* and *dif* are present, *job* = 'E', if *s* is present and *dif* omitted, *job* = 'V', if *s* is omitted and *dif* present, Note that there will be an error condition if both *s* and *dif* are omitted.

Application Notes

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

In first case the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Generalized Singular Value Decomposition

This section describes LAPACK computational routines used for finding the generalized singular value decomposition (GSVD) of two matrices *A* and *B* as

$U^H AQ = D_1*(0\ R)$,

$V^H BQ = D_2*(0\ R)$,

where *U*, *V*, and *Q* are orthogonal/unitary matrices, *R* is a nonsingular upper triangular matrix, and D_1, D_2 are "diagonal" matrices of the structure detailed in the routines description section.

Table 4-7 lists LAPACK routines (FORTRAN 77 interface) that perform generalized singular value decomposition of matrices. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-7 Computational Routines for Generalized Singular Value Decomposition

Routine name	Operation performed
?ggsvp	Computes the preprocessing decomposition for the generalized SVD
?tgsja	Computes the generalized SVD of two upper triangular or trapezoidal matrices

You can use routines listed in the above table as well as the driver routine ?ggsvd to find the GSVD of a pair of general rectangular matrices.

?ggsvp

Computes the preprocessing decomposition for the generalized SVD.

Syntax

FORTRAN 77:

```
call sggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, tau, work, info)
call dggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, tau, work, info)
call cggsvp (jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, rwork, tau, work, info)
call zggsvp(jobu, jobv, jobq, m, p, n, a, lda, b, ldb, tola, tolb, k, l, u, ldu, v, ldv, q, ldq, iwork, rwork, tau, work, info)
```

Fortran 95:

```
call ggsvp(a, b, tola, tolb [, k] [,l] [,u] [,v] [,q] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes orthogonal matrices U, V and Q such that

$$U^H A Q = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \\ 0 & 0 & 0 \end{pmatrix} \end{array}, \quad \text{if } m-k-l \geq 0$$

$$= \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \end{array}, \quad \text{if } m-k-l < 0$$

$$V^H B Q = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

where the k-by-k matrix A_{12} and l-by-l matrix B_{13} are nonsingular upper triangular; A_{23} is l-by-l upper triangular if $m-k-l \geq 0$, otherwise A_{23} is $(m-k)$-by-l upper trapezoidal. The sum $k+l$ is equal to the effective numerical rank of the $(m+p)$-by-n matrix $(A^H,B^H)^H$.

This decomposition is the preprocessing step for computing the Generalized Singular Value Decomposition (GSVD), see subroutine `?ggsvd`.

Input Parameters

jobu	CHARACTER*1. Must be 'U' or 'N'. If *jobu* = 'U', orthogonal/unitary matrix U is computed. If *jobu* = 'N', U is not computed.
jobv	CHARACTER*1. Must be 'V' or 'N'. If *jobv* = 'V', orthogonal/unitary matrix V is computed. If *jobv* = 'N', V is not computed.
jobq	CHARACTER*1. Must be 'Q' or 'N'. If *jobq* = 'Q', orthogonal/unitary matrix Q is computed. If *jobq* = 'N', Q is not computed.
m	INTEGER. The number of rows of the matrix A ($m \geq 0$).

p	INTEGER. The number of rows of the matrix *B* ($p \geq 0$).
n	INTEGER. The number of columns of the matrices *A* and *B* ($n \geq 0$).
a, *b*, *tau*, *work*	REAL for sggsvp DOUBLE PRECISION for dggsvp COMPLEX for cggsvp DOUBLE COMPLEX for zggsvp. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). *tau*(*) is a workspace array. The dimension of *tau* must be at least max(1, *n*). *work*(*) is a workspace array. The dimension of *work* must be at least max(1, 3*n*, *m*, *p*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *p*).
tola, *tolb*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *tola* and *tolb* are the thresholds to determine the effective numerical rank of matrix *B* and a subblock of *A*. Generally, they are set to *tola* = max(*m*, *n*)*||*A*||*MACHEPS, *tolb* = max(*p*, *n*)*||*B*||*MACHEPS. The size of *tola* and *tolb* may affect the size of backward errors of the decomposition.
ldu	INTEGER. The first dimension of the output array *u* . *ldu* ≥ max(1, *m*) if *jobu* = 'U'; *ldu* ≥ 1 otherwise.
ldv	INTEGER. The first dimension of the output array *v* . *ldv* ≥ max(1, *p*) if *jobv* = 'V'; *ldv* ≥ 1 otherwise.
ldq	INTEGER. The first dimension of the output array *q* . *ldq* ≥ max(1, *n*) if *jobq* = 'Q'; *ldq* ≥ 1 otherwise.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, *n*).
rwork	REAL for cggsvp DOUBLE PRECISION for zggsvp. Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a	Overwritten by the triangular (or trapezoidal) matrix described in the *Description* section.
b	Overwritten by the triangular matrix described in the *Description* section.

k, *l* — INTEGER. On exit, *k* and *l* specify the dimension of subblocks. The sum *k* + *l* is equal to effective numerical rank of $(A^H, B^H)^H$.

u, *v*, *q* — REAL for sggsvp
DOUBLE PRECISION for dggsvp
COMPLEX for cggsvp
DOUBLE COMPLEX for zggsvp.
Arrays:
If *jobu* = 'U', *u*(*ldu*,*) contains the orthogonal/unitary matrix *U*.
The second dimension of *u* must be at least max(1, *m*).
If *jobu* = 'N', *u* is not referenced.
If *jobv* = 'V', *v*(*ldv*,*) contains the orthogonal/unitary matrix *V*.
The second dimension of *v* must be at least max(1, *m*).
If *jobv* = 'N', *v* is not referenced.
If *jobq* = 'Q', *q*(*ldq*,*) contains the orthogonal/unitary matrix *Q*.
The second dimension of *q* must be at least max(1, *n*).
If *jobq* = 'N', *q* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggsvp interface are the following:

a — Holds the matrix *A* of size (*m*,*n*).

b — Holds the matrix *B* of size (*p*,*n*).

u — Holds the matrix *U* of size (*m*,*m*).

v — Holds the matrix *V* of size (*p*,*m*).

q — Holds the matrix *Q* of size (*n*,*n*).

jobu — Restored based on the presence of the argument *u* as follows:
jobu = 'U', if *u* is present,
jobu = 'N', if *u* is omitted.

jobv — Restored based on the presence of the argument *v* as follows:
jobz = 'V', if *v* is present,
jobz = 'N', if *v* is omitted.

jobq — Restored based on the presence of the argument *q* as follows:
jobz = 'Q', if *q* is present,
jobz = 'N', if *q* is omitted.

?tgsja

Computes the generalized SVD of two upper triangular or trapezoidal matrices.

Syntax

FORTRAN 77:

```
call stgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha, beta,
u, ldu, v, ldv, q, ldq, work, ncycle, info)
call dtgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha, beta,
u, ldu, v, ldv, q, ldq, work, ncycle, info)
call ctgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha, beta,
u, ldu, v, ldv, q, ldq, work, ncycle, info)
call ztgsja(jobu, jobv, jobq, m, p, n, k, l, a, lda, b, ldb, tola, tolb, alpha, beta,
u, ldu, v, ldv, q, ldq, work, ncycle, info)
```

Fortran 95:

```
call tgsja(a, b, tola, tolb, k, l [,u] [,v] [,q] [,jobu] [,jobv] [,jobq] [,alpha] [,beta]
[,ncycle] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the generalized singular value decomposition (GSVD) of two real/complex upper triangular (or trapezoidal) matrices *A* and *B*. On entry, it is assumed that matrices *A* and *B* have the following forms, which may be obtained by the preprocessing subroutine `?ggsvp` from a general *m*-by-*n* matrix *A* and *p*-by-*n* matrix *B*:

$$A = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \\ 0 & 0 & 0 \end{pmatrix} \end{array}, \quad \text{if } m-k-l \geq 0$$

$$= \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix} \end{array}, \quad \text{if } m-k-l < 0$$

$$B = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

where the k-by-k matrix A_{12} and l-by-l matrix B_{13} are nonsingular upper triangular; A_{23} is l-by-l upper triangular if $m-k-l \geq 0$, otherwise A_{23} is $(m-k)$-by-l upper trapezoidal.

On exit,

$U^H*A*Q = D_1*(0\ R)$, $V^H*B*Q = D_2*(0\ R)$,

where U, V and Q are orthogonal/unitary matrices, R is a nonsingular upper triangular matrix, and D_1 and D_2 are "diagonal" matrices, which are of the following structures:

If $m-k-l \geq 0$,

$$D_1 = \begin{array}{c} \\ k \\ l \\ m-k-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{array}$$

$$D_1 = \begin{array}{c} \\ l \\ p-l \end{array} \begin{array}{c} \begin{array}{cc} k & l \end{array} \\ \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{array}$$

$$(0\ R) = \begin{array}{c} \\ k \\ l \end{array} \begin{array}{c} \begin{array}{ccc} n-k-l & k & l \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \end{array}$$

where

$C = \mathrm{diag}(alpha(k+1),\ldots,alpha(k+l))$

$S = \mathrm{diag}(beta(k+1),\ldots,beta(k+l))$

$C^2 + S^2 = I$

R is stored in $a(1{:}k+l, n-k-l+1{:}n)$ on exit.

If $m-k-l < 0$,

$$D_1 = \begin{array}{c} \\ k \\ m-k \end{array} \begin{array}{c} \begin{array}{ccc} k & m-l & k+l-m \end{array} \\ \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{array}$$

$$D_2 = \begin{array}{c} \\ m-k \\ k+1-m \\ p-l \end{array} \begin{array}{c} \begin{array}{ccc} k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & S & 0 \\ 0 & 0 & I \\ 0 & 0 & 0 \end{pmatrix} \end{array}$$

$$(0\ R) = \begin{array}{c} \\ k \\ m-k \\ k+l-m \end{array} \begin{array}{c} \begin{array}{cccc} n-k-l & k & m-k & k+l-m \end{array} \\ \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix} \end{array}$$

where

C = diag($alpha(K+1),...,alpha(m)$),

S = diag($beta(K+1),...,beta(m)$),

$C^2 + S^2$ = I

On exit, $\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$ is stored in $a(1{:}m, n{-}k{-}l{+}1{:}n)$ and R_{33} is stored in $b(m{-}k{+}1{:}l, n{+}m{-}k{-}l{+}1{:}n)$.

The computation of the orthogonal/unitary transformation matrices U, V or Q is optional. These matrices may either be formed explicitly, or they *may* be postmultiplied into input matrices U_1, V_1, or Q_1.

Input Parameters

jobu	CHARACTER*1. Must be 'U', 'I', or 'N'. If *jobu* = 'U', *u* must contain an orthogonal/unitary matrix U_1 on entry. If *jobu* = 'I', *u* is initialized to the unit matrix. If *jobu* = 'N', *u* is not computed.
jobv	CHARACTER*1. Must be 'V', 'I', or 'N'.

If *jobv* = 'V', *v* must contain an orthogonal/unitary matrix V_1 on entry.
If *jobv* = 'I', *v* is initialized to the unit matrix.
If *jobv* = 'N', *v* is not computed.

jobq — CHARACTER*1. Must be 'Q', 'I', or 'N'.
If *jobq* = 'Q', *q* must contain an orthogonal/unitary matrix Q_1 on entry.
If *jobq* = 'I', *q* is initialized to the unit matrix.
If *jobq* = 'N', *q* is not computed.

m — INTEGER. The number of rows of the matrix *A* ($m \geq 0$).

p — INTEGER. The number of rows of the matrix *B* ($p \geq 0$).

n — INTEGER. The number of columns of the matrices *A* and *B* ($n \geq 0$).

k, *l* — INTEGER. Specify the subblocks in the input matrices *A* and *B*, whose GSVD is computed.

a,*b*,*u*,*v*,*q*,*work* — REAL for stgsja
DOUBLE PRECISION for dtgsja
COMPLEX for ctgsja
DOUBLE COMPLEX for ztgsja.
Arrays:
a(*lda*,*) contains the *m*-by-*n* matrix *A*.
The second dimension of *a* must be at least max(1, *n*).
b(*ldb*,*) contains the *p*-by-*n* matrix *B*.
The second dimension of *b* must be at least max(1, *n*).
If *jobu* = 'U', *u*(*ldu*,*) must contain a matrix U_1 (usually the orthogonal/unitary matrix returned by ?ggsvp).
The second dimension of *u* must be at least max(1, *m*).
If *jobv* = 'V', *v*(*ldv*,*) must contain a matrix V_1 (usually the orthogonal/unitary matrix returned by ?ggsvp).
The second dimension of *v* must be at least max(1, *p*).
If *jobq* = 'Q', *q*(*ldq*,*) must contain a matrix Q_1 (usually the orthogonal/unitary matrix returned by ?ggsvp).
The second dimension of *q* must be at least max(1, *n*).
work(*) is a workspace array.
The dimension of *work* must be at least max(1, 2*n*).

lda — INTEGER. The first dimension of *a*; at least max(1, *m*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *p*).

ldu — INTEGER. The first dimension of the array *u* .
ldu ≥ max(1, *m*) if *jobu* = 'U'; *ldu* ≥ 1 otherwise.

ldv — INTEGER. The first dimension of the array *v* .
ldv ≥ max(1, *p*) if *jobv* = 'V'; *ldv* ≥ 1 otherwise.

ldq — INTEGER. The first dimension of the array *q* .
ldq ≥ max(1, *n*) if *jobq* = 'Q'; *ldq* ≥ 1 otherwise.

tola, *tolb* — REAL for single-precision flavors

DOUBLE PRECISION for double-precision flavors.
tola and *tolb* are the convergence criteria for the Jacobi-Kogbetliantz iteration procedure. Generally, they are the same as used in ?ggsvp:
tola = max(*m*, *n*)*|*A*|*MACHEPS,
tolb = max(*p*, *n*)*|*B*|*MACHEPS.

Output Parameters

a	On exit, *a*(*n*-*k*+1:*n*, 1:min(*k*+*l*, *m*)) contains the triangular matrix *R* or part of *R*.
b	On exit, if necessary, *b*(*m*-*k*+1: *l*, *n*+*m*-*k*-*l*+1: *n*)) contains a part of *R*.
alpha, *beta*	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Arrays, DIMENSION at least max(1, *n*). Contain the generalized singular value pairs of *A* and *B*: *alpha*(1:*k*) = 1, *beta*(1:*k*) = 0, and if *m*-*k*-*l* ≥ 0, *alpha*(*k*+1:*k*+*l*) = diag(*C*), *beta*(*k*+1:*k*+*l*) = diag(*S*), or if *m*-*k*-*l* < 0, *alpha*(*k*+1:*m*)= *C*, *alpha*(*m*+1:*k*+*l*)=0 *beta*(*K*+1:*M*) = *S*, *beta*(*m*+1:*k*+*l*) = 1. Furthermore, if *k*+*l* < *n*, *alpha*(*k*+*l*+1:*n*)= 0 and *beta*(*k*+*l*+1:*n*) = 0.
u	If *jobu* = 'I', *u* contains the orthogonal/unitary matrix *U*. If *jobu* = 'U', *u* contains the product U_1*U. If *jobu* = 'N', *u* is not referenced.
v	If *jobv* = 'I', *v* contains the orthogonal/unitary matrix *U*. If *jobv* = 'V', *v* contains the product V_1*V. If *jobv* = 'N', *v* is not referenced.
q	If *jobq* = 'I', *q* contains the orthogonal/unitary matrix *U*. If *jobq* = 'Q', *q* contains the product Q_1*Q. If *jobq* = 'N', *q* is not referenced.
ncycle	INTEGER. The number of cycles required for convergence.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the procedure does not converge after MAXIT cycles.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `tgsja` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix *B* of size (*p*,*n*).
u	Holds the matrix *U* of size (*m*,*m*).
v	Holds the matrix *V* of size (*p*,*p*).
q	Holds the matrix *Q* of size (*n*,*n*).
alpha	Holds the vector of length *n*.
beta	Holds the vector of length *n*.
jobu	If omitted, this argument is restored based on the presence of argument *u* as follows: *jobu* = 'U', if *u* is present, *jobu* = 'N', if *u* is omitted. If present, *jobu* must be equal to 'I' or 'U' and the argument *u* must also be present. Note that there will be an error condition if *jobu* is present and *u* omitted.
jobv	If omitted, this argument is restored based on the presence of argument *v* as follows: *jobv* = 'V', if *v* is present, *jobv* = 'N', if *v* is omitted. If present, *jobv* must be equal to 'I' or 'V' and the argument *v* must also be present. Note that there will be an error condition if *jobv* is present and *v* omitted.
jobq	If omitted, this argument is restored based on the presence of argument *q* as follows: *jobq* = 'Q', if *q* is present, *jobq* = 'N', if *q* is omitted. If present, *jobq* must be equal to 'I' or 'Q' and the argument *q* must also be present. Note that there will be an error condition if *jobq* is present and *q* omitted.

Driver Routines

Each of the LAPACK driver routines solves a complete problem. To arrive at the solution, driver routines typically call a sequence of appropriate computational routines.

Driver routines are described in the following sections :

Linear Least Squares (LLS) Problems

Generalized LLS Problems

Symmetric Eigenproblems

Nonsymmetric Eigenproblems

Singular Value Decomposition

Generalized Symmetric Definite Eigenproblems

Generalized Nonsymmetric Eigenproblems

Linear Least Squares (LLS) Problems

This section describes LAPACK driver routines used for solving linear least squares problems. Table 4-8 lists all such routines for FORTRAN 77 interface. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-8 Driver Routines for Solving LLS Problems

Routine Name	Operation performed
?gels	Uses QR or LQ factorization to solve a overdetermined or underdetermined linear system with full rank matrix.
?gelsy	Computes the minimum-norm solution to a linear least squares problem using a complete orthogonal factorization of A.
?gelss	Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A.
?gelsd	Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A and a divide and conquer method.

?gels

Uses QR or LQ factorization to solve a overdetermined or underdetermined linear system with full rank matrix.

Syntax

FORTRAN 77:

```
call sgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call dgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call cgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
call zgels(trans, m, n, nrhs, a, lda, b, ldb, work, lwork, info)
```

Fortran 95:

```
call gels(a, b [,trans] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves overdetermined or underdetermined real/ complex linear systems involving an *m*-by-*n* matrix *A*, or its transpose/ conjugate-transpose, using a *QR* or *LQ* factorization of *A*. It is assumed that *A* has full rank.

The following options are provided:

1. If *trans* = 'N' and $m \geq n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

minimize $||b - A*x||_2$

2. If *trans* = 'N' and $m < n$: find the minimum norm solution of an underdetermined system $A*X = B$.

3. If *trans* = 'T' or 'C' and $m \geq n$: find the minimum norm solution of an undetermined system $A_H*X = B$.

4. If *trans* = 'T' or 'C' and $m < n$: find the least squares solution of an overdetermined system, that is, solve the least squares problem

minimize $||b - A^H*x||_2$

Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are stored as the columns of the *m*-by-*nrhs* right hand side matrix *B* and the *n*-by-*nrh* solution matrix *X*.

Input Parameters

trans	CHARACTER*1. Must be 'N', 'T', or 'C'. If *trans* = 'N', the linear system involves matrix *A*; If *trans* = 'T', the linear system involves the transposed matrix A^T (for real flavors only); If *trans* = 'C', the linear system involves the conjugate-transposed matrix A^H (for complex flavors only).
m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgels DOUBLE PRECISION for dgels COMPLEX for cgels DOUBLE COMPLEX for zgels. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the matrix *B* of right hand side vectors, stored columnwise; *B* is *m*-by-*nrhs* if *trans* = 'N' , or *n*-by-*nrhs* if *trans* = 'T' or 'C'. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
lwork	INTEGER. The size of the *work* array; must be at least min (*m*, *n*)+max(1, *m*, *n*, *nrhs*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	On exit, overwritten by the factorization data as follows: if *m* ≥ *n*, array *a* contains the details of the *QR* factorization of the matrix *A* as returned by ?geqrf; if *m* < *n*, array *a* contains the details of the *LQ* factorization of the matrix *A* as returned by ?gelqf.
b	If *info* = 0, *b* overwritten by the solution vectors, stored columnwise: if *trans* = 'N' and *m* ≥ *n*, rows 1 to *n* of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements *n*+1 to *m* in that column; if *trans* = 'N' and *m* < *n*, rows 1 to *n* of *b* contain the minimum norm solution vectors; if *trans* = 'T' or 'C' and *m* ≥ *n*, rows 1 to *m* of *b* contain the minimum norm solution vectors; if *trans* = 'T' or 'C' and *m* < *n*, rows 1 to *m* of *b* contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of modulus of elements *m*+1 to *n* in that column.
work(1)	If *info* = 0, on exit *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, the *i*-th diagonal element of the triangular factor of *A* is zero, so that *A* does not have full rank; the least squares solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gels interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
b	Holds the matrix of size max(*m*, *n*)-by-*nrhs*. If *trans* = 'N', then, on entry, the size of *b* is *m*-by-*nrhs*, If *trans* = 'T', then, on entry, the size of *b* is *n*-by-*nrhs*,
trans	Must be 'N' or 'T'. The default value is 'N'.

Application Notes

For better performance, try using *lwork* = min (*m*, *n*)+max(1, *m*, *n*, *nrhs*)**blocksize*, where *blocksize* is a machine-dependent value (typically, 16 to 64) required for optimum performance of the *blocked algorithm*.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelsy

Computes the minimum-norm solution to a linear least squares problem using a complete orthogonal factorization of A.

Syntax

FORTRAN 77:

```
call sgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, info)
call dgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, info)
call cgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, rwork, info)
call zgelsy(m, n, nrhs, a, lda, b, ldb, jpvt, rcond, rank, work, lwork, rwork, info)
```

Fortran 95:

```
call gelsy(a, b [,rank] [,jpvt] [,rcond] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the minimum-norm solution to a real/complex linear least squares problem:

$\text{minimize } ||b - A*x||_2$

using a complete orthogonal factorization of *A*. *A* is an *m*-by-*n* matrix which may be rank-deficient. Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are stored as the columns of the *m*-by-*nrhs* right hand side matrix *B* and the *n*-by-*nrhs* solution matrix *X*.

The routine first computes a *QR* factorization with column pivoting:

$$AP = Q \begin{pmatrix} R_{11} & R_{12} \\ 0 & R_{22} \end{pmatrix}$$

with R_{11} defined as the largest leading submatrix whose estimated condition number is less than 1/*rcond*. The order of R_{11}, *rank*, is the effective rank of *A*. Then, R_{22} is considered to be negligible, and R_{12} is annihilated by orthogonal/unitary transformations from the right, arriving at the complete orthogonal factorization:

$$AP = Q \begin{pmatrix} T_{11} & 0 \\ 0 & 0 \end{pmatrix} Z$$

The minimum-norm solution is then

$$X = PZ^H \begin{pmatrix} T_{11}^{-1} & Q_1^H b \\ 0 & 0 \end{pmatrix}$$

where Q_1 consists of the first *rank* columns of Q. This routine is basically identical to the original?gelsx except three differences:

- The call to the subroutine ?geqpf has been substituted by the call to the subroutine ?geqp3. This subroutine is a BLAS-3 version of the *QR* factorization with column pivoting.
- Matrix *B* (the right hand side) is updated with BLAS-3.
- The permutation of matrix *B* (the right hand side) is faster and more simple.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgelsy DOUBLE PRECISION for dgelsy COMPLEX for cgelsy DOUBLE COMPLEX for zgelsy. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
jpvt	INTEGER. Array, DIMENSION at least max(1, *n*). On entry, if *jpvt*(*i*)≠ 0, the *i*-th column of *A* is permuted to the front of *AP*, otherwise the *i*-th column of *A* is a free column.
rcond	REAL for single-precision flavors

	DOUBLE PRECISION for double-precision flavors. *rcond* is used to determine the effective rank of *A*, which is defined as the order of the largest leading triangular submatrix R_{11} in the *QR* factorization with pivoting of *A*, whose estimated condition number < 1/*rcond*.
lwork	INTEGER. The size of the *work* array. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.
rwork	REAL for cgelsy DOUBLE PRECISION for zgelsy. Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a	On exit, overwritten by the details of the complete orthogonal factorization of *A*.
b	Overwritten by the *n*-by-*nrhs* solution matrix *X*.
jpvt	On exit, if *jpvt*(*i*)= *k*, then the *i*-th column of *AP* was the *k*-th column of *A*.
rank	INTEGER. The effective rank of *A*, that is, the order of the submatrix R_{11}. This is the same as the order of the submatrix T_{11} in the complete orthogonal factorization of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gelsy interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
b	Holds the matrix of size max(*m*, *n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.
jpvt	Holds the vector of length *n*. Default value for this element is *jpvt*(*i*) = 0.
rcond	Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

For real flavors:

The unblocked strategy requires that:

lwork ≥ max(*mn*+3*n*+1, 2**mn* + *nrhs*),

where *mn* = min(*m*, *n*).

The block algorithm requires that:

lwork ≥ max(*mn*+2*n*+*nb**(*n*+1), 2**mn*+*nb***nrhs*),

where *nb* is an upper bound on the blocksize returned by ilaenv for the routines sgeqp3/dgeqp3, stzrzf/dtzrzf, stzrqf/dtzrqf, sormqr/dormqr, and sormrz/dormrz.

For complex flavors:

The unblocked strategy requires that:

lwork ≥ *mn* + max(2**mn*, *n*+1, *mn* + *nrhs*),

where *mn* = min(*m*, *n*).

The block algorithm requires that:

lwork < *mn* + max(2**mn*, *nb**(*n*+1), *mn*+*mn***nb*, *mn*+ *nb***nrhs*),

where *nb* is an upper bound on the blocksize returned by ilaenv for the routines cgeqp3/zgeqp3, ctzrzf/ztzrzf, ctzrqf/ztzrqf, cunmqr/zunmqr, and cunmrz/zunmrz.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelss

Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A.

Syntax

FORTRAN 77:

call sgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *info*)

call dgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *info*)

call cgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *rwork*, *info*)

call zgelss(*m*, *n*, *nrhs*, *a*, *lda*, *b*, *ldb*, *s*, *rcond*, *rank*, *work*, *lwork*, *rwork*, *info*)

Fortran 95:

call gelss(*a*, *b* [,*rank*] [,*s*] [,*rcond*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the minimum norm solution to a real linear least squares problem:

`minimize ||b - A*x||`$_2$

using the singular value decomposition (SVD) of *A*. *A* is an *m*-by-*n* matrix which may be rank-deficient. Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are stored as the columns of the *m*-by-*nrhs* right hand side matrix *B* and the *n*-by-*nrhs* solution matrix *X*. The effective rank of *A* is determined by treating as zero those singular values which are less than *rcond* times the largest singular value.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgelss DOUBLE PRECISION for dgelss COMPLEX for cgelss DOUBLE COMPLEX for zgelss. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
rcond	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *rcond* is used to determine the effective rank of *A*. Singular values *s*(*i*) ≤ *rcond* **s*(1) are treated as zero. If *rcond* <0, machine precision is used instead.
lwork	INTEGER. The size of the *work* array; *lwork*≥ 1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.
rwork	REAL for cgelss DOUBLE PRECISION for zgelss.

	Workspace array used in complex flavors only. DIMENSION at least max(1, 5*min(*m*, *n*)).

Output Parameters

a	On exit, the first min(*m*, *n*) rows of *A* are overwritten with its right singular vectors, stored row-wise.
b	Overwritten by the *n*-by-*nrhs* solution matrix *X*. If *m*≥*n* and *rank* = *n*, the residual sum-of-squares for the solution in the *i*-th column is given by the sum of squares of modulus of elements *n*+1:*m* in that column.
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*)). The singular values of *A* in decreasing order. The condition number of *A* in the 2-norm is $k_2(A)$ = *s*(1)/ *s*(min(*m*, *n*)) .
rank	INTEGER. The effective rank of *A*, that is, the number of singular values which are greater than *rcond* *s(1).
work(1)	If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm for computing the SVD failed to converge; *i* indicates the number of off-diagonal elements of an intermediate bidiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gelss interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
b	Holds the matrix of size max(*m*, *n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.
s	Holds the vector of length min(*m*, *n*).
rcond	Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

For real flavors:

lwork ≥ 3*min(*m*, *n*)+ max(2*min(*m*, *n*), max(*m*, *n*), *nrhs*)

For complex flavors:

lwork ≥ 2*min(*m*, *n*)+ max(*m*, *n*, *nrhs*)

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?gelsd

Computes the minimum-norm solution to a linear least squares problem using the singular value decomposition of A and a divide and conquer method.

Syntax

FORTRAN 77:

```
call sgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, iwork, info)
call dgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, iwork, info)
call cgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, iwork, info)
call zgelsd(m, n, nrhs, a, lda, b, ldb, s, rcond, rank, work, lwork, rwork, iwork, info)
```

Fortran 95:

```
call gelsd(a, b [,rank] [,s] [,rcond] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the minimum-norm solution to a real linear least squares problem:

$\text{minimize } ||b - A*x||_2$

using the singular value decomposition (SVD) of *A*. *A* is an *m*-by-*n* matrix which may be rank-deficient.

Several right hand side vectors *b* and solution vectors *x* can be handled in a single call; they are stored as the columns of the *m*-by-*nrhs* right hand side matrix *B* and the *n*-by-*nrhs* solution matrix *X*.

The problem is solved in three steps:

1. Reduce the coefficient matrix A to bidiagonal form with Householder transformations, reducing the original problem into a "bidiagonal least squares problem" (BLS).
2. Solve the BLS using a divide and conquer approach.

3. Apply back all the Householder transformations to solve the original least squares problem.

The effective rank of *A* is determined by treating as zero those singular values which are less than *rcond* times the largest singular value.

The routine uses auxiliary routines ?lals0 and ?lalsa.

Input Parameters

m	INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).
n	INTEGER. The number of columns of the matrix *A* (*n* ≥ 0).
nrhs	INTEGER. The number of right-hand sides; the number of columns in *B* (*nrhs* ≥ 0).
a, *b*, *work*	REAL for sgelsd DOUBLE PRECISION for dgelsd COMPLEX for cgelsd DOUBLE COMPLEX for zgelsd. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *m*-by-*nrhs* right hand side matrix *B*. The second dimension of *b* must be at least max(1, *nrhs*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; must be at least max(1, *m*, *n*).
rcond	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. *rcond* is used to determine the effective rank of *A*. Singular values *s*(*i*) ≤ *rcond* **s*(1) are treated as zero. If *rcond* ≤ 0, machine precision is used instead.
lwork	INTEGER. The size of the *work* array; *lwork* ≥ 1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the array *work* and the minimum sizes of the arrays *rwork* and *iwork*, and returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.
iwork	INTEGER. Workspace array. See *Application Notes* for the suggested dimension of *iwork*.
rwork	REAL for cgelsd DOUBLE PRECISION for zgelsd. Workspace array, used in complex flavors only. See *Application Notes* for the suggested dimension of *rwork*.

Output Parameters

a	On exit, *A* has been overwritten.
b	Overwritten by the *n*-by-*nrhs* solution matrix *X*. If $m \geq n$ and $rank = n$, the residual sum-of-squares for the solution in the *i*-th column is given by the sum of squares of modulus of elements *n*+1:*m* in that column.
s	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Array, DIMENSION at least max(1, min(*m*, *n*)). The singular values of *A* in decreasing order. The condition number of *A* in the 2-norm is $k^2(A) = s(1)/ s(\min(m, n))$.
rank	INTEGER. The effective rank of *A*, that is, the number of singular values which are greater than *rcond* **s*(1).
work(1)	If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
rwork(1)	If *info* = 0, on exit, *rwork*(1) returns the minimum size of the workspace array *iwork* required for optimum performance.
iwork(1)	If *info* = 0, on exit, *iwork*(1) returns the minimum size of the workspace array *iwork* required for optimum performance.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm for computing the SVD failed to converge; *i* indicates the number of off-diagonal elements of an intermediate bidiagonal form that did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gelsd interface are the following:

a	Holds the matrix *A* of size (*m*, *n*).
b	Holds the matrix of size max(*m*, *n*)-by-*nrhs*. On entry, contains the *m*-by-*nrhs* right hand side matrix *B*, On exit, overwritten by the *n*-by-*nrhs* solution matrix *X*.
s	Holds the vector of length min(*m*, *n*).
rcond	Default value for this element is *rcond* = 100*EPSILON(1.0_WP).

Application Notes

The divide and conquer algorithm makes very mild assumptions about floating point arithmetic. It will work on machines with a guard digit in add/subtract. It could conceivably fail on hexadecimal or decimal machines without guard digits, but we know of none.

The exact minimum amount of workspace needed depends on *m*, *n* and *nrhs*. The size *lwork* of the workspace array *work* must be as given below.

For real flavors:

If $m \geq n$,

$lwork \geq 12n + 2n*smlsiz + 8n*nlvl + n*nrhs + (smlsiz+1)^2$;

If $m < n$,

$lwork \geq 12m + 2m*smlsiz + 8m*nlvl + m*nrhs + (smlsiz+1)^2$;

For complex flavors:

If $m \geq n$,

$lwork < 2n + n*nrhs$;

If $m < n$,

$lwork \geq 2m + m*nrhs$;

where *smlsiz* is returned by `ilaenv` and is equal to the maximum size of the subproblems at the bottom of the computation tree (usually about 25), and

$nlvl = \mathrm{INT}(\log_2(\min(m, n)/(smlsiz+1))) + 1$.

For good performance, *lwork* should generally be larger.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The dimension of the workspace array *iwork* must be at least

$3*\min(m, n)*nlvl + 11*\min(m, n)$.

The dimension of the workspace array *iwork* (for complex flavors) must be at least $\max(1, lrwork)$.

$lrwork \geq 10n + 2n*smlsiz + 8n*nlvl + 3*smlsiz*nrhs + (smlsiz+1)^2$ if $m \geq n$, and

$lrwork \geq 10m + 2m*smlsiz + 8m*nlvl + 3*smlsiz*nrhs + (smlsiz+1)^2$ if $m < n$.

Generalized LLS Problems

This section describes LAPACK driver routines used for solving generalized linear least squares problems. Table 4-9 lists all such routines for FORTRAN 77 interface. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-9 Driver Routines for Solving Generalized LLS Problems

Routine Name	Operation performed
?gglse	Solves the linear equality-constrained least squares problem using a generalized RQ factorization.
?ggglm	Solves a general Gauss-Markov linear model problem using a generalized QR factorization.

?gglse

Solves the linear equality-constrained least squares problem using a generalized RQ factorization.

Syntax

FORTRAN 77:

```
call sgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call dgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call cgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
call zgglse(m, n, p, a, lda, b, ldb, c, d, x, work, lwork, info)
```

Fortran 95:

```
call gglse(a, b, c, d, x [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves the linear equality-constrained least squares (LSE) problem:

`minimize ||c - A*x||`^{2} subject to `B*x = d`

where *A* is an *m*-by-*n* matrix, *B* is a *p*-by-*n* matrix, *c* is a given *m*-vector, and *d* is a given *p*-vector. It is assumed that $p \le n \le m+p$, and

$$\text{rank}(B) = p \quad \text{and} \quad \text{rank}\begin{pmatrix} A \\ B \end{pmatrix} = n .$$

These conditions ensure that the LSE problem has a unique solution, which is obtained using a generalized *RQ* factorization of the matrices (*B*, *A*) given by

B=(0 *R*)*Q*, *A*=*Z*T*Q*

Input Parameters

m	INTEGER. The number of rows of the matrix *A* ($m \geq 0$).
n	INTEGER. The number of columns of the matrices *A* and *B* ($n \geq 0$).
p	INTEGER. The number of rows of the matrix *B* ($0 \leq p \leq n \leq m+p$).
a, *b*, *c*, *d*, *work*	REAL for sgglse DOUBLE PRECISION for dgglse COMPLEX for cgglse DOUBLE COMPLEX for zgglse. Arrays: *a*(*lda*,*) contains the *m*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *b*(*ldb*,*) contains the *p*-by-*n* matrix *B*. The second dimension of *b* must be at least max(1, *n*). *c*(*), dimension at least max(1, *m*), contains the right hand side vector for the least squares part of the LSE problem. *d*(*), dimension at least max(1, *p*), contains the right hand side vector for the constrained equation. *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of *a*; at least max(1, *m*).
ldb	INTEGER. The first dimension of *b*; at least max(1, *p*).
lwork	INTEGER. The size of the *work* array; $lwork \geq \max(1, m+n+p)$. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

x	REAL for sgglse DOUBLE PRECISION for dgglse COMPLEX for cgglse DOUBLE COMPLEX for zgglse. Array, DIMENSION at least max(1, *n*). On exit, contains the solution of the LSE problem.
a	On exit, the elements on and above the diagonal of the array contain the min(*m*,*n*)-by-*n* upper trapezoidal matrix *T*.
b	On exit, the upper triangle of the subarray *b*(1:*p*, *n*-*p*+1:*n*) contains the *p*-by-*p* upper triangular matrix *R*.
d	On exit, *d* is destroyed.

c	On exit, the residual sum-of-squares for the solution is given by the sum of squares of elements *n*-*p*+1 to *m* of vector *c*.
work(1)	If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance. Use this *lwork* for subsequent runs.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = 1, the upper triangular factor *R* associated with *B* in the generalized RQ factorization of the pair (*B*, *A*) is singular, so that rank(*B*) < *P*; the least squares solution could not be computed. If *info* = 2, the (*n*-*p*)-by-(*n*-*p*) part of the upper trapezoidal factor *T* associated with *A* in the generalized RQ factorization of the pair (*B*, *A*) is singular, so that $\text{rank}\begin{pmatrix} A \\ B \end{pmatrix} < n$; the least squares solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine `gglse` interface are the following:

a	Holds the matrix *A* of size (*m*,*n*).
b	Holds the matrix *B* of size (*p*,*n*).
c	Holds the vector of length (*m*).
d	Holds the vector of length (*p*).
x	Holds the vector of length *n*.

Application Notes

For optimum performance, use

lwork ≥ *p* + min(*m*, *n*) + max(*m*, *n*)**nb*,

where *nb* is an upper bound for the optimal blocksizes for ?geqrf, ?gerqf, ?ormqr/?unmqr and ?ormrq/?unmrq.

You may set *lwork* to -1. The routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?ggglm

Solves a general Gauss-Markov linear model problem using a generalized QR factorization.

Syntax

FORTRAN 77:

```
call sggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call dggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call cggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
call zggglm(n, m, p, a, lda, b, ldb, d, x, y, work, lwork, info)
```

Fortran 95:

```
call ggglm(a, b, d, x, y [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine solves a general Gauss-Markov linear model (GLM) problem:

$\text{minimize}_x \; ||y||_2$ subject to $d = A*x + B*y$

where A is an n-by-m matrix, B is an n-by-p matrix, and d is a given n-vector. It is assumed that $m \le n \le m+p$, and $\text{rank}(A) = m$ and $\text{rank}(A\ B) = n$.

Under these assumptions, the constrained equation is always consistent, and there is a unique solution x and a minimal 2-norm solution y, which is obtained using a generalized QR factorization of the matrices $(A,\ B)$ given by

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix}; \qquad B = Q * T * Z.$$

In particular, if matrix B is square nonsingular, then the problem GLM is equivalent to the following weighted linear least squares problem

$\text{minimize}_x \; ||B^{-1}(d-A*x)||_2$.

Input Parameters

n	INTEGER. The number of rows of the matrices A and B ($n \ge 0$).
m	INTEGER. The number of columns in A ($m \ge 0$).
p	INTEGER. The number of columns in B ($p \ge n - m$).
a, b, d, $work$	REAL for sggglm DOUBLE PRECISION for dggglm

COMPLEX for cggglm
DOUBLE COMPLEX for zggglm.
Arrays:
a(*lda*,*) contains the *n*-by-*m* matrix *A*.
The second dimension of *a* must be at least max(1, *m*).
b(*ldb*,*) contains the *n*-by-*p* matrix *B*.
The second dimension of *b* must be at least max(1, *p*).
d(*), dimension at least max(1, *n*), contains the left hand side of the GLM equation.
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of *a*; at least max(1, *n*).

ldb — INTEGER. The first dimension of *b*; at least max(1, *n*).

lwork — INTEGER. The size of the *work* array; *lwork* ≥ max(1, *n*+*m*+*p*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

Output Parameters

x, *y* — REAL for sggglm
DOUBLE PRECISION for dggglm
COMPLEX for cggglm
DOUBLE COMPLEX for zggglm.
Arrays *x*(*), *y*(*). DIMENSION at least max(1, *m*) for *x* and at least max(1, *p*) for *y*.
On exit, *x* and *y* are the solutions of the GLM problem.

a — On exit, the upper triangular part of the array *a* contains the *m*-by-*m* upper triangular matrix *R*.

b — On exit, if *n* ≤ *p*, the upper triangle of the subarray *b*(1:*n*,*p*-*n*+1:*p*) contains the *n*-by-*n* upper triangular matrix *T*; if *n* > *p*, the elements on and above the (*n*-*p*)-th subdiagonal contain the *n*-by-*p* upper trapezoidal matrix *T*.

d — On exit, *d* is destroyed

work(1) — If *info* = 0, on exit, *work*(1) contains the minimum value of *lwork* required for optimum performance.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = 1, the upper triangular factor *R* associated with *A* in the generalized QR factorization of the pair (*A*, *B*) is singular, so that rank(*A*) < *m*; the least squares solution could not be computed.

If *info* = 2, the bottom (*n*-*m*)-by-(*n*-*m*) part of the upper trapezoidal factor *T* associated with *B* in the generalized QR factorization of the pair (*A*, *B*) is singular, so that rank(*A B*) < *n*; the least squares solution could not be computed.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine ggglm interface are the following:

a	Holds the matrix *A* of size (*n*,*m*).
b	Holds the matrix *B* of size (*n*,*p*).
d	Holds the vector of length *n*.
x	Holds the vector of length (*m*).
y	Holds the vector of length (*p*).

Application Notes

For optimum performance, use

lwork ≥ *m* + min(*n*, *p*) + max(*n*, *p*)**nb*,

where *nb* is an upper bound for the optimal blocksizes for ?geqrf, ?gerqf, ?ormqr/?unmqr and ?ormrq/?unmrq.

You may set *lwork* to -1. The routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Symmetric Eigenproblems

This section describes LAPACK driver routines used for solving symmetric eigenvalue problems. See also computational routines computational routines that can be called to solve these problems. Table 4-10 lists all such driver routines for FORTRAN 77 interface. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-10 Driver Routines for Solving Symmetric Eigenproblems

Routine Name	Operation performed
?syev/?heev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix.
?syevd/?heevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian matrix using divide and conquer algorithm.
?syevx/?heevx	Computes selected eigenvalues and, optionally, eigenvectors of a symmetric / Hermitian matrix.
?syevr/?heevr	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix using the Relatively Robust Representations.

Routine Name	Operation performed
?spev/?hpev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix in packed storage.
?spevd/?hpevd	Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian matrix held in packed storage.
?spevx/?hpevx	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian matrix in packed storage.
?sbev /?hbev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian band matrix.
?sbevd/?hbevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric / Hermitian band matrix using divide and conquer algorithm.
?sbevx/?hbevx	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric / Hermitian band matrix.
?stev	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix.
?stevd	Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric tridiagonal matrix using divide and conquer algorithm.
?stevx	Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.
?stevr	Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix using the Relatively Robust Representations.

?syev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix.

Syntax

FORTRAN 77:

```
call ssyev(jobz, uplo, n, a, lda, w, work, lwork, info)
call dsyev(jobz, uplo, n, a, lda, w, work, lwork, info)
```

Fortran 95:

```
call syev(a, w [,jobz] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*.

Note that for most cases of real symmetric eigenvalue problems the default choice should be ?syevr function as its underlying algorithm is faster and uses less workspace.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
a, *work*	REAL for ssyev DOUBLE PRECISION for dsyev Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraint: *lwork* $\geq$ max(1, 3*n*-1). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.

Output Parameters

a	On exit, if *jobz* = 'V', then if *info* = 0, array *a* contains the orthonormal eigenvectors of the matrix *A*. If *jobz* = 'N', then on exit the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
w	REAL for ssyev DOUBLE PRECISION for dsyev Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.
work(1)	On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If *info* = 0, the execution is successful.

If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine syev interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
job	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance set *lwork* ≥ (*nb*+2)**n*, where *nb* is the blocksize for ?sytrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run, or set *lwork* = -1.

If *lwork* has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array *work*. This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?heev

Computes all eigenvalues and, optionally, eigenvectors of a Hermitian matrix.

Syntax

FORTRAN 77:

```
call cheev(jobz, uplo, n, a, lda, w, work, lwork, rwork, info)
call zheev(jobz, uplo, n, a, lda, w, work, lwork, rwork, info)
```

Fortran 95:

```
call heev(a, w [,jobz] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*.

Note that for most cases of complex Hermitian eigenvalue problems the default choice should be ?heevr function as its underlying algorithm is faster and uses less workspace.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	COMPLEX for cheev DOUBLE COMPLEX for zheev Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. C onstraint: *lwork* ≥ max(1, 2*n*-1).

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

rwork — REAL for cheev
DOUBLE PRECISION for zheev.
Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

a — On exit, if *jobz* = 'V', then if *info* = 0, array *a* contains the orthonormal eigenvectors of the matrix *A*.
If *jobz* = 'N', then on exit the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

w — REAL for cheev
DOUBLE PRECISION for zheev
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.

work(1) — On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine heev interface are the following:

a — Holds the matrix *A* of size (*n*, *n*).

w — Holds the vector of length *n*.

job — Must be 'N' or 'V'. The default value is 'N'.

uplo — Must be 'U' or 'L'. The default value is 'U'.

Application Notes

For optimum performance use

lwork ≥ (*nb*+1)*n*,

where *nb* is the blocksize for ?hetrd returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?syevd

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric matrix using divide and conquer algorithm.

Syntax

FORTRAN 77:

```
call ssyevd(jobz, uplo, n, a, lda, w, work, lwork, iwork, liwork, info)
call dsyevd(jobz, uplo, n, a, lda, w, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call syevd(a, w [,jobz] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric matrix *A*. In other words, it can compute the spectral factorization of *A* as: $A = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Note that for most cases of real symmetric eigenvalue problems the default choice should be ?syevr function as its underlying algorithm is faster and uses less workspace. ?syevd requires more workspace but is faster in some cases, especially for large matrices.

Input Parameters

jobz
CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo
CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n
INTEGER. The order of the matrix *A* ($n \geq 0$).

a
REAL for ssyevd
DOUBLE PRECISION for dsyevd
Array, DIMENSION (*lda*, *).
a(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).

lda
INTEGER. The first dimension of the array *a*.
Must be at least max(1, *n*).

work
REAL for ssyevd
DOUBLE PRECISION for dsyevd.
Workspace array, DIMENSION at least *lwork*.

lwork
INTEGER.
The dimension of the array *work*.
Constraints:

if $n \leq 1$, then $lwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $lwork \geq 2*n + 1$;

if *jobz* = 'V' and $n > 1$, then $lwork \geq 2*n^2 + 6*n + 1$.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork
INTEGER.
Workspace array, its dimension max(1, *liwork*).

liwork
INTEGER.
The dimension of the array *iwork*.
Constraints:

if $n \leq 1$, then $liwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $liwork \geq 1$;

if *jobz* = 'V' and $n > 1$, then $liwork \geq 5*n + 3$.

	If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w	REAL for ssyevd DOUBLE PRECISION for dsyevd Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.
a	If *jobz* = 'V', then on exit this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*.
work(1)	On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, and *jobz* = 'N', then the algorithm failed to converge; *i* indicates the number of off-diagonal elements of an intermediate tridiagonal form which did not converge to zero. If *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*,*n*+1). If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine syevd interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
jobz	Must be 'N' or 'V'. The default value is 'N'.
uplo	Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is ?heevd

?heevd

Computes all eigenvalues and (optionally) all eigenvectors of a complex Hermitian matrix using divide and conquer algorithm.

Syntax

FORTRAN 77:

```
call cheevd(jobz, uplo, n, a, lda, w, work, lwork, rwork, lrwork, iwork, liwork, info)
call zheevd(jobz, uplo, n, a, lda, w, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call heevd(a, w [,job] [,uplo] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian matrix *A*. In other words, it can compute the spectral factorization of *A* as: $A = Z*\Lambda*Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Note that for most cases of complex Hermetian eigenvalue problems the default choice should be ?heevr function as its underlying algorithm is faster and uses less workspace. ?heevd requires more workspace but is faster in some cases, especially for large matrices.

Input Parameters

jobz CHARACTER*1. Must be 'N' or 'V'.

If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* ($n \geq 0$).

a — COMPLEX for cheevd
DOUBLE COMPLEX for zheevd
Array, DIMENSION (*lda*, *).
a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).

lda — INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

work — COMPLEX for cheevd
DOUBLE COMPLEX for zheevd.
Workspace array, DIMENSION max(1, *lwork*).

lwork — INTEGER.
The dimension of the array *work*. Constraints:

if $n \leq 1$, then $lwork \geq 1$;

if *jobz* = 'N' and $n > 1$, then $lwork \geq n+1$;

if *jobz* = 'V' and $n > 1$, then $lwork \geq n^2+2*n$.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork — REAL for cheevd
DOUBLE PRECISION for zheevd
Workspace array, DIMENSION at least *lrwork*.

lrwork — INTEGER.
The dimension of the array *rwork*. Constraints:

if $n \leq 1$, then $lrwork \geq 1$;

if *job* = 'N' and $n > 1$, then $lrwork \geq n$;

if *job* = 'V' and $n > 1$, then $lrwork \geq 2*n^2+ 5*n + 1$.

If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.

The dimension of the array *iwork*. Constraints: if $n \le 1$, then *liwork* ≥ 1;

if *jobz* = 'N' and $n > 1$, then *liwork* ≥ 1;

if *jobz* = 'V' and $n > 1$, then *liwork* $\ge 5*n+3$.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w
REAL for cheevd
DOUBLE PRECISION for zheevd
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

a
If *jobz* = 'V', then on exit this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*.

work(1)
On exit, if *lwork* > 0, then the real part of *work*(1) returns the required minimal size of *lwork*.

rwork(1)
On exit, if *lrwork* > 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1)
On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = *i*, and *jobz* = 'N', then the algorithm failed to converge; *i* off-diagonal elements of an intermediate tridiagonal form did not converge to zero;
if *info* = *i*, and *jobz* = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and columns *info*/(*n*+1) through mod(*info*, *n*+1).
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine heevd interface are the following:

a Holds the matrix *A* of size (*n*, *n*).

w Holds the vector of length (*n*).

jobz Must be 'N' or 'V'. The default value is 'N'.

uplo Must be 'U' or 'L'. The default value is 'U'.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $A + E$ such that $||E||_2 = O(\varepsilon)*||A||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is ?syevd. See also ?hpevd for matrices held in packed storage, and ?hbevd for banded matrices.

?syevx

Computes selected eigenvalues and, optionally, eigenvectors of a symmetric matrix.

Syntax

FORTRAN 77:

```
call ssyevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

```
call dsyevx(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, work, lwork, iwork, ifail, info)
```

Fortran 95:

```
call syevx(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Note that for most cases of real symmetric eigenvalue problems the default choice should be ?syevr function as its underlying algorithm is faster and uses less workspace. ?syevx is faster for a few selected eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A', 'V', or 'I'. If *range* = 'A', all eigenvalues will be found. If *range* = 'V', all eigenvalues in the half-open interval (*vl*, *vu*] will be found. If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *a* stores the upper triangular part of *A*. If *uplo* = 'L', *a* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
a, *work*	REAL for ssyevx DOUBLE PRECISION for dsyevx. Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
vl, *vu*	REAL for ssyevx DOUBLE PRECISION for dsyevx. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues; $vl \leq vu$. Not referenced if *range* = 'A'or 'I'.
il, *iu*	INTEGER. If *range* = 'I', the indices of the smallest and largest eigenvalues to be returned. Constraints: $1 \leq il \leq iu \leq n$, if $n > 0$; *il* = 1 and *iu* = 0 , if $n = 0$. Not referenced if *range* = 'A'or 'V'.
abstol	REAL for ssyevx DOUBLE PRECISION for dsyevx. The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.
ldz	INTEGER. The first dimension of the output array *z*; $ldz \geq 1$. If *jobz* = 'V', then $ldz \geq \max(1, n)$.
lwork	INTEGER. The dimension of the array *work*.

	If $n \le 1$ then *lwork* ≥ 1, otherwise *lwork*=8**n*. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for the suggested value of *lwork*.
iwork	INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

a	On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.
m	INTEGER. The total number of eigenvalues found; $0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.
w	REAL for ssyevx DOUBLE PRECISION for dsyevx Array, DIMENSION at least max(1, *n*). The first *m* elements contain the selected eigenvalues of the matrix *A* in ascending order.
z	REAL for ssyevx DOUBLE PRECISION for dsyevx. Array *z*(*ldz*,*) contains eigenvectors. The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
work(1)	On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, then *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'V', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value.

If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine syevx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
a	Holds the matrix *A* of size (*m*, *n*).
ifail	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+3)**n*, where *nb* is the maximum of the blocksize for ?sytrd and ?ormtr returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If *lwork* has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If *lwork* = -1, then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array *work*. This operation is called a workspace query.

Note that if *lwork* is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*|*T*| is used as tolerance, where|*T*| is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues are computed most accurately when *abstol* is set to twice the underflow threshold 2*slamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*slamch('S').

?heevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix.

Syntax

FORTRAN 77:

call cheevx(*jobz*, *range*, *uplo*, *n*, *a*, *lda*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *rwork*, *iwork*, *ifail*, *info*)

call zheevx(*jobz*, *range*, *uplo*, *n*, *a*, *lda*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *lwork*, *rwork*, *iwork*, *ifail*, *info*)

Fortran 95:

call heevx(*a*, *w* [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Note that for most cases of complex Hermetian eigenvalue problems the default choice should be ?heevr function as its underlying algorithm is faster and uses less workspace. ?heevx is faster for a few selected eigenvalues.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A', 'V', or 'I'.
If *range* = 'A', all eigenvalues will be found.
If *range* = 'V', all eigenvalues in the half-open interval (*vl*, *vu*] will be found.
If *range* = 'I', the eigenvalues with indices *il* through *iu* will be found.

uplo — CHARACTER*1. Must be 'U' or 'L'.

If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work* — COMPLEX for cheevx
DOUBLE COMPLEX for zheevx.
Arrays:
a(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

vl, *vu* — REAL for cheevx
DOUBLE PRECISION for zheevx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues; $vl \leq vu$. Not referenced if *range* = 'A'or 'I'.

il, *iu* — INTEGER.
If *range* = 'I', the indices of the smallest and largest eigenvalues to be returned. Constraints:
$1 \leq il \leq iu \leq n$, if $n > 0$; $il = 1$ and $iu = 0$, if $n = 0$. Not referenced if *range* = 'A'or 'V'.

abstol — REAL for cheevx
DOUBLE PRECISION for zheevx. The absolute error tolerance for the eigenvalues. See *Application Notes* for more information.

ldz — INTEGER. The first dimension of the output array *z*; $ldz \geq 1$.
If *jobz* = 'V', then $ldz \geq \max(1, n)$.

lwork — INTEGER.
The dimension of the array *work*.
$lwork \geq 1$ if $n \leq 1$; otherwise at least $2*n$.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

rwork — REAL for cheevx
DOUBLE PRECISION for zheevx.
Workspace array, DIMENSION at least max(1, 7*n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

a — On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m	INTEGER. The total number of eigenvalues found; $0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.
w	REAL for cheevx DOUBLE PRECISION for zheevx Array, DIMENSION at least max(1, *n*). The first *m* elements contain the selected eigenvalues of the matrix *A* in ascending order.
z	COMPLEX for cheevx DOUBLE COMPLEX for zheevx. Array *z*(*ldz*,*) contains eigenvectors. The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the i-th column of *z* holding the eigenvector associated with *w*(i). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
work(1)	On exit, if *lwork* > 0, then *work(1)* returns the required minimal size of *lwork*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, then *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'V', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine heevx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
ifail	Holds the vector of length *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.

vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+1)**n*, where *nb* is the maximum of the blocksize for ?hetrd and ?unmtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|) , where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*|*T*| will be used in its place, where |*T*| is the 1-norm of the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*slamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*slamch('S').

?syevr

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix using the Relatively Robust Representations.

Syntax

FORTRAN 77:

`call ssyevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)`

`call dsyevr(jobz, range, uplo, n, a, lda, vl, vu, il, iu, abstol, m, w, z, ldz, isuppz, work, lwork, iwork, liwork, info)`

Fortran 95:

`call syevr(a, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,isuppz] [,abstol] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

The routine first reduces the matrix *A* to tridiagonal form *T* with a call to `?sytrd`. Then, whenever possible, `?syevr` calls `?stemr` to compute the eigenspectrum using Relatively Robust Representations. `?stemr` computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For the each unreduced block of *T*:

a. Compute $T - \sigma*I = L*D*L^T$, so that *L* and *D* define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of *D* and *L* cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix *T* does not have this property in general.

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see Steps c) and d).

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.

d. For each eigenvalue with a large enough relative separation, compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to Step c) for any clusters that remain.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine ?syevr calls ?stemr when the full spectrum is requested on machines that conform to the IEEE-754 floating point standard. ?syevr calls ?stebz and ?stein on non-IEEE machines and when partial spectrum requests are made.

Note that ?syevr is preferable for most cases of real symmetric eigenvalue problems as its underlying algorithm is fast and uses less workspace.

Input Parameters

jobz
CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range
CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval:
vl < *lambda*(*i*) ≤ *vu*.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
For *range* = 'V'or 'I' and *iu*-*il* < *n*-1, sstebz/dstebz and sstein/dstein are called.

uplo
CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n
INTEGER. The order of the matrix *A* (*n* ≥ 0).

a, *work*
REAL for ssyevr
DOUBLE PRECISION for dsyevr.
Arrays:
a(*lda*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A*, as specified by *uplo*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

vl, *vu*
REAL for ssyevr
DOUBLE PRECISION for dsyevr.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint:
1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0;
il=1 and *iu*=0, if *n* = 0.

If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for ssyevr
DOUBLE PRECISION for dsyevr. The absolute error tolerance to which each eigenvalue/eigenvector is required.
If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*.
If *abstol* < *n* *eps*|*T*|, then *n* *eps*|*T*| is used instead, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*.
The eigenvalues are computed to an accuracy of eps*|*T*| irrespective of *abstol*.
If high relative accuracy is important, set *abstol* to ?lamch('S').

ldz
INTEGER. The leading dimension of the output array *z*.
Constraints:

ldz ≥ 1 and

ldz ≥ max(1, *n*) if *jobz* = 'V'.

lwork
INTEGER.
The dimension of the array *work*.

Constraint: *lwork* ≥ max(1, 26*n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
See *Application Notes* for the suggested value of *lwork*.

iwork
INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork
INTEGER.

The dimension of the array *iwork*, *lwork* ≥ max(1, 10*n*).
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *iwork* array, returns this value as the first entry of the *iwork* array, and no error message related to *liwork* is issued by xerbla.

Output Parameters

a
On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m
INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z*
REAL for ssyevr
DOUBLE PRECISION for dsyevr.
Arrays:
w(*), DIMENSION at least max(1, *n*), contains the selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*);
z(*ldz*, *), the second dimension of *z* must be at least max(1, *m*).

	If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced. Note that you must ensure that at least max(1, *m*) columns are supplied in the array *z* ; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
isuppz	INTEGER. Array, DIMENSION at least 2 *max(1, *m*). The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). Referenced only if eigenvectors are needed (*jobz* = 'V') and all eigenvalues are needed, that is, *range* = 'A' or *range* = 'I' and *il* = 1 and *iu* = *n*.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, an internal error has occurred.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine syevr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**m*), where the values (2**m*) are significant.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *isuppz* is present and *z* is omitted.

range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+6)**n*, where *nb* is the maximum of the blocksize for ?sytrd and ?ormtr returned by ilaenv.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Normal execution of ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

?heevr

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix using the Relatively Robust Representations.

Syntax

FORTRAN 77:

call cheevr(*jobz*, *range*, *uplo*, *n*, *a*, *lda*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

call zheevr(*jobz*, *range*, *uplo*, *n*, *a*, *lda*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *rwork*, *lrwork*, *iwork*, *liwork*, *info*)

Fortran 95:

call heevr(*a*, *w* [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*isuppz*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

The routine first reduces the matrix *A* to tridiagonal form *T* with a call to ?hetrd. Then, whenever possible, ?heevr calls ?stegr to compute the eigenspectrum using Relatively Robust Representations. ?stegr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For each unreduced block (submatrix) of *T*:

a. Compute $T - \sigma*I = L*D*L^T$, so that *L* and *D* define all the wanted eigenvalues to high relative accuracy. This means that small relative changes in the entries of *D* and *L* cause only small relative changes in the eigenvalues and eigenvectors. The standard (unfactored) representation of the tridiagonal matrix *T* does not have this property in general.

b. Compute the eigenvalues to suitable accuracy. If the eigenvectors are desired, the algorithm attains full accuracy of the computed eigenvalues only right before the corresponding vectors have to be computed, see Steps c) and d).

c. For each cluster of close eigenvalues, select a new shift close to the cluster, find a new factorization, and refine the shifted eigenvalues to suitable accuracy.

d. For each eigenvalue with a large enough relative separation, compute the corresponding eigenvector by forming a rank revealing twisted factorization. Go back to Step c) for any clusters that remain.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine ?heevr calls ?stemr when the full spectrum is requested on machines which conform to the IEEE-754 floating point standard, or ?stebz and ?stein on non-IEEE machines and when partial spectrum requests are made.

Note that the routine ?heevr is preferable for most cases of complex Hermitian eigenvalue problems as its underlying algorithm is fast and uses less workspace.

Input Parameters

jobz
CHARACTER*1. Must be 'N' or 'V'.
If *job* = 'N', then only eigenvalues are computed.
If *job* = 'V', then eigenvalues and eigenvectors are computed.

range
CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: $vl < lambda(i) \le vu$.
If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
For *range* = 'V'or 'I', sstebz/dstebz and cstein/zstein are called.

uplo
CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *a* stores the upper triangular part of *A*.
If *uplo* = 'L', *a* stores the lower triangular part of *A*.

n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	COMPLEX for cheevr DOUBLE COMPLEX for zheevr. Arrays: *a*(*lda*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A*, as specified by *uplo*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
vl, *vu*	REAL for cheevr DOUBLE PRECISION for zheevr. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for cheevr DOUBLE PRECISION for zheevr. The absolute error tolerance to which each eigenvalue/eigenvector is required. If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*. If *abstol* < *n* *eps*|*T*|, then *n* *eps*|*T*| will be used in its place, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*|*T*| irrespective of *abstol*. If high relative accuracy is important, set *abstol* to ?lamch('S').
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: *ldz* ≥ 1 if *jobz* = 'N'; *ldz* ≥ max(1, *n*) if *jobz* = 'V'.
lwork	INTEGER. The dimension of the array *work*. Constraint: *lwork* ≥ max(1, 2*n*). If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

See *Application Notes* for the suggested value of *lwork*.

rwork REAL for cheevr
DOUBLE PRECISION for zheevr.
Workspace array, DIMENSION max(1, *lwork*).

lrwork INTEGER.
The dimension of the array *rwork*;
lwork ≥ max(1, 24*n*).
If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*,
lwork ≥ max(1, 10*n*).
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla.

Output Parameters

a On exit, the lower triangle (if *uplo* = 'L') or the upper triangle (if *uplo* = 'U') of *A*, including the diagonal, is overwritten.

m INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w REAL for cheevr
DOUBLE PRECISION for zheevr.
Array, DIMENSION at least max(1, *n*), contains the selected eigenvalues in ascending order, stored in *w*(1) to *w*(*m*).

z COMPLEX for cheevr
DOUBLE COMPLEX for zheevr.
Array *z*(*ldz*, *); the second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

isuppz	INTEGER. Array, DIMENSION at least 2 *max(1, *m*). The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). Referenced only if eigenvectors are needed (*jobz* = 'V') and all eigenvalues are needed, that is, *range* = 'A' or *range* = 'I' and *il* = 1 and *iu* = *n*.
work(1)	On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.
rwork(1)	On exit, if *info* = 0, then *rwork(1)* returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, an internal error has occurred.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine heevr interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**n*), where the values (2**m*) are significant.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *isuppz* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

For optimum performance use *lwork* ≥ (*nb*+1)***n*, where *nb* is the maximum of the blocksize for ?hetrd and ?unmtr returned by ilaenv.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *lrwork*, or *liwork*) for the first run or set *lwork* = -1 (*lrwork* = -1, *liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *lrwork*, *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *rwork*, *iwork*) on exit. Use this value (*work*(1), *rwork*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *rwork*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*lrwork*, *liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Normal execution of ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

?spev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix in packed storage.

Syntax

FORTRAN 77:

```
call sspev(jobz, uplo, n, ap, w, z, ldz, work, info)
call dspev(jobz, uplo, n, ap, w, z, ldz, work, info)
```

Fortran 95:

```
call spev(ap, w [,uplo] [,z] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* in packed storage.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.

n	INTEGER. The order of the matrix *A* ($n \geq 0$).
ap, *work*	REAL for sspev DOUBLE PRECISION for dspev Arrays: *ap(*)* contains the packed upper or lower triangle of symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
work	(*) is a workspace array, DIMENSION at least max(1, 3*n*).
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

Output Parameters

w, *z*	REAL for sspev DOUBLE PRECISION for dspev Arrays: *w*(*), DIMENSION at least max(1, *n*). If *info* = 0, *w* contains the eigenvalues of the matrix *A* in ascending order. z(*ldz, **). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced.
ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spev interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.

jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?hpev

Computes all eigenvalues and, optionally, eigenvectors of a Hermitian matrix in packed storage.

Syntax

FORTRAN 77:

```
call chpev(jobz, uplo, n, ap, w, z, ldz, work, rwork, info)
call zhpev(jobz, uplo, n, ap, w, z, ldz, work, rwork, info)
```

Fortran 95:

```
call hpev(ap, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* in packed storage.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
ap, *work*	COMPLEX for chpev DOUBLE COMPLEX for zhpev. Arrays: *ap(*)* contains the packed upper or lower triangle of Hermitian matrix A, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).
work	(*) is a workspace array, DIMENSION at least max(1, 2*n*-1).
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .
rwork	REAL for chpev DOUBLE PRECISION for zhpev.

Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

w	REAL for chpev DOUBLE PRECISION for zhpev. Array, DIMENSION at least max(1, *n*). If *info* = 0, *w* contains the eigenvalues of the matrix *A* in ascending order.
z	COMPLEX for chpev DOUBLE COMPLEX for zhpev. Array z(*ldz*, *). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced.
ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpev interface are the following:

ap	Holds the array *A* of size (*n**(*n*+1)/2).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?spevd

Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a real symmetric matrix held in packed storage.

Syntax

FORTRAN 77:

```
call sspevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, iwork, liwork, info)
call dspevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call spevd(ap, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric matrix *A* (held in packed storage). In other words, it can compute the spectral factorization of *A* as:

$A = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
ap, *work*	REAL for sspevd DOUBLE PRECISION for dspevd Arrays: *ap(*)* contains the packed upper or lower triangle of symmetric matrix A, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2)

	work is a workspace array, its dimension max(1, *lwork*).
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraints: if *n* ≤ 1, then *lwork* ≥ 1; if *jobz* = 'N' and *n* > 1, then *lwork* ≥ 2**n*; if *jobz* = 'V' and *n* > 1, then *lwork* ≥ n^2+ 6**n* + 1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.
iwork	INTEGER. Workspace array, its dimension max(1, *liwork*).
liwork	INTEGER. The dimension of the array *iwork*. Constraints: if *n* ≤ 1, then *liwork* ≥ 1; if *jobz* = 'N' and *n* > 1, then *liwork* ≥ 1; if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5**n*+3. If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w, *z*	REAL for sspevd DOUBLE PRECISION for dspevd Arrays: *w(*)*, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*. z(*ldz*,*). The second dimension of *z* must be: at least 1 if *jobz* = 'N';at least max(1, *n*) if *jobz* = 'V'. If *jobz* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*. If *jobz* = 'N', then *z* is not referenced.

ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spevd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1) , the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is ?hpevd.

See also ?syevd for matrices held in full storage, and ?sbevd for banded matrices.

?hpevd

Uses divide and conquer algorithm to compute all eigenvalues and (optionally) all eigenvectors of a complex Hermitian matrix held in packed storage.

Syntax

FORTRAN 77:

`call chpevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

`call zhpevd(jobz, uplo, n, ap, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)`

Fortran 95:

`call hpevd(ap, w [,uplo] [,z] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian matrix *A* (held in packed storage). In other words, it can compute the spectral factorization of *A* as: $A = Z*\Lambda*Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Input Parameters

jobz	`CHARACTER*1`. Must be `'N'` or `'V'`. If *jobz* = `'N'`, then only eigenvalues are computed. If *jobz* = `'V'`, then eigenvalues and eigenvectors are computed.
uplo	`CHARACTER*1`. Must be `'U'` or `'L'`. If *uplo* = `'U'`, *ap* stores the packed upper triangular part of *A*. If *uplo* = `'L'`, *ap* stores the packed lower triangular part of *A*.
n	`INTEGER`. The order of the matrix *A* (*n* ≥ 0).
ap, *work*	`COMPLEX` for chpevd `DOUBLE COMPLEX` for zhpevd Arrays: *ap(*)* contains the packed upper or lower triangle of Hermitian matrix A, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2).

work is a workspace array, its dimension max(1, *lwork*).

ldz INTEGER. The leading dimension of the output array *z*.
Constraints:

if *jobz* = 'N', then *ldz* ≥ 1;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

lwork INTEGER.
The dimension of the array *work*.
Constraints:

if *n* ≤ 1, then *lwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lwork* ≥ *n*;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ 2**n*.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

rwork REAL for chpevd
DOUBLE PRECISION for zhpevd
Workspace array, its dimension max(1, *lrwork*).

lrwork INTEGER.
The dimension of the array *rwork*. Constraints:

if *n* ≤ 1, then *lrwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *lrwork* ≥ *n*;

if *jobz* = 'V' and *n* > 1, then *lrwork* ≥ 2**n*^{2} + 5**n* + 1.
If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork INTEGER.
The dimension of the array *iwork*.
Constraints:

if *n* ≤ 1, then *liwork* ≥ 1;

if *jobz* = 'N' and *n* > 1, then *liwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5**n*+3.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w	REAL for chpevd DOUBLE PRECISION for zhpevd Array, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.
z	COMPLEX for chpevd DOUBLE COMPLEX for zhpevd Array, DIMENSION (*ldz*,*). The second dimension of *z* must be: at least 1 if *jobz* = 'N'; at least max(1, *n*) if *jobz* = 'V'. If *jobz* = 'V', then this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*. If *jobz* = 'N', then *z* is not referenced.
ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of A.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
rwork(1)	On exit, if *info* = 0, then *rwork*(1) returns the required minimal size of *lrwork*.
iwork(1)	On exit, if *info* = 0, then *iwork(1)* returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpevd interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is ?spevd.

See also ?heevd for matrices held in full storage, and ?hbevd for banded matrices.

?spevx

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix in packed storage.

Syntax

FORTRAN 77:

call sspevx(*jobz*, *range*, *uplo*, *n*, *ap*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

call dspevx(*jobz*, *range*, *uplo*, *n*, *ap*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

Fortran 95:

call spevx(*ap*, *w* [,*uplo*] [,*z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric matrix *A* in packed storage. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*< *lambda*(*i*)≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap, *work*	REAL for sspevx DOUBLE PRECISION for dspevx Arrays: *ap(*)* contains the packed upper or lower triangle of the symmetric matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, DIMENSION at least max(1, 8*n*).
vl, *vu*	REAL for sspevx DOUBLE PRECISION for dspevx If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for sspevx DOUBLE PRECISION for dspevx The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.
m	INTEGER. The total number of eigenvalues found, $0 \le m \le n$. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu-il*+1.
w, *z*	REAL for sspevx DOUBLE PRECISION for dspevx Arrays: *w(*)*, DIMENSION at least max(1, *n*). If *info* = 0, contains the selected eigenvalues of the matrix *A* in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine spevx interface are the following:

ap	Holds the array *A* of size (*n*(n+1)/2*).

w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector with the number of elements *n*.
uplo	Must be 'U' or 'L'. The default value is 'U'.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hpevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian matrix in packed storage.

Syntax

FORTRAN 77:

call chpevx(*jobz*, *range*, *uplo*, *n*, *ap*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

call zhpevx(*jobz*, *range*, *uplo*, *n*, *ap*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *rwork*, *iwork*, *ifail*, *info*)

Fortran 95:

`call hpevx(ap, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,abstol] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian matrix *A* in packed storage. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*<*lambda*(*i*) ≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ap* stores the packed upper triangular part of *A*. If *uplo* = 'L', *ap* stores the packed lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
ap, *work*	COMPLEX for chpevx DOUBLE COMPLEX for zhpevx Arrays: *ap(*)* contains the packed upper or lower triangle of the Hermitian matrix *A*, as specified by *uplo*. The dimension of *ap* must be at least max(1, *n**(*n*+1)/2). *work(*)* is a workspace array, DIMENSION at least max(1, 2*n*).
vl, *vu*	REAL for chpevx DOUBLE PRECISION for zhpevx If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for chpevx

DOUBLE PRECISION for zhpevx
The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:

if *jobz* = 'N', then *ldz* ≥ 1;

if *jobz* = 'V', then *ldz* ≥ max(1, *n*).

rwork — REAL for chpevx
DOUBLE PRECISION for zhpevx
Workspace array, DIMENSION at least max(1, 7*n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

ap — On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of *A*.

m — INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w — REAL for chpevx
DOUBLE PRECISION for zhpevx
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the selected eigenvalues of the matrix *A* in ascending order.

z — COMPLEX for chpevx
DOUBLE COMPLEX for zhpevx
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge.

If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hpevx interface are the following:

ap Holds the array *A* of size (*n*(n+1)/2*).

w Holds the vector with the number of elements *n*.

z Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail Holds the vector with the number of elements *n*.

uplo Must be 'U' or 'L'. The default value is 'U'.

vl Default value for this element is *vl* = -HUGE(*vl*).

vu Default value for this element is *vu* = HUGE(*vl*).

il Default value for this argument is *il* = 1.

iu Default value for this argument is *iu* = *n*.

abstol Default value for this element is *abstol* = 0.0_WP.

jobz Restored based on the presence of the argument *z* as follows:
jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted
Note that there will be an error condition if *ifail* is present and *z* is omitted.

range Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:
range = 'V', if one of or both *vl* and *vu* are present,
range = 'I', if one of or both *il* and *iu* are present,
range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,
Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?sbev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric band matrix.

Syntax

FORTRAN 77:

```
call ssbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, info)
call dsbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, info)
```

Fortran 95:

```
call sbev(ab, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric band matrix *A*.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	REAL for ssbev DOUBLE PRECISION for dsbev. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* (*) is a workspace array. The dimension of *work* must be at least max(1, 3*n*-2).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd* +1.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .

Output Parameters

w, *z*	REAL for ssbev DOUBLE PRECISION for dsbev Arrays: *w(*)*, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbev interface are the following:

ab	Holds the array *A* of size (*kd*+1, *n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?hbev

Computes all eigenvalues and, optionally, eigenvectors of a Hermitian band matrix.

Syntax

FORTRAN 77:

```
call chbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, rwork, info)
call zhbev(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, rwork, info)
```

Fortran 95:

```
call hbev(ab, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix *A*.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	COMPLEX for chbev DOUBLE COMPLEX for zhbev. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* (*) is a workspace array. The dimension of *work* must be at least max(1, *n*).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd* +1.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .
rwork	REAL for chbev

DOUBLE PRECISION for zhbev
Workspace array, DIMENSION at least max(1, 3*n*-2).

Output Parameters

w — REAL for chbev
DOUBLE PRECISION for zhbev
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues in ascending order.

z — COMPLEX for chbev
DOUBLE COMPLEX for zhbev.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If *jobz* = 'N', then *z* is not referenced.

ab — On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.
If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.
If *info* = *i*, then the algorithm failed to converge;
i indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbev interface are the following:

ab — Holds the array *A* of size (*kd*+1, *n*).

w — Holds the vector with the number of elements *n*.

z — Holds the matrix *Z* of size (*n*, *n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

jobz — Restored based on the presence of the argument *z* as follows:
jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted.

?sbevd

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric band matrix using divide and conquer algorithm.

Syntax

FORTRAN 77:

```
call ssbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, iwork, liwork, info)
call dsbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call sbevd(ab, w [,uplo] [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric band matrix *A*. In other words, it can compute the spectral factorization of *A* as:

$A = Z*\Lambda*Z^T$

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	REAL for ssbevd DOUBLE PRECISION for dsbevd. Arrays:

	ab (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd*+1.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .
lwork	INTEGER. The dimension of the array *work*. Constraints: if *n* ≤ 1, then *lwork* ≥ 1; if *jobz* = 'N' and *n* > 1, then *lwork* ≥ 2*n*; if *jobz* = 'V' and *n* > 1, then *lwork* ≥ 2**n*^{2} + 5**n* + 1. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.
iwork	INTEGER. Workspace array, its dimension max(1, *liwork*).
liwork	INTEGER. The dimension of the array *iwork*. Constraints: if *n* ≤ 1, then *liwork* < 1; if *job* = 'N' and *n* > 1, then *liwork* < 1; if *job* = 'V' and *n* > 1, then *liwork* < 5**n*+3. If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w, *z*	REAL for ssbevd DOUBLE PRECISION for dsbevd Arrays: *w(*)*, DIMENSION at least max(1, *n*). If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*. z(*ldz*,*). The second dimension of *z* must be: at least 1 if *job* = 'N'; at least max(1, *n*) if *job* = 'V'.

	If *job* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *A*. The *i*-th column of *Z* contains the eigenvector which corresponds to the eigenvalue *w(i)*. If *job* = 'N', then *z* is not referenced.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.
work(1)	On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbevd interface are the following:

ab	Holds the array *A* of size (*kd*+1, *n*).
w	Holds the vector with the number of elements *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T+E$ such that $||E||_2 = O(\varepsilon) * ||T||_2$, where ε is the machine precision.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If any of admissible *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *work* (*liwork*) is less than the minimal required value and is not equal to -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The complex analogue of this routine is ?hbevd.

See also ?syevd for matrices held in full storage, and ?spevd for matrices held in packed storage.

?hbevd

Computes all eigenvalues and (optionally) all eigenvectors of a complex Hermitian band matrix using divide and conquer algorithm.

Syntax

FORTRAN 77:

```
call chbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
call zhbevd(jobz, uplo, n, kd, ab, ldab, w, z, ldz, work, lwork, rwork, lrwork, iwork, liwork, info)
```

Fortran 95:

```
call hbevd(ab, w [,uplo] [,z] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a complex Hermitian band matrix A. In other words, it can compute the spectral factorization of A as: $A = Z*\Lambda*Z^H$.

Here Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i, and Z is the (complex) unitary matrix whose columns are the eigenvectors z_i. Thus,

$A*z_i = \lambda_i*z_i$ for $i = 1, 2, ..., n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the QL or QR algorithm.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).

ab, *work*	COMPLEX for chbevd DOUBLE COMPLEX for zhbevd. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format. The second dimension of *ab* must be at least max(1, *n*). *work* (*) is a workspace array , its dimension max(1, *lwork*).
ldab	INTEGER. The leading dimension of *ab*; must be at least *kd*+1.
ldz	INTEGER. The leading dimension of the output array *z*. Constraints: if *jobz* = 'N', then *ldz* ≥ 1; if *jobz* = 'V', then *ldz* ≥ max(1, *n*) .
lwork	INTEGER. The dimension of the array *work*. Constraints: if *n* ≤ 1, then *lwork* ≥ 1; if *jobz* = 'N' and *n* > 1, then *lwork* ≥ *n*; if *jobz* = 'V' and *n* > 1, then *lwork* ≥ 2**n*^{2}. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.
rwork	REAL for chbevd DOUBLE PRECISION for zhbevd Workspace array, DIMENSION at least *lrwork*.
lrwork	INTEGER. The dimension of the array *rwork*. Constraints: if *n* ≤ 1, then *lrwork* ≥ 1; if *jobz* = 'N' and *n* > 1, then *lrwork* ≥ *n*; if *jobz* = 'V' and *n* > 1, then *lrwork* ≥ 2**n*^{2} + 5**n* + 1. If *lrwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.
iwork	INTEGER. Workspace array, DIMENSION max(1, *liwork*).
liwork	INTEGER. The dimension of the array *iwork*. Constraints: if *jobz* = 'N' or *n* ≤ 1, then *liwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5*n+3.
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work*, *rwork* and *iwork* arrays, returns these values as the first entries of the *work*, *rwork* and *iwork* arrays, and no error message related to *lwork* or *lrwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

w
REAL for chbevd
DOUBLE PRECISION for zhbevd
Array, DIMENSION at least max(1, *n*).
If *info* = 0, contains the eigenvalues of the matrix *A* in ascending order. See also *info*.

z
COMPLEX for chbevd
DOUBLE COMPLEX for zhbevd
Array, DIMENSION (*ldz*,*).
The second dimension of *z* must be:
at least 1 if *jobz* = 'N';
at least max(1, *n*) if *jobz* = 'V'.
If *jobz* = 'V', then this array is overwritten by the unitary matrix *Z* which contains the eigenvectors of *A*. The *i*-th column of *Z* contains the eigenvector which corresponds to the eigenvalue *w(i)*.
If *jobz* = 'N', then *z* is not referenced.

ab
On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.

work(1)
On exit, if *lwork* > 0, then the real part of *work*(1) returns the required minimal size of *lwork*.

rwork(1)
On exit, if *lrwork* > 0, then *rwork*(1) returns the required minimal size of *lrwork*.

iwork(1)
On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero.
If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbevd interface are the following:

ab
Holds the array *A* of size (*kd*+1, *n*).

w
Holds the vector with the number of elements *n*.

z	Holds the matrix *Z* of size (*n*, *n*).
uplo	Must be 'U' or 'L'. The default value is 'U'.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix $T + E$ such that $||E||_2 = O(\varepsilon)||T||_2$, where ε is the machine precision.

If you are in doubt how much workspace to supply, use a generous value of *lwork* (*liwork* or *lrwork*) for the first run or set *lwork* = -1 (*liwork* = -1, *lrwork* = -1).

If you choose the first option and set any of admissible *lwork* (*liwork* or *lrwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*) on exit. Use this value (*work*(1), *iwork*(1), *rwork*(1)) for subsequent runs.

If you set *lwork* = -1 (*liwork* = -1, *lrwork* = -1), the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*, *rwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*, *lrwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

The real analogue of this routine is ?sbevd.

See also ?heevd for matrices held in full storage, and ?hpevd for matrices held in packed storage.

?sbevx

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix.

Syntax

FORTRAN 77:

```
call ssbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w,
z, ldz, work, iwork, ifail, info)
```

```
call dsbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w,
z, ldz, work, iwork, ifail, info)
```

Fortran 95:

```
call sbevx(ab, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q] [,abstol] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric band matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz — CHARACTER*1. Must be 'N' or 'V'.
If *jobz* = 'N', then only eigenvalues are computed.
If *jobz* = 'V', then eigenvalues and eigenvectors are computed.

range — CHARACTER*1. Must be 'A' or 'V' or 'I'.
If *range* = 'A', the routine computes all eigenvalues.
If *range* = 'V', the routine computes eigenvalues *lambda*(i) in the half-open interval: *vl*<*lambda*(i)≤*vu*.
If *range* = 'I', the routine computes eigenvalues in range *il* to *iu*.

uplo — CHARACTER*1. Must be 'U' or 'L'.
If *uplo* = 'U', *ab* stores the upper triangular part of *A*.
If *uplo* = 'L', *ab* stores the lower triangular part of *A*.

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

kd — INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).

ab, *work* — REAL for ssbevx
DOUBLE PRECISION for dsbevx.
Arrays:
ab (*ldab*,*) is an array containing either upper or lower triangular part of the symmetric matrix *A* (as specified by *uplo*) in band storage format.
The second dimension of *ab* must be at least max(1, *n*).
work (*) is a workspace array.
The dimension of *work* must be at least max(1, 7*n*).

ldab — INTEGER. The leading dimension of *ab*; must be at least *kd* +1.

vl, *vu* — REAL for ssbevx
DOUBLE PRECISION for dsbevx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for chpevx
DOUBLE PRECISION for zhpevx
The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldq, *ldz*	INTEGER. The leading dimensions of the output arrays *q* and *z*, respectively. Constraints: *ldq* ≥ 1, *ldz* ≥ 1; If *jobz* = 'V', then *ldq* ≥ max(1, *n*) and *ldz* ≥ max(1, *n*).
iwork	INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

q	REAL for ssbevx DOUBLE PRECISION for dsbevx. Array, DIMENSION (*ldz*,*n*). If *jobz* = 'V', the *n*-by-*n* orthogonal matrix is used in the reduction to tridiagonal form. If *jobz* = 'N', the array *q* is not referenced.
m	INTEGER. The total number of eigenvalues found, 0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.
w, *z*	REAL for ssbevx DOUBLE PRECISION for dsbevx Arrays: *w(*)*, DIMENSION at least max(1, *n*). The first *m* elements of *w* contain the selected eigenvalues of the matrix *A* in ascending order. z(*ldz*,*). The second dimension of *z* must be at least max(1, *m*). If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
ab	On exit, this array is overwritten by the values generated during the reduction to tridiagonal form. If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.

info INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine sbevx interface are the following:

ab Holds the array *A* of size (*kd*+1, *n*).
w Holds the vector with the number of elements *n*.
z Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail Holds the vector with the number of elements *n*.
q Holds the matrix *Q* of size (*n*, *n*).
uplo Must be 'U' or 'L'. The default value is 'U'.
vl Default value for this element is *vl* = -HUGE(*vl*).
vu Default value for this element is *vu* = HUGE(*vl*).
il Default value for this argument is *il* = 1.
iu Default value for this argument is *iu* = *n*.
abstol Default value for this element is *abstol* = 0.0_WP.
jobz Restored based on the presence of the argument *z* as follows:
jobz = 'V', if *z* is present,
jobz = 'N', if *z* is omitted
Note that there will be an error condition if either *ifail* or *q* is present and *z* is omitted.
range Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows:
range = 'V', if one of or both *vl* and *vu* are present,
range = 'I', if one of or both *il* and *iu* are present,
range = 'A', if none of *vl*, *vu*, *il*, *iu* is present,
Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||*T*||$_1$ is used as tolerance, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?hbevx

Computes selected eigenvalues and, optionally, eigenvectors of a Hermitian band matrix.

Syntax

FORTRAN 77:

```
call chbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

```
call zhbevx(jobz, range, uplo, n, kd, ab, ldab, q, ldq, vl, vu, il, iu, abstol, m, w, z, ldz, work, rwork, iwork, ifail, info)
```

Fortran 95:

```
call hbevx(ab, w [,uplo] [,z] [,vl] [,vu] [,il] [,iu] [,m] [,ifail] [,q] [,abstol] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a complex Hermitian band matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*< *lambda*(*i*) ≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
uplo	CHARACTER*1. Must be 'U' or 'L'. If *uplo* = 'U', *ab* stores the upper triangular part of *A*. If *uplo* = 'L', *ab* stores the lower triangular part of *A*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
kd	INTEGER. The number of super- or sub-diagonals in *A* (*kd* ≥ 0).
ab, *work*	COMPLEX for chbevx DOUBLE COMPLEX for zhbevx. Arrays: *ab* (*ldab*,*) is an array containing either upper or lower triangular part of the Hermitian matrix *A* (as specified by *uplo*) in band storage format.

The second dimension of *ab* must be at least max(1, *n*).
work (*) is a workspace array.
The dimension of *work* must be at least max(1, *n*).

ldab — INTEGER. The leading dimension of *ab*; must be at least *kd* +1.

vl, *vu* — REAL for chbevx
DOUBLE PRECISION for zhbevx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu* — INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: $1 \le il \le iu \le n$, if $n > 0$; *il*=1 and *iu*=0 if $n = 0$.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol — REAL for chbevx
DOUBLE PRECISION for zhbevx.
The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldq, *ldz* — INTEGER. The leading dimensions of the output arrays *q* and *z*, respectively.
Constraints:
$ldq \ge 1$, $ldz \ge 1$;
If *jobz* = 'V', then $ldq \ge \max(1, n)$ and $ldz \ge \max(1, n)$.

rwork — REAL for chbevx
DOUBLE PRECISION for zhbevx
Workspace array, DIMENSION at least max(1, 7*n*).

iwork — INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

q — COMPLEX for chbevx DOUBLE COMPLEX for zhbevx.
Array, DIMENSION (*ldz*,*n*).
If *jobz* = 'V', the *n*-by-*n* unitary matrix is used in the reduction to tridiagonal form.
If *jobz* = 'N', the array *q* is not referenced.

m — INTEGER. The total number of eigenvalues found,
$0 \le m \le n$.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w — REAL for chbevx
DOUBLE PRECISION for zhbevx
Array, DIMENSION at least max(1, *n*). The first *m* elements contain the selected eigenvalues of the matrix *A* in ascending order.

z — COMPLEX for chbevx

DOUBLE COMPLEX for zhbevx.
Array z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).
If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*.
If *jobz* = 'N', then *z* is not referenced.
Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.

ab — On exit, this array is overwritten by the values generated during the reduction to tridiagonal form.
If *uplo* = 'U', the first superdiagonal and the diagonal of the tridiagonal matrix *T* are returned in rows *kd* and *kd*+1 of *ab*, and if *uplo* = 'L', the diagonal and first subdiagonal of *T* are returned in the first two rows of *ab*.

ifail — INTEGER.
Array, DIMENSION at least max(1, *n*).
If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge.
If *jobz* = 'N', then *ifail* is not referenced.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*-th parameter had an illegal value.
If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine hbevx interface are the following:

ab — Holds the array *A* of size (*kd*+*1*, *n*).

w — Holds the vector with the number of elements *n*.

z — Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.

ifail — Holds the vector with the number of elements *n*.

q — Holds the matrix *Q* of size (*n*, *n*).

uplo — Must be 'U' or 'L'. The default value is 'U'.

vl — Default value for this element is *vl* = -HUGE(*vl*).

vu — Default value for this element is *vu* = HUGE(*vl*).

il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if either *ifail* or *q* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol* + ε * max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then $\varepsilon * ||T||_1$ will be used in its place, where *T* is the tridiagonal matrix obtained by reducing *A* to tridiagonal form. Eigenvalues will be computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, try setting *abstol* to 2*?lamch('S').

?stev

Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix.

Syntax

FORTRAN 77:

```
call sstev(jobz, n, d, e, z, ldz, work, info)
call dstev(jobz, n, d, e, z, ldz, work, info)
```

Fortran 95:

```
call stev(d, e [,z] [,info])
```

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *A*.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
n	INTEGER. The order of the matrix *A* ($n \geq 0$).
d, *e*, *work*	REAL for sstev DOUBLE PRECISION for dstev. Arrays: *d*(*) contains the *n* diagonal elements of the tridiagonal matrix *A*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the *n*-1 subdiagonal elements of the tridiagonal matrix *A*. The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace. *work*(*) is a workspace array. The dimension of *work* must be at least max(1, 2*n*-2). If *jobz* = 'N', *work* is not referenced.
ldz	INTEGER. The leading dimension of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V' then *ldz* ≥ max(1, *n*).

Output Parameters

d	On exit, if *info* = 0, contains the eigenvalues of the matrix *A* in ascending order.
z	REAL for sstev DOUBLE PRECISION for dstev Array, DIMENSION (*ldz*, *). The second dimension of *z* must be at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, *z* contains the orthonormal eigenvectors of the matrix *A*, with the *i*-th column of *z* holding the eigenvector associated with the eigenvalue returned in *d*(*i*). If *job* = 'N', then *z* is not referenced.
e	On exit, this array is overwritten with intermediate results.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then the algorithm failed to converge; *i* elements of *e* did not converge to zero.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stev interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

?stevd

Computes all eigenvalues and (optionally) all eigenvectors of a real symmetric tridiagonal matrix using divide and conquer algorithm.

Syntax

FORTRAN 77:

```
call sstevd(jobz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
call dstevd(jobz, n, d, e, z, ldz, work, lwork, iwork, liwork, info)
```

Fortran 95:

```
call stevd(d, e [,z] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes all the eigenvalues, and optionally all the eigenvectors, of a real symmetric tridiagonal matrix *T*. In other words, the routine can compute the spectral factorization of *T* as: $T = Z*\Lambda*Z^T$.

Here Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i, and *Z* is the orthogonal matrix whose columns are the eigenvectors z_i. Thus,

$T*z_i = \lambda_i*z_i$ for $i = 1, 2, \ldots, n$.

If the eigenvectors are requested, then this routine uses a divide and conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal-Walker-Kahan variant of the *QL* or *QR* algorithm.

There is no complex analogue of this routine.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
n	INTEGER. The order of the matrix *T* ($n \geq 0$).
d, *e*, *work*	REAL for sstevd DOUBLE PRECISION for dstevd.

Arrays:
d(*) contains the *n* diagonal elements of the tridiagonal matrix *T*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the *n*-1 off-diagonal elements of *T*.
The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace.
work(*) is a workspace array.
The dimension of *work* must be at least *lwork*.

ldz — INTEGER. The leading dimension of the output array *z*. Constraints:

ldz ≥ 1 if *job* = 'N';

ldz < max(1, *n*) if *job* = 'V'.

lwork — INTEGER.
The dimension of the array *work*.
Constraints:

if *jobz* = 'N' or *n* ≤ 1, then *lwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *lwork* ≥ n^2 + 4**n* + 1.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER. Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.
The dimension of the array *iwork*.
Constraints:

if *jobz* = 'N' or *n* ≤ 1, then *liwork* ≥ 1;

if *jobz* = 'V' and *n* > 1, then *liwork* ≥ 5**n*+3.

If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

d — On exit, if *info* = 0, contains the eigenvalues of the matrix *T* in ascending order.
See also *info*.

z — REAL for sstevd
DOUBLE PRECISION for dstevd
Array, DIMENSION (*ldz*, *).
The second dimension of *z* must be:
at least 1 if *jobz* = 'N';
at least max(1, *n*) if *jobz* = 'V'.

	If *jobz* = 'V', then this array is overwritten by the orthogonal matrix *Z* which contains the eigenvectors of *T*. If *jobz* = 'N', then *z* is not referenced.
e	On exit, this array is overwritten with intermediate results.
work(1)	On exit, if *lwork* > 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *liwork* > 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = *i*, then the algorithm failed to converge; *i* indicates the number of elements of an intermediate tridiagonal form which did not converge to zero. If *info* = -*i*, the *i*-th parameter had an illegal value.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stevd interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*).
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted.

Application Notes

The computed eigenvalues and eigenvectors are exact for a matrix *T*+*E* such that $||E||_2 = O(\varepsilon)*||T||_2$, where ε is the machine precision.

If λ_i is an exact eigenvalue, and m_i is the corresponding computed value, then

$|\mu_i - \lambda_i| \le c(n)*\varepsilon*||T||_2$

where $c(n)$ is a modestly increasing function of n.

If z_i is the corresponding exact eigenvector, and w_i is the corresponding computed vector, then the angle $\theta(z_i, w_i)$ between them is bounded as follows:

$\theta(z_i, w_i) \le c(n)*\varepsilon*||T||_2 / \min_{i \ne j}|\lambda_i - \lambda_j|$.

Thus the accuracy of a computed eigenvector depends on the gap between its eigenvalue and all the other eigenvalues.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?stevx

Computes selected eigenvalues and eigenvectors of a real symmetric tridiagonal matrix.

Syntax

FORTRAN 77:

call sstevx(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

call dstevx(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *work*, *iwork*, *ifail*, *info*)

Fortran 95:

call stevx(*d*, *e*, *w* [, *z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*ifail*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *A*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *job* = 'N', then only eigenvalues are computed. If *job* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*<*lambda*(*i*)≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
d, *e*, *work*	REAL for sstevx

DOUBLE PRECISION for dstevx.
Arrays:
d(*) contains the *n* diagonal elements of the tridiagonal matrix *A*.
The dimension of *d* must be at least max(1, *n*).
e(*) contains the *n*-1 subdiagonal elements of *A*.
The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace.
work(*) is a workspace array.
The dimension of *work* must be at least max(1, 5*n*).

vl, *vu*
REAL for sstevx
DOUBLE PRECISION for dstevx.
If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.
Constraint: *vl*< *vu*.
If *range* = 'A' or 'I', *vl* and *vu* are not referenced.

il, *iu*
INTEGER.
If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned.
Constraint: 1 ≤ *il* ≤ *iu* ≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0.
If *range* = 'A' or 'V', *il* and *iu* are not referenced.

abstol
REAL for sstevx
DOUBLE PRECISION for dstevx. The absolute error tolerance to which each eigenvalue is required. See *Application notes* for details on error tolerance.

ldz
INTEGER. The leading dimensions of the output array *z*; *ldz* ≥ 1. If *jobz* = 'V', then *ldz* ≥ max(1, *n*).

iwork
INTEGER. Workspace array, DIMENSION at least max(1, 5*n*).

Output Parameters

m
INTEGER. The total number of eigenvalues found,
0 ≤ *m* ≤ *n*.
If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z*
REAL for sstevx
DOUBLE PRECISION for dstevx.
Arrays:
w(*), DIMENSION at least max(1, *n*).
The first *m* elements of *w* contain the selected eigenvalues of the matrix *A* in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).
If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *A* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*).

	If an eigenvector fails to converge, then that column of *z* contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in *ifail*. If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
d, *e*	On exit, these arrays may be multiplied by a constant factor chosen to avoid overflow or underflow in computing the eigenvalues.
ifail	INTEGER. Array, DIMENSION at least max(1, *n*). If *jobz* = 'V', then if *info* = 0, the first *m* elements of *ifail* are zero; if *info* > 0, the *ifail* contains the indices of the eigenvectors that failed to converge. If *jobz* = 'N', then *ifail* is not referenced.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, then *i* eigenvectors failed to converge; their indices are stored in the array *ifail*.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stevx interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
ifail	Holds the vector of length *n*.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.
range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present,

Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a,b] of width less than or equal to *abstol*+ε*max(|a|,|b|), where ε is the machine precision.

If *abstol* is less than or equal to zero, then ε*||A||$_1$ is used instead. Eigenvalues are computed most accurately when *abstol* is set to twice the underflow threshold 2*?lamch('S'), not zero.

If this routine returns with *info* > 0, indicating that some eigenvectors did not converge, set *abstol* to 2*?lamch('S').

?stevr

Computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix using the Relatively Robust Representations.

Syntax

FORTRAN 77:

call sstevr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

call dstevr(*jobz*, *range*, *n*, *d*, *e*, *vl*, *vu*, *il*, *iu*, *abstol*, *m*, *w*, *z*, *ldz*, *isuppz*, *work*, *lwork*, *iwork*, *liwork*, *info*)

Fortran 95:

call stevr(*d*, *e*, *w* [, *z*] [,*vl*] [,*vu*] [,*il*] [,*iu*] [,*m*] [,*isuppz*] [,*abstol*] [,*info*])

Description

This routine is declared in mkl_lapack.fi for FORTRAN 77 interface, in lapack.f90 for Fortran 95 interface, and in mkl_lapack.h for C interface.

The routine computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix *T*. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

Whenever possible, the routine calls ?stemr to compute the eigenspectrum using Relatively Robust Representations. ?stegr computes eigenvalues by the *dqds* algorithm, while orthogonal eigenvectors are computed from various "good" $L*D*L^T$ representations (also known as Relatively Robust Representations). Gram-Schmidt orthogonalization is avoided as far as possible. More specifically, the various steps of the algorithm are as follows. For the i-th unreduced block of *T*:

a. Compute $T - \sigma_i = L_i*D_i*L_i^T$, such that $L_i*D_i*L_i^T$ is a relatively robust representation.

b. Compute the eigenvalues, λ_j, of $L_i*D_i*L_i^T$ to high relative accuracy by the *dqds* algorithm.

c. If there is a cluster of close eigenvalues, "choose" σ_i close to the cluster, and go to Step (a).

d. Given the approximate eigenvalue λ_j of $L_i*D_i*L_i^T$, compute the corresponding eigenvector by forming a rank-revealing twisted factorization.

The desired accuracy of the output can be specified by the input parameter *abstol*.

The routine ?stevr calls ?stemr when the full spectrum is requested on machines which conform to the IEEE-754 floating point standard. ?stevr calls ?stebz and ?stein on non-IEEE machines and when partial spectrum requests are made.

Input Parameters

jobz	CHARACTER*1. Must be 'N' or 'V'. If *jobz* = 'N', then only eigenvalues are computed. If *jobz* = 'V', then eigenvalues and eigenvectors are computed.
range	CHARACTER*1. Must be 'A' or 'V' or 'I'. If *range* = 'A', the routine computes all eigenvalues. If *range* = 'V', the routine computes eigenvalues *lambda*(*i*) in the half-open interval: *vl*<*lambda*(*i*) ≤ *vu*. If *range* = 'I', the routine computes eigenvalues with indices *il* to *iu*. For *range* = 'V'or 'I' and *iu*-*il* < *n*-1, sstebz/dstebz and sstein/dstein are called.
n	INTEGER. The order of the matrix *T* (*n* ≥ 0).
d, *e*, *work*	REAL for sstevr DOUBLE PRECISION for dstevr. Arrays: *d*(*) contains the *n* diagonal elements of the tridiagonal matrix *T*. The dimension of *d* must be at least max(1, *n*). *e*(*) contains the *n*-1 subdiagonal elements of *A*. The dimension of *e* must be at least max(1, *n*-1). The *n*-th element of this array is used as workspace. *work* is a workspace array, its dimension max(1, *lwork*).
vl, *vu*	REAL for sstevr DOUBLE PRECISION for dstevr. If *range* = 'V', the lower and upper bounds of the interval to be searched for eigenvalues. Constraint: *vl*< *vu*. If *range* = 'A' or 'I', *vl* and *vu* are not referenced.
il, *iu*	INTEGER. If *range* = 'I', the indices in ascending order of the smallest and largest eigenvalues to be returned. Constraint: 1 ≤ *il* ≤ *iu*≤ *n*, if *n* > 0; *il*=1 and *iu*=0 if *n* = 0. If *range* = 'A' or 'V', *il* and *iu* are not referenced.
abstol	REAL for sstevr DOUBLE PRECISION for dstevr.

The absolute error tolerance to which each eigenvalue/eigenvector is required.
If *jobz* = 'V', the eigenvalues and eigenvectors output have residual norms bounded by *abstol*, and the dot products between different eigenvectors are bounded by *abstol*. If *abstol* < *n* *eps*|*T*|, then *n* *eps*|*T*| will be used in its place, where eps is the machine precision, and |*T*| is the 1-norm of the matrix *T*. The eigenvalues are computed to an accuracy of eps*|*T*| irrespective of *abstol*.
If high relative accuracy is important, set *abstol* to ?lamch('S').

ldz — INTEGER. The leading dimension of the output array *z*.
Constraints:

ldz ≥ 1 if *jobz* = 'N';

ldz ≥ max(1, *n*) if *jobz* = 'V'.

lwork — INTEGER.
The dimension of the array *work*. Constraint:

lwork ≥ max(1, 20**n*).
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

iwork — INTEGER.
Workspace array, its dimension max(1, *liwork*).

liwork — INTEGER.
The dimension of the array *iwork*,

lwork ≥ max(1, 10**n*).
If *liwork* = -1, then a workspace query is assumed; the routine only calculates the required sizes of the *work* and *iwork* arrays, returns these values as the first entries of the *work* and *iwork* arrays, and no error message related to *lwork* or *liwork* is issued by xerbla. See *Application Notes* for details.

Output Parameters

m — INTEGER. The total number of eigenvalues found,

0 ≤ *m* ≤ *n*. If *range* = 'A', *m* = *n*, and if *range* = 'I', *m* = *iu*-*il*+1.

w, *z* — REAL for sstevr
DOUBLE PRECISION for dstevr.
Arrays:
w(*), DIMENSION at least max(1, *n*).
The first *m* elements of *w* contain the selected eigenvalues of the matrix *T* in ascending order.
z(*ldz*,*).
The second dimension of *z* must be at least max(1, *m*).

	If *jobz* = 'V', then if *info* = 0, the first *m* columns of *z* contain the orthonormal eigenvectors of the matrix *T* corresponding to the selected eigenvalues, with the *i*-th column of *z* holding the eigenvector associated with *w*(*i*). If *jobz* = 'N', then *z* is not referenced. Note: you must ensure that at least max(1,*m*) columns are supplied in the array *z*; if *range* = 'V', the exact value of *m* is not known in advance and an upper bound must be used.
d, *e*	On exit, these arrays may be multiplied by a constant factor chosen to avoid overflow or underflow in computing the eigenvalues.
isuppz	INTEGER. Array, DIMENSION at least 2 *max(1, *m*). The support of the eigenvectors in *z*, i.e., the indices indicating the nonzero elements in *z*. The *i*-th eigenvector is nonzero only in elements *isuppz*(2*i*-1) through *isuppz*(2*i*). Implemented only for *range* = 'A' or 'I' and *iu*-*il* = *n*-1.
work(1)	On exit, if *info* = 0, then *work*(1) returns the required minimal size of *lwork*.
iwork(1)	On exit, if *info* = 0, then *iwork*(1) returns the required minimal size of *liwork*.
info	INTEGER. If *info* = 0, the execution is successful. If *info* = -*i*, the *i*-th parameter had an illegal value. If *info* = *i*, an internal error has occurred.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine stevr interface are the following:

d	Holds the vector of length *n*.
e	Holds the vector of length *n*.
w	Holds the vector of length *n*.
z	Holds the matrix *Z* of size (*n*, *n*), where the values *n* and *m* are significant.
isuppz	Holds the vector of length (2**n*), where the values (2**m*) are significant.
vl	Default value for this element is *vl* = -HUGE(*vl*).
vu	Default value for this element is *vu* = HUGE(*vl*).
il	Default value for this argument is *il* = 1.
iu	Default value for this argument is *iu* = *n*.
abstol	Default value for this element is *abstol* = 0.0_WP.
jobz	Restored based on the presence of the argument *z* as follows: *jobz* = 'V', if *z* is present, *jobz* = 'N', if *z* is omitted Note that there will be an error condition if *ifail* is present and *z* is omitted.

range	Restored based on the presence of arguments *vl*, *vu*, *il*, *iu* as follows: *range* = 'V', if one of or both *vl* and *vu* are present, *range* = 'I', if one of or both *il* and *iu* are present, *range* = 'A', if none of *vl*, *vu*, *il*, *iu* is present, Note that there will be an error condition if one of or both *vl* and *vu* are present and at the same time one of or both *il* and *iu* are present.

Application Notes

Normal execution of the routine ?stegr may create NaNs and infinities and hence may abort due to a floating point exception in environments which do not handle NaNs and infinities in the IEEE standard default manner.

If it is not clear how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run, or set *lwork* = -1 (*liwork* = -1).

If *lwork* (or *liwork*) has any of admissible sizes, which is no less than the minimal value described, then the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If *lwork* = -1 (*liwork* = -1), then the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if *lwork* (*liwork*) is less than the minimal required value and is not equal to -1, then the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Nonsymmetric Eigenproblems

This section describes LAPACK driver routines used for solving nonsymmetric eigenproblems. See also computational routines that can be called to solve these problems.

Table 4-11 lists all such driver routines for FORTRAN 77 interface. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-11 Driver Routines for Solving Nonsymmetric Eigenproblems

Routine Name	Operation performed
?gees	Computes the eigenvalues and Schur factorization of a general matrix, and orders the factorization so that selected eigenvalues are at the top left of the Schur form.
?geesx	Computes the eigenvalues and Schur factorization of a general matrix, orders the factorization and computes reciprocal condition numbers.
?geev	Computes the eigenvalues and left and right eigenvectors of a general matrix.
?geevx	Computes the eigenvalues and left and right eigenvectors of a general matrix, with preliminary matrix balancing, and computes reciprocal condition numbers for the eigenvalues and right eigenvectors.

?gees

Computes the eigenvalues and Schur factorization of a general matrix, and orders the factorization so that selected eigenvalues are at the top left of the Schur form.

Syntax

FORTRAN 77:

`call sgees(jobvs, sort, select, n, a, lda, sdim, wr, wi, vs, ldvs, work, lwork, bwork, info)`

`call dgees(jobvs, sort, select, n, a, lda, sdim, wr, wi, vs, ldvs, work, lwork, bwork, info)`

`call cgees(jobvs, sort, select, n, a, lda, sdim, w, vs, ldvs, work, lwork, rwork, bwork, info)`

`call zgees(jobvs, sort, select, n, a, lda, sdim, w, vs, ldvs, work, lwork, rwork, bwork, info)`

Fortran 95:

`call gees(a, wr, wi [,vs] [,select] [,sdim] [,info])`

`call gees(a, w [,vs] [,select] [,sdim] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues, the real Schur form *T*, and, optionally, the matrix of Schur vectors *Z*. This gives the Schur factorization $A = Z*T*Z^H$.

Optionally, it also orders the eigenvalues on the diagonal of the real-Schur/Schur form so that selected eigenvalues are at the top left. The leading columns of *Z* then form an orthonormal basis for the invariant subspace corresponding to the selected eigenvalues.

A real matrix is in real-Schur form if it is upper quasi-triangular with 1-by-1 and 2-by-2 blocks. 2-by-2 blocks will be standardized in the form

$$\begin{pmatrix} a & b \\ c & a \end{pmatrix}$$

where $b*c < 0$. The eigenvalues of such a block are $a \pm \sqrt{bc}$

A complex matrix is in Schur form if it is upper triangular.

Input Parameters

jobvs
CHARACTER*1. Must be 'N' or 'V'.
If *jobvs* = 'N', then Schur vectors are not computed.
If *jobvs* = 'V', then Schur vectors are computed.

sort
CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the Schur form.
If *sort* = 'N', then eigenvalues are not ordered.
If *sort* = 'S', eigenvalues are ordered (see *select*).

select
LOGICAL FUNCTION of two REAL arguments for real flavors.
LOGICAL FUNCTION of one COMPLEX argument for complex flavors.
select must be declared EXTERNAL in the calling subroutine.
If *sort* = 'S', *select* is used to select eigenvalues to sort to the top left of the Schur form.
If *sort* = 'N', *select* is not referenced.
For real flavors:
An eigenvalue *wr*(j)+sqrt(-1)**wi*(j) is selected if *select*(*wr*(j), *wi*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected.
Note that a selected complex eigenvalue may no longer satisfy *select*(*wr*(j), *wi*(j))= .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* may be set to *n*+2 (see *info* below).
For complex flavors:
An eigenvalue *w*(j) is selected if *select*(*w*(j)) is true.

n
INTEGER. The order of the matrix *A* ($n \geq 0$).

a, *work*
REAL for sgees
DOUBLE PRECISION for dgees
COMPLEX for cgees
DOUBLE COMPLEX for zgees.
Arrays:
a(*lda*,*) is an array containing the *n*-by-*n* matrix *A*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

ldvs
INTEGER. The leading dimension of the output array *vs*. Constraints:
ldvs $\geq$ 1;
ldvs $\geq$ max(1, *n*) if *jobvs* = 'V'.

lwork
INTEGER.
The dimension of the array *work*.
Constraint:
lwork $\geq$ max(1, 3*n*) for real flavors;
lwork $\geq$ max(1, 2*n*) for complex flavors.

If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork — REAL for cgees
DOUBLE PRECISION for zgees
Workspace array, DIMENSION at least max(1, *n*). Used in complex flavors only.

bwork — LOGICAL. Workspace array, DIMENSION at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a — On exit, this array is overwritten by the real-Schur/Schur form *T*.

sdim — INTEGER.
If *sort* = 'N', *sdim*= 0.
If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *select* is true.
Note that for real flavors complex conjugate pairs for which *select* is true for either eigenvalue count as 2.

wr, *wi* — REAL for sgees
DOUBLE PRECISION for dgees
Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues, in the same order that they appear on the diagonal of the output real-Schur form *T*. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w — COMPLEX for cgees
DOUBLE COMPLEX for zgees.
Array, DIMENSION at least max(1, *n*). Contains the computed eigenvalues. The eigenvalues are stored in the same order as they appear on the diagonal of the output Schur form *T*.

vs — REAL for sgees
DOUBLE PRECISION for dgees
COMPLEX for cgees
DOUBLE COMPLEX for zgees.
Array *vs*(*ldvs*,*);the second dimension of *vs* must be at least max(1, *n*).
If *jobvs* = 'V', *vs* contains the orthogonal/unitary matrix *Z* of Schur vectors.
If *jobvs* = 'N', *vs* is not referenced.

work(1) — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.

If *info* = *i*, and

i ≤ *n*:
the *QR* algorithm failed to compute all the eigenvalues; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged; if *jobvs* = 'V', *vs* contains the matrix which reduces *A* to its partially converged Schur form;
i = *n*+1:
the eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned);
i = *n*+2:
after reordering, round-off changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy *select* = .TRUE.. This could also be caused by underflow due to scaling.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine gees interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
wr	Holds the vector of length *n*. Used in real flavors only.
wi	Holds the vector of length *n*. Used in real flavors only.
w	Holds the vector of length *n*. Used in complex flavors only.
vs	Holds the matrix *VS* of size (*n*, *n*).
jobvs	Restored based on the presence of the argument *vs* as follows: *jobvs* = 'V', if *vs* is present, *jobvs* = 'N', if *vs* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geesx

Computes the eigenvalues and Schur factorization of a general matrix, orders the factorization and computes reciprocal condition numbers.

Syntax

FORTRAN 77:

`call sgeesx(jobvs, sort, select, sense, n, a, lda, sdim, wr, wi, vs, ldvs, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)`

`call dgeesx(jobvs, sort, select, sense, n, a, lda, sdim, wr, wi, vs, ldvs, rconde, rcondv, work, lwork, iwork, liwork, bwork, info)`

`call cgeesx(jobvs, sort, select, sense, n, a, lda, sdim, w, vs, ldvs, rconde, rcondv, work, lwork, rwork, bwork, info)`

`call zgeesx(jobvs, sort, select, sense, n, a, lda, sdim, w, vs, ldvs, rconde, rcondv, work, lwork, rwork, bwork, info)`

Fortran 95:

`call geesx(a, wr, wi [,vs] [,select] [,sdim] [,rconde] [,rcondev] [,info])`

`call geesx(a, w [,vs] [,select] [,sdim] [,rconde] [,rcondev] [,info])`

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues, the real-Schur/Schur form *T*, and, optionally, the matrix of Schur vectors *Z*. This gives the Schur factorization $A = Z*T*Z^H$.

Optionally, it also orders the eigenvalues on the diagonal of the real-Schur/Schur form so that selected eigenvalues are at the top left; computes a reciprocal condition number for the average of the selected eigenvalues (*rconde*); and computes a reciprocal condition number for the right invariant subspace corresponding to the selected eigenvalues (*rcondv*). The leading columns of *Z* form an orthonormal basis for this invariant subspace.

For further explanation of the reciprocal condition numbers *rconde* and *rcondv*, see [LUG], Section 4.10 (where these quantities are called *s* and *sep* respectively).

A real matrix is in real-Schur form if it is upper quasi-triangular with 1-by-1 and 2-by-2 blocks. 2-by-2 blocks will be standardized in the form

$$\begin{pmatrix} a & b \\ c & a \end{pmatrix}$$

where $b*c < 0$. The eigenvalues of such a block are $a \pm \sqrt{bc}$

A complex matrix is in Schur form if it is upper triangular.

Input Parameters

jobvs	CHARACTER*1. Must be 'N' or 'V'. If *jobvs* = 'N', then Schur vectors are not computed. If *jobvs* = 'V', then Schur vectors are computed.
sort	CHARACTER*1. Must be 'N' or 'S'. Specifies whether or not to order the eigenvalues on the diagonal of the Schur form. If *sort* = 'N', then eigenvalues are not ordered. If *sort* = 'S', eigenvalues are ordered (see *select*).
select	LOGICAL FUNCTION of two REAL arguments for real flavors. LOGICAL FUNCTION of one COMPLEX argument for complex flavors. *select* must be declared EXTERNAL in the calling subroutine. If *sort* = 'S', *select* is used to select eigenvalues to sort to the top left of the Schur form. If *sort* = 'N', *select* is not referenced. *For real flavors*: An eigenvalue *wr*(j)+sqrt(-1)**wi*(j) is selected if *select*(*wr*(j), *wi*(j)) is true; that is, if either one of a complex conjugate pair of eigenvalues is selected, then both complex eigenvalues are selected. Note that a selected complex eigenvalue may no longer satisfy *select*(*wr*(j), *wi*(j)) = .TRUE. after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case *info* may be set to *n*+2 (see *info* below). *For complex flavors:* An eigenvalue *w*(j) is selected if *select*(*w*(j)) is true.
sense	CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed. If *sense* = 'N', none are computed; If *sense* = 'E', computed for average of selected eigenvalues only; If *sense* = 'V', computed for selected right invariant subspace only; If *sense* = 'B', computed for both. If *sense* is 'E', 'V', or 'B', then *sort* must equal 'S'.
n	INTEGER. The order of the matrix *A* (*n* ≥ 0).
a, *work*	REAL for sgeesx DOUBLE PRECISION for dgeesx COMPLEX for cgeesx DOUBLE COMPLEX for zgeesx. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

ldvs INTEGER. The leading dimension of the output array *vs*. Constraints:

ldvs ≥ 1;

ldvs ≥ max(1, *n*)if *jobvs* = 'V'.

lwork INTEGER.
The dimension of the array *work*. Constraint:

lwork ≥ max(1, 3*n*) for real flavors;

lwork ≥ max(1, 2*n*) for complex flavors.
Also, if *sense* = 'E', 'V', or 'B', then

lwork ≥ *n*+2**sdim**(*n*-*sdim*) for real flavors;

lwork ≥ 2**sdim**(*n*-*sdim*) for complex flavors;
where *sdim* is the number of selected eigenvalues computed by this routine.

Note that 2**sdim**(*n*-*sdim*) ≤ *n***n*/2. Note also that an error is only returned if *lwork*<max(1, 2**n*), but if *sense* = 'E', or 'V', or 'B' this may not be large enough.
For good performance, *lwork* must generally be larger.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates upper bound on the optimal size of the array *work*, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

iwork INTEGER.
Workspace array, DIMENSION (*liwork*). Used in real flavors only. Not referenced if *sense* = 'N' or 'E'.

liwork INTEGER.
The dimension of the array *iwork*. Used in real flavors only.
Constraint:

liwork ≥ 1;

if *sense* = 'V' or 'B', *liwork* ≥ *sdim**(*n*-*sdim*).

rwork REAL for cgeesx
DOUBLE PRECISION for zgeesx
Workspace array, DIMENSION at least max(1, *n*). Used in complex flavors only.

bwork LOGICAL. Workspace array, DIMENSION at least max(1, *n*). Not referenced if *sort* = 'N'.

Output Parameters

a On exit, this array is overwritten by the real-Schur/Schur form *T*.

sdim INTEGER.
If *sort* = 'N', *sdim*= 0.
If *sort* = 'S', *sdim* is equal to the number of eigenvalues (after sorting) for which *select* is true.

Note that for real flavors complex conjugate pairs for which *select* is true for either eigenvalue count as 2.

wr, *wi*
REAL for sgeesx
DOUBLE PRECISION for dgeesx
Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues, in the same order that they appear on the diagonal of the output real-Schur form *T*. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w
COMPLEX for cgeesx
DOUBLE COMPLEX for zgeesx.
Array, DIMENSION at least max(1, *n*). Contains the computed eigenvalues. The eigenvalues are stored in the same order as they appear on the diagonal of the output Schur form *T*.

vs
REAL for sgeesx
DOUBLE PRECISION for dgeesx
COMPLEX for cgeesx
DOUBLE COMPLEX for zgeesx.
Array *vs*(*ldvs*,*);the second dimension of *vs* must be at least max(1, *n*).
If *jobvs* = 'V', *vs* contains the orthogonal/unitary matrix *Z* of Schur vectors.
If *jobvs* = 'N', *vs* is not referenced.

rconde, *rcondv*
REAL for single precision flavors DOUBLE PRECISION for double precision flavors.
If *sense* = 'E' or 'B', *rconde* contains the reciprocal condition number for the average of the selected eigenvalues.
If *sense* = 'N' or 'V', *rconde* is not referenced.
If *sense* = 'V' or 'B', *rcondv* contains the reciprocal condition number for the selected right invariant subspace.
If *sense* = 'N' or 'E', *rcondv* is not referenced.

work(1)
On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info
INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.
If *info* = *i*, and

i ≤ *n*:
the *QR* algorithm failed to compute all the eigenvalues; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged; if *jobvs* = 'V', *vs* contains the transformation which reduces *A* to its partially converged Schur form;
i = *n*+1:
the eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned);

i = *n*+2:
after reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy *select* = .TRUE.. This could also be caused by underflow due to scaling.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine geesx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
wr	Holds the vector of length (*n*). Used in real flavors only.
wi	Holds the vector of length (*n*). Used in real flavors only.
w	Holds the vector of length (*n*). Used in complex flavors only.
vs	Holds the matrix *VS* of size (*n*, *n*).
jobvs	Restored based on the presence of the argument *vs* as follows: *jobvs* = 'V', if *vs* is present, *jobvs* = 'N', if *vs* is omitted.
sort	Restored based on the presence of the argument *select* as follows: *sort* = 'S', if *select* is present, *sort* = 'N', if *select* is omitted.
sense	Restored based on the presence of arguments *rconde* and rcondv as follows: *sense* = 'B', if both *rconde* and *rcondv* are present, *sense* = 'E', if *rconde* is present and *rcondv* omitted, *sense* = 'V', if *rconde* is omitted and *rcondv* present, *sense* = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* (or *liwork*) for the first run or set *lwork* = -1 (*liwork* = -1).

If you choose the first option and set any of admissible *lwork* (or *liwork*) sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*) on exit. Use this value (*work*(1), *iwork*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*, *iwork*). This operation is called a workspace query.

Note that if you set *lwork* (*liwork*) to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geev

Computes the eigenvalues and left and right eigenvectors of a general matrix.

Syntax

FORTRAN 77:

```
call sgeev(jobvl, jobvr, n, a, lda, wr, wi, vl, ldvl, vr, ldvr, work, lwork, info)
call dgeev(jobvl, jobvr, n, a, lda, wr, wi, vl, ldvl, vr, ldvr, work, lwork, info)
call cgeev(jobvl, jobvr, n, a, lda, w, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
call zgeev(jobvl, jobvr, n, a, lda, w, vl, ldvl, vr, ldvr, work, lwork, rwork, info)
```

Fortran 95:

```
call geev(a, wr, wi [,vl] [,vr] [,info])
call geev(a, w [,vl] [,vr] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues and, optionally, the left and/or right eigenvectors. The right eigenvector *v*(j) of *A* satisfies

$$A*v(j) = \lambda(j)*v(j)$$

where $\lambda(j)$ is its eigenvalue.

The left eigenvector *u*(j) of *A* satisfies

$$u(j)^H*A = \lambda(j)*u(j)^H$$

where $u(j)^H$ denotes the conjugate transpose of *u*(j). The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

Input Parameters

jobvl	`CHARACTER*1`. Must be `'N'` or `'V'`. If *jobvl* = `'N'`, then left eigenvectors of *A* are not computed. If *jobvl* = `'V'`, then left eigenvectors of *A* are computed.
jobvr	`CHARACTER*1`. Must be `'N'` or `'V'`. If *jobvr* = `'N'`, then right eigenvectors of *A* are not computed. If *jobvr* = `'V'`, then right eigenvectors of *A* are computed.
n	`INTEGER`. The order of the matrix *A* (*n* ≥ 0).
a, *work*	`REAL` for sgeev `DOUBLE PRECISION` for dgeev `COMPLEX` for cgeev

	DOUBLE COMPLEX for zgeev. Arrays: *a*(*lda*,*) is an array containing the *n*-by-*n* matrix *A*. The second dimension of *a* must be at least max(1, *n*). *work* is a workspace array, its dimension max(1, *lwork*).
lda	INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).
ldvl, *ldvr*	INTEGER. The leading dimensions of the output arrays *vl* and *vr*, respectively. Constraints: *ldvl* ≥ 1; *ldvr* ≥ 1. If *jobvl* = 'V', *ldvl* ≥ max(1, *n*); If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).
lwork	INTEGER. The dimension of the array *work*. Constraint: *lwork* ≥ max(1, 3*n*), and if *jobvl* = 'V' or *jobvr* = 'V', *lwork* < max(1, 4*n*) (for real flavors); *lwork* < max(1, 2*n*) (for complex flavors). For good performance, *lwork* must generally be larger. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.
rwork	REAL for cgeev DOUBLE PRECISION for zgeev Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

Output Parameters

a	On exit, this array is overwritten by intermediate results.
wr, *wi*	REAL for sgeev DOUBLE PRECISION for dgeev Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.
w	COMPLEX for cgeev DOUBLE COMPLEX for zgeev. Array, DIMENSION at least max(1, *n*). Contains the computed eigenvalues.
vl, *vr*	REAL for sgeev DOUBLE PRECISION for dgeev COMPLEX for cgeev

DOUBLE COMPLEX for zgeev.
Arrays:
vl(*ldvl*,*);the second dimension of *vl* must be at least max(1, *n*).
If *jobvl* = 'V', the left eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues.
If *jobvl* = 'N', *vl* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i***vl*(:,j+1) and *u*(j+1) = *vl*(:,j)- *i***vl*(:,j+1), where *i* = sqrt(-1).
For complex flavors:
u(j) = *vl*(:,j), the j-th column of *vl*.
vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).
If *jobvr* = 'V', the right eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues.
If *jobvr* = 'N', *vr* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *v*(j) = *vr*(:,j) + *i***vr*(:,j+1) and *v*(j+1) = *vr*(:,j) - *i***vr*(:,j+1), where *i* = sqrt(-1).
For complex flavors:
v(j) = *vr*(:,j), the j-th column of *vr*.

work(1) — On exit, if *info* = 0, then *work(1)* returns the required minimal size of *lwork*.

info — INTEGER.
If *info* = 0, the execution is successful.
If *info* = -*i*, the *i*th parameter had an illegal value.
If *info* = *i*, the *QR* algorithm failed to compute all the eigenvalues, and no eigenvectors have been computed; elements *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain those eigenvalues which have converged.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine geev interface are the following:

a — Holds the matrix *A* of size (*n*, *n*).

wr — Holds the vector of length *n*. Used in real flavors only.

wi — Holds the vector of length *n*. Used in real flavors only.

w — Holds the vector of length *n*. Used in complex flavors only.

vl — Holds the matrix *VL* of size (*n*, *n*).

vr	Holds the matrix *VR* of size (*n*, *n*).
jobvl	Restored based on the presence of the argument *vl* as follows: *jobvl* = 'V', if *vl* is present, *jobvl* = 'N', if *vl* is omitted.
jobvr	Restored based on the presence of the argument *vr* as follows: *jobvr* = 'V', if *vr* is present, *jobvr* = 'N', if *vr* is omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

?geevx

Computes the eigenvalues and left and right eigenvectors of a general matrix, with preliminary matrix balancing, and computes reciprocal condition numbers for the eigenvalues and right eigenvectors.

Syntax

FORTRAN 77:

call sgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *wr*, *wi*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *iwork*, *info*)

call dgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *wr*, *wi*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *iwork*, *info*)

call cgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *w*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *rwork*, *info*)

call zgeevx(*balanc*, *jobvl*, *jobvr*, *sense*, *n*, *a*, *lda*, *w*, *vl*, *ldvl*, *vr*, *ldvr*, *ilo*, *ihi*, *scale*, *abnrm*, *rconde*, *rcondv*, *work*, *lwork*, *rwork*, *info*)

Fortran 95:

call geevx(*a*, *wr*, *wi* [,*vl*] [,*vr*] [,*balanc*] [,*ilo*] [,*ihi*] [,*scale*] [,*abnrm*] [, *rconde*] [,*rcondv*] [,*info*])

call geevx(*a*, *w* [,*vl*] [,*vr*] [,*balanc*] [,*ilo*] [,*ihi*] [,*scale*] [,*abnrm*] [,*rconde*] [, *rcondv*] [,*info*])

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes for an *n*-by-*n* real/complex nonsymmetric matrix *A*, the eigenvalues and, optionally, the left and/or right eigenvectors.

Optionally also, it computes a balancing transformation to improve the conditioning of the eigenvalues and eigenvectors (*ilo*, *ihi*, *scale*, and *abnrm*), reciprocal condition numbers for the eigenvalues (*rconde*), and reciprocal condition numbers for the right eigenvectors (*rcondv*).

The right eigenvector *v*(j) of *A* satisfies

$$A*v(j) = \lambda(j)*v(j)$$

where $\lambda(j)$ is its eigenvalue.

The left eigenvector *u*(j) of *A* satisfies

$$u(j)^H*A = \lambda(j)*u(j)^H$$

where $u(j)^H$ denotes the conjugate transpose of *u*(j). The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

Balancing a matrix means permuting the rows and columns to make it more nearly upper triangular, and applying a diagonal similarity transformation *D***A**inv(*D*), where *D* is a diagonal matrix, to make its rows and columns closer in norm and the condition numbers of its eigenvalues and eigenvectors smaller. The computed reciprocal condition numbers correspond to the balanced matrix. Permuting rows and columns will not change the condition numbers in exact arithmetic) but diagonal scaling will. For further explanation of balancing, see [LUG], Section 4.10.

Input Parameters

balanc
CHARACTER*1. Must be 'N', 'P', 'S', or 'B'. Indicates how the input matrix should be diagonally scaled and/or permuted to improve the conditioning of its eigenvalues.
If *balanc* = 'N', do not diagonally scale or permute;
If *balanc* = 'P', perform permutations to make the matrix more nearly upper triangular. Do not diagonally scale;
If *balanc* = 'S', diagonally scale the matrix, i.e. replace *A* by *D***A**inv(*D*), where *D* is a diagonal matrix chosen to make the rows and columns of *A* more equal in norm. Do not permute;
If *balanc* = 'B', both diagonally scale and permute *A*.
Computed reciprocal condition numbers will be for the matrix after balancing and/or permuting. Permuting does not change condition numbers (in exact arithmetic), but balancing does.

jobvl
CHARACTER*1. Must be 'N' or 'V'.
If *jobvl* = 'N', left eigenvectors of *A* are not computed;
If *jobvl* = 'V', left eigenvectors of *A* are computed.
If *sense* = 'E' or 'B', then *jobvl* must be 'V'.

jobvr
CHARACTER*1. Must be 'N' or 'V'.

If *jobvr* = 'N', right eigenvectors of *A* are not computed;
If *jobvr* = 'V', right eigenvectors of *A* are computed.
If *sense* = 'E' or 'B', then *jobvr* must be 'V'.

sense — CHARACTER*1. Must be 'N', 'E', 'V', or 'B'. Determines which reciprocal condition number are computed.
If *sense* = 'N', none are computed;
If *sense* = 'E', computed for eigenvalues only;
If *sense* = 'V', computed for right eigenvectors only;
If *sense* = 'B', computed for eigenvalues and right eigenvectors.
If *sense* is 'E' or 'B', both left and right eigenvectors must also be computed (*jobvl* = 'V' and *jobvr* = 'V').

n — INTEGER. The order of the matrix *A* (*n* ≥ 0).

a, *work* — REAL for sgeevx
DOUBLE PRECISION for dgeevx
COMPLEX for cgeevx
DOUBLE COMPLEX for zgeevx.
Arrays:
a(*lda*,*) is an array containing the *n*-by-*n* matrix *A*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda — INTEGER. The first dimension of the array *a*. Must be at least max(1, *n*).

ldvl, *ldvr* — INTEGER. The leading dimensions of the output arrays *vl* and *vr*, respectively.
Constraints:

ldvl ≥ 1; *ldvr* ≥ 1.

If *jobvl* = 'V', *ldvl* ≥ max(1, *n*);

If *jobvr* = 'V', *ldvr* ≥ max(1, *n*).

lwork — INTEGER.
The dimension of the array *work*.
For real flavors:

If *sense* = 'N' or 'E', *lwork* ≥ max(1, 2*n*), and if *jobvl* = 'V'

or *jobvr* = 'V', *lwork* ≥ 3*n*;

If *sense* = 'V' or 'B', *lwork* ≥ *n**(*n*+6).
For good performance, *lwork* must generally be larger.
For complex flavors:

If *sense* = 'N'or 'E', *lwork* ≥ max(1, 2*n*);

If *sense* = 'V' or 'B', *lwork* ≥ n^2+2*n*. For good performance, *lwork* must generally be larger.
If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla.

rwork REAL for cgeevx
DOUBLE PRECISION for zgeevx
Workspace array, DIMENSION at least max(1, 2*n*). Used in complex flavors only.

iwork INTEGER.
Workspace array, DIMENSION at least max(1, 2*n*-2). Used in real flavors only. Not referenced if *sense* = 'N' or 'E'.

Output Parameters

a On exit, this array is overwritten.
If *jobvl* = 'V' or *jobvr* = 'V', it contains the real-Schur/Schur form of the balanced version of the input matrix *A*.

wr, *wi* REAL for sgeevx
DOUBLE PRECISION for dgeevx
Arrays, DIMENSION at least max (1, *n*) each. Contain the real and imaginary parts, respectively, of the computed eigenvalues. Complex conjugate pairs of eigenvalues appear consecutively with the eigenvalue having positive imaginary part first.

w COMPLEX for cgeevx
DOUBLE COMPLEX for zgeevx.
Array, DIMENSION at least max(1, *n*). Contains the computed eigenvalues.

vl, *vr* REAL for sgeevx
DOUBLE PRECISION for dgeevx
COMPLEX for cgeevx
DOUBLE COMPLEX for zgeevx.
Arrays:
vl(*ldvl*,*); the second dimension of *vl* must be at least max(1, *n*).
If *jobvl* = 'V', the left eigenvectors *u*(j) are stored one after another in the columns of *vl*, in the same order as their eigenvalues.
If *jobvl* = 'N', *vl* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *u*(j) = *vl*(:,j), the j-th column of *vl*.
If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then *u*(j) = *vl*(:,j) + *i***vl*(:,j+1) and (j+1) = *vl*(:,j) - *i***vl*(:,j+1), where *i* = sqrt(-1).
For complex flavors:
u(j) = *vl*(:,j), the j-th column of *vl*.
vr(*ldvr*,*); the second dimension of *vr* must be at least max(1, *n*).
If *jobvr* = 'V', the right eigenvectors *v*(j) are stored one after another in the columns of *vr*, in the same order as their eigenvalues.
If *jobvr* = 'N', *vr* is not referenced.
For real flavors:
If the j-th eigenvalue is real, then *v*(j) = *vr*(:,j), the j-th column of *vr*.

	If the j-th and (j+1)-st eigenvalues form a complex conjugate pair, then $v(j) = vr(:,j) + i*vr(:,j+1)$ and $v(j+1) = vr(:,j) - i*vr(:,j+1)$, where $i = sqrt(-1)$. *For complex flavors*: $v(j) = vr(:,j)$, the j-th column of vr.
ilo, *ihi*	INTEGER. *ilo* and *ihi* are integer values determined when *A* was balanced. The balanced $A(i,j) = 0$ if $i > j$ and $j = 1,..., ilo-1$ or $i = ihi+1,..., n$. If $balanc = 'N'$ or $'S'$, $ilo = 1$ and $ihi = n$.
scale	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. Array, DIMENSION at least max(1, *n*). Details of the permutations and scaling factors applied when balancing *A*. If *P*(j) is the index of the row and column interchanged with row and column j, and *D*(j) is the scaling factor applied to row and column j, then $scale(j) = P(j)$, for $j = 1,...,ilo-1$ $= D(j)$, for $j = ilo,...,ihi$ $= P(j)$ for $j = ihi+1,..., n$. The order in which the interchanges are made is *n* to *ihi*+1, then 1 to *ilo*-1.
abnrm	REAL for single-precision flavors DOUBLE PRECISION for double-precision flavors. The one-norm of the balanced matrix (the maximum of the sum of absolute values of elements of any column).
rconde, *rcondv*	REAL for single precision flavors DOUBLE PRECISION for double precision flavors. Arrays, DIMENSION at least max(1, *n*) each. *rconde*(j) is the reciprocal condition number of the j-th eigenvalue. *rcondv*(j) is the reciprocal condition number of the j-th right eigenvector.
work(1)	On exit, if $info = 0$, then *work(1)* returns the required minimal size of *lwork*.
info	INTEGER. If $info = 0$, the execution is successful. If $info = -i$, the *i*th parameter had an illegal value. If $info = i$, the *QR* algorithm failed to compute all the eigenvalues, and no eigenvectors or condition numbers have been computed; elements 1:*ilo*-1 and *i*+1:*n* of *wr* and *wi* (for real flavors) or *w* (for complex flavors) contain eigenvalues which have converged.

Fortran 95 Interface Notes

Routines in Fortran 95 interface have fewer arguments in the calling sequence than their FORTRAN 77 counterparts. For general conventions applied to skip redundant or restorable arguments, see Fortran 95 Interface Conventions.

Specific details for the routine geevx interface are the following:

a	Holds the matrix *A* of size (*n*, *n*).
wr	Holds the vector of length *n*. Used in real flavors only.
wi	Holds the vector of length *n*. Used in real flavors only.
w	Holds the vector of length *n*. Used in complex flavors only.
vl	Holds the matrix *VL* of size (*n*, *n*).
vr	Holds the matrix *VR* of size (*n*, *n*).
scale	Holds the vector of length *n*.
rconde	Holds the vector of length *n*.
rcondv	Holds the vector of length *n*.
balanc	Must be 'N', 'B', 'P' or 'S'. The default value is 'N'.
jobvl	Restored based on the presence of the argument *vl* as follows: *jobvl* = 'V', if *vl* is present, *jobvl* = 'N', if *vl* is omitted.
jobvr	Restored based on the presence of the argument *vr* as follows: *jobvr* = 'V', if *vr* is present, *jobvr* = 'N', if *vr* is omitted.
sense	Restored based on the presence of arguments *rconde* and rcondv as follows: *sense* = 'B', if both *rconde* and *rcondv* are present, *sense* = 'E', if *rconde* is present and *rcondv* omitted, *sense* = 'V', if *rconde* is omitted and *rcondv* present, *sense* = 'N', if both *rconde* and *rcondv* are omitted.

Application Notes

If you are in doubt how much workspace to supply, use a generous value of *lwork* for the first run or set *lwork* = -1.

If you choose the first option and set any of admissible *lwork* sizes, which is no less than the minimal value described, the routine completes the task, though probably not so fast as with a recommended workspace, and provides the recommended workspace in the first element of the corresponding array *work* on exit. Use this value (*work*(1)) for subsequent runs.

If you set *lwork* = -1, the routine returns immediately and provides the recommended workspace in the first element of the corresponding array (*work*). This operation is called a workspace query.

Note that if you set *lwork* to less than the minimal required value and not -1, the routine returns immediately with an error exit and does not provide any information on the recommended workspace.

Singular Value Decomposition

This section describes LAPACK driver routines used for solving singular value problems. See also computational routines computational routines that can be called to solve these problems. Table 4-12 lists all such driver routines for FORTRAN 77 interface. Respective routine names in Fortran 95 interface are without the first symbol (see Routine Naming Conventions).

Table 4-12 Driver Routines for Singular Value Decomposition

Routine Name	Operation performed
?gesvd	Computes the singular value decomposition of a general rectangular matrix.
?gesdd	Computes the singular value decomposition of a general rectangular matrix using a divide and conquer method.
?gejsv	Computes the singular value decomposition of a real matrix using a preconditioned Jacobi SVD method.
?gesvj	Computes the singular value decomposition of a real matrix using Jacobi plane rotations.
?ggsvd	Computes the generalized singular value decomposition of a pair of general rectangular matrices.

?gesvd

Computes the singular value decomposition of a general rectangular matrix.

Syntax

FORTRAN 77:

```
call sgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, info)
call dgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, info)
call cgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, info)
call zgesvd(jobu, jobvt, m, n, a, lda, s, u, ldu, vt, ldvt, work, lwork, rwork, info)
```

Fortran 95:

```
call gesvd(a, s [,u] [,vt] [,ww] [,job] [,info])
```

Description

This routine is declared in `mkl_lapack.fi` for FORTRAN 77 interface, in `lapack.f90` for Fortran 95 interface, and in `mkl_lapack.h` for C interface.

The routine computes the singular value decomposition (SVD) of a real/complex *m*-by-*n* matrix *A*, optionally computing the left and/or right singular vectors. The SVD is written as

A = *U**Σ**V'* for real routines

A = *U**Σ*conjg(*V'*) for complex routines

where Σ is an *m*-by-*n* matrix which is zero except for its min(*m*,*n*) diagonal elements, *U* is an *m*-by-*m* orthogonal/unitary matrix, and *V* is an *n*-by-*n* orthogonal/unitary matrix. The diagonal elements of Σ are the singular values of *A*; they are real and non-negative, and are returned in descending order. The first min(*m*, *n*) columns of *U* and *V* are the left and right singular vectors of *A*.

Note that the routine returns *V'* (for real flavors) or conjg(*V'*) (for complex flavors), not *V*.

Input Parameters

jobu
CHARACTER*1. Must be 'A', 'S', 'O', or 'N'. Specifies options for computing all or part of the matrix *U*.
If *jobu* = 'A', all *m* columns of *U* are returned in the array *u*;
if *jobu* = 'S', the first min(*m*, *n*) columns of *U* (the left singular vectors) are returned in the array *u*;
if *jobu* = 'O', the first min(*m*, *n*) columns of *U* (the left singular vectors) are overwritten on the array *a*;
if *jobu* = 'N', no columns of *U* (no left singular vectors) are computed.

jobvt
CHARACTER*1. Must be 'A', 'S', 'O', or 'N'. Specifies options for computing all or part of the matrix V^H.
If *jobvt* = 'A', all *n* rows of *V'*/conjg(*V'*) are returned in the array *vt*;
if *jobvt* = 'S', the first min(*m*,*n*) rows of *V'*/conjg(*V'*) (the right singular vectors) are returned in the array *vt*;
if *jobvt* = 'O', the first min(*m*,*n*) rows of *V'*/conjg(*V'*) (the right singular vectors) are overwritten on the array *a*;
if *jobvt* = 'N', no rows of *V'*/conjg(*V'*) (no right singular vectors) are computed.
jobvt and *jobu* cannot both be 'O'.

m
INTEGER. The number of rows of the matrix *A* (*m* ≥ 0).

n
INTEGER. The number of columns in *A* (*n* ≥ 0).

a, *work*
REAL for sgesvd
DOUBLE PRECISION for dgesvd
COMPLEX for cgesvd
DOUBLE COMPLEX for zgesvd.
Arrays:
a(*lda*,*) is an array containing the *m*-by-*n* matrix *A*.
The second dimension of *a* must be at least max(1, *n*).
work is a workspace array, its dimension max(1, *lwork*).

lda
INTEGER. The first dimension of the array *a*.
Must be at least max(1, *m*).

ldu, *ldvt*
INTEGER. The leading dimensions of the output arrays *u* and *vt*, respectively.
Constraints:

ldu ≥ 1; *ldvt* ≥ 1.

If *jobu* = 'S' or 'A', *ldu* ≥ *m*;

If *jobvt* = 'A', *ldvt*≥ *n*;

If *jobvt* = 'S', *ldvt* ≥ min(*m*, *n*).

lwork
INTEGER.
The dimension of the array *work*.
Constraints:

	lwork ≥ 1 *lwork* ≥ max(3*min(*m*, *n*)+max(*m*, *n*), 5*min(*m*,*n*)) (for real flavors); *lwork* ≥ 2*min(*m*, *n*)+max(*m*, *n*) (for complex flavors). For good performance, *lwork* must generally be larger. If *lwork* = -1, then a workspace query is assumed; the routine only calculates the optimal size of the *work* array, returns this value as the first entry of the *work* array, and no error message related to *lwork* is issued by xerbla. See *Application Notes* for details.
rwork	REAL for cgesvd DOUBLE PRECISION for zgesvd Workspace array, DIMENSION at least max(1, 5*min(*m*, *n*)). Used in complex flavors only.
